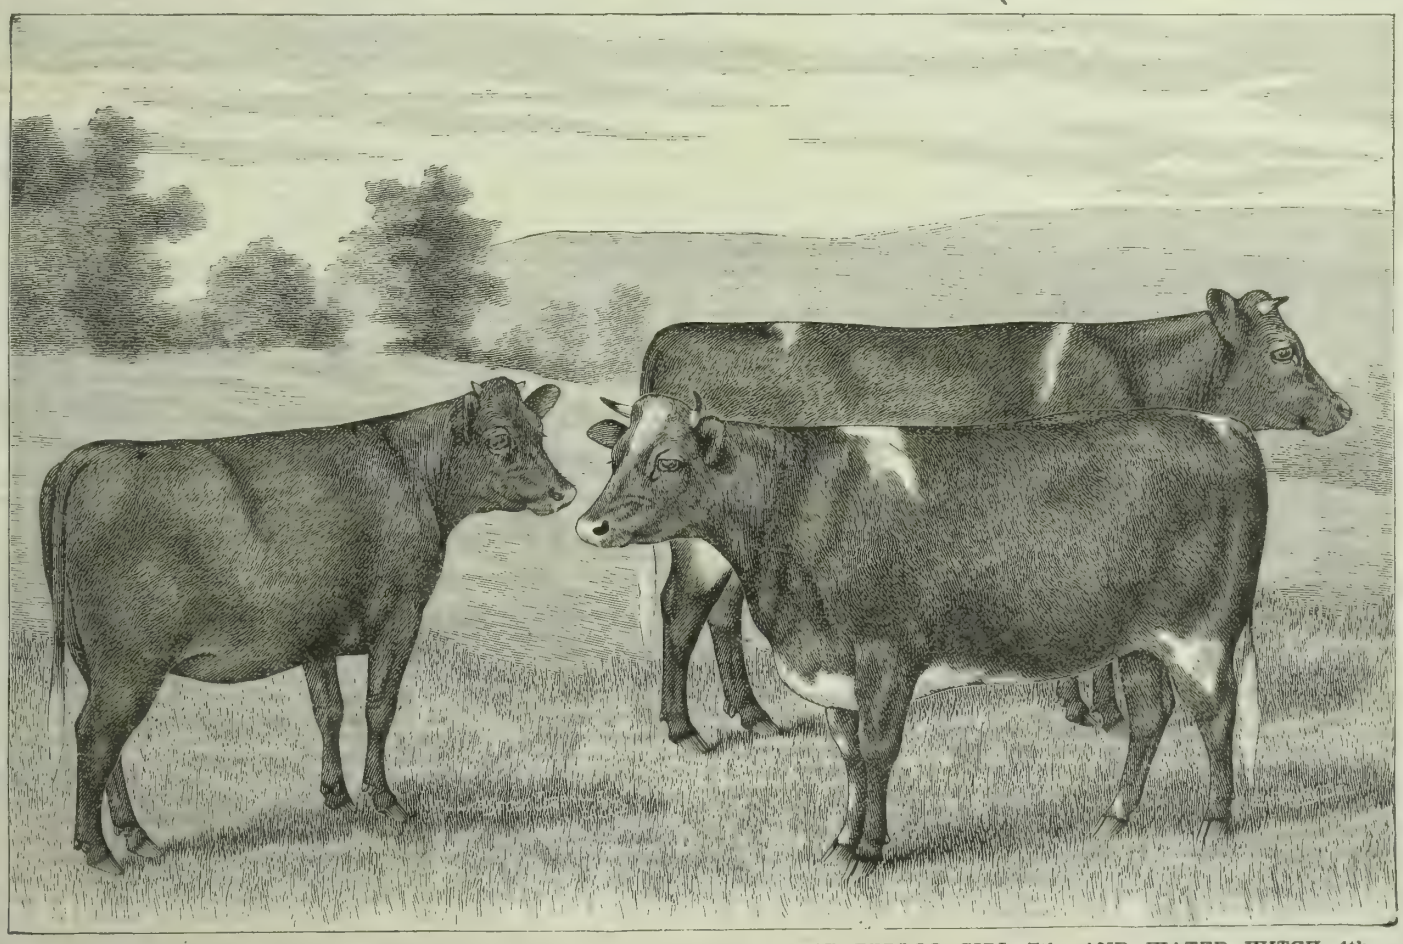
The Colorado farmers upon streams, the higher waters of which are used in mining operations, have a grievance quite different from that which our valley farmers are contending against, and yet in effect it is much the same—that is, the lands are rendered unproductive. In Colorado the killing of the land is accomplished in a very different way, being chemical instead of mechanical as in this State. At a recent meeting in Denver, which we find reported in the *Farmer*, it was stated that land close to Denver, which in a few years should be worth $100 an acre, cannot be sold. Sediment is beginning to run in small quantities in other creeks; in 25 years it will be so big that fish cannot live in streams. The farmers want to know what is the use of spending money on fish hatcheries if the miners are allowed to pollute the water so that fish cannot live in the streams.

It seems that the sediment which the miners throw in the streams contains arsenic, antimony, etc., which poisons the water and soil which it impregnates. It caused the potato disease in 1873 when they would not grow. This fills the whole country with poison and smelters are carrying it in efflorescence and vapor, filling the air. Clear creek farmers drink this poison water in the summer and become sick.

It is very clear that water laden with these poisons cannot be used for irrigation nor for drinking. Plants are very sensitive to arsenic and a very small percentage will kill them outright. The Colorado farmers are aware of the progress made in this State in preventing pollution of streams and destruction of valley lands. Our experience will be of much value to them, and the decision of our courts on the broad principle that one industry cannot be pursued if it injures the property of other parties, will aid them in any corrective legislation they may seek. Though pioneer work in this direction has been well done by California farmers, the Colorado people need not think they will have an easy task to protect themselves. It has required years of earnest and self-denying struggle on the part of our agricultural people, and if they had not been made of stern stuff they would have been baffled and beaten. Their victory is a signal one, but even the fruits of it are only secured by continued effort and ceaseless vigilance. Let the Colorado farmers muster their strength and enlist the support of all possible persons outside of their own ranks. Let them prepare for a long contest. They may be sure of the sympathy and active interest of those who have been carrying on the struggle in California.



A Friend of California.—M. Ch. Joly, vice-president of the National Horticultural Society of France, is a good friend of California. In his pamphlet publications and in his horticultural contributions to an excellent Parisian publication, *La Maison de Compagne*, he makes frequent allusion to our fruit industry, and to the general resources and advancement of the State. In a recent article he says: "In order to give an idea of the resources of the United States, let us cast a glance upon the horticultural production of a State only 30 years old, and which is at the same time the Spain, the France and the Italy of America." Then follows a sketch of our fruit and wine product. We are wont to arrogate to ourselves possession of the adaptations and advantages of the most favored parts of Europe, but it is the more gratifying to see them thus frankly conceded by our friends abroad. We hope M. Joly may soon make us a visit. He might then concede that California is also the Switzerland, the Holland, the Germany—in fact, the Europe of America.

Haymaking began last week near Petaluma.

More Flower Festivals.—A handsome complimentary ticket, with a moss rose pictured in one corner, reminds us that the Floral Fair in Horticultural hall, San Jose, for which elaborate preparations have been going on, begins the day this paper goes to press. Then, too, the young ladies of the Alameda Flower Mission, elated by their recent victory at Oakland, are to hold a flower festival at home, in Tucker's block, near the postoffice, this Friday and Saturday, while Santa Cruz is astir in anticipation of her own Rose Fair, which comes off next week, the exercises including a grand choral praise service and reception of delegates to the World's Conference of Young Men's Christian Associations.

Proposed Summer Fruit Fair.—Captain Weinstock, of Sacramento, makes a good suggestion via the *Bee*, that a fruit fair or festival be made in Sacramento in August next. He advocates that the fruit be first exhibited in Sacramento, and that it then be replenished and shipped to Chicago for exhibit there. He holds that, if two exhibits are found not to be practicable, it would be preferable to have the one in Chicago rather than in Sacramento. No doubt much good could be done by showing at the East fine collections of the fruits we desire to ship in large quantities during the summer and fall months.

Haying has commenced in Tulare county. The first crop of alfalfa is being cut in places where it has been irrigated or is growing in moist land.

PURE BRED SHORTHORN HEIFERS—WATERLOO OF BROWNDALE, WATERLOO GIRL 7th, AND WATER WITCH 4th.

A Handsome Group.

For the once, we rule the lordly sires out of our animal portraiture and give our first page to three noble ladies of the Shorthorn persuasion. Beginning upon the left, the youngest of the group is Waterloo, of Browndale; facing her is Waterloo Girl 7th, and the third, in the background, is Water Witch 4th. The group belongs to the Browndale herd of H. F. Brown, of Minneapolis, Minn. Mr. Brown made a flying visit to California this spring, and assured us that the artist had not done more than justice to these beauties of his herd. The three are classed as Waterloo heifers, tracing closely to Bates' famous Waterloo tribe. The Waterloos are regarded as one of the most desirable Bates families, being rich in the blood of highly-prized sires, and as a family are distinguished for superior form and character. Mr. Brown's herd is very high for pedigrees and for useful qualities, as he maintains the dairy value of the Bates Shorthorns and refrains from reducing their breeding vigor by pampering for show effects. Mr. Brown disposes of his increase at annual sales, this year's sale being set for the 24th of this month at Minneapolis. Live-stock matters are rather brisk this spring, judging from the number of sales which are noted in our advertising columns. Next week we expect to give something about Jersey values, as shown by recent sales at the East.

Wheat in Sight in Great Britain.—One of the important factors in the greatly improved wheat outlook is the reduced stocks of wheat in sight at various points. Take for example the report which we just received by mail of the stocks on hand at the various British centers on April 1, 1887. The totals are 1,367,565 quarters against 1,585,738 on April 1, 1886, or 218,173 quarters less this year. This amount is equivalent to 1,7453,84 bushels.

The artesian well on the Rideout ranch, a few miles south of Willows, is a complete success. It has reached a depth of 871 feet, and the water flows 12 feet above the ground and at a rate of five gallons per minute. People are considerably excited over the new discovery.

HORTICULTURE.

Will There be Too Much Fruit?

Meeting of the State Horticultural Society.

The regular meeting of the State Horticultural Society was held in Irving hall parlor, San Francisco, on Friday, April 29th, President Hilgard in the chair. There was a very large attendance and the meeting was spirited throughout. B. M. Lelong, the newly elected secretary of the State Board of Horticulture, was proposed for membership by Mr. Shinn.

Mr. Lelong was called upon and gave an account of the newly introduced cold-storage process as used in Southern California. He spoke very highly of its results. (We omit this account because we expect the subject will be fully discussed by our editorial representative at the Riverside Fair.)

Dr. Kimball, of Haywards, who made a careful personal examination of the Riverside establishment, spoke very emphatically of its prospective value to the fruit interest of this part of the State, claiming that it would prove of even more importance to growers of deciduous than of citrus fruits.

Mr. Hatch, Mr. Buck and others spoke of the promise of value in the improved Allegretti process, claiming that it would do all the Riverside process would do and its benefits could be had very cheaply. The general sentiment was that all processes should be tested, and an effort made to secure the advantage of cold storage at as low a figure as possible, because everything indicated that California fruit must be sold as cheap as it can be and still leave a fair profit to the grower, for very large sales will depend upon low prices.

The discussion of the subject of the day was then introduced by the following essay by Judge W. C. Blackwood, of Haywards:

Overproduction of Fruit.

We are here to-day to consider the fruit industry of the State, and whether, under the stimulus of high prices and the superior fitness of the soil and climate of California, there is any danger of overproduction.

Overproduction may be effected in two ways. First, when the production is so great that there is not sufficient labor force at command to expeditiously and economically handle the crop; second, when there may be too much land devoted to orchard-growing—that is, when the orchards are brought to full bearing, they will produce more fruit than is required to supply the demands of commerce, with profit to the orchardist.

I will devote a few remarks to the first cause of overproduction and see if there is not, even in the present season, danger of overproduction in some varieties of fruit—for instance, apricots. The season for harvesting this fruit is about 20 days. The crop must all be secured in that time or it is lost. Now it is estimated by experts that in Santa Clara county alone the crop will amount to 15,000 tons, and in Alameda county 3500 tons. I have seen no estimates of the incoming crop of Solano county, but we know there are many large orchards in that county and the crop is reported to be full. Then there are the Sacramento valley and the southern counties of the State, where, in the last few years, large apricot orchards have been planted and are now in full bearing, and presumably promise full crops the present year.

Now, with the present labor force in the State, can this enormous incoming crop be expeditiously and economically handled?

Take the crop of Santa Clara and Alameda, 18,500 tons—to pick this crop from the trees will require 37,000 days' labor. Allowing 20 days to harvest the crop, it will take a force of 1850 men per day to pick the crop from the trees, to say nothing of the required additional force to move the crop from the orchards to the shipping points. I have put a half ton of apricots as what one man will pick in a day. This, take the season through, is about what a lot of men will average, as I have found by years of experience.

Now, if this crop of fruit is to be dried, it will occupy five men a day, of 11 hours, to open a ton and place them on trays in proper order, beside some additional force to sulphurize the fruit and place it in position for drying. This will require an additional 4625 hands for the 20 days, beside the extras, or a total force to pick and dry the crop of these two counties alone of 6475 men, beside the extra help required in loading, unloading, hauling and sulphuring and handling trays, etc.

Now, is that large labor force at command in those two counties? I, for one, think it is not, neither do I think it can be imported at the time it will be required, because other fruit districts will at that time have no labor force to spare. They will probably find themselves as hard pressed for lack of sufficient labor force as the orchardists of the counties we are considering.

But can or will the canneries give the orchardists the relief they will need? In San Francisco, San Jose and Oakland there are some ten canneries. Allow them an average pack of 500 tons each, which I think will be a full average, and the orchardists of those two counties, if the canners bought apricots from no other districts (which can hardly be expected) will only be relieved by the canneries of 5000 tons, leaving in their hands 13,500 tons to be dried, if utilized at all. To do this they must have an operating force of 3375 men besides their picking force for 20 days. Now I don't know where this operating force is to be obtained; so far as Alameda county is concerned, I am confident it is not in the county.

As for making profitable shipments of apricots overland to Eastern fruit centers, I think past experience of the orchardists of Santa Clara and Alameda counties has satisfied them there is not much save disappointment in it. If, then, the present year's crop of apricots cannot be economically handled, although the markets of the world are fair, have we not an overproduction of this very desirable fruit? That is the way it seems to me.

Peaches.

Take again peaches: the newsgatherers report an immense crop. The two Bucks, of Vacaville, are reported as saying their orchards will ripen 800 tons. If other orchards throughout the State promise equally as well, there must necessarily be an immense surplus—much more than can be canned, dried or shipped with profit to Eastern markets. So it would seem of these perishable fruits we have been considering, California is already on the eve of overproduction, yet she has room and climate and soil to produce of these fruits ten times what she is now producing. Thus overproduction may proceed from an inability to economically handle the quantity produced.

Overproduction From Excessive Area.

Overproduction, I have said, might arise, secondly, from devoting more land to orchard-growing than, when the orchard comes to full bearing, is required to supply the demands of commerce with profit to the orchardist.

Take prunes, for instance, for consideration. The importation of prunes into the United States last year was about 60,000,000 pounds. California produced last year a very small amount, as compared to the importations. Yet the production was great enough to test their value as compared with the imported prune in the Eastern markets, and on trial they were found to be superior to the imported prune, and passed into consumption at prices much in advance of what could be obtained for the imported article. This is a circumstance very gratifying to the California prune-grower. And with continued care and the exercise of a proper degree of intelligence in the curing process, I have no doubt that the California prune will continue to maintain its character of superiority over the imported article and in time drive it out of the markets of the United States, and will become a strong competitor with the European article in the markets of the world. But is there danger of overproduction of the prune? Nurserymen will tell you that every spring their stock of young prune trees is exhausted. This shows the area of prune orchard is being constantly extended. In a few years when these young prune trees arrive at full bearing age the production of prunes will be immense, amounting to millions of pounds. At 50 pounds of cured prunes to the tree (a low estimate) and 100 prune trees to the acre, 12,000 acres of prune orchard will produce 60,000,000 pounds of dried prunes—a quantity equal to the present importation of prunes into the United States. I do not know how many prune trees are now set in orchard or how many acres in the State are now devoted to prune orchards, but this I do know: There is unoccupied orchard land enough in Alameda county, and more than enough in Santa Clara county, to say nothing of what is lying unoccupied in all other parts of the State, to grow more prunes than the markets of the world will consent to receive for consumption. And I shall not be surprised if the prune culture is so extensive that in a few years all will acknowledge an overproduction of that kind of fruit.

Other Products.

The same may, I think, be predicted of the raisin and orange culture. I have not statistics at hand showing the quantity of raisins imported into the United States, but the raisin industry of California is rapidly on the increase, while the land suitable for growing the raisin grape is almost unlimited in quantity. Skill and intelligence, to make a desirable raisin, have been put forth, until now the California raisin ranks among the best, and is competing with the foreign article in the markets of the United States. But in my opinion, the raisin-maker has a big job before him. The foreign prune and raisin maker and merchant will not yield the trade in those fruits, which they have possessed and do still possess in the United States, without a desperate struggle. To succeed, we here in California must make as good, or even a better, article than the foreign prune and raisin, and we will have to sell as low, or a little lower, than the importer of the foreign articles can do. In the end I think the prune and raisin manufacturers of California will not only hold their own, but will eventually drive the foreign articles out of the markets of the United States. Then will commence a competition among the California prune and raisin growers themselves; then will come the danger of overproduction from too great an extension of prune orchards and raisin vineyards.

So of the orange industry. It is now proved beyond question that prime oranges may be grown in many sections of the State, which, until recently, were supposed to be unsuited to their culture; and, notwithstanding the immense orchards now in bearing in the southern portion of the State, tens of thousands of young trees are being constantly set, which must increase their production beyond any present power of computation. Some orange-growers hope, and probably think, that by resorting to the modern system of cold storage, now so much talked about in some places, they can hold their crop till such time as the market is comparatively bare and will relieve them of their crops at remunerative prices. Possibly they may be right, and possibly the staff they propose to lean upon may prove a broken reed.

Disposition of Californians.

When we recall to mind the sanguine temperament of the average Californian, the energy of his movements in carrying out his desire to establish and build up a remunerative business, and in a few years rest in the enjoyment of what in most countries would be regarded as a princely income, it would be wonderful if he, with thousands like him, having turned his attention to orcharding, and the supposed immense profits incident to the business, should not overshoot the mark, and by his and their united labor produce more fruit than they can economically handle or profitably sell on the market. Here is our friend, Mr. Hatch; he is a very hopeful, sanguine orchardist and quite a successful one. He has, I am told, possessed himself of about all the lands next to him in Suisun; but his ambition is still vaulting upward, and, like the great Alexander, he sighs for other worlds to conquer. He has invaded Alameda county to continue his conquering career.

> No pent-up Suisun shall confine our powers,
> But great Alameda shall also be ours.

But, Mr. President, there is no human industry which is not at times subject to depression from overproduction. The wheat industry, the cattle industry, the sheep and wool industry, and the pork industry, have all at times suffered from overproduction. So of mining and manufactures. Yet all these industries survive and most of them now flourish. So it will be of the fruit interest of California. Overproduction of some favorite kinds of fruit may prevail for a short time, but it is bound to correct itself. Depression may force some to the wall and seriously injure others, but depression will never kill the fruit industry in California. When we who are here to-day shall have passed away, the fruit industry of California will still flourish; her valleys will still be covered with orchards, yielding the peach and apricot, the plum and the prune, the apple and the pear; her hills will still be covered with the vine, the olive and the fig, and her people will be reposing in ease and luxury beneath the shades of their orchards, their vines and their fig trees, with none to molest them or make them afraid, but will be intelligent, virtuous and happy.

Reasons Why There Will Not be Overproduction.

In opening the negative of the subject under debate, that there is not likely to be overproduction of fruit in this State, Mr. A. T. Hatch, of Suisun, submitted the following points:

Overproduction of fruit in California is possible, but not probable. Of course, I refer to *good* fruit; of poor and indifferent quality there is too much where there is any. The reasons I think there will never be too much good fruit are as follows:

Very few when planting fruit trees are sufficiently particular in the selection of the place having the proper soil and climate for the kind to be planted. Without those two essentials, any one might as well expect to make city officials without the aid of gin-mills and bosses as to produce good fruit.

Again, very few, after having made a judicious selection of soil and climate, take sufficient care in preparing the land and the cultivation of it after planting the trees, or they prune improperly or fail to prune at all, or do not thin the fruit when too thickly set on the trees, or neglect to curb the incoming and spread of destructive insects and fungoid growths.

Even when all of the evils mentioned have been avoided, and the fruit is generally of a good quality, yet many will put it in boxes or baskets that are not appropriate and without properly assorting the fruit or properly placing in the boxes, some being too small or overripe or too green; or they will handle it so roughly that it will be bruised, thereby damaging its keeping quality.

Again, if the fruit is of unexceptional quality and properly picked and packed, it still remains to get it to market in good condition. It must not be jolted over rough roads on wagons without springs. It must be placed in cars in such a manner as to keep it in position, and at the same time so as to allow free passage for air between all packages.

Again, rapid transit and low transportation rates are exceedingly essential—in fact, are more so than all other items put together, as it will be useless for us to put up even very good fruit in large quantities, with an expectation of getting paying returns on a basis of any except very low freight rates, and only reasonable profits to those handling our goods in the different markets. When these ends are accomplished and only good fruits are put by us on the market in any form, popularized by low prices to those consuming them, overproduction will be a word with no meaning, when used in reference to fruit-growing in California.

Some will say that we can never accomplish these ends. Those who say so are not of the class who will work to accomplish them. We must work together for such accomplishment; then it will be done.

It is no hard thing to hurt the markets with poor fruit, it will damage the sale of good fruit, yet the better qualities will bring paying prices when the poor trash is being sold at a loss, and the man who will put his goods on the market in the best shape will always obtain remunerative prices. If we are discussing the overproduction of poor fruit, I have nothing to say. We are there now and always have been and I fear always will be. I claim that it costs no more to produce good fruit than it does to raise an indifferent quality, providing the right thing is put in the right place and treated judiciously. Here in California there are proper places for all except tropical fruits. I do expect that there are those in this room who will live to see the time when there will be twice as many fruit trees planted in California as there are to-day, and yielding profits to the growers of all good fruits properly marketed, even though it may require 10 daily trains of 20 cars each to convey them to the consumers, and much of this, if not most of it, depends upon the facilities afforded us by transportation companies. We will do our part, and we will still hope that they will appreciate the fact that the general prosperity of California depends, at this time, more on the success of the fruit industry than on all other interests, and will foster it to the extent of even temporary losses, knowing that they are sowing seeds from which they will reap a hundred fold.

An important consideration at present is that every fruit-grower, to prevent overproduction, should make himself as self-reliant as possible, by preparing himself for drying, canning and shipping his goods, so that when profitable prices are not obtainable otherwise, then he can save and dispose of his fruit in various ways.

In reply to Judge Blackwood's points on overproduction because of deficient labor supply, Mr. Hatch thought there might be temporary trouble from this cause with some fruits, but there is never any protracted lack of labor. The labor supply adjusts itself to the demand.

Views of Other Growers.

After the opening by Messrs. Blackwood and Hatch, the discussion became general and the tone of it was in the main favorable and encouraging to those in the fruit interest. We shall arrange the points made under the headings of the different fruits, instead of following the sequence of time in the discussion.

The Apricot.

L. W. Buck, of Vacaville, thought the Eastern markets might not be trusted to take large quantities of apricots in a fresh state. The apricot does not commend itself to eating out of hand as the peach does.

Prof. Hilgard said the Eastern people, as a rule, did not know the apricot; then when shipped East the fruit is picked too green to have much flavor. If cold-storage processes enable us to send on well-ripened apricots, he thought large quantities of them would be eaten.

F. C. De Long, of Marin county, said even canned apricots labored under some difficulty, because the people did not know the fruit as they do the peach. To introduce canned apricots the canner must have the fruit at a low price, and at a uniform price from year to year, because it produces a bad effect to sell canned goods low one year and high the next. It checks consumption. As for Judge Blackwood's statistics on the canning of apricots, Mr. De Long thought there would be about 18 canneries at work instead of 10, and he thought also that the estimate of the crop in Santa Clara and Alameda counties was much too large. He thought there would never be overproduction of fruit at reasonable prices, but if the grower expects to get $1000 per acre from his orchard, there will soon be very much—too much fruit. He counted that 100 trees to the acre would easily yield 100 pounds to the tree; at 1½ cents per pound, the gross return would be $150 per acre, and if $50 is allowed the grower for expenses, he would net $100 per acre, which is many times better than he can do with ordinary field crops.

Gilbert Tompkins, of San Leandro, spoke of the taste for the apricot. It had to be acquired, it is true, but, like other acquired tastes, it becomes very strong.

James Shinn, of Niles, alluded to the profit in well-dried apricots, the large product of them in Ventura and elsewhere, and thought this use of the fruit would go far to prevent overproduction. Mr. De Long again, in answer to a question, stated that canned apricots sold well in Australia, also in London and Liverpool, and had been introduced in Paris. If they can be sold at wholesale here at $1.30 per dozen, jobbed in New York at $2 per dozen and retailed at 20 cents per can, he thought there would be practically no limit to the amount which would be consumed when the people understood the fruit better.

Mr. Hatch spoke of his belief in low prices for fruit. He extended his orchard so that he could afford to sell at a lower price, and this he considered one of the secrets of the future success of the industry. He thought a net profit of $50 per acre would not be a bad figure for large growers.

Dr. Kimball, of Haywards, stated that his views on overproduction of apricots had changed materially since he prepared an essay for the Fruit-Growers' Convention three years ago. At that time he thought enough trees had been planted to yield 200,000 tons of fruit in ten years. He had lately observed the dislike of

the tree to irrigation and the fact that many trees were being uprooted in irrigated districts because they were unsatisfactory. This put a very different face upon the outlook. He thought the area of the State where the apricot would be fully satisfactory might be comparatively small, and consequently there is no such danger of overproduction as he once feared. He believed now, too, that the world would take more apricots than he thought three years ago. He thought the cold-storage processes, which enable us to market fruit in a thoroughly ripe state, would increase the consumption almost immeasurably. The population of the United States is increasing rapidly. Canada and British America are a large field. Nowhere, except in a part of California, can the apricot be successfully grown. He thought the outlook for this fruit very promising.

Prof. Hilgard said it gratified him to see that the speakers were approving the position he had taken long ago that the production of fruits which would not succeed elsewhere gave California growers a monopoly and would make their rewards satisfactory. The apricot is such a fruit, so is the olive, so are table grapes of the *vinifera* family, so of raisins and almonds. The growth of fruit in the Western States is becoming more and more hazardous because of the injuries by severe winters, and therefore the opportunity for California fruit is extending.

The Peach.

A number of speakers alluded to the peach, and the general opinion was that the outlook for the California peach is unclouded. Mr. Buck said there might perhaps be danger of overproduction of apricots from some causes, but he could see none in the case of the peach. He thought peaches could be sent East in any quantity, if growers were content with 2 cents per lb. net for their fruit; there is practically no competition at the East with the California peach; every one, too, knows a peach and will buy it if the price is within reach.

Mr. De Long approved this position. The canned peach does not have to be pushed as the canned apricot does. People know it and regard it as the standard of excellence in canned fruit. But it is a mistake to make canners pay high prices. If canners could be sure of having a steady supply of peaches at 2 cents per lb., their sales would be so great that all the available and suitable area of California could be planted to peaches. Eastern canners get their peaches at 1¾ to 2¼ cents per lb., and the fruit they put up bears no comparison to California peaches.

Dr. Kimball also thought there was no danger of overproduction of good peaches.

Mr. Buck remarked that to prevent overproduction there must be good fruit well handled, as stated by some other speakers. The idea of being ready to dry, if the price for green fruit is not satisfactory, is very important. He had the promise of a large peach crop, but did not expect to sell for less than two cents per pound. He would largely increase the capacity of his drier, so as to be able to handle the fruit himself.

The Prune.

Several speakers remarked about the extent of prune planting. The general sentiment seemed to be that while the country imports 60,000,000 pounds of prunes there is little danger of overproduction. Of course there will be a contest with foreign producers, and whichever can produce the best prunes at the lowest price will succeed in getting the trade. There seems to be no doubt about the superiority of California fruit, and as to price, some speakers claimed that if cured prunes could be sold so as to yield one cent per pound, net, for the green fruit, the grower would do reasonably well. Mr. Hatch proposed four grades, which he said could be sold at three, four, five and six cents per pound. As prunes dry about three to one, or two and one-half to one in some cases, and if the average return should be, say four cents per pound, there would still be some profit in it.

Dr. Kimball spoke of his experience with prunes, the Petite prune curing 3 pounds to 1, the German requiring rather more to make 1 pound dried, and the Bulgarian yielding at the rate of 2½ to 1. He told of nonplussing a foreign prune expert by showing a Columbia plum dried like a prune, flattened out French fashion. He called it the "great American prune" and the foreigner had to succumb before it. Dr. Kimball thought there might be temporarily too many prunes grown here, but in the contest with the foreign prune the California fruit would win in the end and still yield some money to the growers.

Several other speakers took part in the discussion. The general opinion of the outlook was favorable to the profit even in the fullest extension of the fruit in this State, providing growers would produce the best fruit and be content with moderate profits as a rule.

Respect to the Memory of Col. Webb.

The secretary offered the following resolutions, which were adopted:

WHEREAS, It has pleased God to summon from among us Col. A. H. Webb, a member of the State Horticultural Society, and for several years secretary of the State Board of Horticulture; therefore

Resolved, That we sincerely regret his death, as it removes from our association a valued member, whom we esteemed for his earnestness in the advancement of the horticultural interest of the State, and who was endeared to us personally by his kindliness of heart and manner. His life among us led us to admire and appreciate his many good qualities, and we desire to place upon record a heartfelt tribute of respect to his memory.

Resolved, That this action of the society be inscribed on our minutes, and a copy sent to the family of the deceased member.

Petition to Railway Managers.

After some discussion, the following resolution was adopted and ordered transmitted to the Railway Managers' Convention, held in Chicago, May 4th:

WHEREAS, The market in and west of Chicago was glutted with California green fruits last year; and

Whereas, The outlook is for a much larger crop this year; therefore, it becomes imperative that markets east of Chicago be developed, and to this end fruit-growers ask a $400 rate to New York, for cars leaving California in special ten-car trains, and running through on passenger time.

Resolved, That the State Horticultural Society of California respectfully urges the Convention of railway managers to grant the rate asked for by the fruit-growers, as the prosperity of our fruit interest depends upon low rates of transportation to Eastern markets.

Subject for Next Meeting.

Senator De Long spoke of a blight which had caused his Bartlett pears to drop from the trees. It was decided to discuss at the next meeting "Blights and Fungoid Diseases of Fruit Trees." Mr. W. G. Klee, State Inspector of Fruit Pests, agreed to examine Senator De Long's trees and open the discussion at the next meeting. The society then adjourned.

Lemon Picking and Curing.

EDITORS PRESS:—My article on "How Lemons are Cured in Sicily," which appeared in a former number of PACIFIC RURAL PRESS, having been copied, and causing some inquiry among those interested in lemon culture, I should like to add a little more on the subject through the columns of your good paper.

A gentleman in this portion of the State has been studying the subject for some time, and after testing the matter has become convinced that lemons should never be allowed to ripen upon the trees, and has accordingly adopted the Sicilian method of curing them.

For lemons shipped to S. F., ripened upon the trees, he formerly received from 60 cents to $1 per hundred; he now receives from $3 to $5 per box for his lemons, depending somewhat on the supply and demand.

This gentleman is still experimenting and does not claim that he knows all about this profitable business.

Those who have handled lemons extensively know that many times a ripe lemon picked from the tree, when cut shows seeds already sprouting, which, of course, indicates a decline in the quality of the fruit, as decay must precede germination.

An accidental test of the foregoing method was given by a gentleman near Santa Paula, and may not be amiss here. Two years since his lemon trees being overburdened with fruit, he picked off a quantity in February, throwing them in a pile under one of the trees, as of no value. On July 4th, of the same year, the lemons that were kept covered and dry were found to be of excellent quality—to the profound astonishment of one of our largest orchardists.

One does not wish to run the risk of too hasty conclusions on a matter of so much importance, but it is certainly worth testing, and if practicable, much fruit would thus be saved that is now unmarketable.

MRS. M. E. DUDLEY.

Santa Paula, April 12, 1887.

THE STABLE.

Equine Surgery.

In our issue for April 16th we mentioned that the leg of a valuable mare had been amputated in Pennsylvania, and that she was said to be doing well. Desiring to learn more about the case, we dropped a note of inquiry to her owner, and have just received the following in reply:

AVONDALE STOCK FARM COMPANY,
AVONDALE, PA., April 25, 1887.

EDITORS PRESS:—In reply to your letter of inquiry, we would say our mare is still improving. The stump is healing rapidly, she has a good appetite, has not lost a great deal of flesh, and can get down quite comfortably, but we usually give her some assistance to get up. She is due to foal in three or four weeks, and we have every hope of saving the lives of both mare and foal. Your account is substantially correct. The doctor's name, however, is Huidekoper. Any further information we will gladly furnish upon inquiry. Very truly,

C. N. BARNARD, Treas.

DIPHTHERIA IN HORSES.—J. C. Wolfskill, of Suisun, owner of the noted race mare Idleweiss, said recently to an *Examiner* reporter: My mare has got something like the diphtheria, and that's what we call it up our way. Several others of my horses have got it. Their mouths are as sore as can be and their tongues coated and ulcerated. J. L. Pritchard's filly, Adaline Cotton, has the same thing. Some of W. B. Todhunter's horses at Sacramento also have the disease, and I have heard of several other cases. That's the reason more of them have not been entered for the Blood Horse races. They are in good condition, but their mouths and throats are very sore.

THE PUBLIC LANDS.

Settlers' Rights Upheld.

The President has sent to the Secretary of the Interior the following letter:

EXECUTIVE MANSION,
WASHINGTON, April 25, 1887.

Dear Sir: I have examined with much care and interest the questions involved in conflict of claims of Guilford L. Miller and the Northern Pacific Railroad Company to certain public land in Washington Territory.

The legal aspects of the case have been examined and passed upon by several officers of the Government, who do not agree in their conclusions.

Miller claims to be a settler upon the land in question, whose possession dates from 1878. He alleges that he has made substantial improvements upon this land and cultivated the same, and it appears that he filed his claim to the same under the Homestead law on the 29th day of December, 1884.

The railroad company contends that the land is within the territory or area from which it was entitled to select such a quantity of the public land as might be necessary to supply any deficiency that should be found to exist in the specified land mentioned in the grant made by the Government to said company in aid of the construction of the road, such deficiency being contemplated as likely to arise from the paramount right of private parties and settlers within the territory embracing said granted lands, and that the land in dispute was thus selected by the company on the 19th day of December, 1883.

A large tract, including this land, was withdrawn by order of the Interior Department from sale, and from pre-emption and homestead entry, in 1872, in anticipation of the construction of said railroad, and the deficiency in its granted lands. In 1880, upon filing a map of the definite location of the road, the land in controversy and much more, which had been so withdrawn, was found to lie outside of the limits which included the granted land, but its withdrawal and reservation from settlement and entry under our land laws was continued upon the theory that it was within the limits of the indemnity lands which might be selected by a company, as provided in the law making the grant.

The Law Question.

The legal points in this controversy turned upon the validity and effect of the withdrawal and reservation of this land and the continuance thereof. The Attorney-General is of the opinion that such withdrawal and reservation were at all times effectual, and that they operated to prevent Miller from acquiring any interest in or right to the land claimed by him.

With this interpretation of the law and former orders and action of the Interior Department, it will be seen that the effect has been the withdrawal and reservation, since 1872, of thousands, if not millions of acres of these lands, from the operation of the land laws of the United States, thus placing them beyond the reach of our citizens, under such laws, to settle and make homes upon the same; and this has been done for the benefit of a railroad company having no fixed, certain or definite interest in such lands. In this manner the beneficial policy and intention of the Government in relation to the public domain have for all these years to that extent been thwarted.

There seems to be no evidence presented showing how much if any of this vast tract is necessary for the fulfillment of the grant to the railroad company. Nor does there appear to be any limitation of the time within which this fact should be made known, and the corporation obliged to make its selection.

After a lapse of 15 years this large body of the public domain is still held in reserve to the exclusion of settlers for the convenience of a corporation which is a beneficiary of the Government and waiting its selection, though it is entirely certain that much of the reserved land can never be honestly claimed by said corporation.

Such a condition of the public lands should no longer continue. So far as a result of executive rulings and methods these should be abandoned, and so far as it is the consequence of improvident laws these should be repealed or amended. Our public domain is the national wealth and an earnest of our growth and the heritage of our people. It should promise limitless development and relief to the crowding population and give homes to the thrifty and industrious. These inestimable advantages should be jealously and carefully guarded and an enlightened policy on the part of the Government should secure them to the people.

In the case under consideration I assume that there is an abundance of land within the area which has been reserved for the indemnity, on which no citizen or settler has a legal or equitable interest, for all the purposes of such indemnification to this railroad company, if its grant has not already been satisfied. I understand, too, that the selections made by such corporations are not complete and effectual until the same have been approved by the Secretary of the Interior or unless they are made in the words of the statute under his direction.

You have thus far taken no action in this matter, and it seems to me that you are in a condition to deal with the subject in such a manner as to protect this settler from hardship and loss.

I transmit herewith the papers and documents relating to the case, which were submitted to me at my request. I suggest that you exercise the power and authority you have in the premises upon an equitable consideration, with every presumption and intendment in favor of the settler; and in case you find this corporation is entitled to select any more of these lands than it has already acquired, that you direct it to select in lieu of the land upon which Mr. Miller has settled other land within the limits of this indemnity reservation upon which neither he nor any other citizen has in good faith settled or made improvements.

I call your attention to Sections 2450 and 2451 of the Revised Statutes of the United States, as pointing out a mode of procedure which may, perhaps, be resorted to if necessary for the purpose of reaching a just and equitable disposition of the case.

The suggestions herein contained can, I believe, be adopted without disregarding or calling into question the opinion of the Attorney-General upon the purely legal propositions which were submitted to him. Yours very truly, GROVER CLEVELAND.

THE DAIRY.

Holstein-Friesians for Butter.

The following records from the Lakeside herd, Syracuse, N. Y., will undoubtedly be of interest. They have been made since the last catalogue of this herd was issued, and are good proof of the quality of Holstein-Friesian milk:

Name.	Lbs.	Ozs.	Days.	Lbs. Milk to Lb. of Butter.
Albino 2d, 3 yrs	25	14¼	7	18.69
Albino 2d, 3 yrs	106	14	30	.....
Bonanza Maid, 5 yrs	25	3½	7	15.85
Clothide 4th, 3 yrs	23	10¼	7	18.17
Netherland Chaperon, 9 yrs.	19	8½	7	18.99
Lambertina, 10 yrs	19	4	7	21.17
Imogenia 2d, 3 yrs	16	6	7	17.60
Artis Eva, 3 yrs	16	15	7	19.02
Lightsome, 6 yrs	18	8	7	19.98
Belle Alexander, 5 yrs	16	4	7	19.01

Albino 2d gave, as a 2-year-old, 18,484 lbs. 13 ozs. of milk in a year, which is the largest milk record ever made by a heifer of her age. Bonanza Maid is of the Albino family.

Clothilde 4th is from Clothilde, which gave over 26,000 lbs. of milk in a year, and sired by Netherland Prince, which is also sire of Netherland Princess 4th and Aaggie's Second Daughter.

Netherland Princess 4th made, when only 28 mos. old, 21 lbs. 10⅔ ozs. of butter in a week, the largest record ever made by a Holstein-Friesian of her age. Aaggie's Second Daughter made 15 lbs. 1 oz. of butter in a week when 2 years old, and had no grain either before or during the test.

This is certainly flattering to Netherland Prince as a sire, and shows that the Clothildes are enormous milkers as well as great butter producers.

Oleomargarine.

NEW YORK, April 28.—The *Tribune's* Washington special of the 27th says: "The subject of oleomargarine will be treated in the next bulletin from the Agricultural Department," said Commissioner Colman to-day, "and the people of this and other countries will receive full and explicit instructions how to detect the presence of the deleterious matter. No later than this forenoon I received through the Secretary of State a communication from Baron Favo, the Italian Minister, in which he requests information as to the scientific tests used by our Government to detect oleomargarine, butterine, suline and other compounds made to supersede butter. In my reply I shall give the result of the investigations made by this department, from which it appears that even the carcasses of horses, dogs and swine have been utilized in the manufacture of oleomargarine, and the manufacturers were not particular about the condition or age of the meat or bones, either. I had a personal experience at my home in St. Louis. When I went to the butcher's shop to get some meat for several hunting dogs that I kept at the time, I often saw that maggots and fly-blown meat were very conspicuous in the refuse barrel at that place. When I asked the proprietor what he intended to do with such material, he said it was intended for the butter-factory."

JERSEY SALE.—The thoroughbred Jersey herd of Major Robert Beck, the late well-known cattle-fancier, is offered for sale by his widow. They number somewhat over 30 head registered in the Jersey Cattle Club Book. Fifteen are cows, nine of which are now in milk. The young stock includes seven heifers. The head of the herd, "Jersey Duke," has received the first premium at two successive State Fairs. He was out of an imported cow, owned by John W. Coleman, of Oakland, and is now five years old. All the young stock is of his get. There are two young bulls in the herd beside him, which are now at the ranch of Senator Johnston, near Richland. It would be likely to prove a good speculation, as they are to be sold at a sacrifice. Mrs. Beck has already received letters from Fresno and Santa Barbara that they could be disposed of at good prices in either place. All the cows are of imported stock and under six years old. A single graded cow goes with the herd. For particulars Mrs. Beck can be consulted at 510 Geary street, S. F.

HOLSTEIN HEIFER RECORD.—The Holstein-Friesian heifer, Imkje's Mercedes, bred and owned by Mr. Thomas B. Wales, Jr., of Iowa City, Iowa, dropped Feb. 24, 1885, sire Mercedes Prince (2150), G. Dam Mercedes (723), Dam Imp. Imkje (5310), has just completed one of the largest butter records ever made by a two-year-old of any breed. The statement of the test which is published shows that the heifer dropped her calf before she was two years of age, and at 25 months and 12 days old commenced a seven-day butter test which resulted in the production of 21 pounds 8 ounces of unsalted butter in seven days. This is the largest butter record ever made by a Holstein-Friesian heifer with one exception, in which case 2⅔ ounces more butter was made. It is shown that the average quantity of milk required to make one pound of butter for the entire test was 14 pounds 11⅔ ounces. Also that the milk of the first two days made one pound of butter from 12 pounds 5 ounces of milk.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Fraternal Orders—The Grange.

The leading feature of this age is the number and extent of fraternal Orders and their followers. It seems but a few years ago when only the Masonic Order was heard of. Then came Odd Fellowship, first struggling and mysterious in infancy, then strong in full growth of manhood. Following these ancient Orders came those of our day, so numerous as to preclude our naming them. All have some good object in view and it is safe to say none are organized for an evil purpose. A large per cent of the population is enrolled on their books and are receiving benefits in proportion to their attendance or deserts. Life is short, and to enhance its pleasures and decrease its pains it is necessary to divide them with our neighbors; thus hand in hand we press forward to make the most of our opportunities.

In the cities, towns and centers of population the fraternal Orders thrive most, which is evidenced by their greater fraternal spirit and sociability, if we may so term it. This is because they see and meet each other more frequently than do the country people, and thus the fellow-feeling grows upon what it feeds.

It is not our purpose to belittle or discourage this fraternal tendency, but rather to indorse and encourage it with the limited ability we possess. This is an age of progress, of enlightenment and of organizations. He who does not enter one of these chariots will find himself left in the rear or groping in the dark. In numbers meeting together in fraternal consultation, there is wisdom, enjoyment and pleasure, all of which is well understood and conceded by those who so assemble.

Prejudice has kept many away and does yet, but prejudice is our worst enemy and should be discarded. It never can replace the pleasures it robs us of; its mission is to make the world miserable and to estrange its inhabitants.

When beginning these lines we had in mind one Order above all the rest of which we wished to speak a word of commendation. Having always resided on a farm, isolated as is the American farmer, we saw the social disadvantage under which we labored. Feeling the want of social and fraternal education, the country folk are too apt to deem themselves inferior to their city cousins—a state of things that engenders distrust, prejudice and jealousy—and really it is little wonder.

Feeling the need of greater fraternity and sociability among the scattered American farmers, a few wise men met together at the Capital of the nation and gave us the Grange. Here was presented the opportunity to the isolated farmer to learn who were his neighbors and to meet his fellows on equal and common ground, for mutual improvement and advancement. Something better might have been instituted for this purpose, but it was the best that *was* instituted, and we know the founders builded wiser than they knew. Having caught the fraternal spirit, the farmers will abide by the Grange until something better makes its appearance.

The institution and accomplishment of the Grange is the wonder of the age, and having outlived its youthful follies, errors and indiscretions, it is putting on the habiliments of manhood and discretion, and drawing to its support and commendation the good and true in every walk of life. It is at last understood that no one can be a good Patron who is not first a good citizen, and what benefits him benefits all mankind. As a result, the sentries of the Order are besieged with applications to enter, and the real, honest and eager demand for light, truth and fraternity is making itself heard all over the American continent, and nowhere more so than in our own beloved State.

What a glorious prospect, when the bulk of the American farmers and their wives and children meet together once or twice a month for mutual protection, enlightenment, culture, advancement and social greeting. The real progress will be in proportion to our zeal, but cannot avoid being immeasurably advantageous to all, individually and collectively, and extend its blessing broadcast over the land. First, we have the local Grange, then the State meeting once a year, and interspersed, the reunions in grove and hall, all bent on rendering agricultural life not only endurable, but pleasant, profitable and elevating; thus checking the outflux of our brightest talent to the city, and creating a demand for the exercise of more talent in the country. No one can deny the progress already made, but none can predict the brilliancy of the future if the guiding star of the Order is steadily kept in view.—*Sutter Farmer.*

A Gala Day in Contra Costa.

From what we learn from Brother Charles Wood and others, everything is favorable for an exceedingly pleasant and profitable Grange gathering at Danville to-day. The address of Dr. Stebbins will be given in the forenoon. We hope there will be a large and prompt attendance. The picnic is held in one of the best agricultural sections of the State, as well as one of the most lovely in scenery and climate. It is worth visiting, especially at this season, by all who like good outdoor recreation.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

THE very first act of the Interstate Commerce Commission is to break the law itself by suspending one of its most important provisions and authorizing certain railroads to charge more for a short than a long haul until after investigation; because the railroads claim that water competition compels them to carry at low rates to some points, and that therefore they must make it up where the people have no protection in the shape of "water competition." In other words, a thief may continue to steal until "after investigation" to see if he really needs the money he takes. Like the railroads, he is after the "big haul;" but the people have made laws saying *it shall not be done.* Is there one kind of law for the thief and another kind for railroads? The farmers are long-suffering, conservative, liberal, tolerant. Law-abiding citizens themselves, they have asked and *expect* "perfect equality before the law." After long years of effort they have secured this law as the *first* to control these giants in their intercourse between the various States. In more than 10,000 different neighborhoods where Granges are located they are vigilant and watchful, "holding the fort," watching and waiting for the proper administration of this law. The farmers of to-day are not the farmers of the past. *Now* they are organized and educated. The same power that brought about the Interstate Commerce law *can enforce it.*

FARMERS must organize for the purpose of protecting themselves against other organized bodies who seek their control and profits. The Grange admits all worthy farmers and their families into this national and fraternal brotherhood, for the purpose of frequently meeting together in consultation as to the best methods of cultivation, the most profitable crop to grow, raising of stock, mixed husbandry, securing supplies, marketing surplus products, and educating its members upon all questions of political economy and affairs of government, local and national, so that we may fully understand our rights and duties as farmers and as citizens. The educational work of the Grange familiarizes us with the ways and methods employed by other organizations, and enables us to meet upon equal ground, and by co-operating and uniting our efforts and influence, we can withstand the encroachments made upon us in the demands for our profits.

"THERE is no way yet provided by which the farmers of any community can become representatives of their class outside of the Grange. In the Grange, opportunity is not only offered for showing who are representatives, but the Grange develops the natural gifts of every member and leads him to the front, where his power may be seen and felt."—*California Patron.*

FARMERS are more and more appreciating the power of the press, and Patrons in particular are learning who are *with* us, who *against* us, and who show no signs of interest either way, and are giving their support accordingly. The following is excellent authority: "I desire to call your attention to the importance of sustaining the Grange and agricultural papers of our State, for they are the 'bone and sinew' of our Order. Good literature is the 'breath of intellectual life.' Every Grange should have a library wherever it has a permanent home. It will be of incalculable benefit to the rising generation. Let us encourage National agricultural literature."—*Ex-Gov. Robie, of Maine, Master of the State Grange.*

Suggestions for the Good of the Order: "In organizing Granges we should take in as charter members young people, and then success would be more sure. The young are more energetic, full of life, fun and frolic, more inventive. The old will come for the very pleasure of seeing their workings. It is the young we need to gather in and educate for both present and future action. Our work should be made attractive, spicy. Let the working hours be interspersed by song, essay' declamation or reading. A work for each should be the rule."—*I. L. H., California.*

"ONE sees the signs of the uplifting of farm-life in many directions. The more convenient and artistic houses; the improved stock; the magnificent dairies; the increasing culture of choice fruits; the general growing of window-plants; the more civilized country schools; the buds of promise in the tree-planting and village-improvement clubs—all these point in one direction—to the beautifying and enriching of the country, and to the refining and ennobling of the country's children." True enough, and the Patrons of Husbandry in their united work for the past 20 years have done more to bring these things about than all other causes combined.

A PASTOR writes: "Since the introduction of the Grange I have seen a remarkable change in the walk and conversation of my flock; they are more careful in their dress and general appearance, and are reading more."

PROGRESS.—*Seven more new Granges*—three of them in California.

IN the present Grange year, to April 13th, *one hundred and two new Granges* have been organized in the United States—eleven more than all last year together, and *it* was ahead of several previous years, and still they come.

NATIONAL GRANGE Lecture-work is now fully under way. Lecturer I. N. Lipscomb, of S. C., will at once commence work in Florida, to be followed by meetings arranged by the Masters of the State Granges of Ga., N. C., and other States in his District. Lecturer J. H. Brigham, of Ohio, goes to Kentucky in May to fill a series of meetings arranged by State Master J. D. Clardy. Lecturer C. L. Whitney, of Mich., goes at once to Colorado. Lecturer D. H. Thing, of Me., goes early in May into Mass., then into Md., Penn., etc. The National Lecturer goes to Va. in June to fill a number of appointments arranged by State Master X. X. Charters, then to Md., Penn., and out West in eight States in the fall. *Special* work is continued in R. I. and Mo.

OREGON S. L., H. E. Hayes is out on an active campaign, and reports a growing interest in the Order.

ALABAMA is brightening up. Deputy A. Dougherty reports organizing four Granges since the last State Grange meeting in December.

Yuba City Grange Picnic.

The Fourteenth Annual Picnic of Yuba City Grange is to be held at Hock farm, Tuesday, May 17th. The *Sutter Farmer* says: "Gov. Bartlett has been invited and has signified his intention of being present unless prevented by official duties. Col. John P. Irish of the *Alta*, who has few equals on the coast as a speaker, will be the orator. He hails from the Granger State of Iowa, is fully imbued with the cause of the agriculturists, and has been long enough in our beloved State to have become enamored of its glorious climate, soil, possibilities, and more than all, her open-hearted, liberal people. His perceptive faculties are acute, his learning and research great; hence he always speaks to the point. A great treat is in store for all who shall come within the compass of his voice."

A public dinner will be served upon the grounds, and no intoxicating liquors allowed. What with two bands of music, prize recitations, foot-races, dancing and exhibits of growing grain and cut flowers, a day of great enjoyment may be looked for.

The Gridley Fund Picnic.

EDITORS PRESS:—The Gridley picnic netted $275 and was a pleasant reunion; but much more will be needed to fill up the G. A. R. lot, where Gridley's ashes will rest in the center—marked by the monument which is to be here by the 28th and dedicated May 30th—with places for his family around, and outside them the resting spots of the G. A. R., Rawlins Post; and about all, a stone coping must be built.

The population of Nevada and all the Washoe mines has scattered and changed, or Austin would not have allowed us all the honor of rescuing her hero's name from oblivion. People of means recount how the great sum he raised helped to save dear ones from horrible death, yet they are tardy to set up a stone over his unmarked grave. His modest wife was at the picnic, and his daughter is in the mountains in delicate health. MRS. W. D. A.

Stockton.

NATIONAL FARM AND FIRESIDE.—This active Grange advocate has removed its office of publication from Baltimore, Md., to Grange Camp, Fairfax county, Va. The change was made on account of the close connection of the editor, Alex. J. Wedderburn, with the Grange Camp Association and the necessity of his giving personal attention to the affairs of the association. The District Grange of Northern Virginia will hold its Fourth Annual Exhibition at Grange Camp, August 11th to 18th, and hopes it will be the means of drawing a desirable class of immigrants to the county of George Washington.

BROTHER J. V. WEBSTER has returned from his farm, at Creston, San Luis Obispo county, in good season to attend the Danville picnic. He reports Brother Cressey as actively engaged in improving his stock ranch at Huero-Huero. Brother Cressey is expected at the Directors' meeting of the Grangers' Bank next week. We hope he will find time to visit some of our Granges and render an account of his recent interesting trip to the New England and Southern States.

MR. DANIEL INMAN, for many years President of the Grangers' Business Association of San Francisco, was presented by members of that body with a very handsome and valuable gold watch on the recent occasion of his retiring. Mr. Inman served the association ably and faithfully, and retired with the good-will of its members and the satisfaction of conscious fidelity.

YUBA CITY GRANGE has developed new life and gained new members since '87 came in. A "Question-Box," with replies and discussions, forms part of the literary exercises at each meeting, and much original thought and talent are thus brought forth.

SAN JOSE GRANGE is to have a picnic at Los Gatos the 14th, and hopes that the addresses expected from Bros. Steele, Pilkington and others will lead to the formation of new Granges in that vicinity.

SACRAMENTO COUNTY GRANGERS have their annual picnic at Beach's Grove, below Freeport, on Thursday of this week. We expect to hear of a jolly gathering then and there.

MR. SHIPPEE'S HORSES.—A RURAL representative visited recently the stables of L. U Shippee, situated on his stock farm near French Camp. He has a string of the Nutwood stock with Tempest four years old at the head, who made a record last fall of 2:29. Six of these are in training and have been entered in the fall circuit. They are likely to be dangerous competitors in each class. He was shown a fine thoroughbred by Joe Daniels and some promising young horses that were being broken to harness.

EARTHQUAKE SHOCKS, severe and prolonged, alarmed the people of Albuquerque, El Paso, Tucson and regions round about those centers on Tuesday last. "Old Castle," a lofty peak in sight of Tucson, has disappeared, and clouds of dust or smoke were rising from its ruins.

Stockton Notes.

[Written for the RURAL PRESS by MRS. W. D. A.]

In place of the looked-for spring showers, high winds and extreme heat ending in cold northers have suddenly checked the finely growing grain, and unless rain comes very soon not more than a quarter of a crop will be cut. Only well-tilled summer-fallow holds out against the drain. Toward Lockeford more rain fell, and fine fields of summer-fallow defy sun and wind. Farmington, near the foothills, had much more rain, and crops there and beyond look finely. Heavy dews refresh at night, but the grain is heading out very short. Each time this year when hope had died out, rain had come, and probably will come—too late.

Down the Calaveras, a gentleman paying money rent on 800 acres got the water on it, as did a farmer near; now the river is low. Many think the trouble of taking care of the river in high water overbalances the use of it in drouth. The hay, from which hired men and new-comers expected work, is very scant and will be cured with little help. It was a shame in the face of this doubtful year to overpuff the State and get people without present means here. Without homes or work they are forced to beg; and it is a greater shame that the Restriction law is not enforced and that hordes of Chinese are brought. Last week 700 came on one ship.

Pastures have been fine all the spring, and most farmers make a little butter to sell, which is down to 10 cents for a good article now. Eastern butter and the 37 oleomargarine factories in the United States have cheapened coast butter.

Think of 5537 retail oleomargarine dealers! And of 12,645,580 pounds manufactured and removed for sale in four months, 152,699 pounds of which was exported. Eggs are better—17½ cents per dozen; and poultry pays well.

Many are going from Stockton to the Grange picnic at Clements, a new and enterprising town in a fine farming part of the county.

Stockton, May 3, 1887.

Silk Culture.

Governor Bartlett has appointed Prof. E. W. Hilgard and Mr. J. J. Rivers, of the State University, members of the State Board of Silk Culture. These gentlemen have a long and intimate acquaintance with the industry and with the sciences underlying it, and their services in this connection will be of much public benefit. By visiting the State Filature, at 21 Montgomery avenue, S. F., one can now secure a practical demonstration of the rearing of the silkworm in all its stages, from the hatching of the eggs, feeding of the worms, spinning of cocoons by the silkworm, to the reeling of the raw silk. This exhibition will illustrate the wonderful operations by which silk is produced. Office hours are from 11 A. M. to 4 P. M. R. H. McDonald, Jr., C. W. T. Carter and S. A. Sellers, Executive Committee, and Mrs. Louise Rienzi, of the Filature Committee, have issued an invitation to the public to examine the workings of the institution as above stated.

Dude Cattle-Raisers.

Under the above caption the *Scott Valley News* quotes with disapproval the assertion that "cattle-raising on the northwestern range is not a business to attract any save those who have ample means at their back and can stand heavy losses," and then tersely expresses its own view of the case as follows:

This mistake accounts for the fact that counts and dukes and lords and dudes of different degrees, incapable of ever becoming American citizens, are monopolizing the cattle business; and yet the idea is encouraged by such big papers, whose editors do not know a lariat from a halter strap, while, as a matter of fact, owners of small herds could take better care of the cattle and furnish a better quality of butter and beef than the non-resident dudes, who hold immense territory against our own citizens for no other purpose than to make money out of a country in which they have no political interest and never expect to have.

IN AMADOR COUNTY.—W. G. Edgar, the Ione nurseryman, dropped in upon us Wednesday, having just come from his home at the head of Jackson valley. Corn, wheat and barley in his neighborhood are very promising, but from Clements down to Stockton the grain looked so poor that he felt sorry and says there will be no crop to speak of except summer-fallow, unless it rains very soon. There will be but a light crop of apples or peaches in his section and plums are almost an utter failure—owing to the hot norther which struck the trees while in bloom—but grapes and apricots are doing finely and promise a plenteous yield.

GENERAL AND MRS. BIDWELL got home from Washington last week, and met with a most cordial welcome by the Chico people. The city was decked with bunting, the military and firemen paraded, while music, bells and steam-whistles made chorus with the cheers of the citizens. The General and his wife were much affected by this kindly demonstration, which he acknowledged in a short address.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

FLORICULTURE IN OAKLAND.—To an *Enquirer* reporter, who lately called upon him, James Hutchison, of the 14th-street nursery, said: "There are about 20 acres right in the city owned by nurserymen and devoted entirely to the raising of flowers. This, of course, does not include ornamental trees and shrubs. I have about six acres, E. Gill has about three acres, Deasy has 1½ acres, Seulberger the same quantity, I believe; Turnbull has about 2½ acres, Keller about two acres, Newsome one acre, J. Carey about one acre, and Blair at Piedmont about one acre. Of course these figures do not represent the size of their nurseries, for all nurserymen devote a number of acres to ornamental shrubs and evergreens. Oakland florists are well patronized, both throughout the State and on the other side of the mountains. Every week I ship parcels of flowers, seeds and other garden stuff to Eureka, Salt Lake, Butte City, Montana, Chicago and St. Louis, and lots of other places."

NURSERIES.—"Then again," continued Mr. Hutchison, "fruit trees take up a large amount of room. There is an incorporated company of us, including John Rock, R. D. Fox, James Hutchison, S. H. Landers, Mr. Henn and Thomas Meherin, which owns 460 acres of land, near Niles, devoted entirely to nurseries for fruit trees of all kinds, strawberries, raspberries, currants, gooseberries, olives, grapes, figs—in fact almost every kind of fruit imaginable."

GRAIN AND HAY.—Livermore *Herald*, April 28: Drives over the valley and through the hills the past week clearly show that considerable grain was stunted during the long dry spell previous to the last storms. Much more is unhurt, and will make an excellent crop, with occasional showers. The volunteer hay crop will be very light, and, without more rain, much of it will not pay for cutting. With occasional showers for the next fortnight, considerable hay will be cut, but not more than one-fourth of last year's crop. There are occasional good stands on the volunteer, but the great bulk of this crop is already beginning to head out, and only good rains would bring a fresh growth. The chevalier barley bids fair to be very heavy.

Butte.

CONDITION OF CROPS.—Oroville *Register*, April 28: D. W. Echus, six miles west of Oroville, says: "There never was a better prospect for grain than at the present time in our section of the county." M. J. Biglow, of Gridley, says: "The long continued north wind did but little damage. Grain is growing very fast and the ground is still moist." Philip Hefner, who has 400 acres of grain six miles south of Oroville, reports grain as looking first-rate. M. Reyman tells us that grain on the west side of Feather river looks in fine condition and promises a good yield. H. Cohn, of Biggs, reports the crops in vicinity of Biggs and Nelson first-rate. A buyer from the Buckeye mill at Marysville is traveling in the county, has examined large tracts of grain in different localities, and thinks the indications good for an abundant harvest.

Colusa.

ARTESIAN INTERESTS.—Willows telegram, May 2: The artesian water struck some days since by N. D. Rideout seems to gain strength as it flows. The whole community is excited over it, and other wells will be put down immediately. Mr. Rideout has ordered heavier and improved machinery from the East, and will sink a well for irrigating purposes. Property already feels the effects, and owners are firm in prices. J. Hill, J. Troxel, F. Quint, the Glenn estate and P. R. Garnet will all sink wells during the summer.

CROP PROSPECTS are good. Summer-fallow is looking exceptionally well.

Contra Costa.

THE AGRICULTURAL SOCIETY of Contra Costa county is to hold its annual meeting at Pacheco Saturday, May 14th, at 1 o'clock P. M., to elect officers, etc.

Fresno.

A GOOD OUTLOOK.—In a private letter from Fresno, April 26th, Mr. Wm. Pool writes: Crop prospects at present are very favorable. In my ride last Sunday I was highly pleased to see so many fields of beautiful wheat, and the vineyards and orchards are looking very promising. I do think the Eisen, Barton and Fresno vineyards, along with many others, are the most beautiful and highly cultivated I ever beheld. I think on the whole this is going to be a prosperous year for Fresno county. Her population is increasing and her resources are developing, and all the avenues of business that are thronged in older places are opening here as fast as time will permit. I think the exceeding droughts of former years will never again visit this county.

Los Angeles.

THE LITTLE BUSY BEE.—Santa Ana *Standard*, April 30: The bees have begun their annual, semi-annual and monthly swarming and are lighting on housetops, capturing chimneys and flues, taking possession of the gable ends of dwellings and making themselves a nuisance as usual. This country is a paradise for them, and all they want is room to work.

CITRUS PRECOCITY.—Pomona *Progress:* Mrs. George E. Ross, on the Palomares tract, has a seedling orange plant one year old and four inches high that has a blossom.

Humboldt.

FLOCKS THRIVING.—Eureka *Standard*, April 25: James Lathbury came in this morning from Garberville and gives most encouraging accounts from that section. The grass is in magnificent condition, and cattle and sheep are doing finely. The product of lambs is excellent, and losses are reduced to the lowest percentage. Taking everything together, there is every prospect of that portion of Humboldt county enjoying a prosperous year.

San Benito.

HONEY AND HIVES.—*Free Lance*, April 29: The bee business of San Benito county is growing rapidly, and those who have devoted their time to it are making it pay. San Benito honey sells side by side with the best Los Angeles brands, commanding top prices. Our producers put their product on the market in the most attractive form possible, and to this end, neat, light boxes, holding about 21 pounds, are required. Frank Dalzell, of the Hollister planing mill, is doing a rushing business, having already cut up over 15,000 feet of lumber into these same frames, and has orders ahead for as much more. John Sherman, alone, used over 30,000 two-pound frames last year, and will use full as many this year. Mr. Dalzell expects to make over 60,000 one and two-pound frames this year, besides an immense number of the boxes to hold them.

San Bernardino.

KEEPING ORANGES.—Col. Tolles informs the San Bernardino *Times* that Mediterranean Sweets grown at Lugonia at an elevation of 1600 feet to 2000 feet can be kept, retaining their delicious flavor, for six months, by the simple process of wrapping them in tissue paper and storing them in a box at any convenient point about the house free from unusual dampness. A good ripe orange in August or September is quite a treat. The colonel has them on the mountains at La Praix's mill up to October and no decayed fruit.

San Joaquin.

GOOSEBERRIES.—Stockton *Independent*, April 30: H. H. Turner, of Linden, has half an acre of English gooseberry bushes which are very profitable. Last year he had 150 bushels and sold the fruit at 15 cents per pound, while other varieties brought but seven cents. Now he has 600 bushels on the half acre. The berries will be ripe the 1st of June, and about the size of walnuts. Mr. Turner has raised his fruit without irrigation.

MYRIAD ROSES.—Lodi *Sentinel*, April 30: In the yard of Mr. C. O. Ivory may be seen a white rosebush in full bloom, covering an area of over 600 square feet. The bush is twined over an arched lattice, and, at present, has no less than 10,000 blossoms upon it.

Santa Barbara.

MUSTARD.—Lompoc *Record*, April 30: There are some excellent mustard crops in the valley, promising even better than mustard did last year at this time, which yielded a ton per acre. The early sown crop is well up to the average, but late sown mustard will not make a good crop, unless one inch of rain should fall soon. However, the land can be put into beans and corn, and in the end little will be lost.

TIMELY THINNING.—At the Childs fruit-farm, adjoining the Santa Rosa ranch, the work of thinning apricots and peaches has commenced. The apricots are half-grown and the ground is literally covered with the superabundant yield picked to give better size and growth to that allowed to ripen.

Shasta.

A GOOD OUTLOOK.—Cottonwood *Index*, April 28: From every section of the valley come flattering reports. Grain on the uplands promises a good harvest, while on the bottom-lands the crop will be heavy. The fruit crop will be unusually large. Acorns promise to be abundant, which is an important item to hog-raisers. Orchards, vineyards, gardens—everything and everybody—look well.

Sonoma.

FRUIT PROMISES.—Petaluma *Argus*, April 30: J. W. Cassidy, whose orchard is just outside the city limits, has left at the *Argus* office two branches—one of cherries, the other plums, each just a foot in length. The cherry branch, of the Napoleon Bigarreau variety, bears 120 cherries no larger than buckshot; and the plum stem of like length carries 130 plums of like size. Mr. Cassidy has 700 cherry trees that will be literally bent to the ground under the weight of fruit. His plums and other trees are carrying every ounce of fruit they can bear. A twig only one foot long, from Chas. Roberts' place, had on it 46 well-formed apricots. If this may be taken as an indication, the apricot crop will be immense. [We should recommend prompt and resolute thinning in all such cases.—EDS. PRESS.]

Stanislaus.

IRRIGATED WHEAT.—Modesto *News*, April 29: A striking instance of the benefits that accrue to the farmer from irrigation is noticeable on the place of Joel Ripperdan, in the suburbs of Modesto. During the protracted dry spell, when everything pointed to a total failure of crops in the county from drought, a small portion of the field of wheat belonging to Mr. Ripperdan was flooded at intervals, and the result will convince the most incorrigible opponent of irrigation that it will pay to irrigate cereals. The patch mentioned, that was subjected to the vivifying influence of moisture, now stands 4½ feet high, and is headed out with kernels full, plump and perfect. The balance of the field is less than a foot high, and will not pay to cut even for hay. We have a specimen of the irrigated grain in our office that we should be pleased to have objectors to irrigation inspect.

GRAIN in all parts of the county is now in fine condition, and with ordinary weather and a couple of showers, the crop in all parts will at least be fair, and in some localities the yield of wheat will be larger than ever before.

Sutter.

ALONG THE FEATHER.—The editor of the *Farmer*, having taken a drive last week from Yuba City to Gridley and home again, says: The crop outlook on the west side was not so good as on the river road. The road running through flat lands and chiefly adobe soil, the crop shows the effect of the cold February rains and the cool, dry March. Fallow wheat is good, but winter sown is backward and small, although all has a good color, and, taken altogether, will make an average crop. Wherever the land was well drained, or the soil changed to a sandy loam, being warmer, the crop was stronger and heavier. In the vicinity of Gridley and the entire distance along the river from Gridley to Yuba City, the stand and growth were much better. Indeed, we saw as fine fields of wheat and barley, and many of them, as we have ever gazed upon. The appearance, too, of the county is steadily improving. We saw many new evidences of prosperity and progress. Gridley is a thriving, growing town, and fast putting on city airs. It is surrounded by a country that has no superior in the State, and to us, who knew the locality when it was only the "Gridley sheep ranch," it was a matter of astonishment and we could hardly believe our eyes. It was the same along the river road with live-oak growth, progress and prosperity on every hand.

Tulare.

GRAIN PROSPECTS.—Visalia *Times*, April 28: M. J. Byrnes, of the Visalia Grangers' Union Branch, returned from a trip through the southern portion of the county on Saturday. He was as far south as White river, and traveled over most of the farming country between Deer creek and Tail Holt. He reports the grain in that newly settled section looking well, especially near the foothills. The grain around Alila is not in so bad a condition as has been reported—a portion of it looking exceedingly well. The farmers all feel confident of harvesting fair crops. George McCann was over from Cross creek on Monday. He reports the grainfields much benefited by the late rains, and says that notwithstanding the fact that crops will be short in some localities, the farmers generally will fare well, owing to the high price of wheat.

A FERTILE REGION.—*Times:* The lands in the immediate vicinity of Visalia and extending to the foothills on the east are most productive. Irrespective of wet or dry seasons, the soil never fails to produce the most abundant crops. Much of this land has been cultivated annually for 30 years, and still remains as productive as when the plowshare first turned the virgin soil, without any artificial enriching. It is not an uncommon thing for young trees in this section to make a growth of 12 to 14 feet in one season; cornstalks grow as well, and on each one of them may be found two or three ears of well-filled corn; sweet potatoes weighing 8 to 12 lbs. are common, and Irish potatoes from this section weighing from eight ounces to a pound are seen in the market the year round. Peaches weighing 16 ounces and measuring from 10 to 13 inches in circumference are shipped hence by the box in their season. All vegetables and fruits grow here in about the same proportion as those mentioned. Water for irrigation is abundant. Land can be purchased at from $30 to $75 per acre.

Yolo.

GROWING RAMIE.—J. T. McMahon in Winters *Express:* I got my first ramie plants from the State University last January. I planted 10 and was so well pleased with the growth of these that I sent to New Orleans for 10,000 plants, enough to plant one acre. They were planted about the 1st of March, and are now six inches high. As soon as I have a chance to cultivate the rows, I will invite the citizens, and farmers in particular, to inspect my field of ramie, that any one interested may see the plant during the different stages of growth, up to time of cutting and curing.

Yuba.

THRIFTY OLD ORANGES.—*Appeal*, April 29: In Byron Burris' garden, at Brown's Valley, are a number of flourishing orange trees. Two of these are each 22 years old, and their trunks are nine or ten inches in diameter near the ground. They are only ten feet apart, are crowded by other trees and shrubbery, have had little or no care and scarcely any cultivation, yet they flourish and are unharmed by frost. From these two trees Mr. Burris took last year over 2000 fine oranges, most of which he sold at 25 cents a dozen, realizing over $20 from each tree. There are other orange trees flourishing in the neighborhood.

BERRIES AND CLOVER.—John Palmer, at Brown's Valley, has four acres in strawberries, which, he informed the *Appeal*, give an average of about $250 an acre, above all expenses. He also has four acres in blackberries, which pay about $200 to the acre, net. Last year he sent some to S. F., and they were so large that a dealer wrote to ascertain the variety. But they were the common Wilson stock, and their size is attributable to the superior advantages of our foothills for berry production. Mr. Palmer has two acres in red clover, and cuts three crops a year, beside pasturing the land in the fall. He gets four or five tons of clover hay to the acre. His irrigation costs him $120 a year. His berry patches are very carefully cultivated, and he uses wood ashes and all the barnyard manure he can save upon his place. He has a beautiful home, owns considerable land and is said to have money out at interest, all from the profits of berry culture. When he began to grow berries, everybody told him he would fail. Yet he has made a great success of it, although he has to haul his fruit 12 miles to market.

ARMY WORMS have again appeared in the willow thicket on the south side of the Yuba river. They began to show themselves about a week ago, and have since multiplied with amazing rapidity. Many willow trees have been stripped of their leaves by the all-devouring insects. They first show themselves as little black worms on the trunks, close to the ground, thence climbing to the branches. For days past they have been crawling over the railroad track through the willows, and upon the D-street bridge. A little tar daubed upon the rails is sufficient to stop the march of the host. Should they get into the city, the gardens would be apt to suffer.

ARIZONA.

GREAT RAISIN VINEYARD.—L. A. *Herald*, April 30: McPherson Bros., the great raisin-makers of Orange, in this county, have completed the planting of their great raisin vineyard in the Salt River valley in Arizona. It will consist of 640 acres, and contain some 400,000 Muscat vines. The grape in the Salt River valley ripens about three weeks earlier than in the Los Angeles valley. This will enable the growers to supply the Eastern markets in August, before the crop matures in this section, while Los Angeles can supply grapes six weeks later than the Arizona crop will last.

OREGON.

FRUIT PROSPECTS IN SOUTHERN OREGON.—Ashland *Tidings:* Up to this time there is promise of an abundant fruit crop in the Ashland orchards—peaches, prunes, plums, cherries, apricots, pears, quinces, apples. We have had some frosty weather this spring—not more than in the Willamette, however—but the trees will be loaded unless a May freeze-up should happen, which our friends need not apprehend.

GALLOWAY CATTLE.—Our readers will find the grand Galloway "Borderer of Drumlanrig," whose portrait appeared upon our first page during the last State Fair, doing duty in our advertising columns this week in announcing a great sale of his breed in Denver, on June 10th and 11th prox. The portrait well represents the nobility and picturesqueness of the Galloways, as well as indicates their solidity and shapeliness, which are gratifying to sordid beef-makers. Though the Galloways have been known in California for several years, their showing at our last State Fair was the largest ever made and many friends were made for the breed. Visitors at the fair will remember that the largest display was the herd brought out by Mr. George L. Goulding as manager for Leonard Brothers, of Missouri. After a successful campaign with the cattle on this coast, Mr. Goulding returned eastward as far as Denver, and established a firm of cattle dealers under the name of George L. Goulding & Co.—a concern which we are informed by disinterested parties has large resources and is trustworthy. The attractive announcement in our columns of the Denver Galloway sale should command the attention of our readers not only in this State, but in the great cattle States east of us. Full particulars of the sale may be had from catalogues, which will be sent on application to George L. Goulding & Co., Denver, Colo.

A USEFUL AND APPROPRIATE MONUMENT.—Engineer Symons, U. S. A., has prepared plans and specifications for a memorial bridge across the Potomac, at Washington, in honor of General Grant. The center length of the bridge as designed is 4650 feet, 1339 feet less than that of the Brooklyn bridge. The central span is 160 feet wide in the clear, the main arches span 240 feet, and the smaller arches span 120 feet. The carriageway is 40 feet wide, and the two sidewalks 10 feet each, making the total width of the bridge 60 feet. The cost is estimated at $10,000,000.

GLIMPSES FROM GOLETA.—Mr. Sexton sends us a fine photogram of the Goleta table at the Santa Barbara Rose Fair and of his own floral booth, which was briefly noticed in last week's RURAL. Better than any merely verbal portraiture, it enables one to form some conception of these ingenious and delicate pieces of floral skill, to view which in the beauty of their natural hues must have been a delight indeed.

THE LATEST VICTIMIZER of farmers works thus: He displays numerous pretty workboxes, nicely bound books, etc., and promises them to each subscriber to some magazine. Then he shows other fancy articles, all which he will send to subscribers for the magazine at a very small price, which must, however, be paid in advance. And the paying in advance is the last of it.

Springtime on the Mountains.

[Written for the RURAL PRESS by MARY P. ARMS]

Over the hillside all damp from the snow,
The green leaves start up while the March winds blow.

When the April sun loosens winter's hold,
Spring blossoms give us their white and their gold.

Miracle of bloom! o'er the earth so brown,
Ermine-hooded winter, yield up thy crown.

The grasses waken from their winter rest,
The bee is astir on honeyed quest.

Little rills of autumn, swollen with snow,
Now rush like rivers with broadening flow;

And tiny mountain streamlets, ice-bound long,
Ripple on their way with murmur of song.

The whole being of nature is stirred,
The notes of the lark and robin are heard.

Rich fruit the autumn and summer-times bring,
But dearer by far is the new life of spring.

Beckwith, Plumas Co., Cal.

The Child's Prayer at the Farmhouse.

[Written for the RURAL PRESS by MAID-OF-ALL-WORK.]

The harvest is all up at the farmhouse. The fields stretch away in unbroken green against the azure sky of spring. Low white clouds float across the sky, flecking the sun-tipped hills with moving shadows, or massing in dark-lined processions across the north, ready to fling themselves away in fleeting shadows, or gathering at sunset in the rosy west to glorify the passing of the day king with their gorgeous temples of crimson and gold.

The song of the one lone singer of winter comes lower and softer with the fading day. A fleet rabbit skims through the dewy grain, scarcely as tall as he. The light wind moves the tender blades and they begin to whisper together the new songs of spring.

It is all hope at the farmhouse when the first warm days break out over the bright-green fields. Hope overspreads the wide sky resting in the calm blue depths or shining on the snowy clouds piled heavenward. The air is soft and fresh, as if blown from some new land.

The old dark roofed farmhouse even seems to look bright and new, with its clean, winter-washed walls, the grass springing up about its doorsteps, and the happy linnets hunting about its eaves for new nesting-places, as if it would show forth to the new year the hopes that renew like the spring under its unpolished shelter.

So it is wherever the warm touches of spring come to the heart of nature; it is hope and new strength, and humanity stirs and moves newly onward to the round of deeds and thoughts that sum up human life.

It is this humanity that looks ever forward, if not upward, that lives as tragically, as sorrowfully, as sickly, under any brown far-away roof as in the crowded places of traffic and rushing incident. The great questions of existence are vital among the lonely hills, and life slips away among sunny fields with the same passionate visions, the same steady gazing into the future, as where periods are marked with greater events. Pain comes silently, care grasps tightly, pride poisons, ambition hurries, and shadows of coming sorrows move darkly over warm hearts that look out of low windows to the changing shadows on the hills. Hope changes from an ethereal maiden to a deep-eyed presence of plainer garb, but she is nearer and more human. Desire becomes more sincere and prayers multiply; and so it is, when the crimson glory changes to dusky gray in the twilight, that hope, weak in its own strength, is folded in the strong wings of prayer and borne upward, carrying the heart of the farmhouse into the land of the eternities.

Evening brings quiet; the display, the pride, the failures, the unfinished tasks are covered by the curtains of night, and every life, whatever be its hope, must wait for rest. The young, the weary, the restless, the brave, the Christian unwearying in well-doing, the revengeful and jealous fearing all men, the sorrowful and weak, father, mother, sister, and child, all must encamp in the tents of darkness, surrender all knowledge, and give hand and heart to the mysterious ghost of dreams.

The first prayer of childhood tells it all—"Now I lay me down to sleep." The statesman, weary beyond all speech, and revolving great schemes, the student regretting that he must sleep, the housewife with care on her brow and pain in her heart, the maiden smiling much to herself, each and all let go of life in the silent watches of the night and are as little children. What are plans, sorrows, poverty, pain or gladness? unconsciousness covers all.

We are brothers in the tents of darkness, we lay aside the buoyancy of health, statesmanship, genius, the grasp of foresight, and the frailty of sickness, to be alike silent, helpless and irresponsible under the spell of dreams.

The sunny hearted child pauses in its laughter to repeat slowly the wonderful prayer of childhood that none can hear without heeding, "Now I lay me down to sleep." The invalid listens, acute to every sound. Perchance he is numbering his good-nights; perchance he sleeps on the border land of the great unknown; but notwithstanding all, he must fold his hands, like the ruddy child, and close his longing eyes on the loving and the loved.

We lay our burdens down, as God wills, and sleep.

But our souls then—waking or sleeping, our souls are God's own. Unwittingly the child lisps, "I pray the Lord my soul to keep," thinking most of the birds and brooks and her play hours; while the invalid lying alone is summing up the incidents of many years, some for gain, some for glory, rich with love, harassed with wrong, years of strife and acquisition all for self, but none for God, and the sufferer breathes out deeply and sincerely, ere the child voice is still, the long, long prayer of life, "I prav the Lord my soul to keep."

Whether the years were spent carelessly or fruitfully; whether love did well or pride did wrong, what can we do but murmur daily through it all, stumbling, striving, rising or falling, "I pray the Lord my soul to keep."

There are degrees of right and shades of error, and while we strive for the right, yet are doing the wrong, who shall keep our souls but God? We may multiply prayer on prayer, we may pray for faith, for hope, for grace, virtue, holiness, but through it all we are making the one petition of artless childhood, "My soul to keep." "If I should die." Sometimes, amid green fields and spring-time breezes, and the healthful and regular passing to and fro at the farmhouse, comes the unspoken, unformed thought quietly falling like a shadow: "If I should die before I wake." Sooner or later the sad old earth will begin to whisper to you its one never-forgotten dirge. The mother at the farmhouse cannot go; her children would suffer. The snapping asunder of the frail cords that bind her warm heart to her home would leave all the hopes and possibilities of that home to the selfish care of alien hands. The father cannot go; he is one of the world-builders. The student cannot go; he is binding himself to life. The child least of all knows what death is or life may be, and yet it bends a baby face over folded finger tips to pray each night, "If I should die."

"If I should die"—to leave bright streams and flowering hills, paths and gardens for the vague unknown. To know no more the joy of life and the grace of gentle friends. To leave the pursuits we have labored so hard to learn to do; to leave the pleasures we have given our lives to learn to enjoy. Have we been forgiven for our thoughtless errors, one to another?

Have we made the green leaves of hope to grow in the barren places of sorrow? What matters it "if we should die"? We may do everything as for God's laws; we may be happy, prosperous, worthy of it all, but between the setting and rising of the sun, we may die.

Clasp the baby fingers closer; they may be beyond our reach soon; bend the gray head; lower the proud brow; let fall the long waves of hair over hidden faces; be humble where the wide fields sweep up to the stately house; for, if you must die ere the late moon rises on the dark night, you may multiply words on words, but there is only one prayer for you: "I pray the Lord my soul to take."

Singers, prayers, preachers and mourners, all may pray, but it is the one highest and last need of the human race, "my soul to take." The good, the powerful die, the sword of the great leader is eaten with rust, the voice of the wonderful preacher is gone, the cottage-door swings open and the humble and unknown pass out into the silent land, but there are no orders of going. He who gives can only take.

What matters it whether life be grand or simple, what state of wrought emotion, what wording of lofty thought, can express more than these four lines—the prayer-destiny of every life:

"Now I lay me down to sleep." After toil, after care, after courage, after triumph, after failure, the sweet calm of sleep, quietude and forgetfulness.

"I pray the Lord my soul to keep." The daily and hourly reward of an upright and godly life, the "kept" soul contains through every battle of sorrows, the defense of the righteous man against his own weakness.

"If I should die before I wake." The possibility of sudden death, the uneasiness of life, the disaster that lurks in every wind, the pitiable helplessness of disease, the burdens of age—these are our heredity.

"I pray the Lord my soul to take." This is our consolation and our strength, the bright star that shines upon every sorrowful road, the sustenance of life and the victory of death.

Can child pray less or aged pilgrim more?

Fold then the tiny fingers where fields grow green, and in the simple habits of the old farmhouse, forget not that sweet and immortal prayer, childish, yet holy and profound, written in monosyllables, yet comprehending the creed of all religions, and the religions of all civilizations.

Contra Costa Co.

NO IMMEDIATE DANGER.—The earth is supposed to lose time at the rate of half a second in a century. Therefore, if the earth ever ceasee to revolve on its axis, it will be more than 6,000,000,000 years before it will stop.

To a Dreamer.

[Written for the RURAL PRESS by CHARLES P. NETTLETON.]

Gliding, drifting down life's river
Wreckage floats and floats forever.
Wreckage—some of sick and mad hearts,
Wreckage—some of wild and sad hearts;
Life-wrecks, soul-wrecks, clash and clear,
Wrecks of all weak man held dear—
Wreckage, wreckage, gliding, shifting,
Man has sent it all a drifting.

Wouldst sleep on—and add to sorrow?
Do thy great deeds ere to-morrow,
Dally not o'er daily pleasures,
Life holds more than earth's mean treasures;
Starving souls demand thy labor,
Love thou them and own thy neighbor.
More gain have men the more men give;
Wake—live the life man's soul may live.

Camp-Fire Stories—Soldiers' Life In War.

General Willich's love of discipline and his efforts to raise all grades of his command to his own high standard of excellence, sometimes led him into mistakes. These errors, however ludicrous they might be, did not lessen the respect and esteem of the soldiers. They had an admiration for his manly courage and a perfect faith in his loyalty. His military capacity inspired confidence, and his almost parental solicitude for the welfare of his "boys," as he called the soldiers of five regiments forming his brigade, won from them affection and devotion. Four of these regiments were the 32d Indiana, the 15th and 49th Ohio, and the 89th Illinois, while the 39th Indiana, the 15th Wisconsin, the 8th Kansas and 51st Indiana became at different times the fifth in number, the four first-named regiments having served together until the close of the war.

One evening some six-mule U. S. wagons attached to the brigade were being "parked" for the night. The country was wooded and thinly settled, and our camp was not far from the road by which we had marched that day. The General noticed that one of these mule-teams was obstructing those forming the park. It prevented those behind it from being aligned, as required by military usage. Something was plainly wrong. Incompetence often caused blunders in every branch of the service. Men who had never seen a mule at home, perhaps had never owned a horse, might try to exchange the known hardships of a soldier for the untried duties of a teamster, and so tempt Providence by attempting the control of six army mules at once—bought and branded by Uncle Sam, yet popularly credited with rebellious tendencies and generally believed to be possessed of the d—l.

These mules which attracted General Willich's notice, as needing proper guidance, were, to use a newspaper phrase current during the war, becoming badly demoralized. No two of them acted alike, and what with standing on hind legs, plunging down on fore legs, varied with frantic surgings to either side, or trying to lie down and roll in harness, braying of mules mingling with army curses from the unfortunate driver, there was certainly something wrong. General Willich was riding a young and spirited horse—a gift from his boys—and he galloped toward the entangled team and ordered the driver of it to "Go on!" The low bushes, which, as a natural shrubbery, hid the ground, were being trampled by the mules. The teamster was in actual distress before Willich came to intensify his torture—if that were possible. He had, without warning, encountered a swarm of yellow-jackets; probably came up in time to be punished for damage done to the nest by others, who had excited them but had escaped the usual penalty. Before the teamster could explain to the General's satisfaction the cause of his multitudinous trials, the horse which Willich was riding suddenly became afflicted with the same violent plungings before made manifest by the disordered mules. General Willich's splendid horsemanship enabled him to keep his seat, but his horse screamed and plunged with pain—the pugnacious little hornets stinging both horse and his now sympathetic commander, who rode away at full speed and was soon out of sight.

Willich had never before been known to retreat without developing the full fighting strength of an enemy. The wagon-master soon ordered up fresh teams which pulled mules and wagon away from the victorious yellow-jackets. A danger signal was planted to warn other teamsters away from the belligerent and plucky little defenders of the soil. When one of General Willich's aids rode up, a few minutes later, the train was moving regularly again and some good-natured laughing had displaced the excitement created by the unexpected interference.

The soldiers who had faced danger in battle without flinching, and who even opened beehives (in spite of stings) to obtain honey, were not so ready to fight yellow-jackets. There was no glory, no honey, no tempting evasion of military rules and regulations. But there was a certainty of stings, and of inglorious defeat; made harder to endure by the presence of men who needed laughter so badly that they fairly ached for some mishap (to another) to furnish excuse for uproarious fun-making. If it was very ludicrous, the story would spread through the camps like a prairie fire; it might even travel farther—the United States mail might convey it to acquaintances at home; a fellow's best girl might laugh at its appearance in citizen's dress, and by return mail report it back to him and make him feel that the shock of battle was a trifle in comparison with a soldier's idea of a camp joke.

General Willich's experience with those yellow-jackets may have helped two of his soldiers some time afterward to escape punishment, when the possession of a beehive, under suspicious circumstances, might have resulted in *confiscation* of the honey, as well as the arrest and punishment of the soldiers. Without dwelling too long on the risks they had run in foraging, and the hardships undergone in securing the hive and transporting their treasure-trove so far toward camp, we may state a few facts.

The beehive had been laid on an army blanket, the ends of which were twisted tightly to keep the bees inside of the blanket and to prevent a sally from the captives while on the march. The soldiers had become separated from their regiment while foraging and securing the plunder; the time so used for this extra duty had brought them in the rear of the column. It was while they were tramping along, trying to find the brigade, that a sharp turn in the road brought these two belated soldiers—stragglers — "bummers" — "absent without leave"—foraging in violation of orders—directly in front of brigade headquarters.

General Willich was in front of his tent, facing the road, sitting on a camp-stool within 50 paces of them. It was too late to go back; the General halted them on sight; the provost guard would certainly capture them if they tried to escape.

Willich ordered them to advance. One of the soldiers was "toting" the beehive, which, although inclosed in the blanket, yet suggested by its shape the nature of its contents. The other soldier was doubly armed, by carrying his own musket and that of his comrade. There seemed to be no time for deliberation, nor chance for parley. The comrade in charge of the guns suddenly dropped them and began to fight imaginary bees in the air. He brushed them from his face, knocked his feigned winged assailants from right and left, and then threw himself on the ground and rolled over in a seeming paroxysm of desperation.

The General may not have been fully deceived by this cleverly acted pantomime, but he halted the soldier who was slowly advancing with the beehive.

The General motioned him away with his hand, sorrowfully saying with his German accent: "Go on! go on! Soon there will not be one man left with two eyes in my brigade."

February, 1887. EDW'D E. CHEVER.

Woman Suffrage in Kansas.

Kansas is the first State in the Union that has granted women the privilege to hold office and vote. They have long enjoyed the privilege of school suffrage there, but seemed to care very little for it. The Legislature last winter gave them the right to vote on all municipal affairs, and as all towns of a population of 250 or more may be incorporated, woman suffrage is practically established.

For this reason the April elections this year possess more than usual interest. It has been a standing objection that women, as a rule, did not want the franchise and would not use it if given to them. This illusion is now dispelled. The official returns show that two-fifths of the registered voters were women, and that over two-fifths of the men voters registered and voted. From this it appears that the women appreciated their privileges and discharged their duties as citizens quite as well as the men. They took a lively interest in caucuses, primaries and conventions. They were extensively employed in registration offices, and served on Election Boards. Several were elected to school offices. On election day the women were out in full force, active, aggressive, persuasive, and the ticket they generally favored in nearly every instance was elected.

Another objection to woman suffrage is that it would add no moral impulse to civic affairs; that the average woman is no better than the average man. There is nothing in the objection. The question is one of right. As long as tramps, drunks and ignorant aliens are allowed to vote, why should the women be kept away? But this election dispels this objection, thin and worthless as it is. The pulsation of a fresher and better life in politics was felt the moment woman came on the field. Take the city of Leavenworth, the largest city in the State, with a population of about 40,000, as an example. Here the battle between the good and bad elements was most hotly fought. The friends of saloons, brothels, deadfalls, gambling dens, and the leaders of jobs and rings had had possession of the city for four years. Into this Sodom came the new voters. The saloon newspapers pawed the air, the smut-mills spurted, the jails were unlocked and the inmates voted, the brothel-keepers were out with their hacks and fair frail ones—the very depths of infamy were scoured for voters, but the ticket supported by the earnest, virtuous and patriotic women won, where it could not have won without their aid. It is certain that Kansas is none the worse for the experiment, and that Leavenworth and other cities are assured of much better municipal government than ever before.

YOUNG FOLKS' COLUMN.

A Country Evening.

[Written for the RURAL PRESS by J. T. O.]

Anxiously the woodcutter sits and watches the setting sun,
He knows when it disappears his labor for the day will be done.

"The plowman homeward plods his weary way,"
And thus ends his work for one long day.

The schoolboy comes home whistling along his way,
And ends his school-life for another day.

His chores for the night now have begun,
His work for the day is by no means done.

Out to the hen-house and coops he goes,
And to the hungry little chickens and their mothers some feed he throws.

Up in the pasture now he is gone,
The cows and horses to bring home.

The cows to milk and the horses to feed,
The flower-beds and the grass to weed.

Now by his mother to supper he is called,
Down to supper he sits with his father, mother, men and all.

He enjoys his supper, for he loves to eat,
And when at last we leave him he is fast asleep.

Yuba City.

We print the foregoing rather for its truth to nature than for the music of its meters.—EDS. PRESS.

The Little Window-Washer.

[Written for the RURAL PRESS by I. H.]

(*Concluded from last week.*)

"My niece tells me you are in trouble, Susie; let us see what we can do to help you out of it. You have got a good mother, haven't you?"

"Yes'm," said Susie shyly but positively; she had no doubt on that subject.

"Now, tell me, who do you think knows best, your mother or you?"

No answer. Susie's eyes were cast down and her cheeks crimson.

"Tell me truly what you think; is it you?"

"No, ma'am; it's my mother."

"Then don't you see that you were a very foolish little girl to tease her into letting you do a thing she thought unwise?"

Two big tears slowly rolling down were all Susie's answer.

"I am sure you do," said Miss Ann kindly. "Let me see your basket."

Susie handed it to her.

"Just as I thought—poor worthless trash. Where did you get these things?"

"At Mason's."

"Mason's! You poor child; they cheated you because you knew nothing. I'll see about that."

And there was a decided ring in Miss Ann's voice which left no doubt that she meant what she said.

"Now, Susie, this is what I will do. I will take your things and give you back your dollar, if you will promise to take it to your mother and tell her you are sorry. Will you do that?"

"Yes'm," said Susie between her sobs, which were not caused entirely by grief.

"Very well. You can come back here on Saturday morning if your mother will let you, and we will try to find out some better and more sensible way for you to help her. Going out with a basket is not fit work for a child like you; it is very little better than begging, and would lead you into idle ways and bad company."

As Julia went to the door with Susie to let her out, she put in her hand one of the packages she had brought from the candy-shop, but it was not the one she had bought for May Allison.

"What in the world will you do with all those things, Aunt Ann?" she asked, returning to the dining-room where the old lady was making Susie's merchandise into a a parcel. "There are enough pins there to last you a lifetime."

"One paper of pins would last me a lifetime," said Miss Ann; "they don't wear out, and I don't lose them. But I have no idea of keeping this rubbish. I happen to know Mr. Mason, and I shall take it back to him and let him see how a poor child has been treated by one of his clerks. If he gives me back my dollar, good and well; if he keeps it, I will not have to go to the poorhouse."

Dollars, as Julia well knew, were rather scarce with Miss Ann, but none of them ever went for caramels, so she was pretty sure to have one to spare for any emergency.

"Do you think she will come on Saturday?" was the next question.

"If she does it will prove that she is worth helping; if she does not, then any effort on her behalf would be thrown away."

"And what will we do with her when she does come?"

"I don't know yet; we must set our wits to work, you and I. I said Saturday that we might have time to think."

"We? O Auntie, it will have to be you. What do I know about earning money? I never earned a dollar in my life."

"And you are 15 years old," said Miss Ann. "It is time for you to think a little about such matters, it seems to me."

Nothing more was said just then, for Mr. Middleton soon came home and engaged his sister in conversation on other subjects. But after Julia had gone to bed, she lay awake trying to think of some plan for Susie. "I have earned my pocket-money sometimes," she said to herself. "Mother used to pay me for making patchwork when I was a little thing, just learning to sew; she pays me now—why, there! I have it; that's the very thing." If mother had been at home, Julia would have got up at once to consult her about the bright idea which had come into her head; but Aunt Ann would not approve of such an irregular proceeding, so she was obliged to sleep upon it.

The plan seemed quite as satisfactory when viewed by the morning light, and as soon as Julia was dressed she hastened to unfold it to her aunt.

"I was wrong when I said I never earned any money, auntie, for I do earn my own pocket-money, at least in a way. Mother gives me 25 cents a week for washing the windows of the parlor and dining-room. Nora has so much to do, and she said I ought to learn to do such things neatly, and it would make me more careful in spending my money if I earned it by my own work. How would it do for me to let Susie come and do it instead and pay her for it? unless you have thought of something better, Aunt Ann."

No, Aunt Ann had not thought of anything better; she was only too well pleased to have the suggestion come from Julia, and she approved it heartily. She had no doubt there were other busy housekeepers who would be glad to pay a small sum for having their windows washed, provided that Susie could be taught to do the work properly.

"I will teach her," said Julia; "she seems a bright little thing. I am sure she can learn."

May Allison got her package of caramels the same day at school, and the plan for providing Susie Carter with work was confided to her. She was deeply interested, and thought her mother would be glad to have the little girl once a week.

Saturday morning brought Susie eager and smiling, quite unlike the disconsolate little creature who had applied to Julia for help two days before. Her mother said she might do anything the ladies liked, she told them, and after she had had a large piece of gingercake and a glass of milk, Julia asked her if she could wash windows.

"Yes'm," said Susie; "I always wash the windows for mother."

"How would you like to come here every Saturday and wash four windows and get 25 cents?"

Susie's eyes sparkled; she would like it very much.

Forthwith, Julia produced her "tools" as she called them; a dishpan, soft rags, a piece of chamois leather, brought the warm water and set the child to work. She watched her for a few minutes, and then rushed off to find her aunt.

"O Aunt Ann, I wish you would come and look at her. I teach her, indeed! She does it better than I ever did, and she is so neat and careful. She must have a good mother."

Never did child try more faithfully to do her work well, and when the four windows were bright and shining she was rewarded by kind words of approval as well as by the promised quarter of a dollar. Then Julia carried her off to Mrs. Allison, who did all her own housework with the assistance of her daughters. She engaged Susie to come to her on Friday morning of every week.

Aunt Ann now promised to find two more customers for the little window-washer, and after lunch she put on her bonnet and shawl and went home with the little girl to see her mother and explain matters to her.

"Such a nice young woman," she said to Julia on her return; "if you had seen her you would not wonder that Susie is a neat and well-behaved little girl. The two rooms they live in are poorly furnished and in a dreary neighborhood, but they are as clean and orderly as it is possible to imagine. The mother herself is so quiet and gentle that I almost laughed when I thought of your asking Susie if she was afraid of a beating. She was so pleased to think of the child getting some suitable work to do, and said a dollar a week would help them along wonderfully. She can easily earn that; and she is to come to us every day for an hour to say her lessons. Keeping her out of school altogether would never do."

Miss Ann has been as good as her word, or even better. To-day Susie Carter has quite a round of houses where she goes to wash the windows, and her one dollar a week has more than doubled. She pays the rent of the pleasant, cheerful rooms where she and her mother and Jack are now living, and there is no longer any need to wait for a pair of shoes when they are wanted.

Julia has found other means of earning her pocket-money, and very little of it ever finds its way to the candy-shop. She is so much attached to her little protege that she enjoys nothing so much as making her some useful present, and is always "saving up" for that purpose.

Aunt Ann is the steadfast friend of both girls, and as she looks at them in their widely different circumstances she often wonders which has gained more good from their intercourse, her own niece or Susie Carter, the little window-washer.

Walnut Creek.

A Flower Piece.

In respect to the season and the prevailing disposition to hold floral fairs, we hoist a floral

DESIGN FOR BASKET OF CUT FLOWERS.

piece upon this page this week. It shows a very neat design of basket, flowers and ribbon garnishment, and if arranged in harmonious colors would make a very pretty arrangement for home or floral fair decoration.

GOOD HEALTH.

LIME-WATER AND ITS USES.—Lime-water, when applied to suppurating or mucous surfaces, checks or stops secretion and produces dryness of the parts; hence it is a desiccant, and is useful in sickness and irritability of the stomach during teething. The power of exciting and changing the mode of action of the absorbent vessels and glands has been ascribed to lime-water, and probably with some foundation, for under its use glandular enlargements have become softer and smaller—in other words, it is resolvent. It often relieves the superficial but painless ulceration of the mucous membrane of the mouth observed in dyspepsia. In these cases one part of lime-water to two or three of milk is usually sufficient. Given in this form, it will often stop the most violent sickness. In some scrofulous ulcers its power of checking secretion is most marked.

HOW TO TREAT THE FAINT.—Old Dr. Gittings, of Columbia, S. C., being called to a lady who had fainted, found the patient stretched upon a sofa, with a high pillow under her head. The doctor's first instructions were: "Take that pillow from under her head and place the family Bible under her heels, and she will be all right in a minute." One who heard him say it has never forgotten this remedy, and has practiced it repeatedly with great success. Fainting is occasioned by lack of blood in the brain. When the sufferer is placed in the position described above, the blood flows back into the brain and the fainting fit is over.

ABOUT WELLS.—In this section it has long been demonstrated that in order to get good drinking water it is necessary to bore to the second strata, and then shut out the surface water by water-tight iron casing. People using water from wells so bored are never bothered with malarial complaints, whereas, when surface water is used it has proved unwholesome. Wells are generally bored to the depth of 70 feet; but, while they are so bored, in not a few instances dishonest well-borers fail to put the casing down over 30 feet, and the result is the well is no better than a surface well, and in fact does not furnish either sufficient or good water. People, therefore, who have wells to bore should be on their guard, and when the boring is being done see to it that the casing is put into the well properly and to a depth sufficient to shut off the surface water. There are honest well-borers who do their work properly and squarely, but there are others who do not. —*Fresno Expositor.*

HONEY CURE FOR CHOLERA.—C. E. Willis contributes the following to the Santa Barbara *Press:* Dr. George Sowers, practicing physician in Socorro, has used pure honey as a specific for cholera for two years past, and has not lost a single case. He has had a large number of cases under his care, whole families being often attacked, and gives them honey, first, last and all the time and nothing else, for food or medicine. It is distasteful to the cholera patient, but is good medicine all the same. John A. Helphingstine, at present Superintendent of the Coronado Beach Company, San Diego, was long a resident of New Mexico, and reports that he has witnessed the wonderful success of this simple remedy.

DOMESTIC ECONOMY.

CREAM CAKE.—One cup of butter, two cups of sugar, whites of two eggs, three and a half cups of flour, one cup of sweet milk, one teaspoonful of soda, one teaspoonful of cream of tartar. For the cream: One pint of sweet milk sweetened to taste, yolks of three eggs; thicken with flour to the consistency of custard, flavor with lemon. This amount makes two good-sized cakes.

RAISED CAKE.—One pint of melted butter, two pounds white sugar, one-quarter ounce of mace, a teacupful of yeast, one quart of milk, flour enough to make a stiff batter; beat and set in a warm place to rise; mix it at night and let it rise until morning, then add one pound of stoned raisins, work well through, and half fill your cake molds. Bake in a hot oven for half an hour.

POTATO LEMON PUDDING.—Three ounces of potatoes, the grated rind and juice of two fine lemons, three ounces of white sugar, two ounces of butter; grate off the lemon peel with lumps of sugar, beat them and add to the other ingredients; boil the potatoes and peel them, mixing all together with the lemon juice and two beaten eggs; bake it slightly.

TAPIOCA PUDDING.—Wash four large tablespoonfuls of tapioca and let it soak for an hour in a little warm water; strain through a sieve and mix with the beaten yolks of four and the whites of two eggs, a quart of milk, half a teaspoonful of grated nutmeg; sweeten with sugar and bake in a dish an hour.

SAGO PUDDING.—Boil five tablespoonfuls of sago, well picked and washed, in one quart of milk till quite soft with a stick of cinnamon; stir in one teacup of butter and two of white sugar; when cold, add six eggs well beaten and nutmeg to taste. Mix all well together and bake in a buttered dish three-quarters of an hour.

FRIED APPLES.—Make a batter of two eggs, a pinch of salt, a cup of milk and six tablespoonfuls of flour. Slice, pare and core tart apples as thin as Saratoga potatoes. Dip them a spoonful at a time in the batter and fry. Eat with powdered sugar and cream or a liquid sauce.

COTTAGE PUDDING.—One egg, cream with one cup of white sugar and a quarter of a cup of butter, mix with two cups of prepared flour and one cup of milk, add the juice of half a lemon, stir briskly for five minutes, put into a cake pan, bake in a moderate oven and eat hot with lemon sauce.

STEWED KIDNEYS.—Soak in cold water half an hour. Skin them and stew slowly in just enough cold water to cover them. When done, thicken the gravy with flour; add salt and pepper, then dish. Kidneys should be used at once; they do not keep well.

FRIED PARSNIPS.—Scrape and leave in cold water for an hour, then cook half an hour in hot salted water; wipe, slice lengthwise, dip in melted butter, then in flour seasoned with salt and pepper, and fry in boiling dripping. Drain free of fat, and dish.

LEMON SAUCE.—The juice of one lemon, a half-cup of sugar, mix with a tablespoonful of flour, add a pint of boiling water and boil five minutes. Serve with nutmeg if desired.

SAUCE FOR FISH.—The yolks of three eggs, one teaspoonful of vinegar, quarter of a pound of butter, a little salt. Stir over a slow fire until it thickens.

EGG CAKES.—Chop hard boiled eggs to a mince, mix with mashed potatoes, and fry in small cakes to a crisp brown.

The Week.

We have had a run of boreal zephyrs this week, which, agriculturally speaking at least, we would have been better without. North winds are valuable from a sanitary point of view and do good service when there is too much moisture and danger of rust, etc.; but with this year's moderate water supply, we have no pressing need of northers. There has been rain during the week at scattered points, but the great central area of the State has watched the clouds to no purpose. Much in grain yield and in the duration of pasture feed depends upon another good soaking before the rainy season closes.

The fruit outlook is still very good and prospects of a full operation of canneries and drying establishments, as well as much greater Eastern shipments, give confidence that though the crop be large there will be many uses for it. What fruit-growers think of the future of their industry may be found quite fully described upon another page.

The Distresses of Labor.

When the old sage declared that the sea was full of toil, he told only half the truth. The earth is also full of restlessness. The incessant moan and surge of the ocean is an emblem of the incessant moan and surge of human life. Its alternate storms and calms, its tidal pulsations that break in waves upon every shore, type to man the infinite unrest and disquietude of the human heart. There is little doubt that if every one could realize his wish, a large sum of unhappiness would still remain in the world. It is certain that industry and remunerative employment fail to bring peace and rest. People, as a rule, seem to be discontented with their lot, and this discontent, this inappeasable hunger for something more and better than we possess, when properly understood is prophetic of a nobler destiny.

But be all this as it may, there is one aspect of the labor question that no philanthropist, no heart warm with fraternal feeling, can look upon without some pain and dismay. We are constantly compelled to witness the poverty and suffering of men anxious to work, and trained to good, honest labor. Ever and anon along comes an invention that supersedes their shape of industrial activity, and often in middle life, with a dependent family on their hands, many once active, worthy, self-sustaining men are left with no work to be done. They have their hands, skill, and honest hearts, but there is no one to hire them. The energy of the muscle and brain is no longer marketable. Thus, for instance, thousands of coopers have been turned out of the shop with their drawing-knife, as there are machines now in operation by which one man can make as many barrels as ten men under the old method. The same is true of the nail machines, shingle machines, sewing machines, the reapers and headers, in short, all the labor-saving mechanisms of the day. No doubt these inventions send society forward, but the great iron wheel of the car of progress passes over many homes and human hearts. While the forms of labor are changing, those must suffer who lived by the first form and before they become adjusted to the new environment. It is not strange that a few men in their blind despair attempted to put the great Robert Fulton to death, for each revolution of his steamboat-wheel marked the retirement of seamen who for years had been sailing or towing their ships or barges along the lakes and rivers of the continent.

The great fluctuations caused by such innovations as the steamboat, the power loom, the railway and telegraph and telephone, are only conspicuous illustrations of what is occurring almost daily in less noticeable forms of labor. In all departments of life, individuals are set aside by progress, often before old age has set them aside or a competency made them able to retire from the struggle. The mail-carrier who can walk but 15 miles a day is discharged in favor of one who can walk 20, and the bookkeeper who, in the former generation learned to write a heavy round hand, is set aside for the young man who can make finer lines in the ledger.

But the special point we now desire to make is, that in addition to the distresses of labor caused by new inventions and by fluctuating taste, an immense quantity comes from the love of city life. To young men in the country, the city is a dazzling object. They are drawn to it as the moth-miller at night is attracted to a lantern hung in the orchard. The flow of young men toward the city is not determined by the law of demand, but by the law of dazzling attraction. In all these metropolitan centers the supply of labor is excessive, and the streets are filled with hundreds of persons with little or no money, seeking places that are not to be found. Advertise for a clerk or bookkeeper to-day and there will be a hundred applicants for the situation the next day. Like birds charmed by the cobra, young hearts flock to the city and are unable to fly back to the country. They buzz around this dazzling lure and are consumed. They hover around this raging maelstrom and are lost. There might be developed an agricultural spirit that would greatly mitigate these griefs of industry. There is no reason why farming may not be made as charming a pursuit as merchandising. It would only be necessary to throw into the pursuit the ambition and intelligence that make the successful lawyer or merchant. And this is one of the chief excellencies of the Grange. It is lifting farming into the region of the fine arts. If farming must always mean the struggle of an ignorant man over a few acres with a hut, a poor horse and a potato patch, the intelligent young men will be drawn to the city. But farming, fruit-growing and vine culture may mean in the country what merchandising means in the city—the rush of ambitious, thoughtful men. There is no reason why the occupation of a farmer should not be made so elegant and charming that between it and the handling of cases of silk, and the pursuit of medicine or theology, the best minds would confess little choice. Much has been achieved already in this direction, but much remains to be done, in order to check the rush of ardent, ambitious, but superfluous energy to that terrible, dazzling, devouring monster—the city.

The Freight Situation.

On another page is given a sketch of the present standing of the overland freight question as related to fruit shipments. There are other very important matters involved; for example, the wool question, which we outlined in our issues of April 16th and 30th. The matter was changed somewhat by the suspension of the long-and-short-haul clause, for upon that action one overland line gave the following wool rates to Boston: Compressed wool, valued at 12 cents a pound, $1.90 a hundred; wool in grease, valued at 18 cents, $2.15 a hundred; wool in grease, compressed and valued at more than 18 cents, $2.40 a hundred; scoured wool, compressed, $2.90 a hundred.

These are not the lowest rates on wool to the Atlantic seaboard, for the Pacific Mail offers to carry wool at $1.62½ per hundred, and the Canadian Pacific will haul it through the Dominion for $1.50 per hundred. But there are objections to both these avenues, although the offer of the Pacific Mail must be deemed the best now available, all things considered. It looks as though most wool would go that way unless figures are changed by the direct overland lines.

The low rate offered by the Canadian Pacific is tempting, but those interested say that the first clause of the Interstate law, which makes it apply to any common carrier engaged in the transportation of property for a continuous carriage or shipment from any place in the United States through a foreign country to any other place in the United States, makes them hesitate about accepting the low rates offered by the Canadians. The managers of the Canadian line will give no guaranty of safe delivery of wool in Boston.

There is now springing up some favor for the Interstate law among merchants and manufacturers, who suffer by masses of Eastern goods brought in at lower freight for the whole trip than our dealers can ship to some points in California. Of course, the raising of overland rates helps them. There are also agricultural interests which would be benefited by the enforcement of the short-and-long-haul section. Our beef and pork interests would be saved from such hard competition with Chicago, our egg producers would not suffer from "railroad eggs" and our barley is sometimes hurt by too much Nebraska corn. There are many things involved in the new legislation, as we have said, and it will take time to see just where the shoe will pinch.

GOVERNMENT ENTOMOLOGICAL WORK IN CALIFORNIA.—One of the gratifying results of Prof. Riley's recent visit is the assurance that the U. S. Government is now to assume local and continual jurisdiction over our insect pests. Prof. Riley establishes what he calls the Entomological Bureau of Northern California, and places in charge Mr. Albert Koebele of Alameda, who has been working upon California insects for Prof. Riley for the last two years—having been especially detailed at the time of the last grasshopper invasion. Mr. Koebele is a careful student and a very agreeable gentleman, and will be very acceptable to our fruit-growers. Prof. Riley expects soon to appoint an agent in Southern California. These agents will be glad to give information on insect pests for the public benefit.

Irrigation Enterprises.

The Stockton *Independent* says that Geo. Weller, of that city, has just concluded the purchase of a mining ditch which heads in Amador county, Italian bar, eight miles above Westmoreland's bridge, on the Mokelumne river, runs along near Lancha Plana, Campo Seco and Comanche, in Calaveras county, and terminates four miles southeast of Wallace, about 30 miles from Stockton. The price of the ditch, water-right and 160 acres of land is stated to have been $25,000. The length of the ditch is 17 miles; its average width 2½ feet at bottom and 6 feet at top, and its depth 3 feet.

It was constructed in 1858, for mining purposes, and a rental of $47,000 was paid for its use for one year, when mining was carried on extensively, and the renters made money by the sale of the water. In later years, repairs having been neglected, the value of the property decreased.

Mr. Weller proposes to enlarge the ditch into a canal of capacity and length enough to irrigate the northern portion of San Joaquin county and supply Stockton. He says the ditch will now empty water into Bear creek at an elevation of 100 feet above the level of the Mokelumne river. From that point, near Wallace, to Stockton the fall is 75 feet. From the Jack Tone place, on the route of the proposed extension, the fall is 40 feet. He estimates that water can be brought into Stockton through his canal for $100,000, and that with the necessary capital the work can be completed within one year.

An irrigation meeting was held at Porterville, Saturday, April 23d. H. M. White was elected chairman, and A. F. Thompson secretary. Mr. Pillsbury, of the *Register*, read the Wright bill, and, by request, explained the provisions of the law regarding organization. After a long and spirited discussion, a motion offered by Mr. Grider, that the chair appoint a committee of ten to investigate and report the territory most advisable to be included in an irrigation district, to prepare petition for organization, etc., to report to an adjourned meeting to be held in Porterville on the second Saturday in May, was carried without opposition. The committee was chosen as follows: W. R. Harris, Woodville; John Tuohy, Lewis Creek; J. R. Grider, Pleasant Valley; Jas. A. Kincaid, Frazier; T. T. Hamlin, Tipton; Capt. Jacob Hayes, Poplar; J. J. Cairnes, Harmony; Alfred Miles, Plano; Leroy Redfield, Porterville; W. L. Burnett, Tulare. They are to meet to-day, May 7th, and report to the adjourned meeting on Saturday, 14th, at 10 A. M.

Board of Horticulture's New Office.

The office of the State Board of Horticulture has been removed from 40 California street to 30 Post street. The idea is to bring the office nearer to the center of the city and adjacent to the hotels, so that fruit-growers visiting the city may find it more convenient to consult the State Inspector and the secretary of the board. The board has a very valuable library on horticultural and entomological subjects and other matters which are of interest to fruit growers. Let the change in number be noted—30 Post street, nearly opposite the Mechanics' Institute library.

VALUE OF ARBOR DAY.—Massachusetts observes its first legal Arbor Day this year. Ere long, probably, every State in the Union will have such an institution. Nebraska has furnished an illustration of the practical value of Arbor Day. In that State of great prairies, on the first of its Arbor days, 15 years ago, 12,000,000 shoots were planted; now the United States Forest Commission reports that there are fine groves growing 300 miles west of the Mississippi, and that 605,000,000 trees are thriving where a few years ago none could be seen save along the streams.

SOME LAND STILL LEFT.—The land-grabbers have not yet got all of Uncle Sam's farm. Although the most choice portions have gone, it is encouraging to note that there still remain, unsurveyed, about 9,000,000 acres in Colorado, 12,000,000 in Arizona, nearly 30,000,000 in California, 49,000,000 in Dakota, 7,000,000 in Florida, 44,000,000 in Idaho, 7,000,000 in Minnesota, 39,000,000 in Nevada, 74,000,000 in Montana, 41,000,000 in Utah, and more than 20,000,000 in Washington Territory, and so on.

Freight Rates on Fruit.

What will be the charge for carrying fruit East this season is still the uppermost topic in horticultural circles. The rates asked for at the Fruit-Growers' Convention in Sacramento last November, viz.: $300 to Chicago and $400 to New York on special 10-car trains running on passenger time, are still contended for. The directors of the Fruit Union are urging the need of granting such figures upon the railway managers on this coast, and they claim that the figures cannot yet be assured, ostensibly because Eastern connections will not agree. For this reason appeal will now be taken to the Railway Managers' Convention, which assembles this week in Chicago, and R. B. Blowers, the Eastern manager of the Fruit Union, started eastward on Saturday evening, April 30th. Mr. Blowers' presentation of the subject in Chicago is to be enforced by a number of telegrams from horticultural and trade organizations on this coast, one of which, from the State Horticultural Society, appears upon another page of this issue.

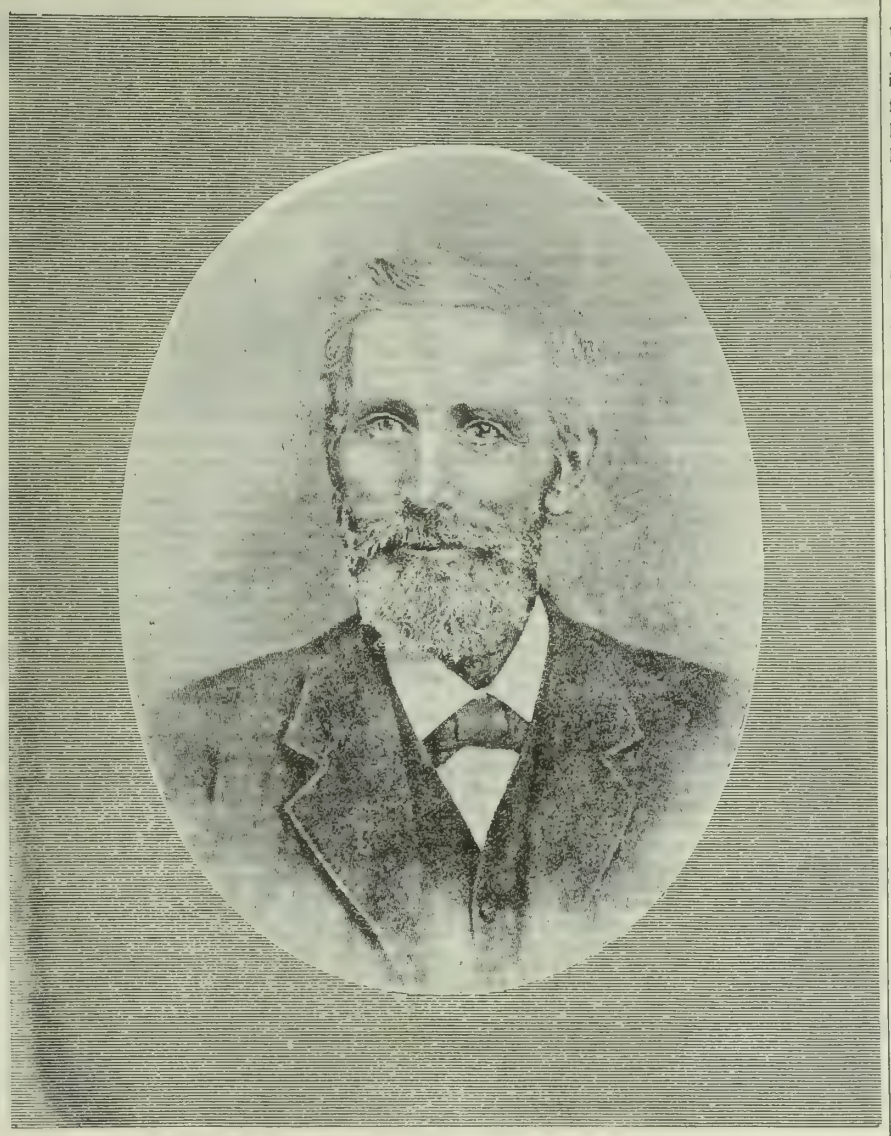
The latest assurance secured from the California railway managers was given at a meeting with Senator Stanford and Mr. Towne in Sacramento on Saturday last. The following dispatch from Sacramento reviews the meeting and its results as follows:

The best that could be offered now was as follows: For single cars attached to passenger train, to Chicago, $500; to Missouri points, $420; for slow freight, $250 to Chicago and $220 to the Missouri.

The company offered further to run special fruit trains of ten cars each on a strict passenger schedule, starting each train one to three hours ahead of the regular passenger train and keeping it always ahead, at a price per car to Chicago which could not be definitely given, but which will be about $413. The price would have to be arrived at by adding to the slow freight rate per car, $250, the extra expenses of running fast trains from California points to Omaha, and that expense was figured at $120; and between Omaha and Chicago it could not be given exactly, but would be in the neighborhood of $43.

The company was prepared to give the Fruit Union a written guarantee on this basis, but its representatives did not feel authorized to accept these rates, as they hoped for still further concessions. The rates offered, however, are a decided improvement on those of last year.

Single cars attached to passenger trains last year paid $600 to Chicago; the proposed rate now is $500. The rate per car for trainloads is this year $413—$113 higher than last year; but when the conditions are considered, the proposed rates will really be a saving to the growers. In the first place, last season no train would be accepted of less than 15 cars, and, again, trains were not run strictly on passenger time; they were from 12 to 48 hours late in reaching Chicago, because owing to the difficulty of getting up such large trains on any one day, and the great additional risk incurred in delay, many of the shippers preferred to ship in single cars attached to passenger trains. As a matter of fact, the great bulk of green fruit last year was shipped at the $600 rate.



It is some comfort to know that the rates will not be greater than last year, as has been feared since the Interstate Commerce law has figured in the situation. It is a fact that in some respects the figures are somewhat better than last year. But the Fruit Union directors are wise in contending for the rates proposed at the Sacramento meeting, for it is clear that to extend the business as is desired higher rates cannot be paid. It remains to be seen what can be done with the assembled representatives of Eastern and Western roads at Chicago.

It is Mr. Blowers' intention to proceed with his work in establishing agencies, etc., at Eastern points, as soon as he finishes his special mission at Chicago. He expects to remain until the first of this year's fruit comes upon the Eastern market, to note the results of the auction method at the far East, etc. Shippers will feel more confidence in his presence there, and his reports will be looked for with much interest.

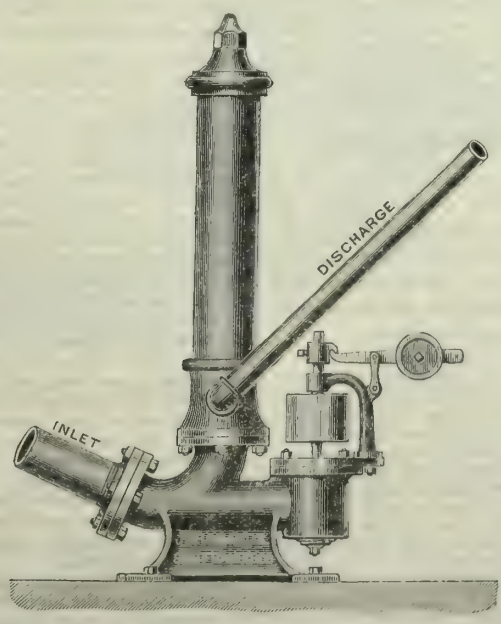
Trespassing Shepherds.—The Southern Pacific Co. sued certain sheepmen in Kern county for trespassing on said company's lands and depasturing 2800 acres. The Superior Court at Bakersfield, April 25th, gave judgment in favor of plaintiff in the sum of $280, or ten cents an acre, the annual rent of the pasture lands. The suit was deemed of great importance in Kern county, as the railroad has contracted to sell hundreds of thousands of acres, and the purchasing parties have never felt safe.

Hon. Cyrus Jones.

As interest turns again to San Jose because of the holding this week of a floral fair in the Horticultural pavilion, we give upon this page a portrait of Hon. Cyrus Jones, already well known to our readers, and who, among his other progressive works, is to be largely credited with the prominence which the horticultural

HON. CYRUS JONES, OF SAN JOSE.

interest has secured by several successful fairs held in San Jose during the last two years. Mr. Jones organized the Horticultural Hall Association and led in the arrangements which resulted in the erection of the fine pavilion. He proposed the recent Citrus Fair which was so successful in many ways. He has been president of the Horticultural Hall Association since its organization, and may be counted upon for tireless effort and wise leadership in matters pertaining to industrial displays, for which he has peculiar genius.



Cyrus Jones was born in Clark county, Ohio, June 21, 1822. Having finished his education at the academy in Springfield, he moved to Towanda township, McLean county, Ill., and engaged in farming and stock-raising, besides shipping stock to Chicago and New York. He was married February 3, 1853, to Margaret K., daughter of Judge Rayburn, of the same county.

Taking a fancy to fine cattle, he owned, for some years, a very choice herd of Shorthorns, and was one of the leading exhibitors at county and State fairs. August 1, 1872, having sold his stock, he started for California and passed the next winter in Santa Barbara. The following spring, in company with Gen. Giles A. Smith, he bought a farm near Alum Rock, known as the Avenue ranch, which he stocked with Shorthorns from Illinois and Kentucky. After the death of Gen. Smith, the herd was distributed through the State, each part forming the nucleus of a new herd. In 1880 Mr. Jones sold his interest in the Avenue ranch and moved to San Jose, where he still resides.

From 1874 to 1881 he was president of the State Cattle-Breeders' Association, and from 1878 to 1880 a director of the State Board of Agriculture. He was elected to the Assembly in 1875, and served two years. He warmly supported the New Constitution, and at the election which followed its adoption was a candidate for the office of State Treasurer.

Having amassed a considerable fortune by his industry and frugality, Mr. Jones retired from business in 1881. He still holds property in McLean county, Illinois. He is one of the largest stockholders in the Farmers' Union, and is a stockholder, also, in the First Nationa bank, both of San Jose.

Mr. Jones is an excellent representative of the retired farmer. He has been an active, working member of San Jose Grange ever since its reorganization. While accepting and faithfully serving in several offices in the Order, he has always declined being put forward for the higher positions.

RICHARDS' PATENT HYDRAULIC RAM.

A New Hydraulic Ram.

Hydraulic rams are employed to excellent advantage in a number of agricultural establishments in California. Where the conditions are favorable there is probably no cheaper way of securing a continual supply of water. We have, during the last few years, shown several styles of hydraulic rams. One of the latest designs is that set forth in the engraving on this page—an improved ram invented by John Richards, of this city. In this connection it may be remarked that, like the blacksmith's anvil, which was thought to be perfect, the old hydraulic ram has moved on to a new place among water-raising machines, and has been the subject of some very remarkable experiments in England, where an efficiency of 80 per cent has been gained with a ram of large size.

Mr. Pearsall, a member of the Institution of Civil Engineers, London, writing on the subject of hydraulic rams recently, says: "Almost the only application of the principle has been the common hydraulic ram invented by Montgolfier, 100 years ago, and very little improved on since. Almost all attempts at improvement have been only slight modifications, and have retained features that have unfitted these machines for use on any but a small scale, as more or less violent shocks were an inevitable accompaniment of their action. Indeed these violent shocks have come to be regarded by many people as essential to the working of such machines. Hence the name 'ram.'

"Careful consideration, however, accompanied by experiments, demonstrates this as an error. Violent shock is not essential to the action of the machines on this principle, though it is an invariable accompaniment of all existing machines. But it can be avoided, and by this avoidance the efficiency is not only not impaired but is increased."

This "revolutionary" proposition respecting hydraulic rams seems plausible enough when we consider that a shock or blow always indicates a loss of power in machinery of almost any kind.

Mr. Richards, in his smaller-size rams—those of less than eight-inch—employs two valves instead of one. These valves are nearly balanced, so they close with much less shock than a single valve. They moreover are not shut by the rush of the water around the valves, but by the action of the water after it escapes.

The engraving shows one of these rams arranged for a low head. The water issues at the top and bottom of the chamber at the right; that from the top strikes under the shield seen on the stem and is reversed by a curved surface beneath and thrown downward, so the impact and also the reaction is employed to close the valve. This operation is performed much quicker than with the old style of rams, but as the valves above and below are nearly balanced, there is but little shock compared to what occurs with a single valve—that is, there is but little shock on the valves or other wearing parts, although the pipes receive the full force. The weight and lever are employed in the case of low heads when the water pressure is not sufficient to sustain the valves with the small difference in their area. In other cases this weight is dispensed with.

In the larger sizes Mr. Richards proposes to adopt the isochronal valve movement, by which all shock is avoided. We see no reason why in such case a hydraulic ram of any size cannot be made and work successfully. Those employed by Sommeiler at the construction of the Mont Cenis tunnel had 30-inch pipes, and some of recent construction are even larger.

It is estimated that California's 1887 wheat crop will amount to 50,000,000 bushels.

Entomological.

Summer Treatment for Insect Pests.

The following are the summer and spring washes and remedies against insect pests recommended at the Fruit-Growers' Convention, held under the auspices of the State Board of Horticulture, at Riverside, April 11 to 14, 1887:

For Evergreen Trees.

Summer washes against the cottony cushion or white scale, *Icerya purchasi*, red scale on orange trees, also for the black scale, *Lecanium Oleæ*, on olive trees. Recommended by Prof. Riley.

Kerosene, 2 gallons=67 per cent.
Common or whale-oil soap, ½ lb., } 33 per cent.
Water, 1 gallon, ... }

Heat the solution of soap and add it boiling hot to the kerosene. Churn the mixture by means of a force-pump and spray nozzle for five or ten minutes. The emulsion, if perfect, forms a cream, which thickens on cooling and should adhere without oiliness to the surface of glass. Dilute before using one part of the emulsion with nine parts of hot water. The above formula gives three gallons of emulsion, and makes when diluted 30 gallons of wash.

Note.—It is of the greatest importance that the above mode of preparation is followed strictly, otherwise the result may produce an unstable emulsion, which has all the objectionable features of a mixture of water and kerosene.

The emulsion can be easily and quickly made by using a good force-pump, so constructed that it can be inserted directly into the liquid, which must be kept in constant and violent agitation by forcing it through some form of spray nozzle back into the same receptacle.

A slightly different formula was recommended by Mr. Elwood Cooper.

Five gallons best kerosene oil, 150° test, one and a fourth pounds good common soap, or one bar and a half of soap usually sold as pound packages; 2½ gallons of water. This makes the emulsion. When using dilute 6½ (to 7) gallons of water for each gallon of oil, and to this mixture add 2½ pounds of good home-made soap dissolved in boiling water. All this mixing is done with hot water. We usually have the solution up to 140° in the tank from which we spray.

For Cottony Cushion Scale.—The following is recommended by Prof. Riley, especially against the cottony cushion or white scale, known as "Prof. Riley's compound 152."

One pound of caustic soda is dissolved in 1½ gallons of water; then the two pounds of resin and one pound of tallow are dissolved in one quart of lye. After the resin is all well dissolved by moderate heat, the lye is added slowly while cooking under continued stirring; the mixture, if good, will become dark brown and thick. Should it become whitish and flocky (this is caused by too much and too strong lye), water should be added and it will become right again. This will make 22 pints of soap, for water should be added to make that amount, after the lye is in, at a cost of 11 cents, excluding labor and fuel in preparing it, which amounts to but little, and will be sufficient for 44 gallons of wash sprayed well. This is for *Icerya.*

Lelong's Wash. — The following, recommended by B. M. Lelong, is a recipe for making fish-oil soap for summer wash. Ingredients for one barrel of 50 gallons:

Potash	14 lbs.
Caustic soda, 98 per cent	8 "
Lime, unslacked	5 "
Fish oil, polar or seal	10 galls.

First dissolve the soda and potash by placing them together in 12 gallons of water. Second: slack the lime in the barrel to be used, in two gallons of water, then add the fish oil to the lime and stir well until the lime and the oil have turned to a thick butter, then add the soda and potash, water boiling hot, and stir well with a dasher for five minutes or more, then leave standing four or six hours; at the end of four or six hours, fill up with cold water; do not pour in all the water at once, but about two buckets at a time. Stir well as the two first buckets go in, to prevent lumps; use the following day. Apply cold, one pound to the gallon of water. In dissolving it do not boil, but weigh the amount to be used, place in a barrel, and on top of it pour hot water, about one bucket to every hundred pounds. After pouring in the hot water stir lively with a dasher until it is entirely dissolved, then reduce with cold water sufficiently thin enough to pass through the strainer; then place in the tank and fill up with water, stir well and it is ready for use.

For Deciduous Trees.

The following is recommended by W. G. Klee as a summer wash against scale insects affecting deciduous trees, as well as against pear slug, saw-fly larva and black-scab fungus of the apple and pear. (See Bulletin No. 5 by the Inspector of Fruit Pests:)

Dissolve 30 pounds whale oil soap (80 per cent soap at the most costing five cents per pound) in 60 gallons of water, by heating the two together thoroughly. Boil three pounds of lye (American concentrated lye is what we have used) with six pounds of sulphur and a couple of gallons of water. When thoroughly dissolved, it is a dark brown liquid (chemically sulphide of soda). Mix the two, the soap and the sulphide of soda, well, and allow them to boil for about half an hour, then add about 90 gallons of water to the mixture, and it is ready for use. Do not allow any of the mixtures to cool while mixing. Apply it warm, at about 130° F., by means of a spray pump. Used warm, its effect is better, and less material is required than when cold.

Treatment for Codlin Moth.

The following is recommended by W. G. Klee against the codlin moth: Burlap bands about six inches wide, fastened with a tack above, drawing the band close to the tree, leaving it loose at the lower edge. These bands should not be more than a foot from the ground, and the bark on the trunk must be smooth and clean. In large trees, place rags in the crotches. Bands must be placed on the trees as early as May 15th, and must be examined every week. The ground must be perfectly smooth, especially around the tree; no rubbish or boards to be allowed in the orchard, as the larva will hide in them. These measures, in addition to the picking off of infested fruit, have proved a great protection in comparatively isolated places whenever the rules have been followed out strictly. In addition, the spraying with Paris green and London purple is recommended for trial.

Proportions used: The following samples have been analyzed at the University of California by Mr. A. Weber, under the direction of Prof. Hilgard, and indicate clearly that they contain a larger amount of arsenic than common Paris green ought to contain; in fact, that they are adulterated with arsenious acid:

	Per cent.
No. 2	55.7
No. 3	38.3
No. 4	54.4

As the recommendations of W. G. Klee, in Bulletin No. 6, of 1 pound to 54 gallons of water was based on a supposed percentage of from 15 to 20 per cent, as used by the State Entomologist of Illinois, the quantity of water to be used to the pound must be placed at 1 pound to about 180 to 200 gallons. Sample No. 4 will most likely present the average of the Paris green in market, being bought from a leading San Francisco firm; it is recommended to strain the Paris green, and it must be constantly stirred, taking care that it does not clog the nozzle. A nozzle that can be opened, with a large aperture in case of clogging, is preferable; but the spray must be as fine as possible, and every fruit reached.

Time to apply: Apply the first time just after the trees are fairly out of bloom; the second time, 10 to 12 days afterward. Do not use any arsenites after the fruits have commenced drooping on their stems, as there is danger connected with its use that late. If possible, choose cloudy weather for spraying.

London Purple.—London purple is another arsenical compound. It is the residue from the manufacture of aniline dyes, and contains lime, arsenious acid and carbonaceous matter. It is more soluble, more adhesive, less poisonous, and generally less expensive than Paris green.

This compound is also exceedingly variable in its percentage. It contains generally considerable free arsenious acid, and for this reason should also be used in cloudy weather, as it may, if used too strong, burn the foliage. It is mixed to a paste and then diluted.

Owing to the uncertainty of the percentage of this compound we cannot recommend any definite proportion, but think that 1 pound to 100 gallons for the first spraying, and 1 pound to 200 gallons for the second, will be right.

It is clear that if these remedies prove efficacious we must have the compounds made by reliable parties here in the State, so that growers can obtain material of a uniform strength.

The Cottony Cushion Scale.

State Inspector W. G. Klee has just received the following interesting letter from W. M. Maskell, who first described the cottony cushion scale and gave it a name. In entomological literature his name also appears, so that the full style of the insect is *Icerya purchasi* Maskell. The following is the letter:

The Museum: Wellington, New Zealand, March 5, 1887.

Dear Sir: I much regret that I can give you no more certain information as to the original home of *Icerya purchasi* than this, that New Zealand is certainly not its home, and that Australia probably is. It came to New Zealand about the year 1877, and first appeared in Auckland upon a hedge of prickly or (kangaroo) acacia, an Australian plant. When I first saw it there, in 1878, it had almost destroyed the hedge (which was about 20 yards long) and the insects were clustered in hundreds on the dying plants. I did not know then as much as I do now about coccids, but I advised the owner strongly to burn every stick of the hedge. He neglected my advice. At that first visit *Icerya* was on that hedge alone, as far as I could see. I visited Auckland again four years afterward or so and *Icerya* had then spread over a large area about the city and was on numbers of different plants. Since then it has invaded with terrible effect a great part of the North island of N. Z. and the warmer parts of the South. It is now firmly established and the supine carelessness of the people allows it to ravage whole districts at will. But it is certainly, as the above shows, not a native of New Zealand.

I understand that it appeared at the Cape of Good Hope some years ago (long before it was established in this country) and that the people there called it the "Australian Bug." As the course of traffic by sea is usually from the Cape to Australia, I suppose it must have been taken there by people going to the diamond fields from Sydney or Melbourne.

In 1880 (I think) I was on a visit to Melbourne and took a run for a day up to Ballarat. There I saw, on various trees in a garden, a number of coccids, which I believe to have been immature *Icerya.* I was not in a position at the time to bring away any specimens, nor even to make more than the most cursory observation. But, if these were not *I. purchasi*, they were something very closely allied to it.

On the whole, from the above facts, I feel convinced that Australia is the country which has made to us and to you a present of this remarkably objectionable pest.

I am bound to say that I have never seen the *Icerya sacchari* of Mauritius alive. I have received specimens in spirits and they do not agree with *I. purchasi.* But might there not be two Mauritius?

If so, the exportation of sugar from that island to Australia, to the Cape, to California and to New Zealand, might well account for *Icerya purchasi* in all those countries. I have several times tried to obtain some information from Mauritius, but without effect.

Now as to natural enemies. As far as our experience goes, *Icerya purchasi* has none such in this country. The only coccids which I have found attacked by parasites here are some *lecanids* (chiefly of my genus *tenochiton*) one or two *diaspids* and a *dactylopius.* Birds do not eat *Icerya*, and in fact we have nothing here to check its increase, to my knowledge. Whether the *hymenopterous* parasites of *tenochiton* will some day attack *Icerya* cannot now be said, but everybody will devoutly hope that they may, and soon.

I shall have great pleasure in forwarding to you a copy of a work now in the press on New Zealand coccids, which will be out, I hope, this month. If it were not too importunate I would venture to ask of you to send me whatever publication of the same kind you could easily let me have from California. I remain, Yours faithfully, W. M. Maskell.

Remarks.

This letter shows that although Mr. Maskell first described the insect, he was comparatively late in seeing it. In his Riverside address, published in the Rural of April 23d, Prof. Riley said he first had specimens from San Francisco in 1872, and we know it was thoroughly established on acacias as early as 1876, as we had abundant samples of it and its work in that year. He also traces it back to 1868 at Menlo Park. Mr. Maskell's discovery of it in New Zealand in 1877 is therefore rather late, and the insect, as he states, had already become a great traveler.

Concerning this scale, in his remarks last week in San Diego, as reported by the *Union* of April 24th, Mr. Klee said:

The principal difference in the habits between this and some other scale insects was that while other scale insects were only able to move about for a comparatively short time, a few hours or days at the utmost, and then become permanently fixed, this insect is able to move about for the greater period of its existence, and not alone able to live on one or two species of trees, as is the case with the other scale insects, but seems to be able to subsist on almost any fare. He cited instances of the insect having lived for weeks without any food whatever, and increasing in size. This has made this insect the most difficult to exterminate. Coupled with this peculiar habit, is the great reproductive power of the *Icerya purchasi.* In California's climate, it generally produces three broods in a season, and a female quite often contains as high as 1000 eggs.

Notes on Dr. Gally's Birds and Bugs.

Editors Press:—In reply to Dr. Gally's interesting letter in your issue of the 16th inst., let me rise to explain that it does not take a smart man to answer his question in regard to the birds. Owing to judicious advertising they were induced to visit San Luis Obispo county, and have become so enchanted with this delightful climate that they have no desire to return to their old haunts. And now, as every real estate agent will testify, our mountains awaken to echo and re-echo their songs, and from every tree, bush or shrub, on mountain or in valley, a glad chorus testifies of bright prospects and of peace and plenty in this land of promise. No need to go in search of cherry bloom when all nature is blooming in such profusion.

The doctor is particularly hard on one fine bird that he calls mean, and says it is a greenish-brown bird with a long, slim beak; that it can't whistle, can't sing, and is not pretty. It surely had the blues in its old haunts at Watsonville and saw no good reason for whistling or singing. But you ought to hear him now as he warbles sweet melody from the topmost boughs of our orange trees. We call him the mocking-bird because he can sing, whistle or laugh, and often pauses in his song to make our real estate men happy by raising the price of land on a tenderfoot.

The doctor may fight his bugs single-handed, but we will have the birds so that, if necessity ever demands it, we will have their assistance in the unequal combat.

He asks if the bugs will follow the birds. Many of the *big bugs* have already arrived and are locating, but the impression prevails that they will not be injurious to vegetation or detrimental to the growth and prosperity of our community. F. U. N.

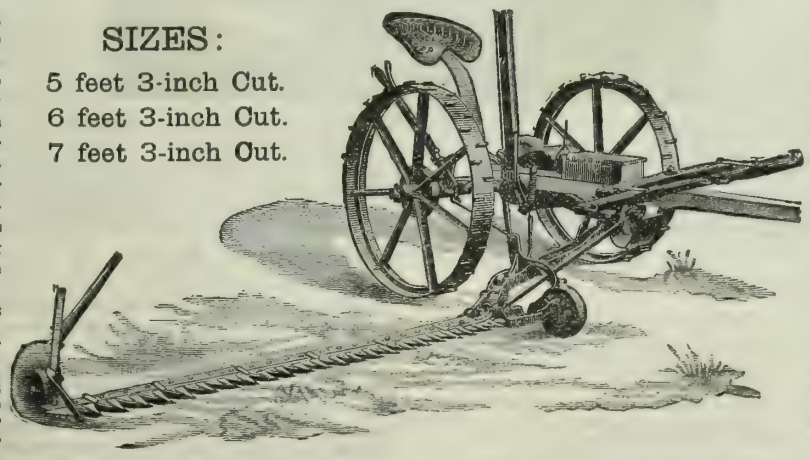
DEERING "GIANT" MOWERS

MANUFACTURED BY

WM. DEERING & CO., CHICAGO, ILL.

Very Strong, Very Economical, Very Light Draft.

THE "GIANT" found no grass in the heavy cutting of last season (1886) which it did not successfully handle; in several instances it was taken into grass that had been given up as being uncutable by other Mowers cutting only 4 feet, at the same time the "GIANT" was cutting a 6-foot Swath.



Intending purchasers of Mowers would consult their own interest by calling upon the local agent and examining into the merits of the "GIANT" before purchasing any other Mower. It is sold under a full guarantee, and intending purchasers are furnished the "GIANT" on Trial.

For doing an immense amount of cutting in a given time, and for leaving the grass in the very best shape for drying, the **Deering Front-Cut Giant Mower** has no equal. With its immense Cutter-Bar of 5 and 6 feet, it is well equipped to do almost **double** the amount of cutting that can be done by the common four-foot Mower, the only thing other factories have to offer to their customers. While the **Giant Mower** can do a giant's work, or about double that of the little Mowers, yet a team of ordinary horses draw it with ease day after day. In short, its draft is little if **any** greater than a common Mower. It is a continual source of wonder to farmers who see the **Giant** for the first time, how a Mower cutting such an **unusual** swath of 6 feet, can be pulled with so much ease by a small span of horses.

The whole secret of the wonderful light draft of the **Giant** Mower lies in the following four facts:

1st, and most important: The Cutter-Bar is supported by a strong **steel** spiral spring, so that the Bar does not rest heavily upon the ground, nor drag with all its heavy weight upon the ground. If it be borne in mind that about 40 per cent of the draft of a common Mower is caused by the dragging of the Cutter-Bar upon the ground, it will be no cause of wonder that the **Giant,** by saving this loss of power,

SIZES:
5 feet 3-inch Cut.
6 feet 3-inch Cut.
7 feet 3-inch Cut.

can turn it to cutting almost double the width of swath done by an ordinary Mower. In addition to the economy of power, there are some incidental advantages. It is free from side-draft. There can be no side-draft if the Cutter-Bar does not drag upon the ground. Another advantage had by having a supporting spring, is that the driver is assisted in lifting the Bar by the spring. Still another advantage is the increased traction gained by throwing the weight of the Bar and Drag-Bar upon the wheels.

2nd. The **GIANT** pulls easy, because of its **High Drive Wheels.**

3rd. It pulls easy because of its **large** and perfect-fitting **gears.** In the Giant there is no gear-cutting nor gear-grinding. Every part fits perfectly.

4th. It pulls easy because the shafts are small where they enter their bearings.

We feel a just pride in the **Front-Cut Giant** for the remarkable record it has made since its first introduction. Every farmer who has written us speaks enthusiastically of its wonderful cutting powers, its light draft for two horses, and its freedom from side-draft.

The advantage of course in buying a Giant is **Economy.**

Ask the Deering Agent in your town, or address us for Special Circulars describing our machines in detail, with Illustrations.

PUBLIC AFFAIRS.

A Friend of Honest Revenues.

Ringing Utterance by Governor Zulick, of Arizona.

Now that the lottery abomination is wielding such sway in private affairs, it is encouraging to see it trampled upon by those in authority. Propositions to increase State revenues in certain directions, by lottery schemes, are receiving the quietus which they deserve. Last month the Territory of Arizona was saved from shame by a heroic veto by Governor Zulick, and since then Nevada has profited by the lesson and decided against a State lottery scheme. The veto message by Governor Zulick is such a forcible arraignment of the lottery evil that we present it in full, and accompany it by a portrait of the man who has done such valuable public service. The portrait was made by our new process from a recent photograph, and is, we trust, a good likeness.

Gov. Zulick's Veto Message.

EXECUTIVE DEPARTMENT,
OFFICE OF THE GOVERNOR,
PRESCOTT, ARIZONA, March, 1887.

To the Council:

I return herewith to the Council, in which it originated, Council Bill No. 60, entitled "An Act to provide for increasing the revenue of the Territory of Arizona and increasing the public-school fund," with my objections thereto. By the provisions of this Act a special gaming corporation is legalized whose business is to distribute prizes by a game of chance, to be conducted under the supervision and guarantee of the Territory, part of the net profits arising therefrom to be appropriated to the public-school fund and the erection of public buildings, the balance of net profits to accrue to the individual stockholders of the corporation.

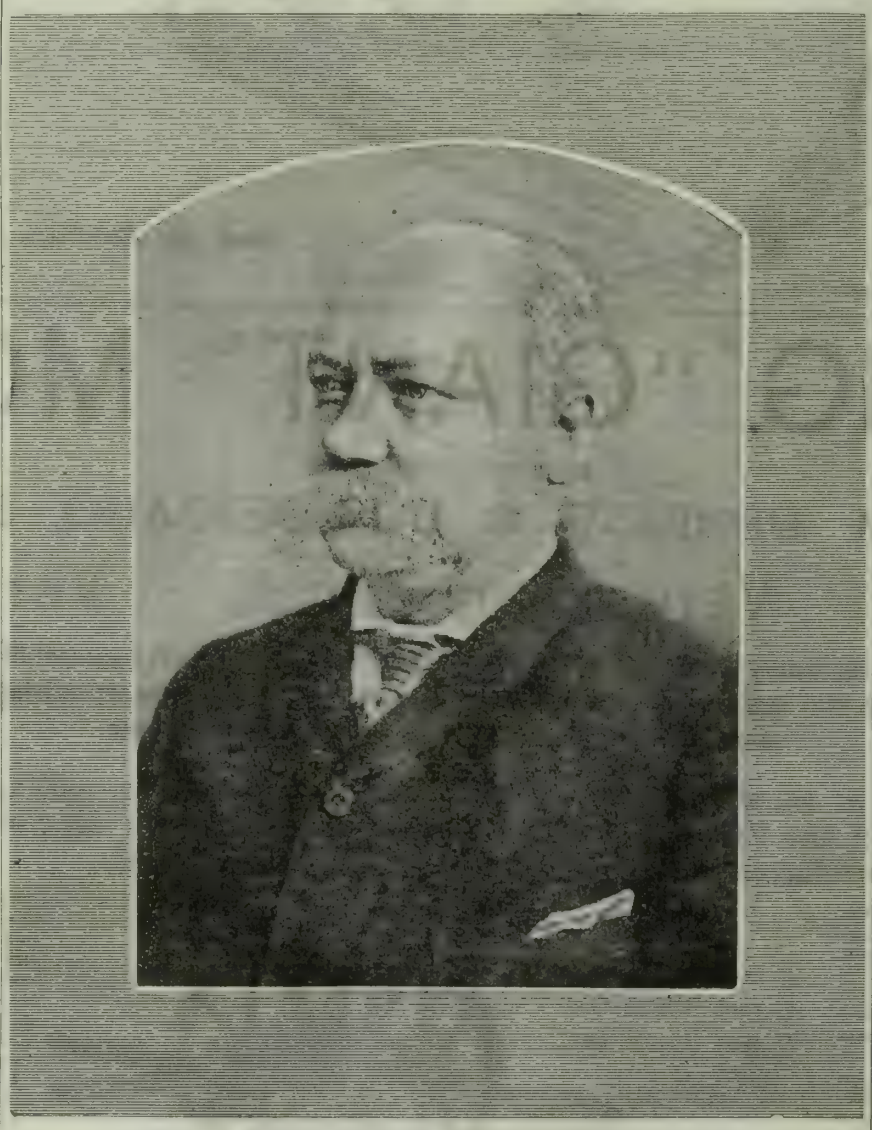
The Act is artfully designed, with attractive features for replenishing a depleted public treasury, and is fashioned after that system of lotteries which has been employed at some period of the history of almost all modern States as a means of revenue, and in some European States is still preserved.

The friends of the measure defend it by argument that as the insatiable passion for play is so universal among the people, it is but wise to retain the money at home, which otherwise would be invested in foreign lotteries, and devote such parts of the profits as is provided by the Act to the public welfare of the Territory.

The force of this reasoning is not sufficient to overcome my objection to this enactment. The policy of our lawmakers in my judgment should be directed against promoting such a passion for gaming, if, as is claimed, it so generally exists (which I am not willing to admit), rather than to foster and encourage it by legal license. Such a system of laws has in the past exerted an unhealthful influence upon public morals. The strength and only safe foundation upon which to build good government is public morality. The homes of our land, the symmetrical beauty of the family relations, and the purity of society, all rest upon the solid basis of personal morality. Equally necessary is it that there should be as elevated a moral standard in the State as in the home, the family and society; all alike conduce to the public weal.

Better, far better that the public schools of the Territory be closed, and each mother in her home, sparing time from her domestic cares and labors, gather her children around her knee and educate them as best she can, than we should engraft into our laws a system of gambling out of the proceeds of which to build up a fund to educate the youth of our land. No such alternative, however, is necessary. Our public-school system is good. In our cities and towns and in every valley, and on every mesa within the limits of our Territory, schoolhouses are dotted, and the benefits of a public-school education are open to all. Why, then, should we resort to such an unnecessary and questionable expedient? The children of to-day, the men and women of the future, soon to take our places and be the intelligent factors to carry on our system of good government, and assume the cares and responsibilities of American citizenship, can more safely and intelligently acquire knowledge through a system of free public schools supported by the honest contributions of a willing people, than out of a fund gathered from the profits of a game of chance.

The evil effects of such a pernicious system must of necessity be early instilled into the minds of our youths, ay, even in the very schoolroom, where taught as they must be, if taught truthfully, that their own education was procured by and through the agency of and profits from a gambling corporation authorized by law. The public-school system of Arizona is now our pride. I am unwilling by any official act of mine to mar its strength, to destroy its moral efficiency or cloud its fair name by surrounding it with such immoral agencies of support.



Whose money will seek investment and build up the immense profits flowing from this lottery scheme? It will be the hard-earned money of the poor; not that of the opulent. By the hope of sudden wealth, prompted by the chances of "a lucky strike," hundreds of thousands of dollars will be diverted from the wages of patient thrift and daily labor. Who will prove the gainer? The treasury by a small tithe, and the fortunate stockholders the enormous balance, with an occasional contribution to the holder of a "lucky number," whose thirst for investment is only thereby increased. Who will prove the losers? Necessarily that class of people who of all in the community can least afford it.

During a period of 12 years the French Government derived from its lottery system an annual income of 14,000,000 francs, yet one year after its suppression the savings banks of Paris showed an increase of deposits of 525,000 francs. England abolished the system years ago, on account of the evils attending it. Public sentiment in nearly every one of the United States to-day is arrayed against the system, and it is prohibited by law and made a penal offense to even vend a ticket or device which has the attributes or elements of a lottery. In very many of the States, the Constitutions absolutely prohibit the Legislature to authorize lotteries. Advanced civilization all over the world has condemned the system as working a mischievous influence upon society.

The Federal statutes expressly prohibit special legislation in the Territory, "granting to any corporation, association, or individual any special or exclusive privilege, immunity or franchise whatever." What is an exclusive privilege or franchise if this is not? Can any but one corporation enjoy the benefits accruing from this franchise? Strictly speaking, a special law is such as is confined in its application to a limited number, and a general law is such as is universal in its application. Does not this Act clearly fall within the inhibitions of special legislation, inasmuch as the exclusive privilege of filing incorporation papers, and the benefits accruing from the same, are restricted to the special corporation organized under authority of this Act? Applying the universally accepted doctrine of legal construction, I think there can be no question that this Act belongs to the class of special legislation, and is prohibited by Federal statutes.

Believing it to be in conflict with what is known as the Harrison Act, and being unwilling to aid in the legalization of a gambling scheme, by which the earnings of men, women and even children can be seduced to investment in lottery tickets, to build up the fortunes of a few interested stockholders at the expense of public morals, under the pretext of replenishing the public-school fund; preferring that our public schools in the future, as in the past, should be maintained by the free, honest offerings of the people, rather than our children should be educated from the overflowing profits of a system of legalized gambling, which, in my judgment, is subversive of every sense of political morality, I cannot but decline to sign this Act. If it becomes a law, it must be by force of that majority vote in the Legislative Assembly provided by law as necessary to overcome refusal of Executive sanction.

C. MEYER ZULICK, Governor.

HON. C. MEYER ZULICK, GOVERNOR OF ARIZONA.

The Mojave Desert.

EDITORS PRESS:—Will you please state in what part of California the "Mojave desert" is located? MANY READERS, *Centerville, Alameda Co., April 30th.*

The Mojave desert includes most of San Bernardino county, lying north of the San Bernardino range, in the regions round about the Mojave river. On its western border it extends a little way into Los Angeles and Kern counties. —EDS. PRESS.

OREGON LAND OPEN.—The acting Secretary of the Interior has approved the decision of the Commissioner of the General Land Office, holding the triangular body of land embracing some 200,000 acres, lying northeast of the unforfeited grant to the Oregon Central Railway Co. and lying along the line of the forfeited portion, to be public lands and subject to entry.

THE railroad tracklayers have reached San Buenaventura, and on the night of April 28th the construction train stood inside the town limits.

THE APIARY.

Honey Interest of Los Angeles County.

C. N. Wilson writes for the Los Angeles Board of Trade pamphlet as follows: It would be no easy matter to find within the limits of the United States a section of country better adapted to bee-keeping than can be found in Los Angeles county—the extensive mountain ranges to be met with on every hand, and the indigenous trees, shrubs and flowering plants, the bloom of which furnishes a nectar that produces a perfect honey, rich and pleasant in flavor, clear and light in color, and when properly handled by the bee-master, possessing a body and keeping qualities that stamp the product as the best honey in the world.

These mountain regions can never to any extent be converted into orchards, vineyards, cultivated fields or pasture lands, and unless utilized as bee pastures would add but little to the wealth of the country * * * The honey-bee gathers the nectar that would otherwise be wasted by the wild winds, and fits it for the use of man. A luxury for the rich, but cheaper and better than beer for the poor man and his family.

In this land of sunshine there is not on an average two weeks out of the 52 in the year that the honey-bee is not on the wing and storing honey, unless it be one of those occasional rainless years when the bloom is cut short for want of sufficient moisture. Honey-bees were not to be found in California until after the Americans acquired the country. To O. W. Childs belongs the honor of introducing the first bees into Los Angeles county in 1855. He bought some in San Francisco, paying for them the round price of $100 gold coin per colony. He placed them in his nursery on Main street, near his present residence, and they soon gave him large quantities of comb-honey, that he sold readily at $1 per pound. His success soon induced others to embark in the business, and quite extensive apiaries were established at different points in the county within a period of two or three years.

There are to-day about 20,000 hives of bees in Los Angeles county, and the most extensive and profitable apiaries are found in the mountains. Los Angeles city has an ordinance imposing a fine of $500 upon any one keeping bees within the city limits. Winemakers object to bees because they gather about the wine presses in the buildings used for winemaking, so that they annoy the workmen.

The average yield of honey per hive is about 260 pounds for the season. Much larger yields are reported from single hives, but in any very large apiary there is always found some hives that are poor honey-producers, and thus the average yield is reduced. The production of beeswax is very large, being much in excess of what it is in the Eastern States per hive. The greater part of the honey produced in Los Angeles county is extracted by centrifugal force from the honey-comb; they are then replaced in the hives and filled with honey again and again by the bees. The extracted honey is put up in tin cans holding about 60 pounds. Two of these cans are put in cases, such as are used for shipping refined petroleum, and in this shape the bulk of the honey yielded is shipped by rail or water either to the Eastern cities or to England. The price of honey is lower just now in Los Angeles than it has ever been before, but it holds its own with other goods in the markets. No doubt the very low price of sugar has some influence on the price of honey.

Of one thing Los Angeles county is assured—that for all coming time her mountains can produce bee pasturage that will yield a nectar unsurpassed in flavor, in color and in body, when converted into either extracted or comb-honey.

The Coming State Fair.

It is announced from Sacramento that the State Board of Agriculture has made a number of important changes in the premium list for this year's State Fair, and many of them will be warmly commended by exhibitors and the public. The following is an outline of the changes:

All animals in the roadster class, two years old and over, must be shown in harness. The same rule applies to standard trotters.

Three additional prizes will be offered for mules.

The number of cattle exhibited by one breeder must not exceed 25 head in each class. Two prizes are offered for milch cows.

Merino sheep will be classed as French and Spanish, and four cash prizes offered for each.

In the goat department second prizes, half of first, are offered in each class.

A special premium is offered for carrier pigeons to take flight from the park. Several additional cash prizes are made in the mechanical departments.

The Third Department remains the same as last year. Several additional premiums were given for Berkshires.

For the best and largest display of grain in the sheaf, not less than 40 sheaves and 10 varieties of grain, sheaves to be not less than 10 inches in diameter—first premium, $40; second, $20; third, $10. It is not incumbent on exhibitor to raise this grain, but he will be required to name locality and grower of each variety.

The county exhibits will remain as they were last year.

Fruit and vegetables must be named by variety, and enter not later than Tuesday, the 13th of September. Exhibitors will be allowed to replenish with fresh fruit of the same variety up to Tuesday, September 19th.

Also, that as soon as the judges pass upon and award premiums, they shall attach ribbons. It was ordered to offer a grand medal, the cost to be $200, to the owners of the sire whose get shall make the best average performance in all colt stakes trotted at the fair this year; the title to the medal to be successfully defended for two succeeding years.

Upon motion of Director Green, it was resolved that the trotting races this season should be governed by the American rules, instead of those of the National Association, as heretofore.

The superintendents were named as follows: Park and stock grounds, Christopher Green; thoroughbred horses, Hancock and Singletery; horses of all work and draft horses, Finigan and Singletery; roadsters, Singletery and Green; standard trotters, Hancock and Chase; to segregate standard trotters, Green and Hancock; saddle horses, Finigan and Singletery; sweepstakes, Singletery, Shippee and Cox; cattle, Carr and Cox; sheep, Green and Hancock; Angora goats, swine and poultry, Hancock and Chase; pavilion, La Rue, except the art gallery, which will be under the superintendency of Norton Bush.

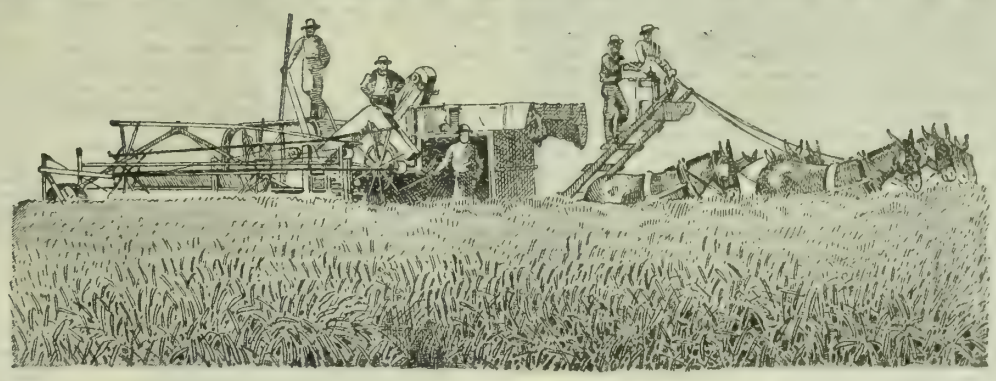
Snug Little Fortunes

May be had by all who are sufficiently intelligent and enterprising to embrace the opportunities which occasionally are offered them. Hallett & Co., Portland, Maine, have something new to offer in the line of work which you can do for them, and live at home, wherever you are located. Profits immense and every worker is sure of over $5 a day; several have made over $50 in a single day. All ages; both sexes. Capital not required; you are started free; all particulars free. You had better write to them at once.

Consumption Cured.

An old physician, retired from practice, having had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung Affections, also a positive and radical cure for Nervous Debility and all Nervous Complaints, after having tested its wonderful curative powers in thousands of cases, has felt it his duty to make it known to his suffering fellows. Actuated by this motive and a desire to relieve human suffering, I will send free of charge, to all who desire it, this recipe, in German, French, or English, with full directions for preparing and using. Sent by mail by addressing with samp, naming this paper, W. A. NOYES, 149 Powers' Block, Rochester, N. Y.

First-Class Mowing Machine for Sale.



A brand-new mower of well-known make can be obtained cheap for cash by addressing D. F., Box 2361, San Francisco, Cal.

THE IMPROVED LINK AND V-BELT COMBINED HARVESTER!

Manufactured by

The Stockton Wheel Co.,

STOCKTON, CAL.

For further information and Price Lists address STOCKTON WHEEL CO., STOCKTON, CAL., or the undersigned, importers of

Wagon & Carriage Materials and Hardware.

HOLT BROTHERS,
30 and 32 Main St.,
SAN FRANCISCO.

Our Improved Harvester will, without question or doubt, be the most popular machine in the grain field this year, as it certainly was last year, wherever used. Everybody who saw it working in the grain, running over rough ground, through hog wallows, over fields studded with trees, with as much ease and regularity as though the fields were smooth and level. Read the testimonials of several farmers who used our Harvester last year.

We have improved our machines over last year very materially, strengthening the weak points by putting in additional truss-iron braces, increasing or lowering speed when required, shortening the chain belts and substituting pivot and sliding boxes for the old fashion solid boxes, which will not give a particle as the frame warps or twists out of line. The greatest and most desirable change we make this year is discarding the sleeve on the main shaft, which caused us more trouble last year than anything else, by sticking to the shaft, making it grind the shaft and run hard. In a few weeks' time it wore away, leaving it rickety and causing the cylinder to run unsteady. This most desirable improvement makes it run one horse lighter at least.

Some of the agents of other manufacturers have sought to frighten farmers into buying their machines by telling them if they buy our Improved Harvester that they are liable to be prosecuted for infringement of patents. Now, these agents know, or if they don't know they ought to, that what they assert is false and malicious. Our Improvements are our own, and infringe upon nobody's patents. To allay all apprehension in the minds of intending purchasers, we say here that we will protect you against any and all losses on account of suits for infringements. The following are some of the advantages our Improved Harvester possesses over all others:

1. Our Improved Harvester runs FOUR horses lighter than any other machine made.
2. It is easily handled, and turns a square corner as readily as a mowing machine.
3. It is less liable to get out of order, and cheaper to keep in repair than any other machine.
4. It has no clumsy, expensive gearing to wear out or break.
5. It is run mostly by Link and V-Belts which, in case of breakage or accident, can be repaired in the field without loss of time.
6. Our Harvester makes no noise to frighten or irritate the horses, and makes less noise than ordinary headers.
7. Our Header is far the simplest and runs the lightest, and is the strongest and best. There are no Rickety Gears or Trembling Rods to break.
8. The Header may be raised and lowered instantly from any part of the Separator.
9. Our Harvester WEIGHS FIFTEEN HUNDRED POUNDS LESS than any other machine of the same capacity in the market.
10. It will cut, thrash, clean and sack more grain in a season, with less expense for labor and repairs than any other Harvester ever turned out.

Remember, all our Improved Harvesters are warranted to work well or no pay. Examine them before purchasing elsewhere. We shall sell our Harvesters upon their merits alone.

TESTIMONIALS:

GRAYSON, CAL., Feb. 21, 1887.

MESSRS. HOLT BROS.—Dear Sirs: As to your machine, we think it a good one. It saved the grain well. Had but little lost time; as to expense, $25 would cover the whole for the entire season. Number of acres cut, 1750. If we were going to buy another, we should certainly get one of yours. Respectfully, F. CARPENTER, R. BROWN.

OAKDALE, Feb. 21, 1887.

MESSRS. HOLT BROS.—Gents: I ran one of your Combined Harvesters last year. Cut 1930 acres of grain in 63 days. Did not lose over one day making repairs and replacing extras. Repairs cost about $10. I cut both light and heavy grain. It did good work, and the grain brought the highest market price, on account of its being better cleaned. I am perfectly satisfied with my purchase. I have worked with three other Combined Harvesters, and consider yours the best in the field for lightness of draft, durability and fine work.

Respectfully yours, D. W. CARMICHAEL.

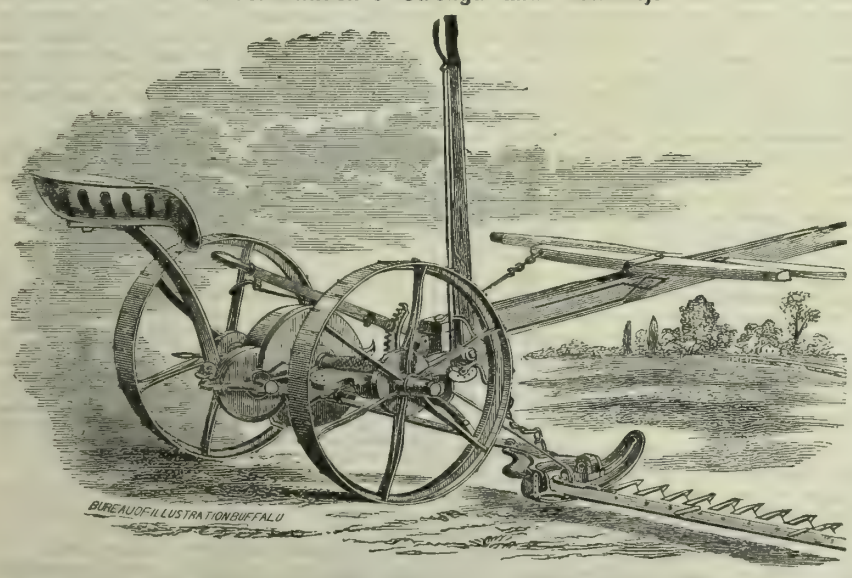
GRIDLEY STATION, Sept. 22, 1886.

MESSRS. HOLT BROS., San Francisco—Gentlemen: I have used one of Holt Brothers' Link Chain and V-Belt Combined Harvesters, and consider it (in my opinion) the best Harvester made. This season I harvested 800 acres; averaged 23 acres per day, with 12-foot cut. I consider the draft is four horses lighter than either the Houser or the Young Machine. does better in all kinds of grain than either of the above-named machines. I run the whole season without any breakage.

GEO. WICKMAN.

TURLOCK, Sept. 16, 1886.

MESSRS. HOLT BROS., San Francisco—Gentlemen: Your letter of the 8th inst. received and contents noted. In reply I will state that I think your machine is the best that is made. I cut 1350 acres of grain with it in 42 days. I did not have to repair the machine from the time I started till I quit running it. It runs lighter, and I think does the best work of any machine that I have seen. Very respectfully, ED. McCABE.



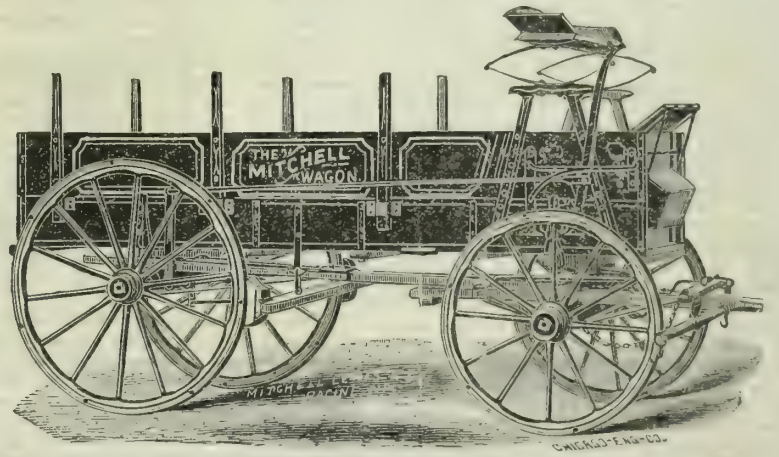
DIXON, Sept. 10, 1886.

MESSRS. HOLT BROS., San Francisco—Dear Sirs: Yours of Sept 8th at hand and contents noted. Will try to answer your questions as nearly correct as I can. Of course I have not seen all of the different Harvesters working, but from what I have seen and learned, will say that so far as my information and experience goes, your Link and V-Belt Harvester is, in all respects, the best in use. It did as good work, if not better work, than the Houser here. It pulls from two to four horses lighter than the Houser. My repairs were nothing; was not detained at all in my harvest on account of breakage. I cut 600 acres in 23 days, and moved four miles three different times. Yours truly, JOS. KLINE.

And Many Others.

THE EMPIRE SENIOR MOWER.

A Combination of Strength and Durability.



NO GRASS GROWS THAT IT WILL NOT CUT.

In any field, whether it be heavy matted clover, or the tangled and heavy grass of the roughest meadow lands, it will go through without choking down or causing the team to stop to clear the guards, or for any other purpose.

There is none more durable; none easier for team; none with a more perfect tilt; none with lighter draft; none will cut closer; none with better pitman connection; none more compact; none more perfect in every respect.

THE MITCHELL WAGON.

The Mitchell Wagon stands to-day at the head and front of all competitors, and is known far and wide as the strongest, most durable, best ironed, best finished and lightest running wagon made in the world. They are unequaled in quality and finish, and are "MONARCH" of the road wherever known and used; are fully warranted for one year—any breakage occasioned from defects in material or workmanship will be made good without cost to the purchaser, upon application to the undersigned, with satisfactory proof of such defects.

BUY THE MITCHELL WAGON AND HAVE NO OTHER.

THE IRRIGATOR.

Reclaiming Land in California.

The Engines and Pumping Machinery Employed.

Up to a recent date the reclamation of swamp lands in California has been more or less of a failure; most of the early efforts in this direction were undertaken with a very slight knowledge of what was required, and the machinery used was inadequate. In fact the appliances were crude and the systems not of a character to insure success. The greatest difficulty met with was one that was not sufficiently recognized at first, and that was the seepage of water that comes through the best levees that can be constructed with the material at hand in the locations where the levees have to be built.

As a consequence, at various times, when crops inside these levees promised large yields, they were entirely destroyed by seepage water caused by high water outside the levee during the spring freshets. There is little difficulty in making the levees high and strong enough to withstand any pressure which is likely to ensue from freshets. This being accomplished, the only thing remaining to perfect a reclamation scheme is to take care of what water may seep through the levee and the rain-water that falls within the reclaimed area in the winter season. At that time, of course, the evaporation is hardly noticeable, and this water must be taken care of by other means.

Before attempting to explain the methods which have been adopted to take care of the seepage-water in various districts, it might be well to enumerate a few of the advantages which reclaimed lands have over the irrigated lands of the State. 1st. The lands are superior in quality. 2d. The land will, in many cases, yield from two to three crops a year. 3d. It is in all cases, at present, arranged so that it can be irrigated if necessary, as the land lies below the surface of the outside water; therefore, by means of iron pipes with gates, it can be irrigated at will. On the other hand, when lifting the surplus water from the land, it can be kept at the most suitable distance from the surface of the land, thus insuring a full crop every year. As to the cost of reclaiming land, it of course depends on the conditions, of amount of area, length of levee, etc. The cost is from $20 to $50 per acre, according to size of district and character of levee.

The cost of this land before reclaiming, in most instances, is $4 per acre or thereabouts, and after being reclaimed, sells readily at from $100 to $1000 per acre. In instances where the land has been properly reclaimed and set out in orchards, prices as high as $1000 per acre have been offered.

The lands which have been reclaimed are mainly in Sacramento, San Joaquin and Colusa counties and near Stockton. It has been found from experience that it is not practicable to reclaim lands west of Collinsville, as is shown by the failure in reclaiming Sherman island, the failure being caused by the hardpan being so far from the surface that it was found to be utterly impossible to build a levee that would not sink. The condition of the islands further to the eastward, along the banks of the Sacramento and San Joaquin rivers, is different entirely from the Sherman, as we shall show further on in this article.

More recently, the conditions of the whole matter have been very much better understood, so that the difficulties which were met with in the earlier history of reclamation in this State have been obviated.

In 1881, the San Francisco Tool Company began to turn its attention to perfecting reclamation machinery and has since then paid special attention to the subject, and erected many successful plants. As a history of this company's work in this direction is, in a measure, a history of recent land reclamation in California, it will be well to follow it.

The first plant they erected (in 1881) was on Rough-and-Ready island, on the San Joaquin river. There they placed a 10-inch centrifugal pump. At the time this pump was put in there had been a break in the levee, and the island had been completely inundated. The island was pumped out at a cost of $1.50 per acre, and the whole finally reclaimed, making the land worth, after reclamation, from $150 to $400 per acre, while, without the pump, it could not have been successfully cultivated. It may be added here that this pumping was done with a 20-horse power thrashing engine, which, during the summer, was utilized for harvesting purposes. It was found by experience that it was too expensive to continue pumping with the thrashing engine, and eventually a 15-inch pump was put in, with suitable horizontal boiler and a single-acting engine of the San Francisco Tool Company. Some of this land has recently been sold for $400 per acre.

The Pearson Reclamation District, near Courtland, Sacramento county, is a notable instance of the value and success of the appliances adopted. In the first place, the Tool Company put in a 10 inch pump, which was afterward replaced by a 12-inch one. Then a 15-inch pump was added. In their contract with the San Francisco Savings Union, they guaranteed the 15-inch Gwynne pump, together with the 12-inch turbine, to raise at least 10,000 gallons of water with an indicated 40-horse power against a head of 10 feet. The results of accurate measurements, made by a thoroughly competent engineer, showed that with only 88 revolutions of the engine, or 264 revolutions of the 15-inch pump, and 234 revolutions of the 12-inch pump, they were able to raise 16,000 gallons per minute, with an indicated horse-power of about 50 against a head ranging from 9 to 14 feet. The average daily consumption of coal was 3750 pounds of South Prairie screenings for a run of 24 hours. After awhile the 12-inch pump was replaced by another 15-inch one, and there then was added a 30-inch siphon centrifugal pump. Then later on there was added to this another 30-inch pump, making two 30-inch pumps and two 15-inch pumps, having a capacity of 100,000 gallons per minute, which is equal to a stream 38 feet wide, 7 feet deep, and running 50 feet per minute.

This siphon centrifugal pump is now adopted in all large reclamation districts in Europe to the almost entire exclusion of other systems. Its main features are: The siphon action preventing the pump from at any time raising the water higher than the exact difference between the two water levels; the connecting of the runner of the pump in a direct manner to the main shaft of the engine on a level above any possible flood-water; the discharge pipe conducted over the levee down to a point below the lowest possible low-water mark of the outside stream. No foot or discharge valves of any kind are used, thus avoiding all friction inevitably caused by valves. The pump is charged by means of the vacuum created by the condenser. When the pump is stopped, a water-gate placed at the discharge of the pump, prevents the outside water from siphoning over the levee into the district; the pump in the meanwhile remains charged or primed. Large hand-plates in the side facilitate the examination and cleaning of the runner. The pump is connected directly to a compound condensing engine with variable expansion gear. The diameter of the high and low pressure cylinders, 14 inches and 26 inches respectively. The stroke is 18 inches; the number of revolutions is from 130 to 210 per minute, according to the hight the water is to be raised or the quantity desired to be discharged under any given circumstances—which can be increased from a minimum of say 10,000 gallons per minute to a maximum of 60,000 gallons per minute. The diameter of the discharge pipe was increased from 30 inches to 40 inches immediately after leaving the pump, and that of the suction pipes from 23 inches to 28 inches, insuring a minimum of friction (9⅛ feet per second, discharging 38,000 gallons per minute), which will greatly save in running expenses the slight excess of first cost incurred. The average of several tests, conducted personally by the agent of the Reclamation Company, showed its capacity to be 37,907 gallons per minute at a lift of 11 feet 7 inches, the engine indicating 156-horse power, with a consumption of 4.4 pounds average Sydney coal per actual horse-power of water raised per hour, the most satisfactory and economical showing so far made by any pumping plant.

This district was at first in the hands of Mr. Pearson, after whom it was named, but finally came into the hands of Mr. P. J. Van Loben Sels, at a time when it was really worth about $3 per acre, there being about 9000 acres in the tract, surrounded by a dike or levee 15½ miles long. The pumping appliances made by the Tool Company were erected under the supervision of Mr. P. J. Van Loben Sels, to whom the success of the Pearson reclamation district is largely due. He was very energetic and untiring in his efforts to carry out the plans, and was confident of ultimate success.

The whole island is now under cultivation, and the land is worth all the way from $100 to $150 per acre, and in some places more, where improvements have been made. This pumping machinery is only run during the winter months, and in ordinary years, the two 15-inch pumps will take care of this district, the large 30 inch pumps only being used as a precaution against rains and freshets. This is the largest reclamation plant in the United States.

"Andrus Island."

At Andrus island (Reclamation District No. 407) a ten-inch turbine was at first put in. When it was put in operation in May, 1884, there were from 800 to 1000 acres of tule land under water, varying in depth from a few inches to four feet. This water was all pumped out in two months, and in October a crop of buckwheat and beans was being harvested from land which was three feet under water in May. Since then they have made a change and replaced this pumping plant with two 16-inch submerged pumps and one compound condensing engine, with suitable condensing apparatus and boiler capacity to raise 33,000 gallons of water per minute. This has all been done under the supervision of J. C. Pierson, C. E. of Sacramento, and chief engineer of Reclamation District No. 407.

The fourth plant is on the land of Geo. F. Smith, at the edge of the river near Stockton. It is a submerged centrifugal pump, plain slide valve engine, with a suitable boiler, with a capacity of 11,000 gallons per minute. The plant is highly successful, and keeps the land free from water.

The fifth is on what is known as Dr. Toland's ranch, near Rio Vista, where a submerged pump with a 50-horse power, single-acting engine and boiler, was put in under the supervision of E. C. Dozier, the capacity of this plant being 15,000 gallons per minute.

The sixth is on Tyler island, near Walnut Grove, for John Miller. That is a submerged pump, a compound condensing engine with the necessary condensing apparatus, with a capacity of 36,000 gallons per minute.

Those desirous of resorting to the use of pumps for the reclamation of land are referred to the Pearson Reclamation District, Tyler island, and District 407, Andrus island, as being three of the best reclamation pumping plants ever erected so far in this country. Mr. J. C. Pierson, C. E., who has devoted most of his time for the last five years to the construction of levees, etc., was the engineer in charge of putting the pumping machinery on Andrus and Tyler islands.

It will be seen from what we have said that the engineering problems connected with the reclamation projects in California were by no means simple. The San Francisco Tool Company having had great experience in the construction of the drainage machinery, now know exactly what is required in special cases. Of course we have only mentioned a few of the plants constructed by this company. At the Pearson district and Tyler island, especial pains were taken to put up suitable buildings for pumping stations.

Floral Awards at Oakland.

Mr. Bentley, manager of the recent Fruit and Flower Fair at Oakland, has sent us the following correction:

OAKLAND, CAL., April 29, 1887.

EDITORS PRESS:—On page 389, issue of April 30th, you state that Miss Lizzie Jean Blair and O. Holen, a retired florist, competed for a $10 prize, offered by me for the largest floral piece, etc., and that the award was made to O. Holen. I desire to correct this statement.

It is true that $10 was offered for the largest and finest flower piece, containing not less than 20 varieties of flowers exhibited on a base not less than three feet high. The committee, composed of Mr. A. D. Thomson, Mr. W. W. Garthwaite, and Mr. C. E. Palmer, after due inquiry, found only one flower piece complying with all the conditions stipulated, which was that of P. J. Keller—and awarded him the prize.

Neither Mr. Holen nor Miss Blair was known to me as competitors for that or any other prize. Miss Blair made a very creditable exhibit, and her efforts to add to the interest of the Flower Fair were duly appreciated. As for O. Holen—I was led to suppose that the star spoken of was exhibited by Mr. R. Turnbull, florist, and did not know to the contrary until after the award had been made. Then, upon entering the hall, I found that some one had been there and removed the star. Upon inquiry learned that O. Holen had carried it off, being greatly displeased because the award was not made for the piece, which I then learned was made by him, out of Mr. Turnbull's flowers.

It is only fair that the truth be made known. For my part, under existing circumstances, I am not willing that any one should think that Holen received an award, nor that the committee erred in judgment. WM. R. BENTLEY, Manager.

TIMBER STEALERS DEFIANT.—In the far West the timber thieves don't like to have the little game they have been playing so long interfered with. Here is the way one firm advertises in a Colorado paper: "We are no rabbits. This is to certify that we are at the old stand, and no son of a gun of a special agent is going to swoop round our ranch. We buy Winchesters for cash and sell all kinds of lumber on time. Our mill is still running up in the La Sals, and our prices are neither higher nor lower than they were before William Andrew Jackson Sparks and his henchmen undertook to reform everything from hell to breakfast. Come and see us. Our pine is on the Mesa and our mill is on the make." It is barely possible that this bluff may land the "We" firm in the penitentiary, where they belong. The timber thieves have been having a high old time for many years and they hate to be interfered with. William Andrew Jackson Sparks takes a different view of public stealing.—*San Diegan.*

TAME ELK.—The Ogden *News* of April 11th says that the U. P. train the evening before brought in two elk—a bull and a cow—consigned to H. A. Clawson, of the Depot hotel. They were fine specimens of their kind and perfectly domesticated. Col. F. F. Obiston, of Idaho Springs, Col., presented them to his friend Clawson, with the understanding that he would take good care of and not dispose of them. They were forwarded to the Humboldt house to be kept there. The weight of the bull was 650 and of the cow 510 pounds. They will prove a great attraction to overland tourists who stop at Humboldt.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

BERKSHIRE SALE.—The last list of transfers of registered Berkshires (which we receive from the secretary, Phil. M. Springer, of Springfield, Ill.,) includes mention of the sale of Elmwood Duke XIX, 13,411, by Wm. Corbett, of San Mateo, to Senator Leland Stanford.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & CO.'s Patent Office Library, 252 Market St., S. F.

FOR WEEK ENDING APRIL 26, 1887.

361,810.—DOOR—M. P. Burk, Prescott, W. T.
361,692.—JOINTER FOR ARTIFICIAL STONE WORK—Geo. F. Gray, S. F.
361,763.—WHIP—L. F. Herrick, Oakland, Cal.
361,719.—WATER-WHEEL BUCKET—H. & W. J. Richards, Jr., Nevada City, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SULPHUR SPRINKLER.—John Fatjo, Santa Clara. No. 360,571. Dated April 5, 1887. This invention relates to a device for sprinkling sulphur upon vines, so as to protect them from the ravages of insects and parasites. It consists of a double conical vessel, the smaller portion of which is centrally located, one end being beveled and provided with a gauze or screen sprinkler, and the other end having a screw-cap through which the material may be introduced.

BEET-PULLER.—Robert R. Burrows, Potter Valley, Mendocino Co. No. 361,205. Dated April 12, 1887. This is a garden implement specially adapted for the pulling of those vegetables having roots or bulbs which grow in or partially in the ground, such as beets, turnips, carrots, etc. The invention consists in a handled blade adapted for gripping one side of the vegetable and a peculiarly curved fulcrum lever pivoted to the main handle or blade, and having a blade adapted for gripping and binding on the other side of the vegetable. The distinguishing feature of this implement lies in the employment of an ogee lever which enables its foot to act as a fulcrum, and concave blades adapted to enter the ground and grasp the root or vegetable.

GRAIN-DRIER.—Lewis Borland and T. J. Parsons, S. F. No. 361,126. Dated April 12, 1887. The grain is put in a garner or hopper, and thence passes down its throat, completely encircling the steam heater, so that in its passage it receives the necessary preliminary heat. The throat being perforated provides an escape for the heat so there will be no condensation and the grain will not be moist. The entire operation of the drier is automatic, there being no shoveling necessary. By the arrangement of hot air chambers the grain, as it passes the upper series, receives the heat directly on one side, and as it passes the lower series receives it directly on the other, so it never has to be turned.

Weak lungs, spitting of blood, consumption, and kindred affections, cured without physicians. Address for treatise, with two stamps, WORLD'S DISPENSARY MEDICAL ASSOCIATION, Buffalo, N. Y.

The "Favorite Prescription."

Dr. R. V. Pierce, of Buffalo, N. Y., whose name has become known over the world through his success as a physician, and especially through the reputation of his "Golden Medical Discovery," has done a good work in preparing an especial remedy for the many distressing troubles classed as "female weaknesses." It is known as the "Favorite Prescription." Under its administration all the pelvic organs are strengthened, and the woman becomes that embodiment of health and beauty which God intended her to be.

Greatest Discovery Since 1492.

For coughs, colds, sore throat, bronchitis, laryngitis, and consumption in its early stages, nothing equals Dr. Pierce's "Golden Medical Discovery." It is also a great blood-purifier and strength-restorer, or tonic, and for liver complaint and costive condition of the bowels it has no equal. Sold by druggists.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

THE GRAND SALE OF THE SEASON!

OF IMPORTED AND NATIVE-BRED

GALLOWAY CATTLE

ON JUNE 10th and 11th,

At GEO. L. GOULDING & CO.'S City Stock Yards, Denver, Colorado.

LEONARD BROS., of Mt. Leonard, Mo.,

—AND—

BUSH & MORSE, OF WINDSOR FARM, DENVER, COL.

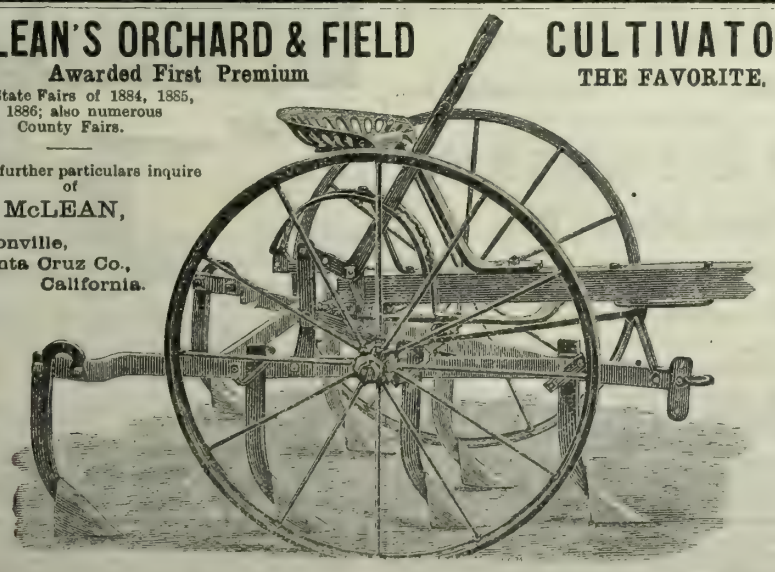
Will hold a joint public sale of **Imported and Native Bred Galloway Cattle.** The lot consists of 100 head of males and females of the choicest breeding and individuality, embracing selections from four different importations by the Leonards, who (it is a well-known fact) brought over only the best that money could buy and careful judgment select. Most of the cattle offered by Bush & Morse, of the Windsor Farm, are direct descendants of the stock imported by the Leonards, who, in breeding the same, combined some of the best strains of blood in their herd. It is once in a lifetime that such an opportunity is offered to the public of purchasing such a splendid lot of cattle, and the undersigned feel no hesitancy in endorsing what is claimed for them—"that they are the finest lot ever offered at public sale in the world." The fact that they were all imported or bred by the Leonards is sufficient guarantee that the stock is as represented—"the very best that can be found." Nearly all the young stock are by the famous sire, "British Nero," 1877, and the females are bred to that grand bull, "Borderer of Drumlanrig," 2628, whose cut appears above.

In the breeding are found such popular strains of blood as represented in the tribes of Drumlanrig Semiramis, Lady Satnley, Forest Queen, etc., embracing such famous sires as Black Prince of Drumlanrig Harden, Moss Trooper, Montague, Scottish Borderer, Pretender, Guardsman and others equally noted for their show yard careers and the grand quality of their get

All necessary assistance will be furnished to buyers from a distance in loading and shipping their stock. Terms of sale, cash, or four months approved paper bearing 8 per cent interest. Catalogues furnished on application.

GEO. L. GOULDING & CO.

COL. S. A. SAWYER, Auctioneer.



NOTE.—During the sale there will be on exhibition some steers and bulls bred from Thoroughbred Galloway Bulls out of Shorthorn Cows. Cattlemen will be able to judge for themselves as to the result of the cross.

McLEAN'S ORCHARD & FIELD CULTIVATOR.

SINGLE-ACTING ENGINE.

TESTIMONIAL.

OFFICE OF THE EUREKA ELECTRIC LIGHT CO., EUREKA, CAL., Feb. 15, 1887.

San Francisco Tool Co., San Francisco, Cal. GENTLEMEN: In answer to yours of Feb. 8, 1887, would say: The four engines purchased from your Company in January, 1886, have been running continuously ever since, from 12 to 16 hours each day, not excepting Sundays, and have never given any trouble; and, furthermore, they have never cost us anything for repairs. I consider them fully as economical as our slide-valve engines, which we are using. One of them is a balanced valve, Haskins' make, and the other is the New York Safety Power Company's make. The relation to the cost of keeping your Single-Acting Engine in repair to the cost of keeping the Slide-Valve Engines which were purchased the same month we purchased your engines, and working under the same conditions, is, that while there has been no expense in either material or labor on the engines furnished by your Company, the expense of keeping the Slide Valve Engines in good running order has cost, on an average, $8 to $12 per month for each engine.

A portion of the time the Single-Acting Engines have been run by the fireman, and I can recommend your engines to parties that are not close to a machine shop, and do not want to keep an engineer and fireman, as with your engine all the attention they require is to fill the oil cups once every 16 hours, and turn the steam on and shut it off. The balance of the time the engine takes care of itself. Yours truly,

A. A. OSBORN, Superintendent.

DEWEY & CO.'S

Scientific Press Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

THE STANDARD MOWERS.

The Only Successful and Practical
WIDE-CUT MOWERS.

The entire weight of the Cutter Bar being suspended on the Spring prevents the Bar from dragging on the ground, thus doing away with all side-draft and enabling us to use a 7-foot bar, thereby accomplishing a feat which cannot be done by other machines.

It has more cutting power, because nearly the whole weight of the cutter-bar and the inside and outside shoes is carried on the drive-wheels, thereby increasing the "*Traction*" more than enough to make up for the additional length of the knife.

The 7-foot Mower is as Light Draft and as easy to handle as any 4-foot Cut Mower made.

Remember with two horses and one man the 7-foot Mower will cut 20 acres of grass per day.

SIZE OF MACHINES:

4 Feet 3 Inches, 6 Feet, 7 Feet.

HORICULTURE.

The Festival of Flowers.

"To me the meanest flower that blows can give
Thoughts that do often lie too deep for tears."
So Wordsworth, Nature's lover, sung, and oft
Our hearts unconsciously have said "e'en so."
For flowers, like music, have a soul, a voice
To stir our better natures and awake
Our finer instincts to a quicker life.
Music, and love, and flowers, these three things
Hath Eden left us, and as there is not,
However low, a race in whom exists
No love of melody, no love of love,
So never yet, where blossoms bloom was found,
Be't black or yellow, brown or white or red,
A race all strangers to the love of flowers.
Arrayed in flowers, fair love is doubly fair,
Nor death, when flowers are near, seems wholly death;
The laughing infant with its sprig of bloom,
The maiden with the May-wreath on her brow,
The blushing bride with orange blossoms crowned,
The laureled victor and triumphal arch,
The sick-room fragrant with the violet's breath,
The hallowed altar and the unlovely tomb,
O'er all, in all, the sympathy of flowers.

The land of gold, and fruit, and flowers, and wine!
A festal week amid its orange groves!
The Angel City's Festival of Flowers!
Behold the temple reared to Flora filled
With floral offerings from every home!
Heaps, garlands, wreaths, bouquets and long festoons,
Flowers overhead, flowers trampled underfoot,
Yet breathing still sweet fragrance as they die!
Here, from a bank of roses, leaps to light
A tinkling fountain, filling with its spray
Of flashing gems the alabaster cups
Of stately lilies, that o'erflow their wealth
Upon the modest violets below.
There, formed of roses, hangs a floral harp,
Such as, when hung where wanton breezes blow,
Makes perfumed music, and again a sward
Of daisies, pansies fit for Cupid's bed.
Here orange blossoms mix their honeyed breath
With oleander, fuchsia, heliotrope,
Verbena, honeysuckle, mignonette,
While, intermingled like a florist's dream,
Palm, pepper trees and feathery pampas plumes,
The rubber tree, with glossy, shield-like leaves,
Pinks, peonies, carnations, prickly pears,
Sea-mosses, ferns and rare Pacific shells,
And there a floral rainbow spans the scene!
And ever and anon the swell and throb
Of music trembles on the fragrant air,
And bright-eyed beauty, lovelier than the buds
Upon its bosom, mingles in the scene,
Till one is dazed by all the shifting sounds
And scents and scenes of music, flowers and love,
Like some one lost in a midsummer's dream.

All hail! thou floral goddess; here abide
Amid our fountains and our orange-groves.
Dwell thou with us in this, the Western Greece,
In this, the glad age of our golden land.

—*Frank Borton, in Los Angeles Times.*

A Rose Fair in San Francisco.

A floral exhibition in aid of the Women's Exchange was given in this city by benevolent ladies, April 28th to 30th, in the new Union Club building, and proved so attractive and successful that it was prolonged through Sunday and up to Tuesday evening of the present week.

The object of the Women's Exchange is to enable women, who are striving to support themselves, to dispose of their handiwork in a quiet way, at fair prices. When it was first established, some two years ago, plain and fancy needlework, knit goods and the like were placed on sale; but of late the business has run more to nicely prepared edibles, and the need of larger accommodations has become pressing. To raise funds whereby the institution may be moved into ample and commodious quarters was the good purpose of the late display; and the proprietors of the new club-house gave it a noble christening when they loaned the store on the ground floor at Post and Stockton streets to so kindly an undertaking.

Florists, nurserymen and owners of private conservatories and flower-gardens, both in S. F. and adjacent counties, were generous in assistance, and the devoted labors of Mrs. John F. Swift, Mrs. Dr. Keeney, Dr. C. B. Brigham and their many helpers brought to pass a most delightful triumph.

The white pillars and balcony railings which run entirely around the apartment were twined and festooned with evergreens—over 1000 yards—which had just been used in decorating the church for Miss Crocker's wedding.

The floor was filled with densely packed but orderly exhibits, and all around on sloping flights of shelves were flowers, arranged in glass jars to the number of 3000 or 4000, especially roses, roses, roses, and the wealth of greenery and bloom that met the entering eye was confusing in its lavishness.

Directly opposite the door as one came in stood the exhibit from Golden Gate Park. The deep purple-pink blooms of Cattleya Skinnerii foremost; above them, sago palms and ferns; and around, foliage plants, orchids, calceolaria and various exotics.

Then came John H. Sievers' great palm-shaded output of potted plants. His handsome glass case of orchids, white, pink and purple, was very noticeable. He also had remarkably fine cut flowers in variety.

John Pouyal, florist and exotic nurseryman of S. F., occupied the entire end of the room on the Post-street side, with his display of potted plants, magnolia trees, etc. Here could be seen the Egyptian papyrus. He also had a choice exhibit of cut roses in jars.

On the right were Mrs. Brendemuhl's roses from Fruit Vale; big jars of yellow pond-lilies, sent by Mrs. J. H. Gardiner, of Rio Vista, and Wm. Meyer's bougainvillea. The little table of rhododendrons shown by Mrs. A. K. P. Harmon, of Oakland, was more than pretty. Mrs. A. W. Foster, of San Rafael, made a handsome display of roses—all grown in the open air—together with lemons and lemon blooms. Adolph Sutro contributed choice pots of plants. From E. Gill's nursery in Oakland, came elegant roses, carnation-pinks and camellias.

A widespread and fascinating exhibit was made by the ladies of the Martinez Free Library. Besides a fine display of labeled roses (among them a green rose, not very pretty but very curious), stretched out on fern-crowned stairs, their stand of wild flowers showed 38 varieties. There was also a diversity of cultivated flowers—stocks, abutilon, fox-gloves, pansies, cactus, weigelia, pomegranates, narcissus, fleur de lis, geraniums, etc.

Among the labeled roses, sweet peas and fragrant carnations shown by Mrs. W. M. Boyd, of Oakland, a great lavender clematis was conspicuous.

The stands for the sale of bouquets and of flowers, attended by charming "salesladies" and lassies, were too tantalizing to poor journalists, who would fain be generous, both for the sake of the cause and for the captivating flowers themselves. There was also a big bowl whence lemonade was dispensed, and one of the prominent features was the bonbon department, presided over by Mrs. S. D. Mayer.

When an observer whose time was limited had passed down the right-hand side with too hasty glances at the bewildering floral beauty, but little more time was left him than sufficed to note the names above the more prominent exhibits—those of Mrs. Tillinghast, of Saucelito; Mrs. E. T. Crane, of San Lorenzo; G. Hast and F. Blum, of East Oakland; three floral tables filled with mingled blooms of many species, no names visible; Miss Julia Tompkins, Mr. Sloss and Mr. Gerstle, and Mrs. Jno. Kittle, all of San Rafael; Mrs. Jas. Palache, of Berkeley—such enchanting roses; Geo. B. Jones, of the Saucelito rose nursery, who cut his graceful, long-stemmed treasures without reserve.

The exhibit from the Hotel del Monte (P. Ulrich, gardener) was singularly pleasing. Mrs. Jerome Deasy & Co., of S. F., and the California Rose Co., did themselves great credit. Miss Pratt, of Fruitvale, varied her display with locust blooms, and Dr. Charles Brigham's double deckload of roses was set forth in beauty and bounty unspeakable.

Let this bare sketch be filled and heaped with geraniums, pinks, heliotropes, marguerites, pansies, locusts and countless other blossoms; with roses white, roses cream, roses yellow, roses pink, roses crimson, and then, after all, "it must be seen to be appreciated."

Against several of the pillars hung large placards announcing "A Special Prize for the Prettiest Plant, raised by a child under 15 years, for next year's Floral Exhibition."

Prizes of $25, $15 and $10 were offered for displays of pot plants, and of the same amounts for cut flowers. Awards were as follows: Best exhibition of potted plants, 1st, John H. Sievers; 2d, John Pouyal. Cut flowers, 1st, George B. Jones; 2d, California Rose Company; 3d, Martinez Free Library.

To parties not competing for prizes the following gratuities were awarded: E. Gill, of Oakland, choice collection of roses—200 varieties—$10. John H. Sievers, choice collection of cut flowers, $10. Martinez Free Library, collection of wild flowers, $5.

The cut flowers were renewed and rearranged, and their loveliness kept fresh from day to day. The evenings brought music and crowds of promenaders and purchasers, and the results of all these pleasing and humane endeavors have been very satisfactory to the lady managers. The attendance and receipts have come well up to their expectations, and Mrs. Swift and her associates purpose doing the like, only better and better, from year to year, with the kindly backing of the many friends of their enterprise in town and country.

CAPT. EADS AND THE PANAMA CANAL.—Whatever may be the effect of the death of the dauntless inventor, Captain Eads, on the future of the proposed interoceanic ship canal, that great competing enterprise, the Panama canal, now gives promise of successful completion. The indomitable de Lesseps declares that his mind is perfectly at ease in regard to the progress of the work, and that in three years the Panama canal will be opened for navigation, without a lock to intercept the free passage of vessels from one ocean to the other. The work of cutting through the rocks is being pushed with great vigor by the contractors, and the use of electric lights will soon enable them to turn night into day and work a double force, making it possible to do six years' work in three. Although the cost of this enterprise will be prodigious, greatly exceeding early estimates, and although obstacles in the form of disease among workmen and discontent among stockholders have tended to discourage the enterprise, the venerable de Lesseps does not seem to have lost heart for a moment, and it now looks as if the old man might live to see the completion of this, one of the greatest engineering achievements of the age.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours.

Electric Motors in San Francisco.

The use of electricity for power is gradually coming into favor. For certain purposes it is much better than steam, since the motors themselves occupy little room and are clean and noiseless. There is much to be done with electricity for railroad use before it is as perfect as is desired; but for small motors in cities, there are many things to commend it. The Electric Power and Light Company, of this city, is now engaged in perfecting arrangements for power circuits, by which motors will be furnished for running presses, sewing machines, elevators, etc. Some of this work is already being done, but the system is to be widely extended and perfected.

The San Francisco Tool Company, on Stevenson street, has put up one of Prof. N. S. Keith's dynamos in its establishment, and run it by a small independent single-acting engine. From this dynamo wires can be run to electric motors in the vicinity, and power thus furnished. One of the Keith electric motors, connected with this dynamo, has been put in at the Leak Glove Manufactory on Market street. It is a six-horse power motor and is intended to run 75 sewing machines, in use in the factory. The motor is set at one side of the room and takes up no more space than a couple of joints of stovepipe laid side by side. The motor is noiseless and there is no smoke, smell, steam, grease, dust, or any other annoyance. The company is very much pleased with the new source of power and is willing to show the little machine to any one interested. More of these motors will doubtless be placed in other factories in the neighborhood. It is very simple to put them in, and all that is needed is a wire to the main dynamo.

RAPID WORK.—Some idea of the extent to which mechanical ingenuity and efficiency have advanced may be had from the following statement: "It is now possible to construct a complete sewing machine in a minute, or 60 in one hour; a reaper every 15 minutes, or less; 300 watches in a day, complete in all their appointments. More important than this, even, is the fact that it is possible to construct a locomotive in a day. From the plans of the draughtsman to the execution of them by the workmen, every wheel, lever, valve and rod may be constructed from the metals to the engine intact. Every rivet may be driven in the boiler, every tube in the tube sheets, and from the smoke-stack to the ash-pan, a locomotive may be turned out in a working day, completely equipped, ready to do the work of 100 horses." Without such machinery and the skilled labor to operate them, the civilized world of to-day would be an impossibility.—*Ex.*

To Those Visiting San Francisco.

The many readers of this paper who may contemplate a visit to the city would do well to stop at the American Exchange Hotel, it being so centrally located for merchants, farmers, miners, and mine-owners with their families, that we can safely recommend it to those who may be looking for a quiet, respectable and well-kept hotel. The proprietors, Chas. and Wm. Montgomery, have been long and favorably known as hotel-men, and the amount of business done is the best guarantee of the merits of the hotel.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

COTTON-SEED AND CACTUS FOR BEEF.—It is said that a trainload of 330 cattle, from Cotulla, Texas, which had been fattened on prickly pear and cottonseed meal, was lately marketed in Chicago. They attracted considerable attention, being the first large lot of cattle ever fed that way for market, and were sold at $4.25 per cwt.

THE output of the locomotive works of this country at present is estimated to number nearly 40 engines per week.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, *to those who pay fully one year in advance of date*, IF REQUESTED the following articles (while this notice continues), at the very greatly reduced figures named at the right:

1.—The Agricultural Features of California, by Prof. Hilgard, 138 large pages, illustrated, cloth, with colored maps (full price $1).....$0.25
2.—World's Cyclopedia, 794 pages, 1250 illustrations; (exceedingly valuable)..... .50
3.—Dewey's Patent Elastic Binder (cloth cover), name of this paper stamped in gilt..... .50
4.—Niles' Stock and Poultry Book for Pacific Coast, pamphlet, 120 pages, illustrated..... .25
5.—Kendall's Treatise on the Horse and Diseases, 89 pages, instructive illustrations.....05
6.—To NEW Subscribers, 12 select back Nos. of the RURAL PRESS, "good as new".....Free
7.—Any of Harper's, Frank Leslie's and most other first-class U. S. periodicals, 15 per ct. off regular rates.
9.—Pacific Coast and Eastern Dailies, Books and Periodicals, *except special publications*, we can usually give 10 to 15 per cent off advertised retail rates.
10.—March of Empire, by Mallie Stafford..... .25
11.—Life Among the Apaches, 322 pages, stiff cloth .25
12.—$1 worth of choice seeds, to be selected from a list of 107 flower and 82 garden seeds, as previously published, or which list we will send on application .25
14.—Dewey's Pat. Newspaper Fileholder (18 to 36 in.) .25
15.—European Vines Described, 63 pages..... .05
19.—Webster's Dictionary, 634 pages, with 1500 illustrations; very handy and reliable..... .50

CROPS

IN THE FIREMAN'S FUND OF CALIFORNIA.

Ditson & Co's Sunday School Music

Ranks with the very best, and no Sunday School management should adopt a new Singing Book without carefully examining one of their "tried and true" Sunday School Song Books.

Voices of Praise (40 cts, $4.20 per doz.) Rev. C. L. Hutchins. Music and poetry dignified and classical, but not dull; in fact, bright and enthusiastic. Very large collection for the money.

Singing on the Way (35 cts, $3.60 per doz.) by Mrs. Jewett, ably assisted by Dr. Holbrook, whose noble compositions are known and loved in all the churches. This, like the book above mentioned, does excellently well for a Vestry Singing Book for prayer and praise meetings.

Songs of Promise (35 cts., $3.60 per doz.) J. H. Tenney and Rev. E. A. Hoffman—the first highly gifted, musically, and the second the author of many hymns of refined and beautiful quality. One of the newest books.

Song Worship (35 cts., $3.60 per doz) L. O. Emerson and W. F. Sherwin, both celebrated compilers, composers and leaders, and the latter well known as having had charge of the music at many Chautauqua meetings.

For other good books, please send for lists and catalogues.

For a lovely little book for the young children of a Sunday School, look no further than FRESH FLOWERS (25 cents, $2.40 per doz.), Emma Pitt. Sweet Hymns, Sweet Music, Pretty Pictures.

Mailed for Retail Price.

S. F. Market Report

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, May 4, 1887.

Continued warm weather is beneficial to the fruit crop, but for cereals rains are sadly wanted. Receipts of all kinds of seasonable vegetables and fruits are increasing. The dry weather causes a strong wheat market here, which is also reflected in an advance in the European markets. To-day's cables are as follows:

LONDON, May 4, 1887.—Cargoes off coast, nothing offering; cargoes on passage and for shipment, firm; Cal. wheat, just shipped, 39s; Cal. wheat, nearly due, 38s 3d; French country market, firm; Liverpool wheat, spot, strong; Liverpool wheat, Cal., 7s 8d@7s 11d; weather in England, warmer.

Foreign Review.

LONDON, May 2.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: There has been a decrease in deliveries. The native wheat markets are scantily supplied and this fact has caused advances of from 6d to 1s. The sales of English wheat during the week were 53,453 quarters at 32s 8d, against 51,955 quarters at 31s during the corresponding period last year. Foreign wheat is stagnant and values are tending downward. Corn is steady. Linseed has declined. Eight cargoes of wheat arrived; two cargoes were sold, five were withdrawn and one remained. At to-day's market wheat was firmer. The values of both English and foreign were 6d higher. Flour was firm. Oats were in demand at 3d to 6d higher. Beans and peas were 6d lower.

Eastern Wheat Markets.

NEW YORK, May 1.—Spot has had a free sale during the week, mostly for shipment. Options were quite active, but with the West markets fluctuated frequently and widely. Cable advices were stiffer and brisker at the outset, with renewed dullness and depression toward the close. Important quantities of wheat are going forward via New Orleans to the United Kingdom and the Continent. The market closed heavy, with slight gains for the week; May, 93¼c; June, 93⅜c; July, 93⅜c; August, 91¾@91¼c; and December, 95⅜c.

CHICAGO, May 4—12 M.—82½c for cash, 82½c for May, 84½c for June, 84⅛@84¼c for July, 83⅜c for August, and 83¼c for September.

NEW YORK, May 4—12 M.—67½c for cash 95⅜c for May, 94⅝@94¾c for June, 94⅛@94⅜c for July and 92¾@93c for August.

New York Hop Market.

NEW YORK, May 1.—Business dull, brewers continuing to buy in a hand-to-mouth way and dealers manifesting no speculative tendencies. Pacific Coast crop of 1886, best, 20 to 21c; common to good, 14@17c; 1885, good to prime, 7@9c.

Eastern Wool Markets.

NEW YORK, May 1.—Prices remain unchanged. Low and medium stock is light, but fine clothing wools are in fair supply. Manufacturers are buying in small invoices, and holders do not push their goods. It is thought, however, that considerable territorial stock has changed hands without being reported. Among the sales were 31 bales of scoured California at 45c; 50,000 lbs Eastern Oregon at 21c; 25,000 lbs fine Montana at 22c.

The Philadelphia market is more active. Blood wools, which are very scarce, have ruled firmer, and in some instances have brought higher prices. Among sales were 1000 lbs Montana fine medium at 22c; 12,000 lbs Montana fine medium at 24c; 1000 lbs Montana fine medium at 26c; 3000 lbs Arizona at 20½c.

In Boston the demand has been light, and sales confined mostly to small lots. Among sales were 224,000 lbs Territory at 15@23c; 45 000 lbs Oregon at 16@19½c; 51,000 lbs fall California on private terms.

California Products at New York.

NEW YORK, May 1.—Fresh Fruits—California tangarines are a new delicacy at 60c a doz. Good oranges are scarce. California Navels, $1.50 ₩ doz.

Honey—The stock of California honey has been concentrated in a few hands and its price advanced to 5½c as inside for either white or amber.

Seeds—Mustard, strong, with a fair jobbing trade. California yellow, 4¼@5c.

Dried Fruit and Canned Goods East.

NEW YORK, May 1.—Canned Goods—The consuming trade makes progress, but in round lots among dealers little is doing. Tomatoes are firmer, with $1.05 as the general asking price. California canned peaches and pears, $2.50@2.95; plums and grapes, $1.75@2; apricots, $2.10@2 50; Columbia river salmon are quoted at $1.60; outside rivers, $1.40.

Dried Fruit—Raisins, dull and unchanged. Prunes—Turkish, quiet and weaker, quoted at 4c; Bohemian selling fairly at 3@3¼c; French are in moderate jobbing request at 6½c to 7½c. Currants—The demand is fair at 5½c. Citron—Leghorn, firm at 16¾@17c.

California Fruit in Chicago.

CHICAGO, April 30.—Dried Fruit—A slightly increased demand for sun-dried quartered apples is apparent. Choice sliced and good evaporated continue in fair request. Canned goods are getting scarce. Cranberries are about out of market and green apples are very high, so what is more natural than increased consumption of dried fruit from this on? Peaches old and dull. The supply of California dried fruit is rather light; prices rule steady; prunes, French ₩ lb, 8@9¼c; plums, pitted, 10@11c; peaches, halves, 11@12½c; do halves, pared, 20@21c; figs, 6@8c; nectarines, 9c; pears, 8@12c; raisins, London layers, 20-lb boxes, $1.40@1.50; loose Muscatel, ₩ box, $1.20@1.30; California layers, ₩ box, $1.25@1.35.

CHICAGO, May 2.—Citrus Fruit—Lemons are about steady, with a moderate trade at former prices. Californias are slow, being smutty or dirty, at $2 to $3 ₩ box. Oranges are in fair supply; arrivals are not large. There is a moderate demand and trade is slow; prices without material change. Quoted by the *Daily Trade Journal:* Bright Riversides, good to fancy, $3.50@4.50; San Bernardino, $3.50@4.25; Santa Ana, $3@3.25; St. Michaels, paper rind, $3.75@4; Orange, $2.50@3; Los Angeles, $2.75@3.25; Navel, according to quality, $5@6; Duarte, $3@3.50; San Gabriel, $2.75@3; blood oranges, fancy, $5@7; culls, $2.

Local Markets.

BAGS—The market is very dull and inactive, with continued shading reported. To-day's quotation for standard size Calcuttas is 5⅛@5¼c for July-August delivery.

BARLEY—The past week has witnessed a strong market, with few fluctuations in prices. The stock reported in this is held against Call Board sales. To-day's sales on Call were as follows:

Morning session: Buyer season—600 tons, $1.17½. Buyer 1887—900 tons, $1.29¼; 100, $1.29⅛; 400, $1.29; 100, $1.28½. Seller 1887—100 tons, $1.11⅝; 400, $1.11¼ ₩ ctl. Afternoon session: Buyer season—300 tons, $1.16¼; 100, $1.16¼; 100, $1.16; 200, $1.15⅞; September—100 tons, $1.13. Buyer 1887—500 tons, $1.27¾; 100, $1.27⅝. Seller 1887—100 tons, $1.10½.

BUTTER—The demand is reported to be fair, and as the receipts are only moderate, prices are steady. It is now very generally conceded that there will be less manufactured this year than there was in 1886.

CHEESE—The market is easier under freer receipts and buyers confining their wants to actual requirements.

EGGS—The market is weak for fair to good, but strictly choice hold up well. The market is unfavorably affected by the receipt of five carloads from the East. These shipments will probably cease, as it costs 18 cts ₩ doz. to lay them down, and then comes draying, commission, etc.

FLOUR—The market is very strong, with some mills asking another advance.

WHEAT—Transactions on Call have been freer at fairly steady prices. It looks as if the syndicate is buying all the wheat they can get at current quotations. To-day $1.87½ was bid on Call for spot No. 1 shipping without finding a selling. Sales on Call to-day were as follows:

Morning session: Spot, season's storage paid—100 tons, $1.86; 100, $1.86⅛. July—500 tons, $1.82½; 300, $1.82; 100, $1.82½. September—1000 tons, $1.76. Buyer season—100 tons, $1.92½; 700, $1.93; 100, $1.93⅛. Buyer 1887—100 tons, $2.05¼; 500, $2.05½; 500, $2.06; 100, $2.06¼. Seller 1887—500 tons, $1.75¼; 400, $1.75⅜; 100, $1.75½; 300, $1.75⅝ ₩ ctl. Afternoon session: Buyer season—100 tons, $1.92½. Buyer 1887—600 tons, $2.06¼; 200, $2.06⅜. July—500, $1.85. Seller 1887—600 tons, $1.75½; 400, $1.75¼; 300, $1.75⅝.

[COMMUNICATED.]

Market Information.

Cereals.

The wheat syndicate, taking all the cash wheat offered them at Chicago on Monday last, has created a different opinion regarding the present move. Many are now inclined to the belief that the present speculative move is founded on something more substantial than a corner. In this the better informed think they are correct, and that time will demonstrate it. It is claimed that the present statistical position of wheat in the supply and demand markets of the world justify a higher range of values than now obtains.

The stock of wheat in this city and at Port Costa on May 1st is given at over 157,000 short tons, an increase of 44,000 tons over the stock on April 1st. The increase is due to heavy deliveries from interior warehouses so as to meet Call board sales. The stock now on hand is either owned by the syndicate or will be when short sellers make deliveries. The sales of seller '87 wheat on Call are all taken by the same parties.

Eastern crop advices, taken as a whole, do not warrant estimating the outturn next harvest at more than 90 per cent of last year's crop, and even this percentage will depend much on favorable weather for the next 60 days. In this State, crop advices are rather conflicting, but stripped of the biased opinions of operators, it is safe to say that the outlook is far from encouraging, and except in a few favored counties the outturn will not be more than one-half of a crop. The estimate heretofore made of 900,000 tons is hardly safe, and can be reduced to 850,000, which will give us an exportable surplus of 500,000 tons. Even to obtain this quantity rains are required. From Oregon our advices report a prospective outturn of about 45 per cent more in that State and Washington Territory than last year. The increase will come from east of the Cascade mountains, where exceptional good crop weather has obtained throughout the winter.

Corn has shown more strength the past week, with holders not disposed to make concessions. Their firmness is due to the large consumption and light available supplies here. The stock on hand is 1804 tons, being 1064 tons less than reported on April 1st last.

The barley market has ruled very strong, with a steadily decreasing stock reported. On January 1, the stock in this city was 21,275 tons, and notwithstanding very heavy receipts, the stock on May 1 was 15,100 tons. The exports, both overland and by sea, aggregate so far this season 48 910 tons, against about 12,500 tons last season. The consumption in this State is very large and constantly increasing. Private circulars and reports issued by interested firms are bearing the market against farmers.

Private circulars or reports are untrustworthy and are always according to how the firm issuing them wants the market to go so as to make money for themselves. They wrote against wheat when it was down, and also against barley, but prices went up.

Oats are easier under freer supplies. The high prices asked restrict consumption and therefore the market drags. Consumers use more largely of ground feed, and also of barley.

Rye and buckwheat are slow.

The United Kingdom, provided consumption be normal, will require to purchase in and ship from all foreign countries from April 16, 1887, in time to arrive by August 31, 1887, upward of 50,000,000 bushels of flour and wheat. The average stocks of wheat and flour in the United Kingdom, taken June 30 and December 31, for six years, have been slightly less than 16,000,000 bushels. The stock of flour April 1, 1887, does not seem to be excessive for 37,000,000 population, being only about 1.37 of a barrel per capita. Late Paris advices place the requirements of France for the remaining portion of the cereal year for foreign wheat and flour at 22,000,000 to 34,000,000 bushels. The French wheat harvest promises to be a late one. French stocks of wheat and flour together, in the ports, in and out of bond, and in Paris, are only about equal to 5,000,000 bushels of wheat. M. Narcisse Meyer, Paris, estimates that France required to import about 60,000 000 bushels of wheat between February 1 last and September 10 next.

Hog Statistics.

The Cincinnati *Price Current* has issued its annual report of the pork packing of the West, from which we copy the following relating to the Pacific Coast: At San Francisco there are several pork-packing establishments, and hogs are slaughtered throughout the year. The leading house there estimates 185,000 hogs as the total number packed during the year 1886 at San Francisco, and 160,000 at other places in the State, making a total of 345,000 for California, compared with 260,000 estimated for 1885 and 225,000 for 1884. Average weight at San Francisco, 180 lbs gross in 1886. Information from Portland, Oregon, indicates that the packing in that city and elsewhere in the State, and in Washington Territory, was approximately 50,000 hogs during the year 1886. The number of hogs credited to California and Oregon in recent years by the Department of Agriculture is shown in the following:

	California.	Oregon.	Total.
1887	1,017,322	229,920	1,247,242
1886	1,027.598	191,600	1,219,198
1885	978,665	187,854	1,166,508
1884	950,160	184,160	1,134,220
1883	856.060	168,954	1,024.954
1882	585.443	160,909	746,352

Live-Stock.

Owing to fears of poor pasture, there is a strong selling pressure for bullocks, and as the consumption is light, prices are lower. In mutton sheep the market is barely steady at quotations. Calves are steadier. Milch cows and horses are reported to be about the same as given in last week's issue.

The following are the wholesale rates of slaughterers to butchers:

BEEF — Extra, 8c; first grade, grass fed, 7½c per lb.; second grade, 7@—c; third grade, 6c.

MUTTON—Ewes, 6½; wethers, 7c.

LAMB—Spring, 9@10c.

VEAL—Large, 6@8¼c; small, 6@8c.

PORK—Live hogs, 4¾@5¼c for heavy and medium; hard dressed, 7½@8¾c per lb; light, 4½@5¾c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Feedstuff.

Bran, middlings and ground barley are strong under a good consumption. The first two are in light supply.

Hay continues to rule strong under moderate receipts, a firm holding and light supplies to draw from. This year's crop promises to be considerably short of last year's, while the consumption is larger.

Vegetables.

Peas continue largely in excess of the demand. The Columbia Canning Company took quite freely for several days, but drew out when the Overland Canning Company entered the market. It is claimed that the first-named cannery does not want to pay over 25 to 50 cts per sack for sweet peas. The crop is said to be very heavy.

Rhubarb holds firm, owing to moderate receipts.

Asparagus fluctuates from day to day, prices being controlled by the receipts.

In other garden truck there is nothing particular to note.

Fruits.

Receipts of strawberries continue free, but the demand being brisk, prices are well maintained. Canners claim that owing to the heavy crop they will be able to put up more than they did last year.

Raspberries are slow in coming in, causing high prices to rule.

Some few barely ripe currants are being received. They sell slow.

Gooseberries are in better supply, with only a moderate demand at quotations, as dealers believe that a lower range must rule soon.

Oranges continue to come in freely, and meet with a ready market. The demand is chiefly on orders from up North, although the local and near-by trade take freely.

The reduction in overland freights for shipments of carload lots of fruits to Chicago and points on the Missouri river, it is claimed, will cause heavier shipments of all kinds of green fruits.

A large consignment of Mexican limes came, and owing to their superior quality and the bare market, sold well.

Lemons are steady, with a good consumption reported, owing to the higher cost of limes.

Dried fruits are in light supply, with choice hard to get even by paying a slight advance.

Canned fruits are in light stock, as canners have been forcing the market so as to close out their holdings. The bulk of goods sold went East.

Miscellaneous.

The lower overland freights have stimulated the demand for wools, but buyers are not taking as freely as they would if the rates were settled. The meeting at Chicago of railroad freight managers will settle the tariff. Shipments to the East have been quite free, both by rail overland and by steam via Panama. The market shows a stronger tone, with top prices more readily obtained.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	230,320	245,311
In port, disengaged	119,577	39,687
In port, engaged	3,862	32,276
Totals	353.759	317,274

The above gives a carrying capacity as follows: 1887, 566,034 short tons; 1886, 507,638 short tons; increase over last year, 58,396.

Beans are firmly held, with choice wanted at a slight advance.

Poultry has ruled weaker for all kinds except choice young roosters, which are still scarce. Hens continue to come in in excess of the demand, causing lower prices to rule.

Hops, owing to increased consumption by brewers, are in good demand, with some sales of choice reported in a small way at an advance on top quotations.

Tallow is very strong under a good demand and only fair supplies.

Hides have a steadier tone.

San Francisco, May 4, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

DEATH TO MILDEW!

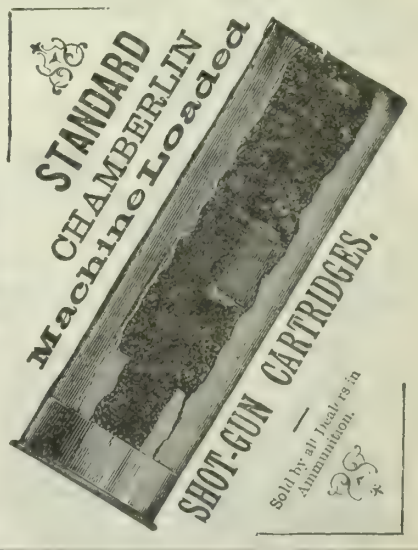
And Insects that prey upon Grapevines and Plants of all kinds.

In Hamilton's Pest Exterminator we are enabled to offer to the public the most valuable and useful article ever discovered for the effectual annihilation of mildew and pests of every kind, that infest our vines and plants. This valuable compound, whose merit has been fully established, is used in a Fumigator as represented in the cut, and is therefore easy of application, and does its work thoroughly.

It Leaves No Noxious Vapors.
It Cleans the Vines or Plants.
It Destroys all Pests and Parasites.

It leaves the plant in perfect health, thus largely increasing the yield of fruit. One trial will convince the most skeptical of its merits. Orders promptly attended to.

Price $5. Patent applied for.



Manufactured and for sale by

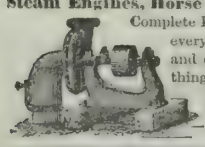
CLIMAX SPRAY PUMPS.

"The Best, most complete, practical, and best constructed Spray Pumps" to-day in the market. All parts and valves made of "non-corrosive" metal. Bamboo extensions, Pacific Cyclone Spray Tips. Send for circulars and prices at once. Cheapest place to buy good Rubber Hose in the city.
CALIFORNIA FIRE APPARATUS M'F'G CO., 18 California St., San Francisco.

COME LOOK AT THIS!



The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

THOMAS D. POOLE,
1867 Encinal Ave., Alameda, Cal.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOEBIG—Dear Sir: I have analyzed your sample of **"Nitrogenous Superphosphate,"** with the following result:

Soluble Phosphoric Acid	12.90 per cent
Reverted Phosphoric Acid	.95 "
Insoluble Phosphoric Acid	2.83 "
Potash	2.23 "
Ammonia	1.87 "
Nitric Acid	2.95 "

The above amount of **Nitric Acid** is equal to 0.85 per cent **Ammonia,** therefore, total of Nitrogen calculated as **Ammonia,** 2.72 per cent.

This **Fertilizer** is a **Valuable Manure** for vineyards, orchards, gardens, farms, and I **recommend** its use by the cultivators of the soil **generally,** in **California.** Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the **"Nitrogenous Superphosphate"** Fertilizer, analyzed by him at your request. It is a **high-grade article,** and as such returns the user a better money value than a low-grade fertilizer. It is **especially well** adapted to use in **California,** on account of the **predominance** in it of **Phosphoric Acid,** which is generally in small supply in our soils. Yet it is desirable that **"complete "**fertilizers be used in our orchards and vineyards, and **yours is of that character** in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of **Phosphoric Acid**—the chief element of all plant food—in combination with the necessary quantities of **Potash** and **Ammonia,** and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from ½ pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sobranto, Station of the C. P. R. R., 20 miles north of San Francisco, at $30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

H. M. NEWHALL & CO., Agents, 309 and 311 Sansome St., San Francisco.

FRESNO COUNTY.

BRIGGS' SELMA TRACT.

This most desirable tract, comprising 1280 acres of first-class gray ash and sandy loam land (situated one and one-half miles from the fast-growing town of Selma, the second in the county, and two miles from Fowler, both being S. P. R. R. towns), has been subdivided and will be sold in 20, 40, 60 or 80-acre farms. The distributing ditches are now constructed, and convenient roads are laid off. The main canal is 60 feet in the bottom.

THE WATER RIGHTS

Consist of stock in the canals and entitle the owner to one-eighth of 2 feet 6 inches of water, to 20 acres, being 2½ times the usual amount supplied for colonies. The owner of the water stock has a pro rata vote in the management of the canal, and the expense per year is $3.75 on a 20-acre lot.

A school-house is to be erected on the land this year, and it has two within two miles of it at present. Fresno, Selma, Fowler and Kingsburg are good local markets for produce. Opportunities to labor with or without teams are abundant, and land can be rented for wheat-growing in the neighborhood. The health of this region is perfection, and, in common with the plains generally, is an excellent sanitarium for persons affected with pulmonary and rheumatic complaints.

The best raisins in the world, wines unsurpassed, the finest grapes, the best peaches, apricots, plums, prunes, nectarines, figs and olives, and in fact all the choicest fruits and vegetables of the world are grown in this favored region. Raisin vines three to six years old yield per acre from four to seven tons, and increase to eleven. Wine grapes three to six years old yield from four to eleven tons per acre. Alfalfa is cut from four to six times a year, and yields from one to two tons per acre at each cutting.

Two good cows and 100 hens furnish more than half the living for a family, and can be kept, with a team, on three acres of alfalfa, the growth of which is incredible in this favorable combination of soil and climate.

A comfortable house for a small family can be built for $150.

The low price, taking into consideration water and transport facilities, should especially recommend this to seekers of homesteads. One-half already sold. The cheapest Colony land in the county, on very easy terms to actual settlers.

ADRIANCE "BUCKEYE" MOWERS.

MAKE SURE THAT YOU BUY THE BEST MOWER MANUFACTURED.

One that will Outwear two of any other make of Machine.

One that is very Simply Constructed and the Lightest Draft.

One that will do Better Work than any other Mower made.

SOME OF THE REASONS why the Farmers prefer the ADRIANCE BUCKEYE to all other Mowers:

It is the **most simlpe.**
Contains **fewer parts.**
Is the best braced and strongest.
Has fewer and better bearings.
A less number of places for oiling.
All its parts are in sight and easily understood and kept in order by the ordinary farm hand.
It is built on correct mechanical principles.
Has the only perfect double-jointed Finger Bar, which adapts itself to every variety of surface.
There is no downward pressure on the Finger Bar, but a lifting tendency when coming out of a ditch or furrow.
The Knives have a truer and more uniform throw through the Guard Fingers.
Has the most perfect cutting apparatus.
No loose connections or knuckle-joints.
Cuts a swath the full length of the Cutter Bar without driving the off-horse in the standing grass.
It is perfectly adjustable to any work.
All its weight is utilized for power.
The horses draw directly from the axle, and no weight comes on their necks.
It is the **lightest draft.**
It is perfectly balanced.
Easiest to operate.
Excels all others in portability.
The Cutter Bar holds firmly, and flat across the frame.
The most comfortable and the **safest** for the driver.
Only the best material and workmanship are used in its construction.
It requires **fewer repairs.**
Extra parts are more easily obtained.
It has the **longest and best record.**
Its average life is double that of others.

☞ The Majority of the Farmers use it Wherever Sold. ☜

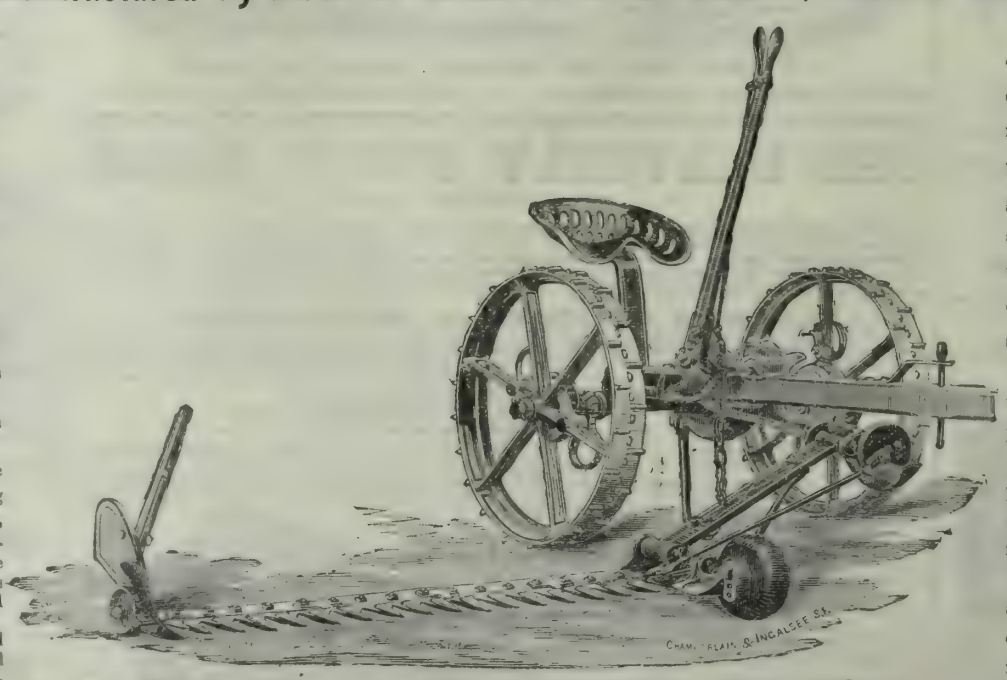
1887

Benicia Improved Mower.

Manufactured by BENICIA AGRICULTURAL WORKS, Benicia, Cal.

In presenting our BENICIA MOWER, as improved for 1887, we are placing on the market a machine that has no superior. Great care has been exercised in their manufacture, both as regards material and workmanship.



The shafts are all made of COLD ROLLED STEEL, which adds at least 50 per cent to their strength as compared with any other shafting used in such machines.

The gearing is incased and is made of the best iron.

The outside shoe is furnished with both a wheel and spring, the spring being wide and heavy. The machine is thrown in and out of gear by means of an eccentric, thereby doing away with the clutch and shifter lever.

The bearings of the crank shaft are long and well babbitted, besides being provided with self-oiling boxes, that is, the boxes are long and filled with wicking or waste, thus guarding against the bearings becoming heated, as the boxes hold considerable oil and continually feed it to the shaft.

The Pitman is long, and is furnished with either straight pin revolving or ball and socket connections, as may be desired.

Weight, 650 pounds. Cuts 4 feet 3 inches. Price, $90.

The knife guides or buttons on the cutter bar are made so that as the back of the knife wears them they can be set forward, thus keeping the knife in its proper position and preventing the grass getting in and clogging the guards. They are bolted to the bar by the same bolts that hold the guards, and their position can be changed or more can be put on if so desired.

The cutter bar can be laid flat across the pole when traveling from place to place.

There are many other points of superiority over other machines, which, on an inspection of the machine, will show for themselves.

In fact we have no hesitancy in guaranteeing the Benicia Mower to be first-class in every particular. It is simple in its construction, of light draft and perfect in its operation.

N. B.—We still have in stock a few CHAMPION MOWERS, which we will offer at greatly reduced prices.

The Latest Triumph in Roses.

Now that floricultural interest is keen, because of the floral fairs which have been held at many places in the State, we deem it pertinent to present a portrait of the latest triumph in rose propagation, and, in some respects, the most remarkable rose in the world. Most rose-growers know by reputation Mr. Henry Bennett, of Shepperton, England, who is ranked as the most successful hybridizer of roses in the world. It is claimed that he has brought his work to such perfection, and he works in accordance with such true scientific principles in his rose-breeding, that he can in time produce a rose having, within certain limits, of course, whatever desirable characteristics his patrons may seek to secure. Mr. Bennett was the originator of the famous Wm. F. Bennett and Her Majesty roses, and his latest production is the Puritan, a splendid white rose, about five inches in diameter, which he sold to Charles F. Evans, of Philadelphia, in the summer of 1885, for $2500. Mr. Evans brought the Puritan into notice, and its characteristics were so remarkable that about April 1st the entire stock of the Puritan was sold by Mr. Evans to J. W. Elliott, of the B. A. Elliott Company, of Pittsburg, Pa., for the enormous price of $18,000, which is more than double the price ever paid before for a new rose. Mr. Elliott will sell the Puritan only in large quantities to the most extensive cut flower-growers of the cities of the country, binding them not to resell any of the plants until February, 1888.

We have given first the commercial measure of the Puritan, because such figures, of course, represent in a most striking manner the florists' estimate of a new variety. But the Puritan has won other honors than dollars. The rose has been honored with a silver medal by the Massachusetts Horticultural Society and the Pennsylvania Horticultural Society. Its most signal triumph was, however, in the land of its birth. Samples of the cut roses were sent to England, and on April 15th the Puritan was awarded a first-class certificate from the Royal Horticultural Society. This is the highest award the society gives for a new flower. We find in the London *Garden*, of April 12th, a reference to the Puritan which is interesting, because of the notes on the rose, and description of the way in which the cut flowers were successfully sent across the Atlantic. We quote from the *Garden* as follows:

THE PURITAN—AN EIGHTEEN THOUSAND DOLLAR ROSE.

The meeting of the Fruit and Floral Committees, held in the conservatory, was rendered particularly attractive by the new feature of cut roses from America, which were staged in excellent condition. The following first-class certificate was awarded, viz: to rose Puritan. Plants in flower and cut blooms of this rose were staged; they had been sent from America to this country for exhibition, 11 days being occupied in transit; they arrived in excellent condition. The foliage of this variety is stout and of a deep metallic green; the flowers large, creamy white, of exquisite form; petals round, and of good substance; while its staying properties may be judged of by the journey to which they had been subjected. One dozen of the cut blooms had been inclosed in a hermetically sealed box, and an equal number had traveled in tubes of water in an ordinary close box; there did not, however, appear to be any appreciable difference in their condition. Judging by examples, it is a great acquisition.

Concerning the origin and specific qualities of the Puritan, Mr. Evans, for whom it was produced by Mr. Bennett, gives a description. The Puritan is a cross between "Mabel Morrison" and "Devoniensis," is of pure white color, of large size, perfect symmetry, and of most delightful fragrance. In size and shape it greatly resembles its parent, "Mabel Morrison," carrying a wreath of foliage close to the bud. The fragrance of the Puritan is deliciously fresh and sweet, being very suggestive of the magnolia. The habit of the plant is very strong and vigorous. It is a most prolific and early bloomer. The buds have very long stems, which is, of course, a good point when it is used for decorative purposes.

No doubt our rose-growers will be on the *qui vive* to get a rose which has such a record, and we shall be glad to see if it will enjoy outdoor life in California as well as other famous sorts.

THE CONTESTED CLAUSE.—It is now claimed by telegraph from the East that on the return of the Interstate Commission from their tour, without hearing more arguments or petitions, an order will be issued suspending the long and short haul clause, section 4, on all the railroads of any account in the country. How long the suspension may be is not stated, but it is thought it may be till after Congress assembles.

Cold Storage.

Methods of keeping ripe fruit free from decay for longer or shorter periods are now coming into prominence in this State. As the fruit-grower hears of the success and practicability of different processes, he wonders why, if all that is claimed for them be true, he has been allowed to suffer so long because of the need of immediate disposition of perishable fruit. He remembers the cords of fine peaches, for instance, which have lain rotting on the sidewalks of San Francisco because the canners had not help nor facilities for handling so much fruit at once. He sees that any enterprise which will keep that fruit in storage which prevents decay, until the glut is removed by consumption, would be profitable both to him and to the warehouseman who provides such storage. He also sees the advantage there would be in having cold storage on his own farm or in his own neighborhood, so that he could hold back his fruit until the market was ready to take it at a fair price. It certainly appears, upon theoretical grounds at least, that arrangements for cold storage would free the marketing of fruit from many of its dangers and disasters.

It seems likely now that such arrangements would soon be provided. There are several processes which can show good results, and, no doubt, they will attract the attention of capitalists. We do not advocate any special device or arrangement. It is for those who desire to invest to examine and choose for themselves. No doubt all owners of patents and processes will be found ready with proofs of the values of their respective processes. Upon another page we give the report of the committee of the late Fruit-Growers' Convention, which examined the process now in use in Riverside. Upon another page still may be found a statement from Mr. Allegretti, claiming his improved process, because of its cheapness and its ease of adaptation to use on a small scale, can be introduced by individual growers on their own ranches, or employed on a more extensive scale by co-operation of growers or canners, or by any parties desiring to keep ripe fruit from decay.

There should be some notable progress made this year in securing cold storage in this part of the State. If the marketing or canning season for deciduous fruits can be prolonged, very much more fruit can be profitably disposed of. As our fruit crop will now be increasing from year to year in a geometrical ratio, it is imperative that everything possible should be done to improve the commercial aspects of the industry.

WOOL.—There seems to be quite an interest in wool at present, and buyers are patrolling the wool counties and raising values by bidding against each other. Let it proceed.

THE Fresno Milling Co. has secured a contract for furnishing 800,000 pounds of flour to Government posts in Arizona.

FRUIT MARKETING.

Cold Storage for Fruit.

The following is the report of the "Committee on Cold Storage" of the recent Riverside Convention. This report was mentioned in our report of the convention; also in the report of the Horticultural Society's meeting in last week's RURAL:

Your committee appointed to examine the question of cold storage and report thereon beg leave to submit the following:

The time given for the examination of so important a question has been entirely too short, but we have gathered as much information as possible in the time allotted.

The Inter-Ocean Cold Storage Company has its works—the only ones of the kind in California, except a small experimental one at Santa Ana, on the depot grounds of the Riverside, Santa Ana & Los Angeles railway in this place, that are reported as costing $40,000.

The works consist of a warehouse divided into several rooms, each of which is constructed with a view to keeping out the heat, and connected therewith is the necessary machinery for the manufacture of ice and the pumping of cold brine through a system of pipes extending overhead in the several apartments of the warehouse.

This system of cooling the atmosphere collects the moisture of the room on the cold pipes in the shape of frost, and thus the room, the atmosphere and the fruit contained therein are kept perfectly dry.

The process of cooling the atmosphere of these rooms is so systematized that the thermometer in any given room is kept at a steady degree of temperature for days and weeks at a time without variation.

The cold storage is used for two purposes—

First—To cool the fruit for shipment East; and

Second—For keeping the fruit for weeks at a time before being put upon the market.

For cooling the fruit for market it requires about 24 hours, and the warerooms have a capacity of 10 carloads of fruit per day.

In one room we found 3500 boxes of lemons which have been stored for next summer's use. This fruit has been in cold storage from two to six weeks, and appears to be curing in good shape, and the indications point to the successful keeping of the fruit until next summer, when it will bring the highest price. If the lemons can be successfully kept for six months so that they can be picked from November to March, and sold in June, July and August, and the fruit when taken from cold storage will have sufficient life to be placed on the market, and consumed without unnecessary decay, the future of lemon culture is assured in California, and this State can, in a few years, drive all foreign lemons from this country.

Your committee examined the oranges and lemons placed on exhibition in the pavilion by the Cold Storage Company. This fruit was put into cold storage on the 9th of February last. Forty-eight days thereafter it was taken out and repacked in the presence of disinterested parties, and each orange and lemon was found to be perfectly sound. At the time it was taken from the warehouse it was removed from a temperature of 48 degrees to a temperature of 70, and during the day this was increased to 80 degrees.

This fruit was repacked at that time and kept in an ordinary packing-house, subject to climatic changes for two weeks, when it was placed on exhibition for the benefit of the State Fruit-Growers' Convention.

This fruit we find to be at the present time in a perfect state of preservation, and from its appearance we should judge it would keep yet as many days from the time of being taken out of cold storage as it would have kept from the time of being picked, if it had never been put in cold storage.

The attention of the committee was also called to some Malta Blood oranges, which had been in cold storage for over two months prior to being taken out three days ago for exhibition purposes. These oranges showed a deep blood-red pulp and rind in excess of anything of the kind ever seen by us before on this coast. It is a well-known fact that the blood-red appearance of this orange only makes its appearance as the fruit ripens and matures. This deep blood-red appearance of this fruit is therefore evidence that under these cold-storage conditions this fruit has ripened and matured in a degree not possible under other circumstances.

The Riverside Washington Navel oranges taken from the cold storage exhibit, having been 48 days in cold storage and 17 days out, show a solid appearance, a tender and juicy pulp, and fine flavor unsurpassed by any fruit of the kind kept under other conditions.

The committee were shown letters from various prominent fruit houses in Chicago and other Eastern cities showing that fruit shipped East from Riverside this season under the cold-storage process had come to hand in excellent condition, and urging that fruit growers and shippers avail themselves of this system as a means of guaranteeing the safe arrival of their fruit at the point of destination in good merchantable condition.

If this system of cold storage will do what is claimed for it—and under all known rules of evidence your committee is forced to the belief that it will—the advantages to be derived therefrom are not confined to citrus fruits, but perhaps its greatest benefits are to be found in its application to the shipment of more perishable fruits, such as grapes, apricots, peaches, pears, the small fruits and winter vegetables.

The field of practical operations in this line is virtually unlimited. When the risk of shipment is reduced to the minimum, a small margin of profit will satisfy dealers, the producer will get a good price and the consumer will still get his luxuries at a fair figure, and the consumption will be increased many fold, still further increasing the profits of our California fruit-growers and gardeners.

Cold storage will, in our opinion, revolutionize the fruit industry of the Pacific Coast. It will enable the producer to ship his fruit by slow freight at $200 a car instead of paying $500 a car for express time. Here is a saving of $300 a car less cost of treatment. It will reduce the risk of shipment, thus enabling the selling of fruit at a lower figure to the Eastern consumer, and it will thus place choice California fruits within the reach of the Eastern masses instead of the wealthy few.

It is claimed by the Cold Storage Company that the success of the system depends upon its intelligent use; that if the fruits are kept in too cold a temperature the system will fail. If the fruit on removal from cold storage is taken out when at a too low temperature, the fruit will sweat and decay will follow. Before the removal of fruit from cold storage to a warmer outside temperature, such fruit must be prepared for removal by raising its temperature to a certain point to prevent sweating. The failure to understand and apply this principle may have been the cause of the failure of cold storage in some cases to give satisfaction.

The cost of cooling citrus fruits for market is at present $60 per car. The fruit is shipped in the Tiffany refrigerator car, which is iced to keep a uniform temperature while in transit over desert and mountains. These cars are so constructed that they will pass through winter blizzards without a material lessening of the inside temperature. On arrival of fruit at place of destination, it can be placed in cold-storage warehouses and kept until the market calls for it, or it can be marketed at once.

We recommend the system to the careful study of the fruit-growers of the State.

FORESTRY.

Forests and Rainfall.

The tangle of decayed vegetation which covers the ground beneath the forest is of considerable thickness. On top it consists altogether of the decayed trunks, branches, and leaves, but it shades down into ordinary dark-colored soil at the depth of a few feet from the surface. This, the decay zone of the forest, lies between the boughs of the air and the branches of the roots. In it go on the most important actions which take place in our forests—actions which affect the history of land and sea. We shall therefore have to consider it in a somewhat painstaking way. The most evident effect of this sheet of decaying wood, and moss which feeds on the decay, is on the rainfall of the region which it mantles. When, after a season of drought, a copious rain falls upon this spongy mass, the water is for a long time absorbed in the interstices and does not flow to the river. Even in times of very heavy rain the water is slowly yielded to the streams; after a dry period of many weeks this sponge retains a good share of water. A like amount of rain falling on tilled fields or prairies slips quickly away to the rivers, and thence to the sea. The first result is, that when the land is destitute of forests it sheds water like house-roofs, breeding floods after every considerable rain, while in the forests the rain is only slowly yielded to the streams.

A second and less evident result of the spongy character of the forest-bed is that, by hindering the escape of the rain-water to the rivers, it increases the actual rainfall of the country. To see the nature and importance of this action, we must turn aside for a moment to consider the origin of the rain which falls upon the land. The original source of this water-supply is the sea, which sends into the lands a tolerably regular annual store of moisture. When this falls as rain or snow, either of two things may happen—the water may go away directly to the sea, or it may return to the atmosphere as vapor to be again precipitated as rain. The chance of its re-evaporation is determined by the speed with which it flows to the streams. From a treeless region it rapidly escapes; in an extensive district of virgin forest it may again and again pass from earth to air, and from air to earth.

The columns of vapor, which in times of summer rain may be seen ascending from every great wood, afford visible evidence of the effect of forests on rainfall. They also may show the observer some of the most beautiful phenomena of atmospheric circulation. In a summer rain-shower the air above the trees becomes much cooler than it is in the recesses below their tents of foliage. This heated air within the wood seeks to rise, and escapes in great columns wherever there is a wide gap between the branches. As soon as it attains the cooler level above, the moisture is condensed, and the air, before transparent, becomes charged with steam. To replace this ascending air, a broad current drifts toward the emerging streams of vapor, commonly from the higher parts of the forest, where the air, owing to the elevation of the site, is cooler than in the lower levels.

This repeated passage of the moisture from earth to cloud, and from cloud to earth, greatly increases the amount of force which the rain applies in its falling drops to the earth's surface; but the rank vegetation protects the surface from the erosion which it would otherwise bring about. Even the forest-clad hillsides of the Cumberland mountains, where the soil lies on declivities of great steepness, suffer little wear as long as their natural protection is left to them. But as soon as they are stripped of the garment of wood which has been upon the region ever since, in the far-off ages, they came from the depths of the sea, they wear with great rapidity. The erosion is limited as long as they are forest-clad to the stream beds, and there is hindered by the innumerable obstacles of the fallen trees and entangled driftwood. The brooks which are strong enough to clear their beds and cut into the earth and rock, are few in number; we may often, on the flatter ground, find tracts of a square mile or more in area in which there is not a single stream that ever assails the surface of the earth. As soon, however, as the forest mat is removed, the surface becomes seamed with channels; they often, on the deforested surface, increase one hundredfold in their length, and more than that measure in their destructive power. Relieved of all restraint from fallen timber, or the close-knit roots which enmesh the earth, they sweep the precious soil away toward the sea. In a single day a tilled field may lose from its surface more soil than would be taken from it in a century of its forest state.—PROF. N. S. SHALER, *in Scribner's Magazine.*

Trees for the Upper San Joaquin.

What trees to plant for forest or for adornment of streets or dooryards in the different parts of the State is an important question and one which must be answered by one having knowledge drawn from local observation. We like to place upon record local experience for immediate service and to aid the future compiler in the preparation of general statements. We find, for example, in the Bakersfield *Californian*, a letter signed R. A. F., giving a descriptive list of certain trees which are growing in that part of the San Joaquin valley. We quote as follows:

Deciduous Trees.

The Texas umbrella tree is probably the best of all deciduous shade trees for this county. It is a rapid and symmetrical grower. The leaves are feathery and of a dark green. In the spring the tree is covered with blue colored flowers. It is entirely different from the China umbrella tree and is a great favorite in Fresno county.

The California black walnut is one of the finest native Californian shade trees. A few specimens may be seen in town, and those who have planted them have done much to improve the appearance of their residences. It is very hardy and is a more ornamental tree than the Eastern black walnut.

The acacia of Constantinople (*Acacia julibrissin*) or silk tree, is one of the handsomest shade trees of Southern Europe; has beautiful foliage and flowers like long silk tassels, and is well adapted to our warm climate.

The umbrella locust is a very fine shade tree, of rapid growth, shaped like an umbrella, and needs no pruning.

The *paulonia imperialis* is a magnificent, tropical-looking tree with enormously large leaves and flowers.

The tulip tree, the poplar of the East, is a rapid-growing tree with tulip-like flowers.

The silver-leaved maple, the English and French elms, the golden-barked ash, the European linden and some of the finer kinds of locusts, are all beautiful deciduous shade trees, and any of them are beyond comparison superior to the present dreary tree growth of our town.

Evergreen Trees.

The true acacias are very desirable trees, having beautiful foliage and very fragrant flowers.

The pepper tree is a very popular tree in Los Angeles, and specimens of it may be seen around Sumner and Bakersfield. If well cared for it is a very beautiful semi-tropical-looking tree.

The Japan camphor tree is one of the handsomest and most interesting evergreen shade trees that can be grown. The Japan cinnamon tree is also very desirable.

The loquat, or Japan medlar, is becoming a very popular ornamental evergreen, has beautiful foliage, fragrant flowers and a delicious fruit.

The eucalypti are strong growing trees, have a semi-tropical appearance, and if well cared for make a finely shaped tree.

The flowering gum is one of the handsomest of flowering trees, having a bright scarlet flower.

The *magnolia grandiflora* is the finest of all American evergreens, is of slow growth during the first few years, but afterward quickly develops into a magnificent tree. The leaves are large and of a brilliant green, and the flowers are large and sweet-scented.

Of cedars: The cedar of Lebanon and the Himalaya cedar (*deodara*) are exceedingly handsome and succeed admirably in this climate. They make fine trees and are vastly superior to the funereal-looking cypress.

There are also various nuts and fruit trees which are as valuable for their shape and ornamental appearance as for their fruit, of which are the Italian and Japanese chestnuts and persimmons, olives, pecans, some kinds of peaches, the pessardi or Persian prune, the white celeste fig, and of course oranges and lemons.

THE STABLE.

A San Benito Horse Farm.

The Hollister *Free Lance* gives a description of B. F. Ingels' horse farm, where it says "some of the finest horses in San Benito county are bred and raised." We quote as follows from the description of what a reporter saw during a recent visit to the ranch of Mr. Ingels, four and one half miles east of Hollister:

A farm of 680 acres situated inside the line of foothills separating the Hollister and Santa Ana valleys, inclosed by a strong wire and board fence, divided by cross fences into convenient-sized fields, containing from 40 to 100 acres; three immense barns, having a storage capacity of more than 400 tons of loose hay, and fitted up with stalls and feeding stanchions, by which 130 horses can be fed and stalled at one time; a neat, comfortable dwelling-house of 10 rooms, and outbuildings enough to form a moderate-sized village; a well-stocked blacksmith and carpenter-shop with every facility for repairing tools, sharpening plows and shoeing horses; large, roomy sheds for farming tools, and, in fact, a place for everything and everything in its place.

A fine stream runs through the ranch the entire year, furnishing an abundance of water for stock purposes, while a large windmill fills the tank which supplies each barn, as well as the house, with the same useful element. Mr. Ingels farms some 400 acres of his ranch, and last year raised more than 6000 centals of wheat and barley, to say nothing of the 350 tons of hay which he puts up for the use of his horses. But it is not alone as a grain ranch (although as such it is far above the average) that we speak of Mr. Ingels' place; it is as a home for the horse that we wish particularly to describe it.

Mr. Ingels, for years, has made the breeding of horses his specialty, and that he has succeeded in this industry is attested by the large sales he makes each year. There are at present on the place 125 horses, including four stallions, two of which are thoroughbred Percheron stock, the other two being unusually fine specimens of crossed breeds. Of the horses, 50 are brood mares, and it is safe to say that for size, symmetry and all other qualities that go to make up the best specimens of this class of stock, no finer horses than those owned by Mr. Ingels can be found in San Benito county.

Thirty-two colts, two and three years old, occupy one of the fields. In the adjoining field are 30 yearlings. These colts have all been carefully handled and are perfectly docile. No pleasanter sight can be imagined than that presented by one of the stalwart sons of the proprietor, who, stretching his listless length on the green sward, and surrounded by the equine youngsters, played alternately with one and another of the 30 beauties that crowded upon each other in their eagerness to come within reach of his caresses.

Mr. Ingels is a firm believer in the utility and profitableness of the heavy draft horse. His chief argument for the raising of this class of animals is seen in the difficulty which presents itself when an effort is made anywhere to obtain a fine team of horses suitable for heavy draft work. A good team of these animals always commands at least $400, and at present they are difficult to find at a sum far exceeding that amount.

A Kern County Breeder.

EDITORS PRESS:—In a recent conversation with E. M. Roberts, at his farm and residence 2½ miles northwest of Bakersfield, we took note of some remarks on the breeding of the horse which we deem worthy of mention.

He believes in breeding our common mares of small or ordinary size to large horses. Deems this more practicable, at present, than the method of grading up, in the matter of size, by breeding large mares to small horses, as it is easy to obtain the large horses for breeding purposes, while the mares of small or ordinary size are already on hand.

The most profitable breeding in this country is from our mares of ordinary size, by Norman horses, the product being mares of good size making suitable mothers for large mules. These large mules, at the proper age, will always sell well; in fact, are in demand. In this business he deems the breeding of first-class jacks of importance.

Mr. Roberts is proving his faith in this course of breeding by actually working by the above program. He keeps quite a number of brood-mares, some of which are of good size, and is adding to the lot. He keeps two good jacks at present, and a fine Norman stallion, imported from France, of 1700 pounds weight.

Kern Co. McD.

THE VINEYARD.

Sulphuring and Suckering.

At the last meeting of the Santa Clara County Viticultural Society there was a discussion on sulphuring and suckering which is timely and interesting. We quote from the *Mercury* report as follows:

Mr. Gibson considered the French sublimed far superior and cheaper in the end than the California variety. His experience had shown that the result was better by applying the sulphur early in the morning than in the middle of the day.

Mr. Daggett differed with Mr. Gibson in regard to the superiority of the two kinds of sulphur. He always used the California variety. He found that the cheaper sulphur went as far as the sublimed. He had visited vineyards where the French sublimed sulphur had been used, and could see no advantage gained by them. If there was any mildew on his vines last year he failed to observe it. If there had been any danger of the disease the California sulphur had warded it off.

Secretary Combe said that if there is such a thing as California sublimed sulphur he would use it, but he did not believe there was. The process of subliming made the sulphur finer than flour, and when applied it would permeate all parts of the foliage. Experts say that the very finest sulphur will be found the cheapest in the end. He was satisfied that the California sulphur was fully as strong as the other, but the mode of its preparation was not as good.

Captain Merithew thought the best qualities of California sulphur were the most economical. One year when his vines were infested with green bugs he applied French sulphur without effect. When he used the California variety the insects succumbed. His experience had shown that California sulphur was stronger and lasted longer. He had also found that the fumes of the sulphur arising from the ground kept the frost off the vines. In his opinion too much sulphur was used at one application. It should be used in less quantities and applied more often. He had bought a carload this year in conjunction with Mr. Pierce.

Mr. Feeley used California sulphur some years ago and found it to contain foreign matter, and to be very coarse.

Captain Merithew said that the sulphur was prepared much better now than a few years ago, and Mr. Pierce never used any other. He generally used about 8 barrels on 40 acres, but this year he would use about a ton on 40 acres. The greater part of what is called French sulphur really came from Italy, Belgium and other places, being used as ballast for ships. He considered the best time to sulphur just before the vines came into blossom.

Mr. Feeley said he applied the sulphur with a bellows, which method he found most economical.

Captain Merithew did not believe it wise to apply the sulphur when the vines were wet with dew. The sulphur would settle in the hollows of saucer-like leaves in large quantity and eat holes in. When sulphur was put on late in the season it should be applied very lightly, otherwise it could be detected in the wine. It also checks fermentation.

The question of suckering was next discussed.

Captain Merithew said he generally suckered the crowns, but it required good judgment to do the work properly. There was no question about the propriety of taking off all the suckers that came out below. The Muscats were about the first vines for late suckers. Sometimes the spring shoots bore fruit.

Mr. Daggett said one year he began cutting off the suckers close to the vine when they first appeared. He thought the work was all done, but suckers came out again in May. This was on the Chavigneau varieties.

Captain Merithew had found that long pruning did a great deal to keep back suckers on Chavigneau and other vines that needed long pruning. He also found that with long pruning the crop could all be had at one time.

Mr. Combe—Clarence Wetmore stated that with long pruning he got all his grapes in one crop, there being no sign of a second crop. Spurs enough should be left to absorb the surplus sap.

Captain Merithew said he never suckered the Muscat above the crown because they don't get shade enough and the surplus sap should be allowed to go to the top.

Mr. Combe had found that a wise plan.

A Fresno Expert on Sulphuring.

Capt. Ch. de St. Hubert writes to the Fresno *Republican* as follows: As it might be interesting to many of your readers to know when sulphuring the vines is needed, I have the pleasure to detail the subject. It is now time to observe the vines and apply the curative named, as up to date I am not aware that a preventive has yet been discovered for the mildew of our Pacific southern coast, and that used more successfully yet is the sulphur; also a compound of sulphur and lime, which Mr. J. F. Allen describes thus: Boiling three pounds of the flowers of sulphur and lime in six gallons of water until it is reduced to two gallons. When settled, pour the liquid in bottle for use. One pint of that solution in 12 gallons of water is strong enough, and is good for the vines and the peach trees. Attach to the hose of a pump a small nozzle, and the liquid is diffused over all parts of the diseased vines. But the flowers of sulphur alone is less labor and cost, and about as good. I would then use the sulphur (flowers of) applied at an elevated temperature, not under 75 degrees Farenheit, if possible.

The heat favors the production of the sulphur fumes which are rapidly given off when the temperature ranges high, and also 75 degrees Fahrenheit is the best temperature to meet the development of the fungus, which is destroyed more rapidly by timely application of sulphur. If it reaches 100 degrees Fahrenheit during the day, one can spread the sulphur on the ground under the vines and it will destroy the mildew.

The time when sulphur should be applied is early in spring, at the first appearance of the mildew, and most effective when the application is made on a bright, warm day, when the dew is all evaporated; and a second application will complete the cure, if made 30 or 40 days after the first sulphuring. In vineyards much affected with that disease, it would be best to first sulphur when the young shoots are four inches long, the second time when the vines are in blossom, and third, some time after the turning of the berries. But I should insist upon the sulphuring at the time of blossom, for the flowers are almost certain to be rendered sterile if attacked.

THE LUMBERMAN.

California and Oregon Woods for Decoration.

The natural woods of California are beginning to be largely used for decoration—for the interior finish of expensive residences. They have been used quite extensively, indeed, for eight or ten years, both at home and abroad. The woods most generally used are the redwood, the white cedar, the laurel and the sycamore. The redwood takes the lead for general use, and is largely used for interiors. It will take a good polish, and is the best cheap wood for finish that California produces. For general use, wear and staying qualities it has no superior in any forest in the world. The laurel is smooth, firm, beautifully figured, and altogether a most desirable wood. The value of the sycamore as an ornamental wood has only quite recently become generally known. Its grain is much like that of the Eastern beech—has waving lines close together. At the East it is called buttonwood. It is quite tough and strong, qualities which give it value for veneering. At several of our Mechanics' Fairs have been shown excellent exhibits of California fancy woods—plain and polished—which have greatly surprised people, both at home and from abroad, who have not familiarized themselves in regard to what California forests can do in the way of such desirable products. A similar exhibit was made by the C. P. Railroad Co. at the Centennial Exposition in Philadelphia.

Oregon Woods.

Oregon is also able to make a fine display of woods. The Oregon ash is a very pretty and useful fancy wood. It is figured with concentric curves and admits of a good polish. The maple of that State is also beautiful. It looks very well in furniture and is beginning to be sought after for such purpose by manufacturers in San Francisco. Light yellow in color, its surface is covered with small, wavy lines. A somewhat enthusiastic writer says: "It reminds one much of a sheet of burnished gold, and when the gaslight plays upon its burnished surface the effect is grand." Still, like most of the Oregon woods, it is but little known. Indeed, aside from the world-renowned redwood, the real beauties of either Oregon or California woods are but little known. They are known only to the few who have become sufficiently interested in them to make them a study. It is only such persons who are anything like fully aware of the undeveloped industry which lies dormant in the beautiful figured woods of the Pacific Coast.

Fancy Figures in Woods

Are sometimes found by those who have a taste and an eye for such things. The writer above quoted describes several such specimens as follows: "Specimens of fancy woods are very often secured in which the lines assume some well developed figure, such as a head or an animal. I well remember a piece I have in my museum now, in which the head of a child is distinctly shown. It came from an old pile that had been for years stuck in the mud, supporting Donahue's old building on First street. I have a piece of California walnut which was exhibited at the fair, in which, as plain as day, can be seen the figures of a man and woman. They are side views. The man is apparently as naked as when he was born, but the woman is attired in complete walking costume. The specimen is called 'Adam and Eve.' I have also a splendid specimen of California laurel, in which there is a bear's head. But the figures are almost as many as are the specimens. Heads, bodies and even trees are also figured in the woods. I have seen one piece in which there were two birds."

Beautifully Figured Woods.

Aside from woods of ordinary or normal growth, the coast abounds with those unique specimens of nature's fancy products, such as burls, knots, etc. These are quite common in the redwood. The laurel often presents a curious abnormal growth of this description. A recent writer in the *Chronicle* describes it as follows: "A curious fact about the laurel is that the tree often looks as if a great tree had grown and then melted down and another tree had grown from the residue of the first. This curious growth of formation makes a large ground burl, from the center of which the tree grows. A splendid specimen of such a formation may be seen in Laurel Grove, near San Rafael. The burl of that tree is fully 15 feet in diameter, and the tree grows from the center of it."

A good specimen of figured wood, like a burl, or even a somewhat peculiarly marked natural growth, is always in demand for various purposes of decoration. Of course such woods must be cut in a certain way to bring out the figure to the best advantage, and it takes much judgment and experience to do such work—to know how to cut and treat the wood so that the figure may be brought out and shown to the best advantage.

The Philosophy of Such Growths.

The same writer speculates upon such abnormal growths as follows:—"I find that the prettiest figures are generally on the wood of trees which grow in a marshy or well-irrigated place. I think that the bark outgrows the twig and will therefore wrinkle. When the twig grows the wood will, of course, fill up all the wrinkles and cavities in the bark, and the surface will therefore be marked and riffled. This is what makes the figures on the wood. Sometimes, also, the bark runs through the heart of the tree. This is a fact not generally known, but to it I attribute the existence of so many hollow trees in the forests of California, for the bark will be ignited from any prairie fire, and burn through the core of the trunk, leaving the tree hollow."

CALIFORNIA REDWOOD.—A writer in the Sonoma *Democrat* gives an interesting letter on the subject of redwood. He says that Sonoma, Humboldt, Mendocino and Santa Cruz counties have a monopoly of this wood, the first in commercial importance on the Pacific Coast. Oregon and Puget sound with their magnificent forest of pine have none, and in fact there is very little outside of the four counties named anywhere else in the world. The redwood is a close-grained timber, splits true, and is in color like the Eastern cedar or cypress. It works beautifully under the plane, and will stand more fire and is easier quenched when on fire than any other wood; it has the merit of retaining its place and shape without warp or shrinkage; its durability is unquestioned; for fence-posts and railroad ties it is the best-known wood, resisting the action of both air and water with matchless durability. The redwood belongs exclusively to the foggy coast regions, and the foliage possesses the peculiar power of condensing this mist and converting it into rain, thus supplying the roots which sustain the mighty bole of the tree with moisture during the long and rainless months of summer. Few persons can appreciate the grandeur of these redwood forests. The reader will bear in mind that there is yet in Sonoma county a vast amount of tan-bark and laurel, and millions of cords of hardwood of which no estimate is made. A statement by sections of timber suitable for sawing in Sonoma county places the total at 740,000,000 feet.

THE STOCK YARD.

Jersey Values at the East.

From the *Country Gentleman* of April 28th we compile some interesting statements concerning the values of Jersey cattle as shown by recent public sales. The previous week Messrs. Peter C. Kellogg & Co. held their eighth annual combination sale in New York, the animals being consigned for sale by a number of breeders. The summary of the sale is as follows:

23 bulls, average	$112 17	Total	$ 2,580
326 cows, do	106 37	do	34.676
349 animals, average	$106 75	Total	$37,256

This sale gave data for the award of the Breeders' Cup for 1887. Concerning this contest, the auctioneers write to the *Country Gentleman* as follows:

The competition for the annual Breeders' Cup, provided by subscription for the best average upon five animals bred by any one consignor to the annual special combination sale held by Peter C. Kellogg & Co., in New York, was won this year by Dr. Ehrick Parmly, of Oceanic, New Jersey. Though prices ruled low throughout the sale, there was more general competition for the cup this year than ever before. This was owing to two reasons. First, a greater number of consignors, by reason of being longer in the interest, were able to be represented by good animals of their own breeding; and second, there was no overreaching boom for any one strain to the exclusion of others that enabled the one to distance its competitors hopelessly. Approved strains of blood were preferred to chance animals, but always with the proviso that the strains were represented by a superior animal. Blood no longer sells high unless the animal indicates by individual quality that the blood has told. Nevertheless, the results of this sale where prices were determined more than in any previous one by the individual merits of the animals sold, is a striking illustration of the merits of breeding from a superior family as well as from a good individual. A few years ago the cow Jersey Belle, of Scituate, attracted great attention by making the largest yield of butter for a year that had ever been known, viz.: 705 pounds. She was one of the most marvelous natural cows ever known, as her great yield was strictly an unforced product, and with no scientific manipulation, either of the cow or of the milk, which was set in open pans. Very little of her blood could be had by ambitious breeders, as Mr. Ellms would not part with her daughters, and her bulls had only been bred upon grade stock when public attention was attracted to the cow. Dr. Parmly, Mr. A. B. Darling and Mr. Orestes Pierce each secured a bull, and finally Col. H. S. Russell secured a heifer, which he afterward sold to Mr. Orestes Pierce at a large price. Others who were first charmed by the great merits of the old cow afterward took a "sour-grapes" view of the subject, and it was not long before she was talked about as a marvelous instance of individual merit that did not reproduce itself—no "prepotency," as the saying goes. But Dr. Parmly and Mr. Pierce each held on to their cattle and bred the blood in-and-in. For the first time, the doctor sold some of the best results, showing some superb cows with one to four crosses of the blood of Jersey Belle of Scituate. Apart from the doctor's consignment, it happened that others sent very choice cows of the same strain, notably three sent by Mr. Richard Ingraham, of Hempstead, Long Island. Altogether the Scituate blood made a highly favorable impression. The best seven averages on five animals bred by the consignors were as follows:

DR. EHRICK PARMLY.

Roscita, cow	$ 430
Ocean Lily, cow	390
L'Ainee, cow	350
Mioscita, cow	170
Sunny Gazelle, cow	60
Total	$1400
Average	280

The other averages to complete the seven mentioned above we give in condensed form as follows: D. F. Appleton, $258; V. E. and H. H. Fuller, $232; Green Mountain Stock Farm, $224; V. E. Fuller, $218; Mrs. E. M. Jones, $208; Nathan Robbins, $194.

Messrs. Kellogg also say in their letter: Several of the consignors got higher prices for animals not bred by themselves than for those used in the above averages, but as the cup average is computed upon animals bred by the consignor, those not so bred are excluded. It is the home-bred animal that measures the breeder's skill. The idea of the Breeders' Cup originated with Mr. D. F. Appleton in 1880, and has done much to stimulate the consignment of choice cattle. It will be noticed that Mr. Appleton was second competitor for it this year, and has on former occasions 'come within one of it.' He has been, with the exception of one or two years, the chairman of the committee who received the subscriptions, and provided the cup, which on this occasion was a heavy silver tankard."

California's Interest in the Above.

The mention of the Scituate blood above has especial interest here, because this blood is strongly represented in the Yerba Buena herd of Henry Pierce of this city. He has two bulls now in use which are of the blood of old Jersey Belle of Scituate, and there is a large number of females of the same breeding. This blood is being distributed on this coast by Mr. Pierce's sales—as for example, the Scituate bull sold for $1000 to the late Mr. Bliss for the Petaluma Stock Association. As we have said before, Mr. Orestes Pierce mentioned above is a relative of Henry Pierce, and they are mutually interested in the ownership of this excellent and popular strain of blood.

SIMPLE MEASUREMENT.—The approximate breadth of a river, or other stream, may be determined by means of the brim of a hat or the peak of a cap, and this can be done by a boy as well as a man. The person desiring to ascertain this fact must place himself at the edge of one bank of the river and lower the brim of his hat, or peak of his cap, till he finds the edge just cuts the other bank; then after placing the hand under the chin, he must turn round steadily till he faces some level ground on his own side of the river, and observe when the edge of the peak again meets the ground. The measure of this distance will be very nearly the breadth of the river.

UTILIZING THE SPARROWS.—Here is the way they make sparrows useful in Germany: Long troughs, placed at the eaves of houses, are occupied by the sparrows in building their nests. When the young are hatched and the mother goes out to procure food, wire screens are placed over them, with interstices large enough to permit the passage of food in to the younglings but too small to allow them to escape. As soon as they are large and plump they are killed, and make a very desirable article of food.

OLIVE OIL FOR LUBRICATING PURPOSES.—Put pure olive oil into a clear glass bottle with strips of sheet lead, and expose it to the sun for two or three weeks, then pour off the clear oil, and the result is a lubricant which will neither gum nor corrode. It is used for watches and fine machinery of all kinds.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Grange Picnic at Danville.

The weather on Friday of last week was decidedly unpleasant in Alameda and Contra Costa counties. In some parts, brisk showers of rain fell, and in others not enough to settle the dust. Saturday, however, proved one of the pleasantest days of the season, and Grangers, farmers and their friends wended their way to the picnic grounds at Danville in great numbers.

Four to five hundred teams and vehicles, gathered together from all parts of the country, were strung along the highway for a great distance, affording a very novel sight. It was estimated that at least 1500 people were in attendance during the day. It was undoubtedly the largest gathering ever held in that part of Contra Costa county known as San Ramon valley. The picnic grounds consisted of three good-sized lots, inclosing the Grange hall, Presbyterian church and schoolhouse. These lots were shaded and ornamented by well-grown locusts in full, snowy bloom, looking beautiful and adding sweet fragrance to the occasion. The speaker's stand was handsomely decorated with American flags, but the greatest attraction of all was the

Decoration of Danville Grange Hall,

Owned, together with the large lot on which it stands, by the Grange. Most beautiful, complete and appropriate were the decorations. All the Grange implements were accurately wrought in immortelles, placed on the wall farthest from the main entrance, including the plow, axe, spade, hoe, harrow, pruning-knife and sickle. Above all these was a crescent and stars of the same flowers; beneath, these words:

Welcome Friends,
P. of H.

All this was the work of Mrs. William Z. Stone, Flora of Danville Grange, who had charge of the decorations, assisted by many and willing hands—sorry we know not the names of all. Beneath stood the piano, fringed with locust blossoms and wreathed with roses, while several vases holding beautiful bouquets were placed along its top. Festoons of roses drooped gracefully from either corner of the ceiling to the center, where they were caught up and finished by a long pendant of white flowers and bright marigolds, from which hung a huge ball of many-colored roses. The chandeliers were fringed with locust blooms, while each cup held, instead of the usual lamp, a bunch of roses. The windows were framed in festoons of wheat and wild oats. Wreaths were scattered all along the walls, while at each side of the main entrance were beautiful triangles of flowers, the work of Miss E. Wood. Over this door were sheaves of wheat and pampas grass. Over one of the rear doors was this motto: "Who comes here?" and over the other: "Good luck to all." Garlands of evergreens and flowers hung suspended in each corner, from ceiling to floor. The whole effect was most charming! Many, varied and constant were the expressions of delight. Great credit redounds to the able manager and her corps of efficient workers.

As the different delegations came in they were greeted in hearty Granger style by those who had previously arrived. A little before noon the call was made for all hands to gather around the speaker's stand and listen to and take part in the following

Exercises of the Day.

1. Instrumental music.
2. Remarks by the President of the Day, Judge W. C. Blackwood.
3. Address of welcome, by Hon. Charles Wood.
4. Oration, by Dr. W. W. McKaig.

The president announced, by request, that hot tea and coffee would be furnished free to all, and in a short time the numerous tables, provided for the convenience of the attendants, were well loaded and abundantly supplied with all the good things that the heart could expect or desire on such an occasion. The scene, at this time, was one of rare occurrence, and could not fail to please the eye and cheer the heart of all who had the privilege of overlooking it.

After an hour or more spent in disposing of lunch, the assemblage was recalled to the stand to listen to volunteer speeches from leading Grange officers. Dancing was freely indulged in by the young people, in the Grange hall, from noon to night, the music furnished by Blum's band, from San Francisco, being declared excellent.

We are enabled to give, in substance, some of the speeches listened to during the day. We regret that we have not fuller reports of several of them. First came the very appropriate

Address of Welcome by Hon. Chas. Wood.

Farmers, Guests, and Fellow-Patrons.—LADIES AND GENTLEMEN: To me has been assigned the privilege of offering greetings and a cordial welcome to this, the Second Annual Grange Picnic in Contra Costa county, to speak the prologue to the play, as it were.

This pleasant gathering is the outcome of a wish on the part of the Patrons of Husbandry of Alameda, Solano, and Contra Costa counties, to meet together, at least once a year, to renew old and make new acquaintances; to interchange the courtesies of our fraternity; to compare notes and stimulate thought and action by a few hours of recreation and social intercourse.

At first glance, it would seem that a point more generally accessible on the line of some railroad encircling the county would have been selected for this occasion; but further reflection suggests the reason of the choice of this quiet spot to be the desire to get away as far as possible from the noise and confusion of the busy haunts of men; and certainly no more secluded and pretty place, if I may be allowed to say it, could have been found within a day's ride of San Francisco. As was said not long ago, by Worthy Master Baldwin, San Ramon valley and vicinity is as little known to the people of the State, generally, as if it were in Africa. This is the people's loss and not *ours*, who live within its precincts and have reveled for years in its genial, health-giving climate, and enjoyed the unfailing products of its soil. The topographical and natural beauties of this region cannot have escaped the eye of any of our visitors, whether coming from the east, north, west, or south. Farmers, more perhaps than others, need these reunions to lift them out of and away from the narrowing effects of the drudgery and isolation almost necessarily incident to farm life. The contact and attention of one mind with another, arousing to some extent the antagonisms that belong to nature, inducing thought and repartee and development, is the best educator, and no one can be said to be truly learned and wise who has not had frequent and familiar association with his fellow-beings in a larger sense than in the immediate affairs of the home circle.

Webster defines the word picnic, in its present use, as "an entertainment carried by a party on an excursion of pleasure into the country." *Our* Order amends this definition by adding the words "and instructive," and to this end it provides a feast for the mind as well as the body, and to which on this occasion all are invited.

The limitation of the laws of nature, and the laws and customs of organized society, environ our lives as with a high fence, over which it is impossible to leap; hence let us within this environment seek as much contentment, satisfaction and happiness as lies in our power, without being dissatisfied and envious of what is going on outside.

We wish you to lay aside ceremony and cold formality, and enjoy yourselves in a fraternal manner. "Eat, drink, and be merry."

Again we extend to you all a most sincere and cordial welcome, trusting and hoping that the Danville Union Picnic of the Grangers will be long remembered as one of pleasure and profit.

President Blackwood expressed regrets that Dr. Stebbins was unable to be present as the orator announced for the occasion. On account of the death of one of his old parishioners, the eminent pastor remained at his post of duty to perform the last sad rite for his departed disciple. In his stead

Dr. W. W. McKaig

Had kindly consented to favor the audience with an address, for preparing which he had but a few hours. This address, published in another part of to-day's issue, was heartily received and commended by the assemblage.

Upon calling the audience together after lunch, Judge Blackwood made some excellent remarks, and was followed by

Hon. Wm. Johnston,

Master of the State Grange, who declared that he had attended several Grange picnics during the three days past, and would rather like to continue attending such picnics every day. He spoke of the necessity of the Grange working for and receiving more members; that special efforts should be made to secure young members, mutually for the benefit of the Grange and for the education and advantage of young men and women, who join the ranks of the Order.

Brother Johnston gave some very interesting information concerning the transactions of the last session of the National Grange, and especially referred to the action on the Woman Suffrage question. He explained that the final vote on that subject was not a fair expression of the popular feeling and will of the members of that body. He believed that the representatives were really largely in favor of giving women enlarged social and industrial privileges and voting powers. He also spoke in strong words of the action of our own State Grange on the same subject, and predicted that, at another session, the popular will of the Grange would be shown by an emphatic expression in favor of additional rights and legal privileges for women. He believed the day had come when Americans should take more pride in their elective franchise privileges, should rescue and protect the ballot-box from the abuses with which it is threatened by un-Americanized foreigners and careless, ignorant and indifferent voters. The speaker urged all, especially the young, to avail themselves of the superior privileges of the Grange and our progressive age for self-advancement. His speech was followed by applause.

Then the solid Yuba City Granger and sturdy champion of the anti-debris cause,

Hon. Geo. Ohleyer

Came forward in response to numerous calls, and having been introduced by the chairman, spoke substantially as follows:

He had desired to attend this picnic from the time it was first announced, but owing to other duties and engagements had entertained little hope of being able to come. Having had business in San Francisco, however, the past few days, and finished it Friday afternoon, he had an opportunity to stop over on his way home. He said he was wholly unprepared to address the audience, in fact, had never done such a thing, and judging from the array of talent advertised and present, and the excellent speeches which had been made already, he thought it scarcely necessary to do more than show himself.

He had resided across the bay in Solano county, 34 years ago, and in those days he heard of the beauties of the interior of Contra Costa county, of Pacheco, San Ramon, and other valleys, but language failed him to express his delight at their beauty and fertility, and their romantic and picturesque surroundings, and, more than all, the thrift and contentment everywhere visible. He had frequently been in sight of and along the borders of the county, but never in the interior, and was glad he had embraced this opportunity to make this visit.

Regarding the Grange, his predecessors had spoken of the Order, but much more might be said and not exhaust the subject. It is a fraternal Order, and none stand in greater need of social advantages than the American farmer. It is also an educational institution, in which all can learn something. As already remarked by other speakers, the knowledge of individuals becomes the common property of the members. Imagine the spread of intelligence, when the agriculturists everywhere assemble once or twice a month and interchange opinions, compare their experiments, and share their joys and sorrows.

No one, be he ever so able or intelligent, has a moral right to withhold his contribution to the general fund, or hold himself above his surroundings, for he would certainly feel very lonesome; but it is his duty to bring his neighbor up to his standard. No man is so learned or experienced but he can learn something from the humblest object.

Speaking of farmers as legislators, and of the late Legislature, he said: "Your Chairman, Judge Blackwood, was selected by the late State Grange as chairman of a legislative committee, and as such he felt disappointed in the result, and was disposed to criticise the farmer and Granger members. He is right. The members deserve it; and yet we must remember that they did not control the body, were fully up to the average, and should not be held responsible for all the schemes. To make their numbers effective, they must combine as do the city members, irrespective of politics. The late Legislature was very expensive to the people, which was all wrong and should be condemned; and yet these clerkships and other useless legislative appendages were trifling in comparison to the great expenditures in enlarging and building State prisons and asylums of various kinds; there is where the millions go. The last of these costly institutions was the Asylum or Home for Feeble-Minded Children. This, like all the other institutions, was good in its way, and much can be said in their favor, but the question is: Where shall the line be drawn? A solicitor for State aid came to me and set forth in glowing terms the great good that his Home had done for the feebie-minded, and as a result there was a great rush for the Home, necessitating enlarging the quarters, etc." Here again, thought the speaker, it became necessary to draw the line to prevent the majority, who might be thought fit subjects for the Home, from going there at the expense of the State. Any number of families might and certainly would unload their offspring upon the State. But whether abused or not, this, like the other State institutions, is becoming a costly elephant and should be watched by the people.

A well-deserved compliment was paid by Bro. Ohleyer to his colleague in the Assembly, Bro. D. N. Sherburne, for his intelligent, diligent and upright course. During the delivery of his remarks, the speaker was frequently applauded, showing that the audience was in sympathy with his utterances.

Other Speakers.

Lecturer Daniel Flint, of the State Grange, being called upon, read an able and instructive speech, well worth publishing in our columns, although far better received from Brother Flint's frank and earnest delivery. We forego further mention, as he will, no doubt, deliver the lecture again. We can consistently recommend all Grangers and farmers to improve the opportunity of listening to it, whenever and wherever the chance occurs.

Overseer W. L. Overhiser, of the State Grange, gave what was pronounced the best Grange speech he ever made, full of earnestness, and demonstrating that he has improved his time and opportunities in recent active work for the Grange.

Hon. J. V. Webster, being loudly called for, reluctantly responded with the remark that he was not in the habit of speaking to such empty benches, and regretted to say that too often has the Grange been injured by talking audiences tired, and the benches to emptiness. The whole State Grange knows Brother Webster as one of the most able and popular Grange speakers. The loss of a good speech from one who has the confidence of the Grange in such round measure was the only thing much to be regretted during the whole occasion.

Among other State Grange officers and many active and prominent Patrons present, were Bros. B. F. Frisbie, Chaplain; J. Chester, Secretary, and editor of the *Patron;* Bros. Strentzel, Baldwin, Renwick, Jones, Dennis, and Kelsey. Sister Strentzel, who has lately suffered from illness, ventured to be present, and was warmly greeted, together with Secretary Lander and many other faithful and well-known sisters.

Bros. Smith, Loucks, Sharpe, and the Committee of Arrangements as a whole, deserve thanks for their active and successful efforts.

We have enjoyed many pleasant Grange picnics, but none which will be remembered by the legions who attended with more lasting pleasure than the Danville picnic of 1887. We regret our utter inability to do it justice in our report, but shall advise readers who can, to be on hand and observe for themselves on similar occasions hereafter.

Hock Farm Picnic.

We have received a cordial invitation to attend the Yuba City Grange picnic at Hock Farm on the 17th, with the remark that, having seen Sutter county (at the time of the last State Grange session) in its sere condition, we ought now to view it in the bloom. We know that this good invitation from Yuba City will apply to all Patrons, and we hope that large delegations will be present from all parts of the State, whether we are able to go or not; for, according to the past experience of all who have met with Yuba City Grange, no one will go away dissatisfied.

A Farm Visit.

Starting from Danville in the evening, just as the last picnickers were leaving the grounds, we drove eastward some four miles, passing along not far from the western base of Mt. Diablo. Crossing a slight ridge, our road followed the trend of a narrow and most beautiful valley. The low hills on either side were charmingly rounded and covered with bright flowers, green grass, and fields of wheat, barley, and oats.

The soil in the level portion of this valley is exceedingly deep. Upon the sides of the hills also, and even upon the tops, the soil is both rich and deep, and produces well in nearly all seasons, and very prolifically in the best. The summer-fallowed grain appears certain of yielding well the present year, while the winter sown is not nearly so good.

At the end of our journey, Worthy Master Johnston and ourself and family were hospitably received and delightfully entertained at the happy and well-ordered home of Brother Charles Wood.

Brother Sherburn owns a comfortable and valuable piece of 600 acres next west of Brother Wood. In the evening he brought Brother Overhiser to Brother Wood's, and with conversation, music, and other amusements, a most enjoyable evening was passed.

In the morning we all reluctantly bade goodbye to the Worthy Master and Overseer, who took their departure for home by a carriage ride to Pleasanton and thence by rail. We hope they both will write us how they enjoyed the picnic, the farm visit, and their ride hence through the green and fertile valleys which they passed.

Brother Wood is practicing diversified farming in a very successful and commendable manner. His dairy herd consists of some 80 excellent cows, about one-half of which are now being milked. His stock barn is large and well built, with the best and most sensible modern improvements. His dairying outfit is equal to anything of its size we have seen in the State. It consists of a De Laval cream separator and revolving barrel churn, operated by an upright steam boiler and engine. The latter is also used for sawing wood.

His storage and butter-working basement seems convenient and ample. All this looks very fine, but more delighting still is the fact that this dairy is engineered and operated to perfection by Miss Libbie Wood, who takes entire charge of the establishment, and turns out some of the best fresh butter that it has ever been our fortune to taste. Everything about the establishment seems neat and in proper order.

Another young daughter is interested in poultry, and we had the pleasure of seeing on the place over 200 pure white Leghorns, which were reported as the very best of layers and quite a profitable flock.

Brother Wood cultivates some 200 acres of grain, and seldom fails of a good crop. He prefers pasturing alternate seasons, for the purpose of resting the land, and we are convinced that his most successful practice might well be followed more extensively by farmers in this and other sections of the State.

We could not but observe with interest the careful storing of his farm vehicles and implements, which filled a good-sized barn.

A fine stream runs through the place and furnishes plenty of water for irrigating his flower and vegetable gardens, also for several fishponds, beside supplying his stock constantly with fresh and wholesome water. We commend heartily Bro. Wood's principle of encouraging his sons and daughters, by giving them a share of stock to own, care for and "accumulate" in their own names.

We cannot feel otherwise than proud of Brother and Sister Wood as fellow-Patrons and friends, for obvious reasons. His systematic methods in farm and business transactions embody so many excellencies, that it would be a benefit to mention them more particularly. We hope he will hereafter write more concerning his well-tested method for the benefit of his fellow-farmers.

From Santa Rosa.

EDITORS PRESS:—Santa Rosa Grange still grows. New members are applying at nearly every meeting. There is every reason for believing the next session of the State Grange will be more largely attended than has been any session for many years past. The members of the local Grange will spare no efforts to make the session more than enjoyable. Santa Rosa's good name will not suffer at the hands of its Grangers. Active and intelligent work is already being done. All Patrons who can, ought to attend the State Grange at Santa Rosa, the first Tuesday in October, 1887.

Santa Rosa Grange will have an anniversary reunion on the 28th of May. The program will be both amusing and instructive; a jolly company will be present, and a good dinner will be

served to members of the Order. Short speeches, select singing, racy readings, exhaustive essays and actual amusement will be furnished without money and without price. All Patrons entitled to attend will be more than welcome. No special invitations. Give the rap, grip and sign, and get the best that the country affords, is the rule at Santa Rosa. That you will come and enjoy one day at the Grange is the wish of A PATRON.

WE accord the Danville picnic large room this week, to the exclusion of other interesting Grange matter—further remarks concerning Contra Costa county will appear later.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

CROWDING CLUSTERS.—Livermore *Herald*, May 5: Vines trained upon the Chaintre and Guzot systems are fruiting very heavily. Frank Fowler counted 135 bunches on one of his five-year-old Chaintres a week ago. They were big bunches, too. C. G. Sperry has a five-year-old Rose of Peru vine trained on his piazza, which, at a low estimate, has set 500 fruit bunches.

APRICOTS GALORE.—On a three-year-old apricot tree on C. G. Sperry's place this week, we counted 20 half-grown apricots within a space of four inches on one branch. D. G. Paul has picked 600 apricots from a four-year-old tree on his place this season, and there still remain all it can properly mature.

FLOURISHING GRAIN.—W. H. Wright made a tour of the hills northeast of Livermore this week, and states that, in the country between the Doolin canyon and Tassajera creek, he never saw a better stand of grain than is now on the ground. The old Martin horse pasture, which, until a few years ago, raised nothing but mustard, is now all in grain, and will produce an enormous crop. He mentioned several extra fine crops, one of 100 acres of Chevalier barley belonging to John Armstrong, on railroad land near the head of Doolin canyon, and another of common barley on the Matt. Gallagher ranch.

MERINO SHEEP.—*Reporter:* James Roberts can show some of the finest French merino sheep. Orders come to him for bucks and ewes from South America, England, etc. He says the healthfulness, longevity and general improvement in stock here is very noticeable.

Colusa.

COUGARS ENOUGH.—J. M. Pugh, of Little Stony, tells the Maxwell *Argus:* On the night of April 29th, I had six sheep killed in my corral. The bodies were poisoned next day with strychnine. Next morning I found four large panthers killed by the poison, all within 50 yards of the corral.

Contra Costa.

ALMONDS.—Martinez *Item*, May 10: The almond trees in this vicinity have fruit developed to almost full size. The trees are vigorous and the young fruit healthy, and will mature a good crop. The almond is free from all pests and is one of the varieties of fruit that will thrive in any favored nook in the San Ramon valley.

STRAWBERRIES.—Antioch *Ledger*, May 7: We have had an opportunity to test the "Antioch strawberry," Mr. Biglow having remembered this office generously. In the drawer received, while all were of good size, a large percentage measured from 4 to 4½ inches in circumference. Unlike overgrown fruit usually, this berry proves to lose nothing in quality when of great size. The flavor is superior, and the fruit firm, though well ripened throughout.

Lake.

ALMONDS, ETC.—*Avalanche:* A. H. Poe says that his almond trees are loaded with fine and almost grown nuts; that nowhere in the county has he seen any fruit damaged by the frost; that there is entirely too much fruit on the trees, and to get first quality much will have to be picked off.

Monterey.

DISTRICT FAIR.—*Democrat:* Monterey District Agricultural Association No. 7, embracing the counties of Monterey and San Benito, will hold its fair this year at Salinas the week immediately following the Santa Clara fair.

Napa.

PONIES FROM S. A.—St. Helena *Star:* At Oakville, Tuesday, our friend Edington drove up with a pair of South American ponies. They were from the Rutherford ranch and were beauties in their way. A little larger than Shetlands, they were still much smaller than California mustangs. They were imported from South America and are said to be far ahead of the Shetland.

San Bernardino.

OLIVE OIL.—San Bernardino *Index:* Towne & Nickerson have a few bottles of olive oil, made by Mr. J. S. Hewitt, of Lugonia, which is pure and unadulterated. Mr. Hewitt has a small orchard of olive trees which are just beginning to bear and as yet does not make much of the oil, but what he does make is first class. We are glad to see this industry in our valley.

Sacramento.

EDITORS PRESS:—A cold north wind is blowing. Last night a heavy frost damaged the grapes more or less; also tomatoes and potatoes. Farmers have commenced cutting hay. As far as known, the crop is light; chiefly wheat and barley raised. There was so much hay last year, more will raise grain. Many are holding back their hay, as it looks probable it will bring a good price next fall. Strawberry season at hand; many have set out extensive new patches; some have estimated as high as 100 acres. Oranges and lemons are hanging in full blossom.—G. R., *Sacramento*.

Shasta.

DAMSONS AND RAISINS.—Cottonwood *Index:* On the Gamback farm up in the mountains near Shingletown, 100 damson plum trees, two years old, were set out one year ago, and the same season the fruit from those trees was sold for $10.50. J. R. Lowe has 56 acres in vineyard on the red gravelly land, a few miles northwest of Cottonwood. Sixteen acres of this vineyard was three years old last season and yielded $80 net profit to the acre, or $1280, for the raisins on that particular 16 acres.

Solano.

EDITORS PRESS:—The weather is pleasant, though cloudy. We had quite a shower of rain last Friday. Haying has commenced, but the crop will be light—$10 and $12 per ton is asked for it in the stack. Cultivating orchards and vineyards is about done, and many are thinning peaches. This is quite a job this year. A man can thin from 14 to 20 trees per day. The ground under many of the trees will be covered with the fruit picked off. Some half dozen driers will be brought to Vacaville this week and there is talk of getting more. Others are getting trays to dry in the sun if the prices of fruit in the city do not justify them in shipping. People generally are holding apricots at two cents per pound, and say they will dry if they do not get that. Pringle apricots will be ripe by the 20th of May. W. W. Smith is shipping about 200 boxes of cherries per day, and working 70 hands, white and Chinese. He says his cherries will turn out about half a crop. He is not shipping East and will not while they are worth $1 per box in San Francisco. There does not seem to be much disposition among fruit-growers, especially small ones, to ship East. So many got cinched last year that they seem to think if they cannot sell at home for a good price the best way will be to dry.—G., *Vacaville, May 8th.*

ALMONDS PAYING.—Dixon *Tribune:* Mr. Abernathie, of Suisun, has ten acres of almond trees 14 years old. The yield now amounts to about a ton to the acre, from which he realizes from 11 to 33 cts. per lb. The profits are more than can be realized from 320 acres of wheat.

Sonoma.

OLIVE OIL.—*Republican*, May 5: Col. Geo. F. Hooper brought to Santa Rosa, Monday morning, samples of fine olive oil made from olives grown upon his own grounds, now in the tenth year of their growth, from cuttings planted by himself. He has four hands engaged in making the oil, and will have a bounteous product. The oil is clear and rich. To Col. Hooper belongs the credit of having produced the first ripe olives and made the first pure native oil in Sonoma.

REALIZING ON ROSES.—Cloverdale *Reveille*, May 7: Charles Knust sent to the florists at the Bay, during the opera season, 22½ dozen of Marechal Niel roses, realizing therefrom $15. They were all grown on one tree.

Plumas.

GOOD PROSPECTS.—*Sagebrush Stockman*, May 4: Jerry Tyler, of Plumas county, was at Reno Monday. He reports everything favorable for a good year in his section of the footstool, and although grass is not as desired, stock is doing well, and a good crop of cereals and a large yield of fruit are assured. Last year Mr. Tyler sold over 3000 boxes of fruit in Nevada, and expects to do fully as much business this year.

Sutter.

CANNERY OUTLOOK.—Geo. Ohleyer to Marysville *Appeal* reporter: This season the company's machinery will run day and night, and then the fruits from many orchards not already contracted to S. F. canneries will have to be shipped. The crop of peaches and apricots exceeds by from two to three times that grown in any previous year, and from the manner in which many farmers are converting their grainfields into orchards, the time is near at hand when a half dozen canneries can be successfully operated. The time is too short to enlarge the capacity of the present cannery this season, or it would be done. Next year it will probably be enlarged to several times its present size. The first operations for this season will commence about May 15th and continue until late in the fall.

Tulare.

FRUIT WITHOUT IRRIGATION.—Tulare *Register:* In 1878 and 1880 Mr. A. Fullwiler planted a number of almond trees. In 1877 he planted a small orchard of peach trees, in 1880 pear trees, and in 1881 apple trees. He had no irrigation ditch that came in range of his trees, and consequently his trees had no irrigation. We have had several so-called dry years since he planted his trees, but his trees grew, thrived, and early matured fruit. All of his trees have attained a good size, show a healthy condition, and no year have failed to produce a fair crop of good fruit, some of it of a superior quality. He has also grapevines trained for an arbor that have more the appearance of trees than vines, the main stems being from seven to eight feet tall and from five to seven inches through. These, too, were grown without irrigation and bring a good crop of grapes each year. J. B. Bailey has a small vineyard, that, although irrigated when first planted, has been growing fair crops of a good quality for several years without irrigation. Both of the places are in the valley, 10 or 12 miles from the foothills. Trees grown without irrigation send their roots down deep after moisture.

Ventura.

BLUE GUM PLANTATION.—*Free Press:* Jos. Sexton has planted about 100 acres on the Harmon ranch in eucalyptus trees. In a few years he will find sale for them for railroad ties and fuel.

Yuba.

THE CLIP EXCELLENT.—Marysville *Appeal*, May 6: N. D. Coombs is engaged with his men in shearing a large flock of his sheep now on pasture near Moore's Station. He said yesterday that the clip this season would be the best in years, both in point of quality and quantity.

GRAPES ON HARDPAN.—O. Whiteside, who lives on Dry creek about 14 miles east of Marysville, has a vineyard of five or six acres on red soil underlaid with hardpan. In places the hardpan comes within two feet of the surface of the ground. The vines were grown from cuttings where they stand, and have never had any irrigation. They have always borne well.

FOOTHILL ORANGES.—W. Williams brought to the *Appeal* office yesterday a cluster of five magnificent-looking seedling oranges, grown at his place in the foothills, 17 miles northeast of Marysville, and two miles this side of the Stanfield house. The elevation is about 700 feet. The tree is 15 years old, and bore a large number of oranges last year. It has never been injured by frost. The oranges brought in were remarkably clean and bright, of a deep, rich color. They proved to be sweet, but had remained so long on the tree that the pulp had shrunk a good deal through evaporation.

NEVADA.

STOCK THRIVING.—*Stockman*, May 4: T. B. Rickey came in from his Douglas county ranch Monday evening. He reports grass abundant on the ranges in the southern part of the State, the cattle are doing well, and the calf crop so far very satisfactory. Andrew Benson returned from the eastern part of the State Sunday morning, and reports everything favorable for a good year. The grass has a good start and is already as plentiful as it was at any time last year, and cattle are waxing fat. It makes but little difference now whether any more rain falls or not, as good feed is assured. His travels took him through Eureka, Lander and Churchill counties, and what is said above applies with equal force to each.

Sacramento County Notes.

EDITORS PRESS:—I have finished spraying apples and pears with Paris green for codlin moth, and next spring I intend to spray for peach moth with the same. It is late now, as the damage is already done.

My apricot trees when young have been frozen down; some partially and some killed outright. I thought to experiment this year with manure around the trunk of the tree. I piled manure and old straw in a conical shape around the trees about 18 inches high, and out of 1000 so protected I lost only one tree. I shall continue the experiment.

I will give you a list of squirrel poisons I have been experimenting with: Arsenic, Paris green, strychnia and prussic acid. The acid is prepared in this way: To 15 lbs. of wheat take oil of rhodium, ½ oz.; oil sweet anise, ½ oz.; strychnia, ½ oz.; prussic acid, ½ oz.; 1 cup sugar. Mix the oils with the wheat first; second, the strychnia; third, the acid; fourth, the sugar. The scent of the oils attracts the animals. This is the most deadly poison in the world and needs to be handled with the greatest possible care, as a very little causes speedy and sure death.

Several land sales have been made between Sacramento and Folsom at prices ranging from $100 to $300. The boom is coming. The prospect for a fine crop of fruit is very good, and grain begins to show to advantage, as the late rains saved it from a failure. Some sharp men have sold their grapes and some lines of fruit in advance, for fear of a glut in the market. Some are preparing to dry with evaporators, etc.

Routiers, Cal. MONTGOMERY PIKE.

Allegretti Process of Cold Storage.

Readers will remember that favorable allusion was made at the last meeting of the State Horticultural Society to Mr. Allegretti's improved process of cold storage. This process has been so cheapened that the cost of storage is exceedingly small. As we give on another page a report on the Riverside storage enterprise, it is but fair to give herewith a statement just issued by Mr. Allegretti. There is abundant room in this State for all good processes, and we commend the subject to the careful consideration of fruit-growers.

To all Concerned: I am informed that the canneries will be unable to can the immense crop of apricots this year; that their consumption is only about 5000 tons, and that the reason that they cannot can more is due to the fact that the apricot crop comes in (or rather ripens) all at once. The canneries, not having the facilities to keep the apricots stored away, treated against decay, etc., they are compelled not to buy any more than they can use; and thus they will not buy more lest they will spoil on their hands. The early peach crop will be in very soon, and they will have to stop on the apricot and commence on the peach; but if they had means whereby they could keep the apricots, say for three to four weeks, they could continue to can them in perfect condition, the consumption would be much greater, and the canneries could put up more fruit than possible under the present circumstances.

I have the means to preserve the apricot for that length of time, and with a very small expense. I can furnish substantial evidence to prove this fact. By such means I consider that at least $100,000 could be saved to the fruit-growers this season. My process does not require four or five months to be put in operation, as there is no machinery in it whatever. In two or three weeks I can build rooms for the various canneries, or for fruit-growers, with a capacity of several thousand tons. The fruit would thus remain to supply the demand three, four or six weeks, if necessary.

Should any of the various canneries or individual fruit-growers desire a further explanation, I would be happy to hear from them. I would also be glad to meet with the fruit-growers of the various sections, and demonstrate to them the advantages of my system, which is the result obtained from many years of practical experiment.

Very respectfully, I. ALLEGRETTI.

West Berkeley, Cal., May 9.

San Jose Floral Fair.

[Written for the RURAL PRESS by H. M. H.]

The Floral Fair, which was held in the Horticultural hall, in San Jose, from the 4th to the 11th inst., proved a great success. Entering the hall, one was bewildered with the magnificence of the scene. The large hall had the appearance of a city, with its monuments, towers, domes, and palaces completely decked with flowers of every conceivable form and hue, while the perfume that pervaded the air was indescribably delicious.

A huge rainbow with all the colors represented by flowers, spanned the entrance. At the left was a design in moss of Mt. Hamilton and its surrounding hills, the summit bearing a floral telescope, the work of Miss Mattie Ross.

A wooden framework, covered with evergreens and flowers, was the emblem of San Jose, the boom being typified by a globe of snowballs. A temple and shrine, with all their fixtures accurately delineated with flowers, was a beautiful piece of art. Near the middle of the hall was an excellent imitation of San Jose's electric tower, at the right of which Mrs. A. P. Hill had set a dinner-table with choice wares from the store of W. S. Richards. The unique disposition of rare flowers and ferns gave the beholder the impression that this table was spread for fairies.

A summer-house, well provided with easy-chairs and lounges, all covered with flowers thickly set, was tempting to the weary beyond the power of resistance.

A large monument of callas was a thing of great beauty, and the many odd and striking designs seem to have taxed the ingenuity of the exhibitors to the utmost.

Too much credit cannot be given to Hon. Cyrus Jones, president, Capt. Frank Dunn, secretary, of the Horticultural Hall Association, and the ladies who contributed to the success of the fair.

One of the leading features of the exhibition was a procession every evening of 40 little girls, each drawing a wagon decorated with some variety of roses.

The following contains the names of the ladies who provided the wagons, the variety of the rose used in ornamentation, and the little girls who appeared in the procession:

Mrs. Frank Stock, Lamarque rose, drawn by Susie Stock.
Miss Lizzie Monahan, Blackberry rose, Frankie McGettigan.
Miss Monahan, Queen of Roses, Virgie Wilcox.
Miss Monahan, white Lady Banksia, Clara Belle Battee.
Mrs. Norton, Marie Van Houtte rose, Eva Norton.
Mrs. Nellie Freitag, Hermosa rose, Gertie Freitag.
Mrs. O. A. Hooker, yellow Lady Banksia rose, Ivy Hooker.
Mrs. C. Ayers, Cloth of Gold rose, Marian Ayers.
Mrs. L. E. Rodibaugh, Gold of Ophir rose, Nellie Rodibaugh.
Mrs. G. M. Bruce, Jacqueminot rose, Bertie Bruce.
Mrs. T. B. Keesling, Castilian rose, Emma Keesling.
Mr. K. B. Diedrick, Eliza Savage rose, Lottie Diedrick.
Mrs. J. P. Jarman, Wild Rose of the Prairie, Katie Jarman.
Mrs. S. W. Boring, Malmaison rose, Mez L. Bailey.
Mrs. W. D. Castle, pink moss rose, Ada Castle.
Miss Mabel Watkins, La Salmona rose, Lotta Bragg.
Mrs. F. M. Tenney, Homer rose, Cora Baggs.
Mrs. Bradley Smith, Lamarque rose, Ethel Kirk.
Mrs. Clifford Owen, Marechal Niel rose, Jennie Owen.
Miss Mary Whittier, white rose, Hattie Quilty.
Miss Cora Blaine, Cloth of Gold rose, Anna Rude.
Mrs. E. C. Smith, Safrano rose, Mattie Smith.
Miss Nellie Gardner, Triomph de Luxembourg rose, Fannie Gardner.
Mrs. Anna Curtis, La Marque rose, Jennie Curtis.
Miss J. May Trephagan, tea rose, Maud Trephagan.
Mrs. C. H. Corey, Agrippina rose, Della G. Grimes.

TEHAMA COUNTY placed a bounty of 15 cents on jackrabbits last November and has since paid out $2270 for 15,134 scalps. It will be discontinued June 1st.

The Wind-Swept Wheat.

Faint, faint and clear—
Faint as the music that in dreams we hear—
Shaking the curtain fold of sleep,
That shuts away
The world's hoarse voice, the sights and sounds of day,
Her sorry joys, her phantoms false and fleet—
So softly, softly stirs
The wind's low murmur in the rippled wheat.

From West to East
The warm breath blows, the slender heads drop low,
As if in prayer.
Again, more lightly tossed in merry play,
They bend, and bow and sway,
With measured beat,
But never rest;
Through shadow and through sun,
Goes on the tender rustle of the wheat.

Dreams, more than sleep,
Fall on the listening heart and lull its care;
Dead years send back
Some treasured, half-forgotten time,
Ah! long ago,
When sun and sky were sweet,
In happy noon
We stood breast-high 'mid waves of ripened grain,
And heard the wind make music in the wheat.

Not for to-day—
Not for this hour alone—the melody;
So soft and ceaseless, thrills the dreamer's ear!
Of all that was, and is, of all that yet shall be,
It holds a part—
Love, sorrow, longing pain;
The restlessness that yearns;
The thirst that burns;
The bliss that like a fountain overflows;
The deep repose;
Good that we might have known, but shall not know;
The hope God took, the joy He made complete—
Life's chords all answer from the wind-swept wheat!

—Mary Ainge De Vere.

Mis' Deacon Clapp, Second.

"Mis' Deacon Clapp's dead!"

"La! You don't say, Mis' Potter. How suddent!"

"It's nat'rel. We're all a-comin' to it. I'll have a mite of bacon and a dozen eggs."

"How-de-do, Mirandy? Heard Mis' Clapp's been taken?"

"Massy! I want to know. Poor man, *how* he must feel!" and Miss Miranda Brown heaved a sympathetic sigh.

"I'm so worried about the children, poor dears," said the little storekeeper. "Fred, you let me catch your hand in the sugar again! As I was a-sayin', there's three on 'em, and old Nance Barker can't get through the work, let alone—"

"Dear me! when I had ought to have been Christian enough to have offered my poor help before," and Miss Miranda turned hastily and tripped out.

"Did you ever? Aint that girl forrid!" ejaculated Widow Slocum.

"Girl?" echoed Mrs. Potter. "The land sake! Why, Mirandy Brown's forty year old!"

"Well," said Mrs. Slocum, deftly cuffing her eldest hope with one hand, while with the other she selected the largest eggs for her customer, "Mirandy needn't dream she'll ever be Mis' Deacon Clapp, second, for if deacon marries, 'taint Mirandy he'll ask."

"Du tell. Who do you s'pose?"

"Land, Sarah! 'taint proper to be talkin' so, and Mis' Clapp just departed."

"Certingly not," said Sarah, eyeing with latent suspicion Mrs. Slocum's careful "makeup."

"They do say there's the most elegant furniture, just up from Bosting, and she had to leave it. Dear me, it brings poor Potter right into my mind," and she hurried away muttering "She knows who he'd marry! I vow! Thinks it's her."

Many were the caresses bestowed on the motherless Clapps, and many a sympathetic glance met the deacon's. Deaf old Nancy Barker couldn't long preside over his household, argued female Birneyville, and he must think of the poor, dear children. But a second year followed like the first, and "Mis' Deacon Clapp, second," was not.

Like many New England farmers, Deacon Clapp possessed a superior education, and, his ample means permitting, spent many hours in his library. He was reading there one morning, when Joe pushed open the door.

"Papa, have you forgotten school begins today, and we've been waiting for you ever so long?"

The deacon rose at once. "So it does, girlie, and there's a teacher to be introduced, too," for he was committee man.

The two boys ran ahead, but Joe walked by her father's side, her hand clasped in his.

"What would you ever do without me, papa, you forget things so."

He smiled, but a sharp pain darted through his heart, and his clasp tightened convulsively. His love for Joe, with her mother's fragile beauty, was almost idolatry.

Reaching the school, he made the usual speech, then turned to the teacher; he knew she was a graduate of Holyoke, highly qualified, experienced, etc., and came expecting to meet a somewhat dictatorial person whose vocation could be told at a glance. He saw a pale, dark-haired, dark-eyed woman of 30, with the quiet refinement that marks the true lady, and a resolute gentleness of manner peculiarly charming.

The deacon walked slowly home, thinking it odd that he should be so stirred by sight of a new face. As he passed Mrs. Potter's she called from the door: "Won't you please step in?" and walked into the parlor, the deacon, perforce, following.

"Set right down, deacon. My parlor aint as tricked out as some folkses, but if I do say it, it's clean;" and she whisked out an invading fly before he could buzz a single note of triumph.

"Decidedly neat," said the deacon, looking at the portrait of the departed Potter over the mantel, and the pictured eyes stared back with something of warning in their faded depths.

"Well," said the widow, rocking herself violently, "Helen M'hitable Slocum told me that Mis' Jim Graves told her ma that Nance Barker told her that you said you was goin' to furrin' parts for the winter, and wanted some one to live to the house, and take care on it."

"I am going to New York for the winter."

"Well," continued she, "I know the Bible says we hadn't orter speak ill of anybody, but I'm certain there is cases where it is our bounden duty not to be still, and I always live up to my light. Helen M'hitable said her ma had some notion of speaking. as the store don't pay. Land! how could it? Such a shiftless creature as Mis' Slocum is! Now, me and Mis' Clapp always set store by each other, and I know just how she'd feel to have a passel of dirty Slocums traipsin' over her carpets."

The deacon winced.

"Besides, I should be willing to do it myself. I know poor, dear Maria'd be glad to have me there."

The deacon rose abruptly. "Nothing would suit me better. To-morrow we will settle the terms."

"Dear me," sighed the widow, accompanying him to the door, "how you must miss your partner. And the poor children running wild without no ma! That settles Mis' Slocum, I guess," she muttered, closing the door.

Great was the chagrin of Miranda and Mrs. Slocum when they discovered the widow's march, but in the spring when the deacon returned and she was installed in her own quarters, their hopes revived immensely.

One beautiful June afternoon, Miranda and Mrs. Slocum walked home from sewing circle together. "For my part," said Miranda, "I am heartily tired of it. It's Miss Barton, here, and Miss Barton, there, and Miss Barton, what do you think? everywhere."

"But she's the nicest schoolmarm ever I've seen," said Mrs. Slocum, who was really kind at heart.

"You'd think she was an angel," continued Miranda. "I know she's an artful, designing minx. Why, she has infatuated Joe and the deacon, too, I'll warrant. What do you suppose I heard to minister's yesterday?"

"What?" eagerly, for Miranda, as village music-teacher, garnered choice gossip.

"Miss Gray and minister's wife and me was to dinner, and Miss Gray said the young Clapps were home, and she supposed deacon would be along pretty soon, and then she said she heard that like as not deacon and Miss Barton would step off together."

"The idea!"

As they parted, "Miranda," called Mrs. Slocum, "take these strawberries. They won't keep over Sunday."

Miranda expressed her thanks, and was hurrying homeward, when, as she neared the deacon's, seized by inspiration, she turned in at the gate and was mounting the steps, when Dr. Black opened the door and paused abruptly.

"Why, who's sick, doctor?"

"Miss Josie."

"Why, I'm real sorry. I was just bringing her some berries; 'taint so long since I was her age, but I remember what I liked then."

"H'm, yes, ma'am, but they're not exactly suited to this case."

"I guess I'll go in and see Joe; I've some experience in sickness if I am young."

"H'm, yes," said the doctor, "but I can't let you in here, unless, indeed, you'll agree to take charge of her."

"What's the matter, doctor?"

"The smallpox, ma'am!"

Down went the berries, and Miranda sped away like the wind.

With a sigh of relief, Miss Barton dropped the key of the schoolhouse in her pocket, and set out on her walk to the boarding-house, breathing in the fresh June air with a delicious sense of freedom, thinking of the dear old home in the shadow of Mt. Wachusett, the loving hearts waiting her coming.

"O Miss Barton!" cried Jennie Nelson, breathlessly, "Joe Clapp has the smallpox!"

"No, oh, no!"

"Yes, but she has," persisted Jennie, "and Dr. Black can't get any one to take care of her. Isn't it shocking?"

Miss Barton walked on, all the bright light stricken from her day. Reaching the farmhouse, she heard the same story, and, tired and disturbed, went to her room, but not to pack. She was gazing absently out, when Dr. Black drove by. Calling to him, she ran out to the gate.

"It is only too true, Miss Barton, and the worst of it is I can find no one to care for her. The old woman is perfectly useless. I am going to Castine, but I confess I am not very sanguine."

"Meanwhile she may perish?"

He nodded.

"Doctor," said Miss Barton, "take me; I am not afraid, and if God sees fit to call me—" her voice trembled a little—"I am ready to say, 'Thy will be done.'"

"Bless my soul, you don't know what you are saying, Miss Barton! Not one of these people who have been coddling these children for three years would do it, and you are a comparative stranger."

"The Levite passed on, but the Samaritan ministered unto the stricken one. Say no more, doctor; I am fully determined. Please wait for me."

"'When a woman will, she will,'" muttered the doctor as he watched the slight figure flit away.

She speedily rejoined him, and they drove away in utter silence. Reaching the house, she listened calmly to the doctor's instructions, but left alone with poor Joe, she sank on her knees and implored His strength and guidance.

Mr. Clapp was almost distracted when he heard of his darling's danger, and exacted from the doctor a promise to show a white flag if the worst came. How he watched the window where the red flag fluttered, expecting, dreading, each moment to behold the fateful sign substituted; ah, no parent's heart needs the story.

It was the great excitement of the village, which was divided into two parties; all the sour, malicious old women expressing their shocked astonishment over Miss Barton's unmaidenly forwardness; all the tender-hearted mothers praising her heroism and praying for her success.

It was not to be.

It was a sultry July afternoon, the air barely stirring the muslin curtains. Miss Barton sat watching the poor little disfigured face nestled among the pillows. Joe was sleeping, and she tried to persuade herself that death would be merciful, and spare the child who had so won her heart, yet she could not but see the fell shadow deepening, deepening. Suddenly the great brown eyes opened, all the fever glitter gone—in their depths new light.

"Dear Miss Barton," said Joe, feebly, "I am so sorry for poor papa and the boys."

"Don't talk so, Joe," the tears falling despite her.

But the child smiled pitifully. "We always loved each other, didn't we?"

Miss Barton kissed her tenderly.

"Oh, I would like to stay with you and them. It was hard to think of going, but now I was dreaming of mamma, and she smiled and seemed to wait for me, and I can't turn from her."

"Joe, dear, it was only a dream. Try to sleep again."

"No, I must talk now; I want you to tell papa and Archie and Charlie, how much, how very much I loved them and you, and to tell papa he mustn't be very sorry, and to be good to him and the boys, won't you?"

"I promise."

There was silence; the tall old clock ticked loudly, never so loud and fast as now, Miss Barton thought, as if it were hurrying away the hours that the end might come.

"Tell me of Jesus," said Joe.

And the woman obeyed, and when she ceased the child exclaimed: "'Suffer little children to come unto Me!' Oh, I'm not afraid to meet Him!"

The gray shadow deepened, the little fingers grew colder, the breath came short and quick.

"Lift me," she murmured; "I want to look out."

The sweet scent of new-mown hay, the perfume of roses, the hum of insects, the murmur of voices came into the room. Joe's eyes lit as she saw the meadow where the men, with their broad-brimmed hats and white sleeves, were swinging their scythes, the waving fields of gold-tasseled corn, the sleek cow placidly surveying the antics of a sportive calf, and the golden sunlight gilding all with matchless glow. And afar off at the stile was a tall figure, with glass in hand, gazing into the room.

"Papa," cried Joe. "Papa! I see him! He, oh, he *does* see me!" she panted with delight, and tried to wave her hand; it fell at her side, and her mouth quivered, and she turned away her head. "Let me lie in your arms, so. It *was* him, though."

"Shall I signal him?" whispered the doctor, who had softly entered, but Joe shook her head.

And the sun sank lower, and the lines of golden light narrowed, and the soft gray twilight came on apace. Joe's lips moved: "Sing."

Tremblingly Miss Barton began Joe's favorite song, but not looking into the wide, wistful eyes, gathered strength:

"Asleep in Jesus, Blessed Sleep,"

And without the gray feathers of the night were falling, and within the black plume of death was waving.

Once, twice, the singer's voice died out. She looked at Joe and sank beside her. "Asleep in Jesus" indeed.

"There goes the deacon," said Miss Miranda, looking up from her tea and gossip. "I suppose, now, Mrs. Gray, that minister will be called on by the deacon pretty soon. Of course Miss Barton won't refuse him."

"She has refused him," said Mrs. Gray, quietly, and all Miranda's coaxing could draw from her nothing more than that she thought Miss Barton was actuated by a higher motive than the seeking of earthly applause.

"All the same," mused Miranda, "it's very nice to have such lofty ideas; I'm sure I do admire Miss Barton, but I do wonder who'll be Mis' Deacon."

And she is still wondering.

Notions and Facts.

[Written for the RURAL PRESS by MRS. J. HILTON.]

How strange it is that our ideas of people's looks are so seldom verified. We will imagine a person tall and thin, but nine cases out of ten will prove we were mistaken, and the person will be short and thickset. Or maybe we will think a person will be young and pretty when she is old and plain. I have so often been told that I was so different from what I was thought to be that I have taken to noticing the mistakes made more than I otherwise would.

We often know, or think we know, a person by hearsay or by his writings. We go to the town where he lives, and maybe our attention is attracted by some action or words said, and we wonder to ourselves who that person is. He may prove to be the very person we wanted to see. Sometimes our risibles are affected at some odd or comical situation, and we find an old acquaintance, whom we thought very dignified, doing something extremely undignified. I had been anxious to see a certain young editor. One morning, looking out from a friend's doorway, there stood a pleasant-looking young fellow, with a long stick in his hand, watching very intently for a poor little mouse supposed to be lurking in a bag with some empty fruit-cans. An older gentleman had a short, thick stick in his hand, and he also was watching for the mouse. Pretty close to the bag were two ladies intent on taking out the cans. Before they got through up came another man, also with a stick. Come to find out, the group included the editor I had wished to see, also a veteran school-teacher and a preacher—all intent on one poor little mouse, which proved to be a big black bug. You should have seen how quick the sticks were dropped when they found that the small but active rodent was not there. It was very comical. Being out of sight, I enjoyed a laugh all by myself.

Often we, as Charles Lamb said, hate a person because we do not know him. We take one person's word for another's ills, and think we never can like such a person, when maybe in time he becomes one of our very best friends. How careful we ought to be as to what we say of people. Yet how seldom we stop to think what effect a careless word may have upon a person's life.

The Latest Fashion in Girls.

The proper thing in girls this year is dashing and straight and strong. She greets mankind with an impressive stare, as she strides along the street with her chin in the air, her shoulders well back and her arms swinging to and fro. This season settled it. The opera brought society back, and the proper girl came romping home with flashing eyes and the ruddy glow of perfect health showing through the nut-brown tan of the summer's campaign. The clinging girl with tender eyes, the romantic girl with the yearning glare, the domestic girl with the purring voice, the "brilliant" girl with her turgid French, the smuggling girl with her artful smirk, and the girl who clung to the skirts of mamma—they are gone. They went away in a flutter with timorous screams at the snort of the engine and the rush of the burly world.

Now they've come back, but they're not the same. Instead, there's an army of lofty, gay, intrepid, meddlesome, dashing girls, who swagger abroad with delicious feminine audacity, and who have brought the breeze of the mountain-top, the salty flavor of the ocean's edge and the buoyant air of the Berkshire hills into the very heart of dirty, dusty, and stale New York. Of all the types, that of the girl of to-day, with her high-bred look, her daring style and winsome assumption of manliness, is far and away the most fetching thing that the world at large can show.—*N. Y. Mail.*

Although not quite willing to indorse all the above item says, yet looking about among my girl acquaintances I see that the robust, jolly girls are much in the ascendency, and I for one am thankful. I also find that nine out of ten of those girls who can and do create such a breeze in their immediate neighborhood are the girls one can depend upon for help when needed. A girl who can climb mountains and who can race over the beach is of much more account than the namby-pamby girl, who thinks it "so undignified to run."

Although the jolly girls have taken on breezy ways, yet their hearts are just as tender as ever and their sympathy just as fervid. And in fact I think more so, for they are not thinking of self all the time. It makes me happy to see the bright, rosy girls. And if fashion has anything to do with it, I say bless fashion and may he, she, or it, whichever it may be, always keep our girls bright, buoyant and self-assertive.

Los Alamos.

THE OLDEST PICTURE in the world, or what is supposed to be such, is in the museum at Boulak, in Egypt. It is a fresco from a tomb at Maydoom, representing six geese.

Emerson.

The highest minds of the world have never ceased to explore the double meaning, or shall I say, the quadruple, or the centuple, or much more manifold meaning of every sensuous fact.—EMERSON.

Divine magician of my native land!
Since thou hast touched great Nature with thy wand,
Her many stores seem fuller than before,
And indice give of undreamed mystic lore.
O most c'ear-seeing one! We cannot look
With thy keen eyes on star, and hill and nook—
We who tread on the plain so far beneath
Thy mountain-tops aglow with many a wreath
Of heavenly light. Still we can try to grasp
The esoteric from creation's clasp;
And where our strivings hard and vain appear,
Against the blue our struggling souls to cheer,
Thou, lofty spirit, wilt remain outlined—
Grand apotheosis of heart and mind.
—*Fannie H. Avery in Boston Commonwealth.*

One Standard for Both Sexes.

Josiah Allen's children have been brought up to think that sin of any kind is just as bad in a man as in a woman; and any place of amusement that was bad for a woman to go to was bad for a man.

Now when Thomas Jefferson was a little feller, he was bewitched to go to circuses, and Josiah said: "Better let him go, Samantha; it haint no place for wimmen or girls, but it won't hurt a boy."

Says I, "Josiah Allen, the Lord made Thomas Jefferson with jest as pure a heart as Tirzah Ann, and no bigger eyes and ears, and if Thomas J. goes to the circus, Tirzah Ann goes too."

That stopped that. And then he was bewitched to get with other boys that smoked and chewed tobacco, and Josiah was just that easy turn that he would have let him go with 'em. But says I:

"Josiah Allen, if Thomas Jefferson goes with those boys and gets to chewin' and smokin' tobacco, I shall buy Tirzah Ann a pipe."

And that stopped that.

"And about drinkin'," says I, "Thomas Jefferson, if it should be the will of Providence to change you into a wild bear, I will chain you up, and do the best I can by you. But if you ever do it yourself, turn yourself into a wild beast by drinkin', I will run away; for I never could stand it, never! And," I continued, "if I ever see you hangin' 'round bar-rooms and tavern doors, Tirzah Ann shall hang too."

Josiah argued with me. Says he:

"It doesn't look so bad for a boy as it does for a girl."

Says I, "Custom makes the difference; we are more used to seeing men. But," says I, "when liquor goes to work to make a fool and a brute of anybody, it don't stop to ask about sex; it makes a wild beast and idiot of a man or a woman, and to look down from heaven, I guess a man looks as bad layin' dead drunk as a woman does."

Says I, "Things look differently from up there than what they do to us—it is a more sightly place. And you talk about *looks*, Josiah Allen. I don't go on clear looks, I go on principle. Will the Lord say to me in the last day, 'Josiah Allen's wife, how is it with the soul of Tirzah Ann ——, as for Thomas Jefferson's soul, he bein' a boy, it hain't of no account?' No! I shall have to give an account to Him for my dealin's with both of these souls, male and female. And I should feel guilty if I brought him up to think that what was impure for a woman was pure for a man. If a man has a greater desire to do wrong, which I won't dispute," says I, lookin' keenly onto Josiah, "he has greater strength to resist temptation. And so," says I, in mild accents, but firm as old Plymouth Rock, "if Thomas Jefferson hangs, Tirzah Ann shall hang, too."

I have brought Thomas Jefferson up to think that it was just as bad for him to listen to a bad story or song as for a girl, or worse, for he had more strength to run away, and that it was a disgrace for him to talk or listen to any stuff that he would be ashamed to have Tirzah Ann or me to hear. I have brought him up to think that manliness didn't consist in having a cigar in his mouth, and his hat on one side, and swearin' and slang phrases, and a knowledge of questionable amusements, but in layin' holt of every duty that comes to him, with a brave heart and a cheerful face; in helpin' to right the wrong, and protect the weak, and makin' the most and the best of the mind and soul God had given him. In short, I have brought him up to think that purity and virtue are both feminine and masculine, and that God's angels are not necessarily all she ones.—*Selected.*

A HINT FOR CALIFORNIA NUT-GROWERS.—A Connecticut farmer, who owns a fine grove of "Shagbarks," has found it very difficult to secure the nuts, owing to the lawless visitors who, as soon as the crop begins to fall, persist in taking a hand in gathering it. Having tried various expedients for saving the nuts for his own use without avail, he finally hit upon the plan of turning his old bull into that pasture lot as soon as the nuts began to fall in the autumn. He reports the plan a perfect success, as the old bull is up bright and early in the morning and remains on guard until late in the evening. Whenever the farmer's family wish to pick up nuts in the pasture, the old guard is taken to the stable, to be turned out again when the fallen nuts are gathered. N. B.—This mode of protecting the nut tree is not patented.—*Ex.*

YOUNG FOLKS' COLUMN.

Ginger.

Ginger went to the sociable. He had not cared in the least about going, but he went. The boys made him go. He considered himself too far advanced in years for such gayeties. His limbs were tottering beneath him from very age. His breath came short from his wheezing lungs. His joints were stiff from rheumatism.

They went four miles into the country, over a romantic woody road. It was in the royal month of October; the moon was at the full; the night was lovely. Ginger was blind. What, therefore, signified to him the glorious moonlight bathing in its tender radiance the trees clothed in their autumn suits of russet, yellow and brown?

The boys were, all six of them, more or less inclined to be musical. Frank carried a cornet, Johnnie a jewsharp, Fred a mouth organ, Willie an accordeon, little Harry a fish-horn; Guy could sing. But Ginger had no ear for music. He never did have, even in his youth.

The boys looked as neat and as trim as six little new pins, each arrayed in his Sunday suit, set off with a buttonhole bouquet, and all felt as happy as six little larks. Poor Ginger had but one suit to his back—an iron-gray; it was well worn out with age. If he went he must needs wear that. And, so far as he was concerned, he never felt more miserable in his whole life.

The ladies of the "Presbyterian Aid Society" had provided a bountiful supper for all who came. That, however, was no temptation to Ginger. He could not chew ordinary food, having lost his teeth years upon years before.

He went. But not of his own accord did he go. The boys just made him go. For the trifling sum of 75 cents, exactly one shilling apiece, did these six little lads hire of his owner, Mr. Pratt, this blind, spavined and wheezy old horse, to carry them to the sociable.

They hitched him, with an eye, perhaps, to the "eternal fitness of things," to the village undertaker's wagon, and Frank, the undertaker's son, drove him—that is to say, he held the lines, for Ginger went about as he pleased. He pleased to go slowly, very slowly indeed. How could he help it at his age and with his infirmities? The only wonder is that he could go at all.

But the boys did not care how he lagged. They were happy. They halted before every farmhouse upon their road and saluted and serenaded its inmates. To be sure, their musical instruments were not in perfect accord, nor their playing in exact time, yet it nevertheless, in every instance, produced the desired effect. People came out of doors to see what was the matter. Of course, no one invited them to come in and be treated, or even thanked them for their music. The boys did not expect it. It was compensation enough to hear, "Oh, it is a lot of young fellows from Benton going to Mr. White's to that church sociable." "Young fellows." There was music and magic in the words.

To our six jolly little boys, to whom social pleasures were nearly new and altogether delightful, the time for departure came far too soon. Good boys they, not one of them forgetting their mamma's injunction to "shake hands with Mrs. White and thank her for a very pleasant evening."

Mr. White escorted them out to their wagon with some surprise, and, maybe, a little reproof in his voice. "Why, boys, if you have not old Ginger! Forty years old if a day. Seems like cruelty to animals to drive that old creature."

Off they started in the best of spirits. But Ginger did not care in the least about going. But he went. The boys made him go. That is, he went for a little while, then he stopped short, and by his actions declared he could not or would not go one step further.

"Go 'long, Ginger," said Frank. "Get up, Ginger!" cried all six in concert. He did not budge one inch. "Whip him and make him go," said little Harry. Frank was kind-hearted, and Mr. White's expression, "cruelty to animals to drive that old creature," was still ringing in his ears. "No, let us get out and lead him awhile," he said; "maybe he is afraid of something. Come Fred." They led him easily for a quarter of a mile or so, then, resuming their seats in the wagon, tried to drive him. Again he stopped. Then Willie and Guy led him half a mile. Once more they tried to drive him. Once more he stopped. Plainly, it was useless, so they took it, turn about, leading him and said not one word of repining or complaint. When they reached the foot of a steep hill, every boy of them clambered out of that wagon and helped that venerable horse drag that wagon up that hill, singing and shouting at the top of their voices every step of the way. Jack Frost, mischievous elf, nipped their ears, tweaked their noses, pinched their fingers. The man in the moon looked coldly down upon them, with eyes stern and pitiless. The pale little stars winked and blinked at them in the most knowing and unaccountable manner.

At 2 o'clock in the morning, John, Mr. Pratt's hostler, was awakened by voices saying: "Here, John, is old Ginger." Then the boys sought each his own fireside and couch. Strange, but not one of them closed his eyes in slumber, late as it was, tired as they were.

At half-past eight that same morning, just as the first schoolbell was beginning to ring, the six boys met—was it by chance, do you suppose?—at Mr. Pratt's livery stable door. Curiosity, expectation, dread, was written upon each face, John, the hostler, was standing in the door. For a moment no one spoke. At last Frank gasped out: "John, how is Ginger?" John pointed to a small lot back of the stable. All looked. There stood Ginger, erect upon his four legs, the bluest of October skies above his head, the most refulgent rays of October's sun shining full into his sightless eyes, alive and wheezing. At which glad sight the boys threw up their hats, gave three cheers and were off to school in a twinkling.

Ginger is alive to-day. In winter he is warmly housed and well fed. In summer he drags his stiffened limbs through green pastures, feeding upon the tenderest herbage. Our six little boys, big boys now, often stop to pull for him a bunch of clover, or pat his lean neck. Somehow they feel grateful toward him. Sometimes they whisper to him slyly: "Say, Ginger, would you not like to take us to another sociable?"

But Ginger never did.—*New York Tribune.*

GOOD HEALTH.

STOMACH DIGESTION.—Opportunities for studying gastric digestion through fistulous openings into the stomach are, thanks to modern surgery, more frequent than formerly. This is important, as the physiology of digestion, as understood at the present day, requires more than the classical instance of Alexis St. Martin to place it on a sound experimental basis. Such a case, with experiments *ad hoc*, is recorded in the *Revue Scientifique* by Von Herzen, of Lausanne. The subject was a man, aged 28, on whom gastrostomy had been performed for occlusion of the œsophagus. The observations made were as follows: Bile always appears in the stomach during digestion, but generally only in the later stages. The amount of HCl amounts to 1.8 to 1.9 gramme pro liter; it increases during digestion, and reaches its maximum in the third hour. Sodium chloride appears rather to diminish the amount of acid. When the stomach was empty in the morning but little pepsin was found, and a large amount of propepsin; peptogen accelerated digestion. In the first hour, of a quantity of albumen introduced, two per cent was digested without peptogen, 12 per cent with it. In the second hour, 23 per cent was digested without, 45 per cent with peptogen. In the third hour, 51 per cent without, 76 per cent with peptogen. These results agree with those obtained by Schiff. Chloral, quinine sulphate, and above all potassic iodide, retard digestion. The author would forbid red wine in disturbances of digestion, but would recommend bouillon and dextrin; blood fibrid is also indicated in many cases.—*Medical Press.*

IS THE BARK OF THE LOCUST TREE POISONOUS?—The inner bark of the fragrant flowered locust (*Robinia pseudacacia*), commonly cultivated as an ornamental tree, and for its invaluable timber, has long been known to have a sweetish taste, resembling that of licorice, and to have emetic and cathartic properties. But we believe it has never been considered poisonous. In the New York *Medical Journal* of January 22d, Dr. Z. T. Emery reports a case of poisoning of 32 boys at the Brooklyn Orphan Asylum from chewing some of this bark, which they had obtained from fence-posts in the yard. In the mildest cases, vomiting of ropy mucus was observed, together with flushed face, dryness of throat, and dilated pupils. In the severest cases, large quantities of ropy mucus mixed with blood were vomited. The other symptoms were retching, pain in the epigastrium, debility, stupor, cold and pulseless extremities, a feeble and intermittent action of the heart, dilated pupils, and face of a dusky pallor. The patients were given subcarbonate of bismuth and brandy by the mouth, and morphine hypodermically; sinapisms were applied over the stomach, and bottles of hot water along the extremities. The patients were discharged from the hospital in two days.

WHERE TO DIG THE WELL.—Let us remember that a well will drain an area with a diameter equal to twice its depth. Therefore, a well 12 feet deep will drain an area the diameter of which is 24 feet, that is to say, that it will drain the surrounding soil for 12 feet in every direction. Obviously then the privy should be more than the depth of the well away from it, and more than this again if it is proposed to place it on a higher level, which, however, should never be done. The well should be lined inside thoroughly with mortar so that percolation cannot occur between the crevices of the bricks, and it should be well covered, so that surface drainage cannot get into it, for you want to drink water that has come into the well from the bottom, after it has been purified by filtration through the earth. Thus, then, these are the precautions to be observed in locating and building your well in the country. How about the city? Well-water in the city should never be used; the sources of contamination are too numerous and too hidden to be avoided.—*Annals of Hygiene.*

DOMESTIC ECONOMY.

Boston Cooking-School Recipes.

Beef Croquettes.

Chop fine three-quarters pound cold roast beef, moisten quarter pound stale bread with a little stock; season with salt and pepper and a few drops of onion juice; moisten with a little brown sauce; add yolks of two eggs beaten well; cool, roll in crumbs, egg and crumbs, and fry in hot fat. Serve with tomato sauce. Mix together the beef and bread crumbs. Add the seasoning and enough of the brown sauce to moisten all.

Tomato Sauce.

Cook one-half can tomatoes, one slice of onion, one bay leaf and one sprig parsley together for ten minutes; strain; melt one tablespoonful butter, add one tablespoonful flour, pour on slowly the strained tomato; season with salt and pepper. Pour this around the croquettes just before they are brought to the table. This makes a delicious dish.

Cecils.

One cup cold cooked meat, chopped fine; add yolk of one egg beaten well, one-half tablespoonful butter, one tablespoonful bread crumbs, a few drops onion juice, one-half teaspoonful salt and one-half saltspoonful pepper and seven tablespoonfuls stock; stir all together over the fire until hot; then cool, form into balls, roll in crumbs, egg and crumbs, and fry in hot fat. Serve with Bechemel sauce. Any sort of meat may be used for this. The stock is to moisten the mixture, and water or milk may be substituted. Spread out on a tin plate to cool if scant of time.

Bechemel Sauce.—Melt one tablespoonful butter, add one tablespoonful flour, pour on one-half cup hot stock and one-half cup cream, the beaten yolk of one egg, one-half teaspoonful salt and one-half saltspoonful pepper.

Scalloped Mutton.

Remove fat and skin from cold roast mutton, cut the meat into small thin slices, season with salt and pepper. Butter a dish, put in a layer of meat, then cold-boiled macaroni, moisten with tomato sauce, and so continue until all is used. Cover with buttered crumbs, and brown in the oven.

If you have no macaroni cold, break up about 12 sticks—a quarter of a pound—into hot water, in which has been put a tablespoonful of salt. Let it cook for about 20 minutes. Stir it up once in awhile to keep it from burning on to the dish. When it can be cut easily it is done.

Finish preparing the dish as by above rule. Serve as soon as done, else it will get dry.

Fish a la Reine.

One pound cold-boiled fish, flaked, melt one tablespoonful butter, add one tablespoonful flour, pour on one cup hot milk, add the fish, three chopped mushrooms, salt and pepper to taste. When thoroughly heated add the yolk of one egg well beaten and one tablespoonful chopped parsley; serve.

This is a delicious way of serving fish, and may be improved by adding a few more mushrooms to give a stronger flavor.

Stewed Mushrooms.

Peel and wash fresh mushrooms (one-half pound) and break into pieces. Season with salt and pepper and let them stand one-half hour; melt one tablespoonful butter and one teaspoonful flour, and one pint mushrooms. Simmer 15 minutes; then add four tablespoonfuls milk or cream and the well-beaten yolk of an egg.

Sweetbreads.

Wash in cold water, remove pipes and membranes. Cook in boiling salted water, with one tablespoonful lemon-juice, for 20 minutes. Drain and put into cold water.

Larded Sweetbreads.—Lard and bake till brown, basting with brown stock. Serve with mushroom sauce.

Creamed Sweetbreads.—Break into small pieces, add white sauce and mushrooms cut fine; cook ten minutes and serve.

Sweetbreads should be put into cold water as soon as brought from the market, as they spoil quickly. The lemon-juice or vinegar is added to harden the sweetbreads in cooking, as they, like fish, are composed mostly of albumen and may be hardened in this way. All fish is improved, both in flavor and appearance, by the addition of vinegar or lemon-juice to the water in which it is cooked, as it makes it solid and flaky for salad, etc. One tablespoonful vinegar to four pounds of fish is a good proportion.

Sweetbreads must first be cooked as described above, whatever is done to them afterward. They may then be broiled like a steak and buttered and seasoned, or cooked in a variety of ways, either plain or fancy. Two of the best methods are larding and creaming, as given above.

Cabinet Pudding.

Butter a mold and decorate with raisins. Fill the mold with alternate layers of sponge cake, raisins and macaroni. Fill with an uncooked custard made with one pint milk, yolks of four eggs, four tablespoons sugar, one saltspoon salt and one teaspoon vanilla. Steam slowly two hours. Serve with sauce.

The sauce to go with this pudding is a creamy sauce: Cream one-half cup butter, add slowly one-half cup powdered sugar, one-quarter cup cream, juice and grated rind of one lemon.

The Week.

This week has seen the mowers started quite generally in the valleys of the upper half of the State. Slight showers fell here and there, as is expected when the hay is cutting, but the downfall was hardly dust thick, and if this constitutes our "hay rain" for 1887, it will go on record as a very little one. Following the showers there has been day after day of north wind very persistent and very cold, so that at times the temperature has fallen below usual May records, and in some places frost has seriously affected the vines and tender garden plants. This norther, as we stated last week, was rather an unnecessary intruder this year and has probably prepared the way for a good deal of light and shriveled wheat. The hay crop does not promise to be overlarge, and the wheat average over the whole area will fall low this year. The rise in wheat values continues in force, and so far as California is concerned there should be good prices to help out on a short crop. The only good crops, except in unusually wet regions, will be found on summer-fallowed and early sown grain which has had the advantage of all the rain which has fallen. There is much late sown which will hardly make a decent weight of hay, unless it should have something better than a norther to grow on.

Short feed promises to shorten up the milk flow, and scanty feed gives growers a lot of poor beef cattle. Our vines and trees will be relied upon to furnish the large figures this year.

International Convention.

The Twenty-seventh International Convention of the Young Men's Christian Association convened in the First Congregational Church Wednesday morning and expects to remain in session about a week. There are about 400 delegates and members in attendance. Nearly every State and Territory in the Union is represented, besides many delegates from Canada and the islands of the South Pacific. More than 200 of these visitors arrived on Tuesday's overland train, and were met by the Committee of Reception at Lathrop with a car laden with fruits and flowers. Dainty boutonnaires were prepared for each member of the party, and the rich floral display from the gardens of Oakland and Berkeley must have made these good people from a harsher clime feel as if they had struck the country described in the dear old hymn, "Where everlasting spring abides, and never withering flowers." General O. O. Howard welcomed the delegates in a brief but very felicitous speech.

In 1841, a young clerk, George Williams, in a London dry goods establishment, became interested in the moral and social welfare of his associates. This was the initial impulse of a movement that is in successful operation in nearly all the large towns and cities of the world. In all, 3372 associations exist, with a total membership of about 150,000. Though undenominational, the association has always been in the hands of the young men of the so-called evangelical churches. Its chief aim has been the saving of young men from the seductive vices of towns and cities, helping the needy, furnishing employment to the idle, free reading-rooms and social benefits, ever keeping in view their moral elevation. The association was fortunate in early securing the aid and countenance of that philanthropic nobleman, the late Earl of Shaftesbury, who was for many years president of the London association, and the late Earl of Cairns, who gave it the warmest sympathy and most liberal aid. The organization soon spread over Europe, and numbers among its zealous friends the Emperor of Germany, the Crown Prince of Sweden, and many of the most eminent statesmen and literary men of the age.

The observation of its working by a student of the New York University, George M. Vanderlip, while on a visit to England, led to an organization on the London basis in Boston, Nov. 29, 1851. Planted on American soil, the good seed took root and has grown more thriftily than in any other land. There are 1002 associations in the United States alone. There are now 28 associations in California, with a membership of over 3000, all volunteer workers in this army.

We would not forget that it is to this association we are indebted for the Christian Commission, one of the most beneficent agencies ever devised to assuage the miseries and soften the harsh and cruel features of war. During the four years of our civil strife this commission received and distributed voluntary contributions in the shape of food, medicine, delicacies of all sorts worth nearly $3,000,000, and $2,500,000 in money. Nearly 5000 noble-hearted men and women went out under its auspices as helpers in hospital, camp and religious work, imparting help, sympathy and consolation to the soldier, not caring to ask whether he wore the Confederate gray or Union blue.

We are glad the representatives of so excellent an association have assembled in California. We welcome them, trusting that the visit may be agreeable to them and being assured that the holding of their International Convention in our State will do us good, by calling wider attention to the aims and needs of the associations carrying on such beneficent work in California.

CHERRIES FOR THE EAST.—L. W. Buck, manager of the Fruit Union, states that it is probable that a car of cherries will be sent East within two weeks. One of Palmer's refrigerator cars is waiting, and it will be loaded and started on its way soon.

FLORAL FAIRS are reported in several places besides San Jose, but we are obliged to defer for another week all extended notice.

POINTSMAN, said to be the largest horse on earth, died at Petaluma on the night of May 9th. He was valued at $5000.

The Fruit Outlook.

The fruit crop is advancing toward maturity without especial hindrance or drawback thus far. The cold of the last few days may have hurt the vines somewhat in some exposed places, but we hear of no wide injury. It is pleasant to note that the indications are for a year of unusual activity among the canners and fruit-driers. Though the pack of canned fruit last year was on the whole very large, sales have covered the product well, and the new season will open with a bare market. This and the prospect of getting plenty of fruit at reasonable rates encourages the canners to prepare for running at their full capacity. The fruit-drier has much the same outlook. Supplies of last season's drying are well disposed of; in fact, it is claimed by some that supplies at this point are not enough to meet the ordinary consumption from this date until new dried fruit may be expected. It seems reasonable to expect, therefore, very large figures as the results of this year's work in fruit preservation, and there is little danger of excessive productions if prices court consumers as they ought to do this year. The outlook for the raisin pack is also looked upon as encouraging. Though the product last year was enormous, judged by previous outputs of California, there was no excess, and the market will be ready for the new crop.

The assurance of something less than last year as the cost of freight on fruit to the East, coupled with the new and apparently harmonious arrangements for distributing the fruit at the East, should enable our growers to put a vast amount of fruit on the Eastern markets with better results than last year. Wednesday morning's *Record-Union* has the following item:

A Sacramentan, interested in fruit-growing, has received a dispatch from the East, stating that the traffic managers, at their convention in Chicago, determined to make the necessary arrangements for fixing the rate of freight on ten-carload lots of fruit from the Pacific Coast to $300 per car to Chicago, and $400 to New York.

This does not amount to a demonstration that the desired rates will be granted, but it is a good sign so far as it goes. The announcement will be received with much satisfaction by the fruit-growers. If this should be secured, it must be added to the other indications which are favorable for the turning of the large fruit crop of 1887 to good account.

London Purple for Codlin Moth.

Samples of London purple procured in the San Francisco market have been analyzed at the State University for Mr. Klee, State Inspector of Fruit Pests. It has been found that one sample contained over 33 per cent of metallic arsenic, which is equal to over 44 per cent of arsenious acid; another sample had nearly 26 per cent of metallic arsenic, equal to 34 per cent of arsenious acid. Comparing these analyses with the analyses of London purple used for spraying at the East, it is seen that the California samples are much richer in arsenic, as the material used in Missouri is shown to contain only about 22 per cent of metallic arsenic.

It has been found that solutions of London purple at the rate of one pound to 80, 100 and 160 gallons of water respectively, have all injured the foliage of pear trees to which they were applied, although the weaker solutions did not seem to be so injurious to the apple. It seems likely that the washes which have been recommended because of Eastern experience will prove too strong here unless they are based upon a lower percentage of arsenic such as is shown by the Eastern analyses of London purple. With such an amount of arsenic as the London purple obtained in San Francisco contains, a wash of one pound to 200 gallons of water would be safer to use—at least on pear trees.

This is a very important matter and must be further investigated. There should be some standard of arsenic-contents in commercial London purple, so that fruit-growers may prepare their washes intelligently and with assurance that they will not injure foliage or fruit. As the apples and pears in most parts of the State are now so well grown, it is probable that those intending to spray for the codlin moth have already made the application. We should like to hear from all our readers who have applied white arsenic, London purple, or Paris green this year; how much they used of each to a gallon of water and what effect was produced on the tree. We have just heard of injury to foliage by Paris green. Let us have all experience possible in this matter, to the end that a safe and effective solution may be agreed upon.

California Poultry Association.

The adjourned annual meeting of the California Poultry Association was held at No. 625 Market street, S. F., Wednesday evening, May 4th. In the absence of Pres. Bayley, Vice-Pres. Presson occupied the chair.

Pursuant to notice given at the fall meeting, an amendment to Art. III of the Constitution, to the effect that the offices of recording secretary and treasurer be held by one and the same person, was adopted. Also, amendment to Art. V, providing that regular meetings of the association be held on the first Wednesday of October, and during or immediately after the exhibition, or in case of no exhibition being held, then on the second Wednesday of the year—the latter to be termed the annual meeting.

Resolutions offered by Mr. Everett, that nine members should constitute a quorum for the transaction of business; also, that a quorum of the executive committee consist of five members, were carried.

Officers for the ensuing year were then elected as follows: J. J. Jones, president; Geo. R. Presson, C. N. Cousens, D. H. Everett, T. D. Morris, vice-presidents; G. T. Marsh, recording secretary and treasurer; H. G. Keesling, corresponding secretary; G. B. Bayley, J. N. Lund, H. H. Carlton, C. A. Pitkin, S. McBirney, O. J. Albee, W. M. Newhall, C. N. Crowell, executive committee.

After some informal discussion as to the next show, etc., the meeting adjourned.

AT HAYWARDS.—A delightful ride of 14 miles from Oakland, last week, winding up through a fine avenue bordered with blooming locusts, brought the writer and family, just at nightfall, to the graceful home of Judge W. C. Blackwood, near Haywards.

The social evening spent with Mr. and Mrs. Blackwood and their friend Crane and neighbor Winton will last pleasantly long in the memory of their humble guests. The residence of the B.'s seems pleasingly arranged for summer and winter comforts—most especially so when both B.'s are "at home" to straying visitors.

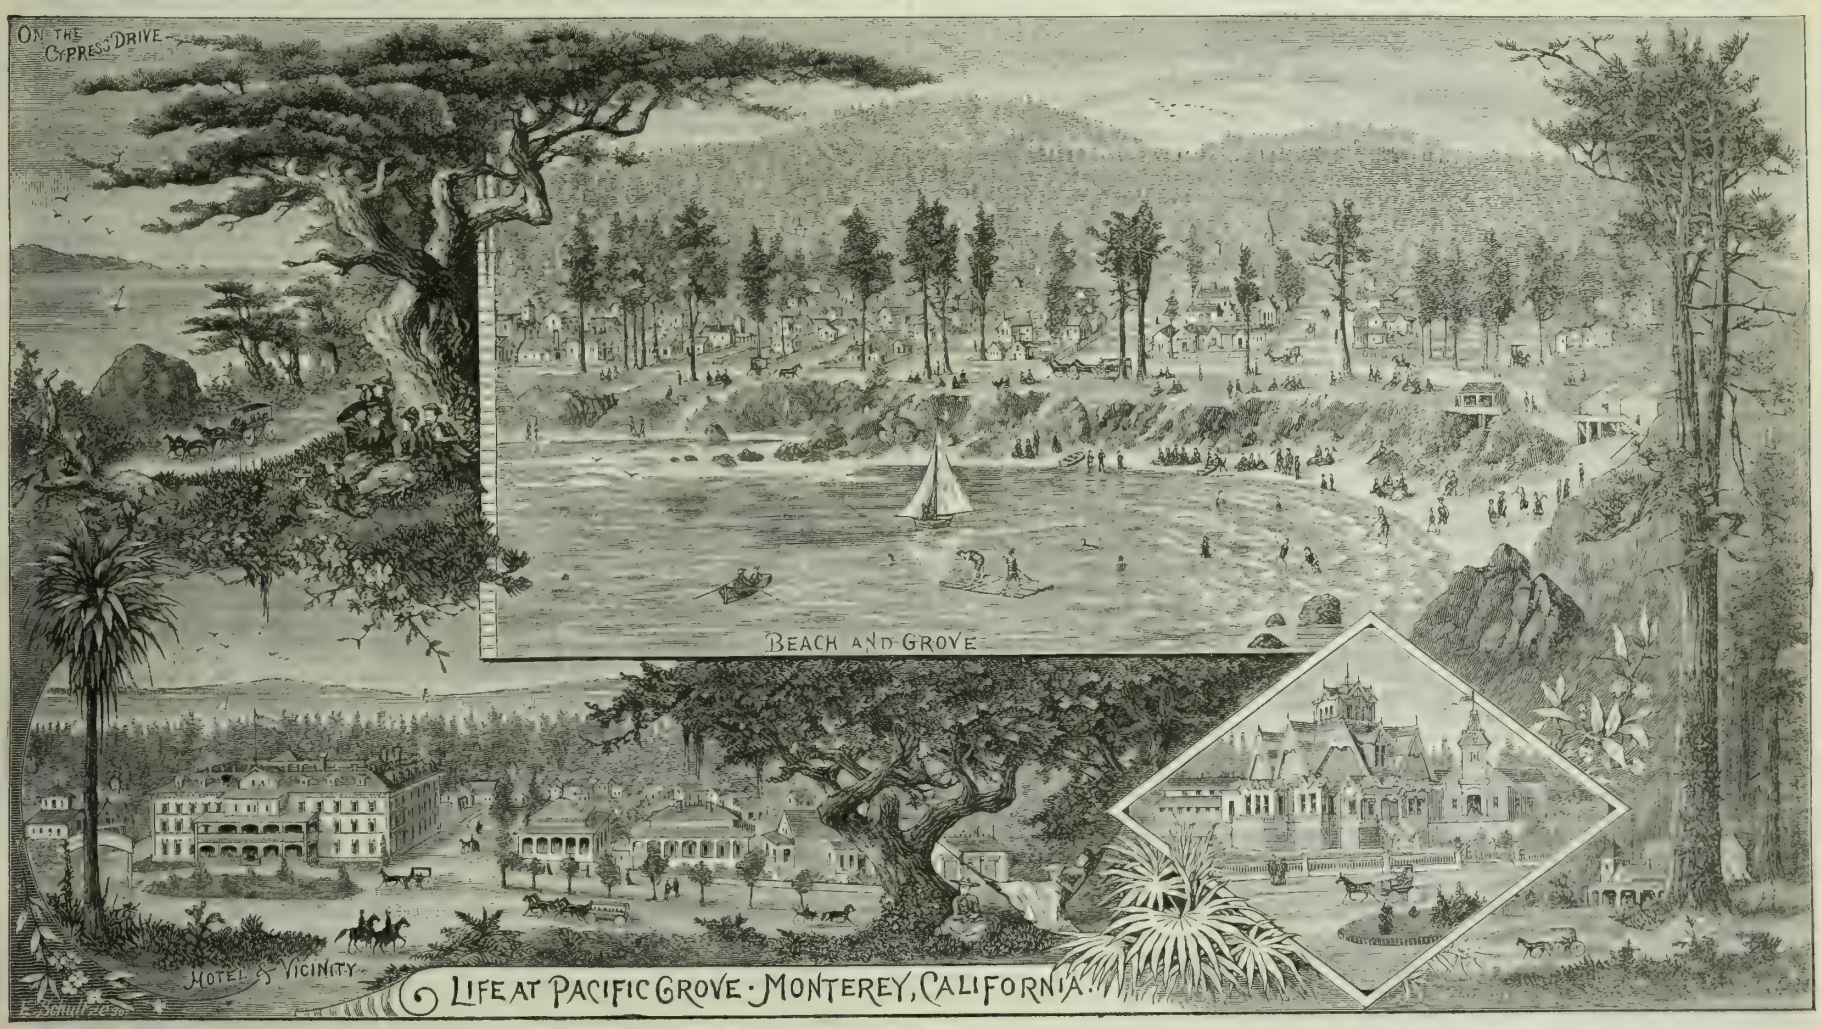
In the morning we had just time to merely glance at one of the most fruitful and well-kept orchards in America (which environed our home for a night) before starting, with sincere thankfulness in our hearts, for the Danville picnic.

RAILROAD RATES.—It is announced that rates on west-bound freight from the Missouri river to Pacific Coast terminals are reduced from 20 to 35 per cent since the tariff of April 27th. It is owing to the competition with the Canadian Pacific. There is published a schedule of these rates, but as our readers are mostly interested in freight movements away from California the general statement of the reduction will suffice for that. There has been adopted also what is called a "commodity tariff," which works both eastward and westward and includes articles of direct interest to our readers. It is as follows: Wool, regardless of valuation, to New York and Boston, $1.50 per 100 pounds. Corn and oats, Missouri river to California, 60 cents. Canned goods, to Missouri river, St. Louis and Chicago, 75 cents. Canned goods, to New York, $1 per 100 pounds.

WEATHER BULLETINS. — General Greely, Chief Signal Officer, will henceforth issue from Washington a special weekly bulletin with the view of promptly placing before the public each Monday morning reliable information relative to climatic indications in the agricultural districts. It is believed that these bulletins containing information of deficiencies or excess relative to the temperature and rainfall during the growing season will serve as a reliable basis for determining conditions favorable or not for the growing crops. The issue of May 8th states that since January 1st there has been a large deficiency in the rainfall in the Northern States, ranging from six to nine inches. The deficiency in the grain regions of the Northwest has been slight, ranging from one to three inches.

TELEPHONING between New York and Philadelphia is now as easy as it was between points about a block apart a few years ago.

Pacific Grove Retreat.



The burning of Hotel del Monte, which has been widely heralded, has awakened public interest in the steps to be taken for the restoration of the attractions the fame of which has become world-wide. We understand that work is rapidly progressing which will, in a few months, result in a new and much improved Del Monte. The immediate effect of the loss of the great hotel is to call out into more prominence the twin attraction of Monterey, the Pacific Grove Retreat. Our readers have seen frequent allusions to this seaside beauty-spot, as the seat of the California branch of the great Chautauqua University, and as the gathering-place of leading religious assemblies. Fortunately before the Del Monte fire there was approaching completion a new hotel at Pacific Grove which now comes forward to serve those who desire to resort to the environs of Monterey during the present summer. Our engraving on this page presents in a very acceptable manner the beauties in and around Pacific Grove as they now appear, including recent improvements, and therefore superseding previous sketches.

On a promontory one mile west of Monterey, covered with pines and clumps of oak that would gladden a Druid's eye, is located the now famous Pacific Grove Retreat, the Seaside Camp-ground and Christian Seaside Resort. The encampment commands a magnificent view of the bay of Monterey and the variegated scenery that environs it. The general arrangements of this watering-place are based upon the principles guiding those of the Eastern States, especially the one held at Ocean Grove, in the vicinity of Long Branch, N. J. History is full of surprises. One mile from the spot where Father Junipero Serra, the best known and noblest of the Franciscan missionaries, landed and took possession of the country in the name of the King of Spain, chanting the Te Deum and scattering holy water, a new race and people have come, with quite another shape of religion, and made the place notable for rest, health, prayer-meeting, missionary and Sunday-school conventions.

The quiet of this sylvan retreat has recently been broken by the land boom. The voice of the buyer is heard in the grove. The fever for eligible sites has invaded the calm and shady retreat. The great number of visitors during the summer of 1886 was the first decided thrill of prosperity that determined what this place shall be, and from month to month has witnessed new and cozy homes in all portions of this beautiful spot. Avenues and streets are being constantly opened and improved by the Pacific Improvement Company, and also by private individuals.

El Carmelo is the name of the hotel lately erected by the Improvement Company at Pacific Grove, and which has already been opened under the management of George Schonewald. It is a thoroughly complete building in all its interior arrangements, and will have elegant accommodations for upward of 200 guests. It will be kept in splendid style, and no pains or expense will be spared to render it a pleasant and popular place of resort. Mr. Schonewald will make every provision for the entertainment of those who seek its hospitality, and the tanks at "Del Monte" will be placed at their disposal, together with the clubhouse and stable. The opening of the El Carmelo at this time is most opportune.

This picture shows that Pacific Grove is quite like a metropolis with its superb hotel, bathing pavilion, streets, avenues and boat-houses. So far as nature has a chance, this place is now in its gayest attire. The bay, the beach, the bathing, are all fine; the trees are in full leaf, the grass is soft and green, wild and cultivated flowers are in profusion, the music of the mocking-bird and linnet greets the ear in all directions, made more melodious by the baritone of the ocean's waves. "See Naples and die." We had rather pass a few days at Pacific Grove and live.

CALIFORNIA PRODUCTS IN GERMANY.—If Count Bismarck does not object too seriously, it seems likely that some California products may attain wide sale in the Fatherland. Consul Miller, of Leipsic, in a late report, says California wine is already known to some extent in Germany. A further fact of interest is that extensive collections which have been lately shown by European makers, and the processes employed, appeared to have been very successful, but for size and quality the fruit could not be compared with California products, and there is no doubt that the American fruits, energetically introduced, could compete successfully with the native productions.

EFFECT OF THE ELECTRIC LIGHT UPON PLANTS.—A citizen of Davenport, Iowa, whose garden is situated at 100 feet from an electric light tower, has remarked that his lilies close at sunset, but open again a few minutes after the arc lamps have been lighted. It has been observed at Detroit, too, that the foliage of the trees exposed to the rays of the electric light is much more luxuriant than that of trees as are not.

A NEW CANNERY is to be built at Healdsburg, Sonoma county.

Southern California.

The Sanitarium of the Continent.

[Editorial Correspondence.]

There are few portions of the globe that are so completely satisfactory as a home, for either winter or summer, as Southern California. The entire region from Los Angeles eastward through the San Gabriel and San Bernardino valleys, and then southward through a series of valleys traversed by the California Southern railroad to and including the city and environs of San Diego, together with many smaller outlying valleys, not forgetting the large expanse of territory of which Anaheim is an important and central locality, combines all the varieties of mountain, vale and sea which nature has anywhere provided. This region is also blessed with a climate, the air of which is dry, pure and wholesome, and most admirably varied in its slight characteristics to suit every form of disease, bodily ailments or condition to which flesh is heir. The philosophy of this peculiarity of climate is directly traceable to that great ocean current which, having its origin in the tropical seas off Southeastern Asia, sweeps up along the shores of China and the islands of Japan, is deflected by the converging continents at Behring's Straits, and thence moving southward, reaches the shores of Southern California with a temperature never varying over 3° from that of 56°.

This immense body of warm water, 500 miles in breadth and more than a mile in depth, forms the great hot-water pipe, which, by the aid of the protecting influence of the grand old mountain chain which sweeps around the landward side of the Southern California valleys, serves to gently temper the ocean winds and impart to them their genial, balmy, semi-tropical character, which secures to this locality its matchless climate—so gloriously invigorating, so stimulating as a tonic and so much superior, in every respect, to the celebrated resorts of the Old World. So uniform is the climate here that the changes of the seasons are scarcely perceptible. The mountains are unlike mountains, generally, elsewhere. They are not clothed, as those of moderate elevation generally are, with dense growths of forest and undergrowth, covering a vast mass of constantly falling and decaying vegetable matter, the whole pleasing to the eye, it is true, but giving out large quantities of gases, which, in many cases, more than overbalance the more healthful emanations which proceed from the vigorous forest growth. The mountains which surround the Southern California valleys possess very peculiar characteristics. Their sides are steep, rugged and mostly devoid of trees except along the river-courses. They rise abruptly from the valleys and act as great sheltering walls, absorbing the heat of the sun by day and tempering the naturally cool nights by gradually giving it out by radiation until the sun again makes its appearance.

As a summer resort for tourists and health-seekers, Southern California cannot be excelled. It has already become well known, and the rush thither is increasing with each coming year. We were assured during our recent visit there, by tourists, excursion agents and others, that the rush during the coming year will be far in excess of anything which has preceded it. The number of people who come in search of health is almost beyond computation, and among the hundreds with whom we have conversed we have never yet found an individual who has been disappointed in what he has heard of the climate and its advantages. It is fast becoming the great sanitarium of the continent.

Varieties of Climate.

As already intimated, judgment should be used by health-seekers in the selection of their stopping-places. Equability of temperature, dryness of atmosphere, and mountain elevation are the essential requisites which go to make up a model health resort; in lung complaints this rule especially obtains, hence dry and hilly regions, wind protected, and above mist and fog, have, in all countries, reached a higher value than the seaboard lands, which latter are best adapted to the recruiting of that health which, in the course of overwork, or convalescence from acute diseases, requires the tonic and bracing effect of sea breezes; more variety in amusements, such as easy rambles by the sea, boating and bathing.

Easiness of access is a factor indispensable to all such places; rails and roads there are, others in contemplation, and some in the course of construction, which will enable the most enervated individual to reach any desirable part of this favored country and allow him to enter on a course of climatic treatment under the most favorable auspices.

In summing up we would say that no one need be concerned if he should not, at first, be fully satisfied with the immediate atmosphere and temperature of the locality selected. In the absence of medical knowledge or advice, being everywhere in an exceptionally healthful climate, the invalid can, with very little trouble, make a practical exploration for the climate and temperature which will give him or her the greatest relief; for, within a radius of 50 or 60 miles from almost any location in

these valleys, a person may suit his taste or needs from the sea-beach to perpetually snow-crowned peaks.

Very few comers at first really understand the climate of this region, and persons of delicate health oftentimes submit themselves to exposures which even robust people should avoid. It is often the case that the spring-like balmy air of a winter's morn and the sunny, tempered warmth of the mid-day allures the invalid to undue exposure to the, perhaps, decidedly cool air of the evening and a consequent "chill." A careful study of the climate should be made a matter of business by every invalid. It would be a great boon to visitors, and a matter of great importance to this section of the State, if some practical medical man, thoroughly versed in the peculiar characteristics of its climate, would prepare a popular hand-book, describing places, precautions and results already obtained, to be employed by the invalid for furnishing all necessary information as to the precise locality where each one should go to receive the greatest benefit to any particular ailment.

The climatic advantages and grand and beautiful scenery of Southern California will suffer nothing even when compared to the most favorable localities of Southern Italy, with its charming lakes, its enchanting river banks, and its grand and beautiful ocean-beaches. Here there is a steady tone in the atmosphere, like draughts of champagne or the subtle presence of iron. The inspiration of the air invites outdoor labor or exercise. Horses can travel more miles a day here than in any other locality in the States. Under the inspiration and tonic influence of the climate every one feels impelled to more than usual activity. And what is possibly still more interesting is the fact that there is room here for all—pleasant homes, fertile fields, an opportunity to make a living, and a chance to live out one's days with a minimum of suffering. Great inducements are held out to new-comers from all parts of the world, not only in Southern but in all parts of California, from Oregon on the north to the Mexican line on the south. Owing to the rapid advance in the price of land at the south, and the peculiarities and time required to bring fruit-lands into productive value, persons deciding to settle in Southern California must bring with them means for support for four or five years in addition to that needed to secure a home. In Northern California, as a general thing, where mixed farming is the rule, a new comer may obtain a full support for his family from his first year's labor.

In this connection it may not be inappropriate to give the following statement from an exchange, which our own observation enables us to pronounce substantially correct: "It has been said that 5000 heads of families immigrated to Northern and Central California in 1886. We have no means of testing the correctness of the statement; the number was certainly large. None of them, if they bestow on their new farms the thrift and patience which would be necessary to insure success anywhere, will have reason to regret their coming. They will do us good, too. We need new blood every year to maintain the cosmopolitan character of our people, and to prevent our relapsing into the provincialism which is the fate of isolated communities. The most successful races in the world are mixed races; the more strangers pitch their tents among us, and become as one with us, the brighter will be the destiny of California in the future."

The Southern California Boom

The writer has frequently been asked about the Southern California "boom": "How long will it continue?" "Has it any real support?" etc. Those who are in a position to best judge, such as railway officials, etc., deny that so far as the influx of strangers is concerned, there is any boom at all. They say that the influx is simply a regular overflow from the Atlantic and Mississippi States, and that this overflow will continue as a regular business from year to year for an indefinite period. They assert that the summer travel which has heretofore been directed to Florida, Bermuda, the West Indies, etc., has now been turned toward California, and that it will not only continue, but that it will largely increase. There is good reason to believe that this is the case from the fact that the winter travel in other directions, and especially to Florida, is gradually falling off. There is much dissatisfaction manifested against Florida, for reasons well known to the public in general. There is also another factor connected with the travel in this direction, which tells strongly in favor of California. No one claims that Florida is a desirable or hardly a permissible place for permanent residence for persons of northern birth, while all admit that California is. The consequence is that every year large numbers of Eastern visitors, charmed with our climate and other advantages, decide to make this State their permanent home. It is chiefly this class of visitors and their rapid increase that is filling up the waste places of California, and particularly its southern portion. Many of those who locate there are invalids; but there is a large proportion also who are well-to-do, who enjoy good health wherever they are, but who are delighted with our climate, scenery, business advantages, etc., and decide to make California their future home. Southern California just now seems to have the "call," and the influx thither will continue until the country is literally filled up. All the large land holdings there are being divided up, and smaller ones are also being subdivided, and the indications seem to justify the conclusion that Southern California is destined at an early day to become one great city of gardens, orchards and villas, with small centers of business at frequent intervals. Dependent upon this population, and growing out of it, there will probably be three great cities—Los Angeles, San Bernardino and San Diego, the first being the commercial center proper of Los Angeles and San Bernardino counties; the second, located at the junction of the two great overland railroads, will become the chief shipping point for the fruit product of the great and productive valleys in and near which it is located; while the latter, located directly upon the ocean, with the second best harbor on the Pacific Coast, will become not only a great terminal point, but a large transhipping port, where the fleets of the world engaged in the East India and Australian traffic will transfer their cargoes, from ship to car, for distribution throughout the continent and for overland transmission to Europe. It is this prospect which has caused the recent large advance in the value of real estate throughout Southern California. There may be something like a "boom" attending this advance in the price of town and city lots. The advance in such property has probably reached its fullest healthy point, and any further upward movement, especially of outside property, should be ignored and discouraged. It is safe to say that more than double the number of city and town lots have been laid out beyond what will be needed for the next three or four years. This statement will hold good for all localities from Los Angeles up through the San Gabriel valley and down the chain of valleys to San Diego, including both terminal points. In regard to acreage prices, where the land is good and productive, we believe they will be well sustained and still further advanced in value by occupation and improvement. The future of Southern California is both assured and grand. There is no need that it should be discounted. It is good for its present face value, with a steady and healthy advance.

It is a Veritable Paradise.

Exempt from climatic afflictions; blessed with a profusion of Nature's bounties and surrounded with grand mountain scenery such as cannot fail to awaken the purest and warmest emotions of delight in the bosom of either traveler or permanent resident. Most fortunate are the dwellers therein, and most assuredly will every well-located and available acre within its limits be soon occupied and improved. The stranger, who for the first time gazes upon the lofty, snow-capped mountains, "kissed by storm and sunshine," which so completely surround this favored region, cannot fail to be awed by their grandeur and beauty. And he is no less astonished and pleased when he looks upon his more immediate surroundings and beholds spread out before him, in every direction, fields of golden fruit, interspersed with acres of purple vintage, the air redolent with perfume and brilliant with flowers and foliage of every hue and color. A merchant of St. Louis writes as follows:

"I Think This Whole Region a Marvel.

"It is a perpetual surprise to me—not the least of which is that there remains to day a single acre of uncultivated land in this whole valley. * * * On coming here, last spring, from the snow, and sleet, and chilling winds of St. Louis, I seemed transplanted to a new world! I could not believe my own eyes! I thought I was under the spell of some mighty magician who had conjured up this world of beauty only to mock and disappoint me. I looked to see it vanish at a touch of his enchanting wand. But as I rode day after day among these lovely homes, where every kind of beautiful flowers seemed to run riot, and saw thousands upon thousands of magnificent groves, fragrant with blossoms and laden with golden fruit, I began to realize it was no conjuror's spell, but a wonderful reality. But I cannot realize, even now, that all these miracles of beauty and culture and wealth have been wrought out of what was, but a few years ago, barren plains—dry, dusty and verdureless. I have traveled extensively in this and other countries, but I have never seen another place where such results were possible. * * * I own an orange-grove in Florida, which has furnished me some amusement and a place for my spare cash for several years. I believe it is one of the best in that State, of its age; but I see that Florida cannot compare with Southern California."

The rapid growth of Southern California during the last two years is a marvel indeed. This growth is not limited to her towns and cities, but it is shared by all the most available parts of the interior as well. It is not the result of the great influx of visitors who come to stay awhile, leave a little money and then return. The real growth is due to those who come to stay—to build homes and plant vineyards and orchards. The mild and matchless climate and grand and beautiful scenery first induced them to come. Our rich soil and wonderful possibilities for business, for fruit-growing, etc., finally held them. The same inducements are constantly attracting others. Every family that locates is a standing advertisement for more to follow. All these advantages will continue to bring home-seekers, so long as there is any choice between perennial spring and summer on this side of the continent in contrast with severe winters and constant change of climate on the other.

These letters will be continued from week to week, until the notes taken by the writer, at all the principal points in Southern California, from Los Angeles to San Diego, have been exhausted.

W. B. E.

Advantages of Rural Life.

The following is the address of Dr. W. W. McKaig at the Grangers' Union Picnic, at Danville, Contra Costa county, on May 7th. A report of other leading features of the occasion is given on a preceding page:

Ladies and Gentlemen: With the advent of May we are not only reminded of the spring fever, spring poetry, spring chickens, and the like, but of a certain vague longing for the woods. Human nature needs change. To eat the same kind of food day after day, week after week, is enough to break down a constitution of iron. All good housekeepers know this and take special pains to vary the articles of diet every day. We have long had a theory that dyspepsia, with its ugly brood of horrors, blues, hypos, and suicidal meditations, can be traced to keeping the digestive mill too long grinding at the same sort of grist. If any one doubts this let him slip into the grounds of a hygienic establishment and take a peep at the devotees of Graham bread and watery vegetables or Edenic simplicity, as they loll on the benches, rustic seats, or swinging chairs, and talk of their aches and woes. The need of change and variety is so deeply wrought in our nature that no matter how pleasant one's home and surroundings, it becomes tedious and monotonous. The same round of duties, routine of business and household cares induce a feeling of satiety, languor and melancholy. Many call it biliousness and take tansy bitters, limes and blue mass. A camping trip to the Yo Semite Valley or Big Trees would bring them out all right. And then, fern-gathering, rambling, sketching, botanizing or lying under a tree throwing pebbles at the lizards and squirrels, is so much better than doctor's bills and funerals.

But as every one cannot afford the time or means for this sort of healthful regalement, the next best thing is the picnic. Blessings on the man who invented the picnic! Then all the people, rich and poor, who constitute a church, school, Order or Grange, may take a few hours' respite from business and domestic routine and care. No one can go out into the grove at this fair season, with its new leaves, bright blooms, soft green grass, and blithe nest-building birds, and not feel all the better for it. Indeed, no one can take an hour's ride along the country roads gazing at fragrant orchards, vineyards and sweeps of grain-fields, inhaling the perfumed air, and fail to come home with more sunshine in the face and the odor of flowers in the temper. And then, what an appetite one has for dinner after a ramble over the hills, through the woods, or along the shore of the sea. The man who has never eaten a lunch on a log, spread on the grass, or from the lap of his wife or best girl in the shade of a breezy grove, has never caught a glimpse of Nirvana.

As you are possessed of a rich commissary of lunch baskets, and regaled by the delicious anticipation of fragrant coffee, cold ham, chicken, hard-boiled eggs, sardines, and a score of other nice things, you can stand a poorly prepared speech. You are too kind to grumble at a commonplace dinner when you suddenly call upon a friend not expecting you. The best housekeepers are not always prepared to entertain. As I was invited to address you at a very late moment, you will patiently listen to a sort of pot-luck speech

I shall first ask you to notice the relation of agriculture to bodily health, vigor, and long life. The farmer follows a calling that more than any other furnishes all the needed elements of a noble physical manhood. The tallest, stoutest, best-looking men and women come from the country. You have purer air to breathe, purer water, and fresher food. With you, life is more uniform and tranquil. You have few temptations to dissipation and irregular hours. You are but little worried by cares, competitions, rivalries, and social antagonisms. In towns and cities, indolence, intemperance and lust consume one class, and hard labor and hot rivalship in business grind up the energies of another. Men living in narrow streets, huddled in low tenement-houses, or breathing in the stifling atmosphere of workshops, are more liable to disease. Epidemics and pestilence will run over a city like fire on a dry prairie. In the city the trades and guilds war upon each other. It is the amphitheater of the bulls and bears, a constant struggle between labor and capital. How roughly here the sharp extremes of wealth and poverty, luxury and starvation, refinement and barbarism, jostle and elbow each other. And now, what is the result of all this social attrition and friction upon the health and the duration of life? We are not left to theorize or conjecture. The statistics show that the average duration of life in the city is 20 years, while the average in the country is 40 years. Were it not for the influx of fresher blood, more robust and sanguine energy from the country, the population of our cities would die out or degenerate into runts or dwarfs. But agriculture sustains a relation to the development of the intellectual and moral powers in a way we are not apt to suspect. All life is susceptible of large improvement and augmentation, and that of man more than any other. The brute cannot be debased or elevated beyond a certain limit, but man may be sunk below the animal, or winged to the hight of an angel. And what have been the modifying circumstances that have lifted civilization out of the savage state? What has helped to make the difference between the ripe scholar, the elegant gentleman, the active, enterprising man of business, and the lazy, coarse-haired, coarse-featured Indian? Race has doubtless much to do with this distinction, but not all, for it is apparent that more might be made of even the lowest races. It may not be flattering to a transcendental philosophy, but it is nevertheless true that the development of our moral and intellectual power is largely conditioned upon the food we eat and the place we live in. A finely organized brain and a delicate and exquisitely harmonious system cannot come from poor living. The Digger Indian, who feeds on worms and grasshoppers, will partake of their nature. Great enduring intellectual power is always dependent on a good physical constitution. The larger the caliber of the gun, the stronger should be the carriage upon which it is mounted, or it will break down at the first detonation. The mind rides on the back of the animal, and the animal must be strong and well fed or the rider will make but little headway. Say what you will, a good stomach generously supplied with various and nutritious food, and an active brain, are intimately akin. The nations that feed on leeks and onions, a watery, fibrous and porous diet, are not noted for great commercial activity, enterprise, and daring adventure. The finest poems, orations, and philosophies do not blossom from Graham bread and cold water. It is not at the water-cure, but where people have a variety of good food, you find the most noble looking, wide-awake, sprightly men. Whatever, therefore, refines the quality of food, multiplies its variety, augments its abundance, must largely tend toward the intellectual development of a people. Agriculture, just so far as it has improved the properties of grain, fruit, and the breed of cattle, has been a generous contribution in this direction.

Agriculture lies at the base of social order and stability. One great distinction between civilized and savage men is the relation they sustain to the soil. The savage has no fixed abode. He makes no claims to the earth. He knows nothing of fee-simple deeds and leases. All he asks is a place to pitch his tent for a night, or during the hunting season. There can be no social organization, no law, no order, so long as men are nomadic and unsettled. Agriculture attaches men to the soil, and this lays the corner-stone of the social fabric. It fixes them to some chosen spot they call home, and clothes it with sweet and tender memories and associations. There the stars sparkle more brightly, the flowers bloom more fragrantly, the fruits taste more deliciously. Every tree, hill, field, and stream is daguerreotyped imperishably upon his soul. It is the fairest, loveliest spot on earth to him. The garden, the orchard and the field represent more to him than the annual yield of fruit and grain. It is the home of his wife, the place where he has unfolded his secret heart-history, and written upon cradle, play-ground, schoolhouse, and rural graves the evangel of his love. You can easily see how, with this attachment to the soil, this love for a chosen spot you call home, begins the development of social stability and order. What was your condition so long as you were a restless, roving gold-seeker, living in covered wagons and canvas houses, and carrying all your goods and chattels on the back of a pack-mule? It was not until you appreciated the value of the soil, the blessings of a home, that society began to crystallize into a goodly shape, and the love of law and order reigned. Socialism is a disease of cities and great crowded centers. It can never strike root and thrive among people who own their homes.

Agriculture not only contributes to social order and stability, but it fosters the love of liberty and has ever been the most unswerving foe of despotism. The government of savage tribes is despotic. One man, by superior strength, prowess, cunning or wisdom, gains the mastery and rules with absolute sway. At the other extreme there has always been a tendency in commercial and manufacturing circles toward aristocracy and monarchy. Vast wealth, accumulated at these centers, in the hands of a few, loves to rule; men who live in opulence and luxury, who control markets and corporations, form an exclusive class and are often disposed to domineer over the masses. Even in our free land the great cities make the slate and dictate the nominations. They furnish the money that carries elections and tamper with the integrity of legislation. The only offset to this accumulation of power is in the laborers of the rural districts, and it has ever been the tendency of agriculture to foster the spirit of liberty. The farmer stands on his own soil. Social distinctions do not disturb him. He is never inflated with snobbishness. His gains come so slowly that he is rarely puffed into egotism and ostentation by enormous wealth. He is above financial contingency, and consequently is never depressed by poverty into servility. His bread is dependent upon no man's caprices. He can vote as he pleases without fear of being dismissed from employment the next morning. In politics he is free, in a measure, from rings and cliques. In religion he is free from sectarian domination. In society he is not afraid of eavesdroppers and gossips. Lord of himself, owning the soil, harvesting his own grain, and driving fat cattle and sheep to the market, he feels his manhood, his independence, and has ever been the best friend of free institutions. History verifies the fact that whenever a people have established a democratic form of government, or in any way encroached upon the domains of monarchs from the olive groves of Greece, the snow-capped mountain homes of the Swiss peasantry, the broad steppes and savannahs of South America, or the sweeping rivers and virgin acres of the United States, the majority of the people have been owners and cultivators of the soil.

And now let me counsel the agriculturist to be content with his calling, and not to look with envy upon those who dwell in cities. You may find a very suggestive lesson in a certain good old book that I fear you badly neglect to read. "And the Lord God took the man and put him in the Garden of Eden, to keep it and to dress it." The first man, fresh from the hand of God, and his blushing young wife, just fashioned from a rib to indicate that she should always keep near his side, were placed in a garden. With what love-glancings and hand-squeezings they must have walked into their fair, bright home that bridal morning. God must have laughed outright when He invented the idea of woman, it seemed to make Adam so happy. Indeed, it is said that the morning stars sang together, and all the sons of God shouted for joy. From that hour the culture of the earth and the ownership of a cozy home in the country has come the nearest realizing Eden. But now do not forget the next lesson. Cain got angry one day and threw a club at the head of Abel and killed him, and was cut off from the culture of the earth as a punishment. "When thou tillest the ground it shall not yield thee her strength." "And Cain went out from the presence of the Lord and built a city." How many a young man who has given up the tillage of the soil and a quiet country life, to try his luck in the city, has gone out from the presence of his health, purity, and manhood. Who can gather up all the blighted hopes, shattered consciences, wasted lives and broken hearts thrown over this mighty social maelstrom?

When you come to look at this matter closely you will find that a very large portion of the distresses of labor come from our inordinate love of city life in this country.

To young men in the country, the city is a dazzling object. They are drawn to it as the moth-miller at night is attracted to a lantern hung in the orchard. The flow of young men toward the city is not deter-

mined by the law of demand, but by the law of dazzling attraction. In all these metropolitan centers the supply of labor is excessive, and the streets are filled with hundreds of persons with little or no money, seeking places that are not to be found. Advertise for a clerk or bookkeeper to-day, and there will be a hundred applicants for the situation the next day. Like birds charmed by the cobra, young hearts flock to the city and are unable to fly back to the country. They buzz around this dazzling lure and are consumed. They hover around this raging maelstrom and are lost. There might be developed an agricultural spirit that would greatly mitigate these griefs of industry. There is no reason why farming may not be made as charming a pursuit as merchandising. It would only be necessary to throw into the pursuit the ambition and intelligence that make the successful lawyer or merchant. And this is one of the chief excellencies of the Grange. It is lifting farming into the region of the fine arts. If farming must always mean the struggle of an ignorant man over a few acres with a hut, a poor horse and a potato patch, the intelligent young men will be drawn to the city. But farming, fruit-growing and vine-culture may mean in the country what merchandising means in the city—the rush of ambitious, thoughtful men. There is no reason why the occupation of a farmer should not be made so elegant and charming that between it and the handling of cases of silk, and the pursuit of medicine or theology, the best minds would confess little choice. Much has been achieved already in this direction, but much remains to be done, in order to check the rush of ardent, ambitious, but superfluous energy to that terrible, dazzling, devouring monster—the city.

And now a few friendly words with the young men I see around me. If not married, get a wife, a good, healthy, Granger's daughter, and commence to build a home. Do not wait until you are well-to-do, for few young men learn the art of economy till the solemn sense of domestic responsibility is upon them. If you are poor, pull, sing, play and economize together, and as soon as you are in some degree independent, get out of the ruts of routine and extract all the honey there is in the passing hours. But if you are already pretty well fixed, then do not compel your wife to cook for the hired men, slave over a wash-tub, make butter and cheese, hunt eggs, and raise turkeys and chickens, until her beauty fades and the sweetness of her temper sours. Get her a piano, music and charming books and magazines to read, and try and make the charms of the country as cheerful and pleasant to her as possible. Never grumble at the milliner's bills. If your wife loves a nice, fashionable dress, and a bewitching, daintily trimmed hat, you should be all the more proud of her. What are you for, you great, strapping, stalwart fellow, but to make some woman happy and your home a little heaven to go to heaven in? If you love a fine horse, and bright, shining harness, why should not your wife be gratified in the line of her tastes? Then do not labor so long and hard that you have no time for reading and inteilectual improvement. Soul-wealth will outlast your orchards and vineyards. Shrouds have no pockets, but remember the mind will safely carry all you store in it above all the wear and mutations of time. When you visit the city do not go where you would feel ashamed to take your wife and daughter, and do not stay long unless you are a good temperance man. Loan all the money you can spare, but never hire if you can possibly avoid it. Never allow your homestead to be clamped in a mortgage. Be honest, be temperate and independent, keep out of debt, never go security, avoid lawsuits, lotteries, stock-gambling, and in short, as we sometimes say in bidding a friend good-by, be good and you will be happy.

Gold Fields,

That pan out richly, are not so abundant as in the early California days, but those who write to Hallett & Co., Portland, Maine, will, by return mail, receive free, full information about work which they can do and live at home wherever they are located, that will pay them from $5 to $25 per day and upward. Either sex, young or old. Capital not required; you are started in business free. Those who start at once are absolutely sure of snug little fortunes.

Consumption Cured.

An old physician, retired from practice, having had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung Affections, also a positive and radical cure for Nervous Debility and all Nervous Complaints, after having tested its wonderful curative powers in thousands of cases, has felt it his duty to make it known to his suffering fellows. Actuated by this motive and a desire to relieve human suffering, I will send free of charge, to all who desire it, this recipe, in German, French, or English, with full directions for preparing and using. Sent by mail by addressing with samp, naming this paper, W. A. NOYES, 149 Powers' Block, Rochester, N. Y.

Any tract will be set in raisins or fruit and brought to bearing by proprietor of colony, if desired Send stamp for circular, and state how you wish the installments. GRIFFIN BROS., Cottonwood, Shasta Co., Cal.

DEERING "GIANT" MOWERS

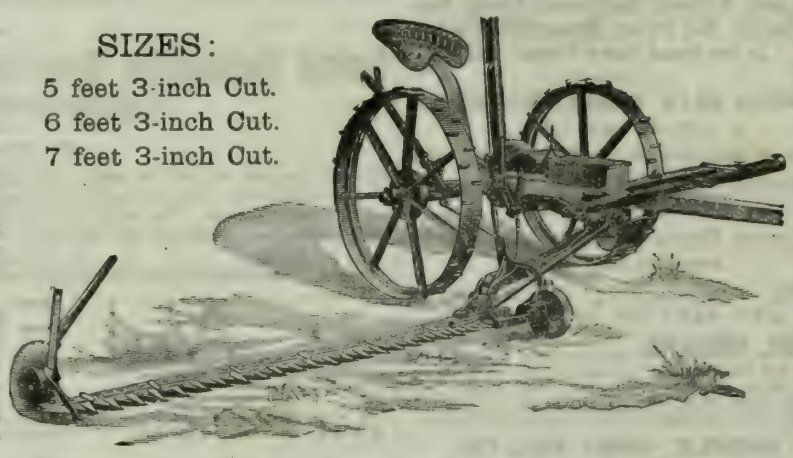
MANUFACTURED BY

WM. DEERING & CO., CHICAGO, ILL.

Very Strong, Very Economical, Very Light Draft.

THE "GIANT" found no grass in the heavy cutting of last season (1886) which it did not successfully handle; in several instances it was taken into grass that had been given up as being uncutable by other Mowers cutting only 4 feet, at the same time the "GIANT" was cutting a 6-foot Swath.

Intending purchasers of Mowers would consult their own interest by calling upon the local agent and examining into the merits of the "GIANT" before purchasing any other Mower. It is sold under a full guarantee, and intending purchasers are furnished the "GIANT" on Trial.



For doing an immense amount of cutting in a given time, and for leaving the grass in the very best shape for drying, the **Deering Front-Cut Giant Mower** has no equal. With its immense Cutter-Bar of 5 and 6 feet, it is well equipped to do almost **double** the amount of cutting that can be done by the common four-foot Mower, the only thing other factories have to offer to their customers. While the **Giant Mower** can do a giant's work, or about double that of the little Mowers, yet a team of ordinary horses draw it with ease day after day. In short, its draft is little if **any** greater than a common Mower. It is a continual source of wonder to farmers who see the **Giant** for the first time, how a Mower cutting such an **unusual** swath of 6 feet, can be pulled with so much ease by a small span of horses.

The whole secret of the wonderful light draft of the **Giant** Mower lies in the following four facts:

1st, and most important: The Cutter-Bar is supported by a strong steel spiral spring, so that the Bar does not rest heavily upon the ground, nor drag with all its heavy weight upon the ground. If it be borne in mind that about 40 per cent of the draft of a common Mower is caused by the dragging of the Cutter-Bar upon the ground, it will be no cause of wonder that the **Giant**, by saving this loss of power,

SIZES:

5 feet 3-inch Cut.
6 feet 3-inch Cut.
7 feet 3-inch Cut.

can turn it to cutting almost double the width of swath done by an ordinary Mower. In addition to the economy of power, there are some incidental advantages. It is free from side-draft. There can be no side-draft if the Cutter-Bar does not drag upon the ground. Another advantage had by having a supporting spring, is that the driver is assisted in lifting the Bar by the spring. Still another advantage is the increased traction gained by throwing the weight of the Bar and Drag-Bar upon the wheels.

2nd. The **GIANT** pulls easy, because of its **High Drive Wheels.**

3rd. It pulls easy because of its **large** and perfect-fitting **gears.** In the Giant there is no gear-cutting nor gear-grinding. Every part fits perfectly.

4th. It pulls easy because the shafts are small where they enter their bearings.

We feel a just pride in the **Front-Cut Giant** for the remarkable record it has made since its first introduction. Every farmer who has written us speaks enthusiastically of its wonderful cutting powers, its light draft for two horses, and its freedom from side-draft.

The advantage of course in buying a Giant is **Economy.**

Ask the Deering Agent in your town,,or address us for Special Circulars describing our machines in detail, with Illustrations.

M. K. LAUDEN, General Agent,

Warehouse, 1021 to 1027 Bryant St., SAN FRANCISCO, CAL.

THE IMPROVED LINK AND V-BELT COMBINED HARVESTER.

Manufactured by

The Stockton Wheel Co.,

STOCKTON, CAL.

For further information and Price Lists address STOCKTON WHEEL CO., STOCKTON, CAL., or the undersigned, importers of

Wagon & Carriage Materials and Hardware.

HOLT BROTHERS,

30 and 32 Main St.,

SAN FRANCISCO.

Our Improved Harvester will, without question or doubt, be the most popular machine in the grain field this year, as it certainly was last year, wherever used. Everybody who saw it working in the grain, running over rough ground, through hog wallows, over fields studded with trees, with as much ease and regularity as though the fields were smooth and level. Read the testimonials of several farmers who used our Harvester last year.

We have improved our machines over last year very materially, strengthening the weak points by putting in additional truss-iron braces, increasing or lowering speed when required, shortening the chain belts and substituting pivot and sliding boxes for the old fashion solid boxes, which will not give a particle as the frame warps or twists out of line. The greatest and most desirable change we make this year is discarding the sleeve on the main shaft, which caused us more trouble last year than anything else, by sticking to the shaft, making it grind the shaft and run hard. In a few weeks' time it wore away, leaving it rickety and causing the cylinder to run unsteady. This most desirable improvement makes it run one horse lighter at east.

Some of the agents of other manufacturers have sought to frighten farmers into buying their machines by telling them if they buy our Improved Harvester that they are liable to be prosecuted for infringement of patents. Now, these agents know, or if they don't know they ought to, that what they assert is false and malicious. Our Improvements are our own, and infringe upon nobody's patents. To allay all apprehension in the minds of intending purchasers, we say here that we will protect you against any and all losses on account of suits for infringements. The following are some of the advantages our Improved Harvester possesses over all others:

1. Our Improved Harvester runs FOUR horses lighter than any other machine made.
2. It is easily handled, and turns a square corner as readily as a mowing machine.
3. It is less liable to get out of order, and cheaper to keep in repair than any other machine.
4. It has no clumsy, expensive gearing to wear out or break.
5. It is run mostly by Link and V-Belts which, in case of breakage or accident, can be repaired in the field without loss of time.
6. Our Harvester makes no noise to frighten or irritate the horses, and makes less noise than ordinary headers.
7. Our Header is far the simplest and runs the lightest, and is the strongest and best. There are no Rickety Gears or Trembling Rods to break.
8. The Header may be raised and lowered instantly from any part of the Separator.
9. Our Harvester WEIGHS FIFTEEN HUNDRED POUNDS LESS than any other machine of the same capacity in the market.
10. It will cut, thrash, clean and sack more grain in a season, with less expense for labor and repairs than any other Harvester ever turned out.

Remember, all our Improved Harvesters are warranted to work well or no pay. Examine them before purchasing elsewhere. We shall sell our Harvesters upon their merits alone.

TESTIMONIALS:

GRAYSON, CAL., Feb. 21, 1887.

MESSRS. HOLT BROS.—Dear Sirs: As to your machine, we think it a good one. It saved the grain well. Had but little lost time; as to expense, $25 would cover the whole for the entire season. Number of acres cut, 1750. If we were going to buy another, we should certainly get one of yours. Respectfully, F. CARPENTER, R. BROWN.

OAKDALE, Feb. 21, 1887.

MESSRS. HOLT BROS.—Gents: I ran one of your Combined Harvesters last year. Cut 1950 acres of grain in 63 days. Did not lose over one day making repairs and replacing extras. Repairs cost about $10. I cut both light and heavy grain. It did good work, and the grain brought the highest market price, on account of its being better cleaned. I am perfectly satisfied with my purchase. I have worked with three other Combined Harvesters, and consider yours the best in the field for lightness of draft, durability and fine work.

Respectfully yours, D. W. CARMICHAEL.

GRIDLEY STATION, Sept. 22, 1886.

MESSRS. HOLT BROS., San Francisco—Gentlemen: I have used one of Holt Brothers' Link Chain and V-Belt Combined Harvesters, and consider it (in my opinion) the best Harvester made. This season I harvested 800 acres; averaged 23 acres per day, with 12-foot cut. I consider the draft is four horses lighter than either the Houser or the Young Machine. does better in all kinds of grain than either of the above-named machines. I run the whole season without any breakage.

GEO. WICKMAN.

TURLOCK, Sept. 16, 1886.

MESSRS. HOLT BROS., San Francisco—Gentlemen: Your letter of the 8th inst. received and contents noted. In reply I will state that I think your machine is the best that is made. I cut 1350 acres of grain with it in 42 days. I did not have to repair the machine from the time I started till I quit running it. It runs lighter, and I think does the best work of any machine that I have seen. Very respectfully, ED. McCABE.

DIXON, Sept. 10, 1886.

MESSRS. HOLT BROS., San Francisco—Dear Sirs: Yours of Sept 8th at hand and contents noted. Will try to answer your questions as nearly correct as I can. Of course I have not seen all of the different Harvesters working, but from what I have seen and learned, will say that so far as my information and experience goes, your Link and V-Belt Harvester is, in all respects, the best in use. It did as good work, if not better work, than the Houser here. It pulls from two to four horses lighter than the Houser. My repairs were nothing; was not detained at all in my harvest on account of breakage. I cut 600 acres in 23 days, and moved four miles three different times. Yours truly, JOS. KLINE.

And Many Others.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours.

THE MECHANICS' FAIR.—A large meeting of prominent citizens was held at the Mechanics' pavilion in this city on Tuesday evening, at the call of President Cornwall, of the Institute. The object was to interest the city in advancing the exhibition to be held this autumn, in view of the great number of strangers now visiting the State. It was stated that the Institute would expend $35,000 upon the exhibition, and if the citizens would contribute, a much larger fund might be secured. The proposition seemed to commend itself to the meeting and favoring resolutions proposed by Senator Williams were adopted. Several speakers, including Senator Hearst, M. M. Estee and others, favored the proposition as an important means of adding to the fair fame which California is now enjoying.

What Would the World Do

Without woman? asks the essayist who starts out to say something new on this oft-treated subject. Of course, the human element of the world would not exist without woman, so the question is gratuitous. It would have been far more sensible to ask: What would the world do without the salvation of woman, without a panacea for her physical ills and a cure for her peculiar diseases? In a word, what would the world do without Dr. Pierce's "Favorite Prescription," the great remedy for female weaknesses? It is indispensable for the ills of womankind.

Nightmare,

Sick-headache, depression of spirits, and want of ambition are symptoms of a diseased liver. The lungs, stomach, and bowels are all in sympathy. Life is only a living death. Dr Pierce's "Golden Medical Discovery" acts upon the torpid liver, and effectually removes all these difficulties and disorders. Nervous feelings, gloomy forebodings, and irritability of temper all disappear.

Young or middle-aged men suffering from nervous debility and kindred weaknesses should send 10 cents in stamps for large illustrated treatise suggesting sure means of cure. World's Dispensary Medical Association, Buffalo, N. Y.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

MESSRS. ALLISON, GREY & Co., wholesale commission merchants, have removed to the corner of Washington and Front Sts., taking stores Nos. 501 to 509 (inclusive) Front St. Their increasing trade demanded enlarged premises and the new location and ample stores are just suited to their growing business.

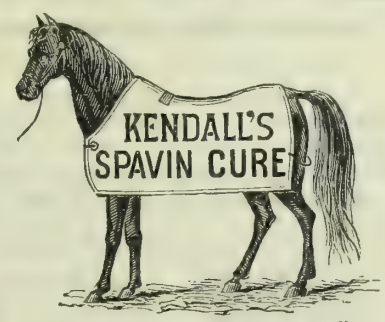
SCALDS and BURNS should have prompt and proper care or they may prove very dangerous and perhaps FATAL.



ACCIDENTS are constantly happening. A kick of a horse or cow may cause a bad bruise; the slip of an axe or knife may result in a serious cut.

Any of these things may happen to one of YOUR family at any moment. Have you a bottle of PERRY DAVIS' PAIN KILLER ready for use in such cases? It has no equal for the cure of Scalds, burns, cuts, swellings, bruises, sprains, sores, insect bites &c.—All Druggists Sell it.

PERRY DAVIS & SON, PROVIDENCE R. I.

The most Successful Remedy ever discovered and it is certain in its effects and does not blister. Read proof below.

KENDALL'S SPAVIN CURE.

PHILADELPHIA, PA., March 18, 1885.

DR. B. J. KENDALL CO.—Gents: I had occasion to test your Kendall's Spavin Cure about a year since in the following manner. We had a horse which had been used by the Frankford and Southwark Fifth and Sixth Streets Philadelphia City Passenger R. R. Co., that developed a Ringbone, and after some months became so lame that we were compelled to put him away by selling, which we did to a party who took him to the country, and said party commenced a treatment of the horse with your Kendall's Spavin Cure which he followed up for the space of about three months with such results that at that time they put him to work, and a little later succeeded in entirely curing him, leaving the part perfectly smooth, which circumstance warrants me in saying that I have a great amount of confidence in your Kendall's Spavin Cure. Yours truly, GEORGE F. RICHER, Assistant Stable Foreman of Frankford and Southwark Fifth and Sixth Sts., Philadelphia City Passenger R. R.

Price $1 per bottle, or six bottles for $5. All Druggists have it or can get it for you, or it will be sent to any address on receipt of price by the proprietors, Dr. B. J. KENDALL Co., Enosburgh Falls, Vt.

MUSIC TEACHERS.

Teachers of Piano; Teachers of Organ;
Teachers of Theory; Teachers of Choirs;
Teachers of Music in Schools;
Teachers of all Instruments;
Trainers of the Singing Voice;
Teachers of Classes;

Are all WELL AND FULLY provided for in the immense stock of Oliver Ditson & Co., which contains 500 books directly used in teaching, and 1500 other music books, all well compiled and useful. These are of their own publication, and they have, in addition, all the other noted books of the world. Also, pieces of Sheet Music almost without number.

Teachers of Music who cannot visit their stores in Boston, New York or Philadelphia, or that of Lyon & Healy in Chicago, their principal agents in the WEST, are cordially invited to call for and examine Ditson & Co.'s books in any reputable music store, or to correspond directly with **Oliver Ditson & Co., Boston.**

Lists and Catalogues cheerfully furnished to the profession, and all inquiries as to music and music books answered, and musical advice given by their army of employes, many of whom are well-trained singers, players and composers. Send to, or call on

OLIVER DITSON & CO., Boston.

C. H. DITSON & CO., - - 867 Broadway, NEW YORK.

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Park Association, Santa Clara Valley Agricultural Society and Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. The follower has a movement of 26½ inches, the first revolution of the screw moves the follower 1½ ins., the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.

Printed Testimonials can be had on application of the following parties, who have bought my press: J. B. J. Portal, San Jose; Wm. Pfeffer, Gubserville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. Stiller, Gubserville; Lay Clark & Co., Santa Rosa; Vache Freres, Old San Bernardino; J. F. Crank, San Gabriel; James Finlayson, Healdsburg; P. & J. J. Gobbi, Healdsburg; Wm. Allen, San Gabriel; Wm. Metzger, Santa Rosa; J. Lawrence Watson, Glen Ellen; Walter Phillips, Santa Rosa; Geo. West, Stockton; Eli T. Sheppard, Glen Ellen; Rancheto Wine Co., Rancheto, Los Angeles Co.; Downing Fruit & Wine Co., Downey; J. L. Beard, Centerville; Wm. Palmtag, Hollister; A. Burnham & Son, Santa Rosa; Paul O. Burns Wine Co., San Jose; E Emil Meyer, Santa Cruz Mountains, Wright P. O.; Marshall & Hill, Laguina Station; R. J. Northam, Anaheim.

THE GRAND SALE OF THE SEASON!

OF IMPORTED AND NATIVE-BRED

GALLOWAY CATTLE

ON JUNE 10th and 11th,

At GEO. L. GOULDING & CO.'S City Stock Yards, Denver, Colorado.

LEONARD BROS., of Mt. Leonard, Mo.,

—AND—

BUSH & MORSE, OF WINDSOR FARM, DENVER, COL.

Will hold a joint public sale of **Imported and Native Bred Galloway Cattle.** The lot consists of 100 head of males and females of the choicest breeding and individuality, embracing selections from four different importations by the Leonards, who (it is a well-known fact) brought over only the best that money could buy and careful judgment select. Most of the cattle offered by Bush & Morse, of the Windsor Farm, are direct descendants of the stock imported by the Leonards, who, in breeding the same, combined some of the best strains of blood in their herd. It is once in a lifetime that such an opportunity is offered to the public of purchasing such a splendid lot of cattle, and the undersigned feel no hesitancy in endorsing what is claimed for them—"that they are the finest lot ever offered at public sale in the world." The fact that they were all imported or bred by the Leonards is sufficient guarantee that the stock is as represented—"the very best that can be found." Nearly all the young stock are by the famous sire, "British Nero," 1877, and the females are bred to that grand bull, "Borderer of Drumlanrig," 2628, whose cut appears above.

In the breeding are found such popular strains of blood as represented in the tribes of Drumlanrig Semiramis, Lady Satnley, Forest Queen, etc., embracing such famous sires as Black Prince of Drumlanrig Harden, Moss Trooper, Montague, Scottish Borderer, Pretender, Guardsman and others equally noted for their show-yard careers and the grand quality of their get

All necessary assistance will be furnished to buyers from a distance in loading and shipping their stock. Terms of sale, cash, or four months approved paper bearing 8 per cent interest. Catalogues furnished on application.

GEO. L. GOULDING & CO.

COL. S. A. SAWYER, Auctioneer.

NOTE.—During the sale there will be on exhibition some steers and bulls bred from Thoroughbred Galloway Bulls out of Shorthorn Cows. Cattlemen will be able to judge for themselves as to the result of the cross.

IMPORTANT!

That the public should know that for the past **Sixteen Years** our **Sole Business** has been, and now is, importing (**Over 100 Carloads**) and breeding improved Live Stock—Horses, Jacks, Short Horns, Ayrshires, and Jerseys (or Alderneys) and their grades; also, **all the varieties** of breeding Sheep and Hogs. We can supply any and all good animals that may be wanted, and at **very reasonable prices** and on **convenient terms.** Write or call on us. PETER SAXE and HOMER P. SAXE.

San Francisco, Cal., Oct. 22, 1886. **PETER SAXE & SON, Lick House, S. F.**

Not One of These Harvesters Has Been Returned.

THE HARVEST QUEEN.

MATTESON & WILLIAMSON,

The only manufacturers in Stockton who make a specialty of making everything needed by the farmer in seeding and harvesting. Among their latest triumphs in harvesting machinery is the unrivaled

HARVEST QUEEN,

To Which They Invite the Attention of the Careful Farmer.

This machine was first placed in the field during the harvest of 1886. From the testimonials of those who have had it in use it is considered the peer of any now offered for public favor. For stanchness of build, lightness of draft, economy of manual labor and animal power, and in saving and cleaning the grain, its equal has yet to be produced. It is so furnished with efficient and ready-operating brakes that the lives and limbs of operators are in no degree endangered. A limited number of the HARVEST QUEEN are being constructed for the harvest of 1887.

ORDERS AND CORRESPONDENCE SOLICITED.

☞ We refer you to the following-named persons who have had the Harvest Queen in use during the past harvest season: D. P. Edwards, Maxwell, Colusa Co.; H. Beckman, Woodbridge; H. W. Childs, Acampo; Ralston & Grigsby, Acampo; Yosemite Stage and Turnpike Co., Maderia; H. W. Patterson, Borden.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, May 11, 1887.

The past week has been characterized by unusual cool weather for the season of the year. Continued dry weather creates fear in many sections regarding crops, that heretofore did not express any fear regarding the outcome. The wheat market abroad has been gaining strength with an advance reported on last week's sales. To-day's cables are as follows:

LIVERPOOL, May 11.—Cargoes off coast, quiet; cargoes on passage and for shipment, quiet, but steady; Cal. wheat off coast, 39s 6d; Cal. wheat just shipped, 39s 6d; Cal. wheat nearly due, 39s 6d; Liverpool wheat, spot, upward tendency; Liverpool wheat, Cal. 7s 10d to 8s 1d.

Foreign Review.

LONDON, May 9.—The *Mark Lane Express*, in its review of the past week, says: Values of English wheat are against buyers. In provincial markets there is scarcely any offer, and an advance of 6d@1s is asked. The sales of English wheat during the week were 60,492 quarters at 33s 2d, against 65,930 quarters at 31s 5d during the corresponding week of last year. Trade in Foreign wheat is steady and rather against buyers. Corn is in short supply and values are stiffening. Two cargoes of wheat arrived; one cargo was sold and one was withdrawn. At to-day's market wheat was quiet and prices were unchanged. Flour was firmer at an advance of 3@6d on the week.

Crops at the East.

CHICAGO, May 8.—The *Farmers' Review* will print the following crop report this week: The rains have been beneficial to winter wheat in all States reporting this week, but more is required to give that crop and spring wheat more rapid growth. The seeding of spring wheat is completed, and in many instances the crop is above ground and promising well. The average condition of winter wheat in the 14 counties in Illinois reporting this week is 88 per cent. The general average condition of winter wheat for the Indiana counties reporting this week is 87 per cent. The condition of winter and spring wheat in Iowa is reported as fine, but the acreage is small. The condition of spring wheat is good in nearly every report. The condition of winter wheat in Kansas on the whole is not promising. In Kentucky the condition of the crop is quite satisfactory, and the same may be said of Michigan with the exception of Berrier county. In Minnesota the winter wheat is in fair condition, but spring wheat is not above the ground yet. Prospects in Missouri are very good for a full crop of winter wheat. Winter and spring wheat in Nebraska is in fairly good condition, but more rain is still required. The average condition in Ohio is rather low. The condition of the crop in Wisconsin, and also in Dakota, is fair. The meadows and pastures are improving, but in many localities rain is needed.

Eastern Wheat Markets.

NEW YORK, May 8.—Wheat has been bullish on very active, excited and feverish markets. Prices sharply advanced on extensive covering purchases made on foreign as well as home account. The close was barely steady, and the temper of traders inclined to be bearish for further reactions in the absence of stimulating news. Final prices were down ¾ of a cent for May, at 96c; ⅝ for June, at 95½; ⅞ for July, at 94½; and ½ for August, at 93.

NEW YORK, May 11—12 M.—98⅛c for cash, 96⅛c for May, 96⅛c for June, 95⅝c for July and 93⅛c for August.

CHICAGO, May 11—12 M.—84⅛c for cash, 84⅝c for May, 86⅛c for June, 85⅝@85¾c for July, 84⅛c for August and Sept.

Eastern Wool Markets.

BOSTON, May 7.—The unsatisfactory tone of the wool market, noticed for a long time past, continues. The sales for the past week were small, amounting only to 1,660,600 pounds. The market is steady and there is no change in prices to notice. Oregon wools are steady and in fair demand. There were sales of 10,000 lbs of valley at 23@25c, 20,000 lbs of Eastern at 16@20c, 125,000 lbs of Eastern at 16½c and 9000 lbs Eastern on private terms. There have been sales of 122,000 lbs of new spring California wool on private terms. Most of the sales, it is understood, were on a basis of 60c for long staple and 57c for fair staple. Buyers are offering 55c to 58c for clean quite freely. Fall wools are very full. Large stocks are in the hands of commission merchants, which will probably produce some competition.

The Philadelphia market was less active. Among the sales were 10,000 lbs Montana fine and 21,700 Territory, and fine medium, at 22 cents; 10,000 lbs Territory, three-eighths spring and fall, 24 cents; 4000 lbs Territory improved, 20@21 cents.

California Products at New York.

NEW YORK, May 8.—Beans—The demand is moderatively active, but prices are strong on light receipts. California Lima, $1.80.

Green Fruit—Small lots of California cherries are arriving which bring $1 ₩ lb. Next week a better supply is expected. California tangerines are selling at $4@4.50 ₩ box and 75c a dozen. Extra good cargoes are scarce. The seedless Navel variety fetch $1.50 a dozen.

Honey—Moderate orders for California honey continue to be received, but as the stock is under control, buyers are unable to do better than 5½c. Freight rates are against further shipments from the Pacific Coast.

Seeds—California brown mustard has been in demand, and sales are reported of 500 bags at 4½@5c; quoted at the close at 5@5¼c; California yellow mustard quiet at 4¼@4½c.

New York Hop Market.

NEW YORK, May 8.—The variable reports that come in from the State hopfields make up about all there is in the way of life in the market. In view of last year's experience dealers show no inclination to speculate on crop receipts, and as the brewers are still buying indifferently, prices are barely maintained. The Cooperstown *Journal* says: We have before us reports from a large portion of the hop district of this State. As a rule, early indications give promise of a very light crop. A great many old yards will be plowed up and put to better use, and very few new yards will be set out. This condition of things tends to keep the hops of '85 and '86 off the market. N. Y. State 1886 common to good, 15@17c; do 1885 medium to best, 6@10c; Pacific Coast 1886 best, 18@20c; do common to good, 14@17c; do 1885 good to prime, 7@9c.

California Fruit in Chicago.

CHICAGO, May 7.—California lemons are in moderate demand and slow at $2@3 ₩ box. Oranges are in fair supply. Choice fruit is held steady, while common is rather easy. There is no material change in prices. Bright Riverside, good to fancy, ₩ box, $3.50@4.50; San Bernardino, $3.50@4.25; Santa Ana, $3@3.25; St. Michael, paper rind, $3.75@4; Orange, $2.50@3; Los Angeles, $2.75@3.25; Navel oranges, according to quality, $5@6; Duarte, $3@3.50; San Gabriel, $2.25@3; blood oranges, fancy, $5@7; culls, $2.

Dried fruit is steady. There is a moderate demand for all cuts of apples of choice quality and fine grades, and they are not plenty. There are some ordinary lots of quarter sun-dried, and they are dull, but all other lines of apples sell fairly and rule steady. Peaches continue quiet; the supply consists mainly of old peaches, which are uncalled for, while new, which would sell, are very scarce. California dried fruits quiet. The supply is small and is in moderate demand. Prunes, French, ₩ lb, 8@9¼c; plums, pitted, 10@11c; peaches, halves, 11@12½c; do halves, pared, 20@21c; figs, 6@8c; nectarines, 9c; pears, 8@12c; raisins, London layers, 20-lb boxes, $1.40@1.50; loose, Muscatel, ₩ box, $1.20@1.30; California layers, ₩ box, $1.25@1.35.

Dried Fruit and Canned Goods East.

NEW YORK, May 8.—Dried Fruit—Raisins have met with little more attention through the jobbing trade, and prices are more steady. Two-crown loose California $1.25@1.30; do London layers, $1.50@1.55. Prunes firm, with a steady jobbing request. Sales 75 cases at 3¾@4c. Currants firm at 5c@5½c. Citron dull, offerings limited; quoted 16¾@17c.

Canned Goods—For all descriptions there is a moderately active consuming trade, and in many lines the tendency of prices is better. Tomatoes continue to exhibit considerable strength. Peas are firmer with 2 lbs quoted at $1.25@1.50. Lima beans are in better demand. Gallon apples are scarce and held firmly. Three-gallon pie peaches are in light supply. California canned fruit of "extra" quality has been in demand of late. Contracts are reported made for forward deliveries of new crop. "Standard" goods, however, are not at the moment inquired for. The prices quoted for the next pack are about 10 per cent less than those at the opening of last year. California canned peaches and pears, $2.50@2.75; plums and grapes, $2@2.10; apricots, $2.15@2.25.

Local Markets.

BAGS—The arrival of large consignments has weakened the views of holders. Sales are reported at concessions on asking prices, which are 5¼@5¾c for standard Calcuttas.

BARLEY—The market has ruled steady but firm throughout the week, with brewing grades in more active demand. On Call, transactions in options were only fair. The following are to-day's sales:

Morning Session: Buyer season—200 tons, $1.12½. Buyer 1887—100 tons, $1.27. Seller 1887—200 tons, $1.09½; 200, $1.09⅝; 100, $1.09¾ ₩ ctl. Afternoon Session: Buyer season—200 tons, $1.12; 200, $1.12½; 100, $1.12¾. Buyer 1887—200 tons, $1.27¾; 100, $1.27½. Seller 1887—100 tons, $1.09¾ ₩ ctl.

BUTTER—Notwithstanding receipts have been heavy, prices continue strong, owing to the free demand from packers and dealers. Stocks are kept well cleaned up.

CHEESE—The market is barely steady, but at the close an improved demand is reported.

EGGS—Heavy offerings of Eastern at lower prices have weakened Californian still more. The supply here is largely in excess of requirements.

FLOUR—The market is strong at full figures. The demand is in a small way and chiefly local.

WHEAT—Transactions on Call the past week have been large, with buyer season and spot options receding and seller '87 advancing. The latter option, it is reported, has been freely shorted. Sales on Call to-day were as follows:

Morning Session: Buyer season—100 tons, $1.84; 600, $1.83¾; 100, $1.83½; 100, $1.83¼; 400, $1.83; 400, $1.82½. June—100 tons, $1.84. July—100 tons, $1.81½. August—200 tons, $1.78¾; 100, $1.79⅜; 700, $1.80; 100, $1.80¾; 100, $1.81. Buyer 1887—400 tons, $2.05¼; 200, $2.05; 100, $2.04¾. Seller 1887—500 tons, $1.77¼; 300, $1.77⅜; 2500, $1.77½; 3500, $1.77⅝; 300, $1.77¾; 500, $1.77⅞; 1800, $1.78 ₩ ctl. Afternoon Session: Spot, season's storage paid—100 tons, $1.81; 100, $1.80¾. Buyer season—100 tons, $1.83; 100, $1.82½; 300, $1.82¾. Buyer 1887—200 tons, $2.04¼; 100, $2.04½; 700, $2.04. August—500 tons, $1.81. September—100 tons, $1.79. Seller 1887—200 tons, $1.77⅞; 700, $1.77¾ ₩ ctl.

COMMUNICATED.]

Market Information.

Cereals.

Crop advices in this State continue unfavorable. The plant on adobe and sediment land is, as a rule, reported poor, but on clay soil the stand is more promising, as is the plant on the foothills. Rain is a crying necessity to insure even half of an average yield to the acre. Oregon and Washington Territory advices continue favorable. East of the Cascade mountains the crops of wheat, barley and flax promise to be unusually large.

Eastern crop advices, taken as a whole, are less favorable than on April 1. European crop prospects are essentially unchanged.

Eastern advices report heavy transactions in actual wheat at Chicago. One large firm sold a line of 1,600,000 bushels, equal to 960,000 centals or 48,000 short tons. One of the members of the firm was in this city looking after wheat, and it was probably under his advice that the sale was made. It is claimed that the large bulk of the visible supply at the East is held by the syndicate. It is also claimed that the syndicate will be compelled to enter the market for the coming season's crop on a larger scale than they are now operating upon.

Our market the past week, so far as can be ascertained, has been void of transactions in actual wheat, but on Call transactions have been free in the different options. Spot wheat, season storage paid, ranged in value from $1.81¼@1.82½ and even higher. These sales virtually fix the price of actual wheat. In options the dealings have been very heavy in buyer '87 and also seller '87, and at strong prices. It now looks as if the syndicate is trying to control the incoming crops. Two vessels were chartered the past week to load wheat for the United Kingdom.

The exports of wheat from this port last month aggregated 570,768 centals, and of flour 79,923 bbls.

The quantities of flour and wheat shipped from California in the first ten months of the current cereal year have been as follows:

	Flour. Bbls.	Wheat. Centals.
July	105,251	754,423
August	73,791	853,050
September	91,801	1,841,977
October	124,654	1,195,379
November	98,271	1,946,382
December	117,352	1,568,126
January	72,776	1,186,591
February	83,760	429,884
March	79,841	442,504
April	79,923	570,768
Totals	927,420	10,789,084

Reducing flour to wheat, the combined shipments of flour and wheat for the first ten months of the year compare as follows:

	Centals.
1882–83	16,307,400
1883–84	13,298,000
1884–85	17,994,800
1885–86	12,453,000
1886–87	13,571,300

The shipments for the past ten months are equal to 678,567 tons.

Feedstuff.

Choice hay continues to rule steady, under light stocks. The loss by fire in this city on Tuesday last of about 1000 tons of hay is severely felt. Some new alfalfa hay, this year's crop, was received on Monday last and sold at $8@9 per ton.

Bran, middlings and other ground feed are strong, with a good demand ruling.

Live-Stock.

Although there is not so great a selling pressure, the market is barely steady for bullocks, owing doubtless to the lessened consumption. Mutton sheep are steady. Hogs are slow, with only a block demand reported. In horses there is nothing new to report. A span of matched bays, good steppers and fine appearance, was sold at a slight advance on $1000. This is considered a fancy price. Milch cows are in light inquiry.

The following are the wholesale rates of slaughterers to butchers:

BEEF — Extra, 8c; first grade, grass fed, 7½c per lb.; second grade, 7@—c; third grade, 6c.

MUTTON—Ewes, 6½; wethers, 7c.

LAMB—Spring, 9@10c.

VEAL—Large, 6@8½c; small, 6@8c.

PORK—Live hogs, 4¾@5c for heavy and medium; hard dressed, 7½@8¾c per lb; light, 4½@5c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

Old potatoes hold to strong prices under light supplies and a good demand. Some Utah are coming in. New potatoes are shading off, the quality is improving, and consequently more are going into consumption.

Onions are fairly strong, particularly for choice hard keepers. New onions are slow, as the quality is still poor.

In garden truck, asparagus has held up well. Sweet peas are in good demand, chiefly from canners, causing prices to rule fairly steady at the low prices. Other vegetables have fluctuated according to the supply and demand.

Fruits.

Oranges came in more freely the past week, causing low prices to rule, owing to the lessened consumption. Limes and lemons are steady.

The demand for strawberries the past week was good, keeping stocks well cleaned up. Cherries are coming in more freely, causing lower prices to obtain, particularly for the poorer qualities. Raspberries are in light receipt. Gooseberries are hard to place.

The stock of dried fruits is very light, causing a higher range of values to obtain in California French prunes and unpeeled peaches.

Raisins, particularly choice, are in light supply, and as overland freights are lower, the feeling on the part of holders is stronger.

The first cherries received this year came from Robinson Bros., Vacaville. They also sent the first to this market last year.

Patrons of this paper sending first shipments of fruits, vegetables or cereals to this market will confer a favor by having the consignee report it to this paper so we can publish the same.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	245,951	248,004
In port, disengaged	113,001	28,474
In port, engaged	3,404	29,906
Totals	362,356	306,384

The above gives a carrying capacity as follows: 1887, 579,769 short tons; 1886, 490,214 short tons; increase over last year, 89,555.

Owing to the reduction in overland freights, wool is in better demand, with buyers willing to pay an advance. Some choice clips were placed at a slight advance on top quotations.

In poultry, choice large young fowls are higher and in good demand. Receipts are light.

Nuts are very scarce, with a further advance reported in walnuts and soft-shell almonds.

Honey is strongly held, owing to light stock and a probably light crop this year.

With lower overland freights there is more disposition to advance beans, as the stock here is light.

Mustardseed holds strong, due to light supplies and unfavorable crop advices.

Hops are in good demand, with holders asking more money, owing to the scarcity of choice goods.

Tallow continues scarce and high, not only here but also at the East.

Hides are stronger.

San Francisco, May 11, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

J. W. EVANS, Gen'l Agent,
29 Post St., San Francisco.

Who Has DUPLICATED Our Cut and Tried to IMITATE Our PUMP?

GOULD'S SPRAY PUMP, WITH BAMBOO EXTENSION AND SPRAY NOZZLES COMPLETE.

Each Pump is fitted with our latest improved Metallic Valves, dispensing with all leather and rubber, as used heretofore, making the valves perfect in every respect. This Pump we have got up expressly for spraying vines, fruit trees and other shrubbery infested with the destructive insects which inflict so much injury in orchards, vineyards, etc. It has been adopted and recommended by the State Horticultural Society. The working parts are constructed entirely of Brass, and will not be affected by the corrosive solutions used in them. THE BAMBOO EXTENSION is an admirable invention. The operator of the Pump, by the use of this extension, can get to all parts of the tree while on the ground; also saving himself from getting his hands and face burnt from the solution. Our SPRAY NOZZLES will save their price within a day, as the amount of liquid saved is two-thirds over any other style in use. It throws a very fine mist.

We are sole agents for the IMPERIAL, SAN JOSE, and CYCLONE NOZZLES. Price, each, $1.00. Bamboo Extension, $3.00.

OUR CHALLENGE SPRAY HOSE.—We are now manufacturing a very superior Spray Hose that will resist the powerful solutions that are generally used for spraying purposes. Have something now that will give the best of satisfaction. EACH FOOT GUARANTEED. Not genuine unless word Challenge is stamped on hose.

We make a specialty of these goods, and are prepared to put you in nothing but first-class articles. Send for special prices and circulars before purchasing elsewhere.

DEATH TO MILDEW!

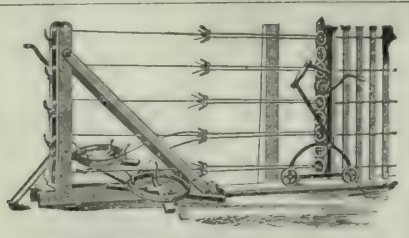
And Insects that prey upon Grapevines and Plants of all kinds.

In Hamilton's Pest Exterminator we are enabled to offer to the public the most valuable and useful article ever discovered for the effectual annihilation of mildew and pests of every kind, that infest our vines and plants. This valuable compound, whose merit has been fully established, is used in a Fumigator as represented in the cut, and is therefore easy of application, and does its work thoroughly.

It Leaves No Noxious Vapors.
It Cleans the Vines or Plants.
It Destroys all Pests and Parasites.

It leaves the plant in perfect health, thus largely increasing the yield of fruit. One trial will convince the most skeptical of its merits. Orders promptly attended to.

Price $5. Patent applied for.



Manufactured and for sale by

A. O. HAMILTON,

HAMILTON'S PEST EXTERMINATOR.

COME LOOK AT THIS!

The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KORBIG—Dear Sir: I have analyzed your sample of "**Nitrogenous Superphosphate,**" with the following result:

Soluble Phosphoric Acid	12.90 per cent
Reverted Phosphoric Acid	.95 "
Insoluble Phosphoric Acid	2.83 "
Potash	2.23 "
Ammonia	1.87 "
Nitric Acid	2.95 "

The above amount of **Nitric Acid** is equal to 0.85 per cent **Ammonia**, therefore, total of Nitrogen calculated as **Ammonia**, 2.72 per cent.

This **Fertilizer** is a **Valuable Manure** for vineyards, orchards, gardens, farms, and I **recommend** its use by the cultivators of the soil **generally, in California.** Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KORBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "**Nitrogenous Superphosphate**" Fertilizer, analyzed by him at your request. It is a **high-grade article,** and as such returns the user a better money value than a low-grade fertilizer. It **is especially well** adapted to use in **California,** on account of the **predominance** in it of **Phosphoric Acid,** which is generally in small supply in our soils. Yet it is desirable that "**complete**" fertilizers be used in our orchards and vineyards, and **yours is of that character** in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of **Phosphoric Acid**—the chief element of all plant food—in combination with the necessary quantities of **Potash** and **Ammonia,** and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from ½ pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

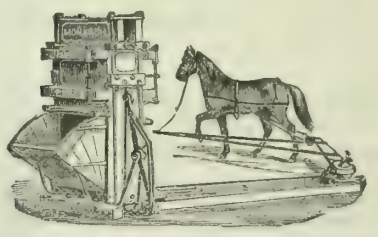
HAY PRESSES.

THE HURRICANE,
A Mounted Double-Ender Baling Machine, capable of baling 40 tons per day.



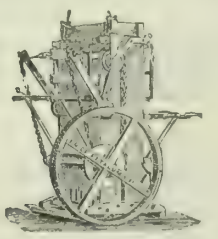
ITS RECORD

For the first year of its existence is as follows: **Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.**

Two sizes: Compressed bales and common bales. **Improved this year so that it is nearly one-quarter faster than before, and the back-and-forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.**

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., **$1000.**



THE JUNIOR MONARCH
Does its own Tramping. Feeds at Side, near the Bottom.

HAS THE FOLLOWING RECORD:

33 tons in one day; 105 tons in 3½ days; 20 tons and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., **$500.**

—THE—
Genuine Price Petaluma,
With Latest Improvements.

Made under the supervision of the inventor, JACOB PRICE. Too well known to need further description. First-class material and workmanship. Capacity, from 10 to 18 tons per day. Hay must be tramped in press.

Price, at factory, San Leandro, Cal., **$350.**

☞Send for large illustrated Catalogue of above presses. **Office and Factory, SAN LEANDRO, CAL.** Address

Address 319 and 321 MARKET STREET, SAN FRANCISCO, CAL.

THE LATEST

IMPROVED RANDOLPH HEADER

WHY DON'T YOU GET A **RANDOLPH HEADER**

IT HAS THE LIGHTEST DRAFT! IT HAS THE BEST ELEVATION!
IT IS SIMPLE IN CONSTRUCTION! IT IS THE MOST DURABLE!

In the "Improved" Randolph Header for 1887, manufactured expressly to suit California farmers, we will offer a PERFECT HEADER, second to none on the Coast.

NOTE THE FOLLOWING POINTS:

Simplicity of Construction.—It is the most simple in its gearing of any Header on the Coast, consequently it is less likely to get out of order.

Superior Elevation.—The Spout is thoroughly ironed off, and is extra long. Having two Drapers in it, the grain passing between them, makes the elevation positive at any desired angle, **and entirely prevents the wind blowing grain away** as it is being elevated, as is the case with all other machines. Every farmer will recognize that this is a point of superiority, and a real grain-saving device, which in quite windy weather will save enough grain each day to pay for running the machine. **Lightest, Easiest Handled and Most Economical Header ever sold on this Coast.**

THE RANDOLPH HEADER IN SOUTHERN CALIFORNIA.

SAN BERNARDINO, CAL.

MESSRS. TRUMAN, ISHAM & HOOKER, San Francisco—Gentlemen: Our 12-foot "Randolph Header" which we purchased of you last season, worked alongside of the Hodges-Haines, they using 6 horses, while we only used 4 small horses, we averaged 28 acres per day, they averaging 23, and it was on very rough, hilly ground. I think the Randolph the lightest running, and the best for lodged or broken down grain on the Coast; you can cut almost as close to the ground with it as you can with a mowing machine. We calculate to cut all our hay this year with it. You will thus see that the "Randolph Header" will pay for itself in one season over any other Header on the Coast.

Yours very truly, FRANK MOIR.

Send for prices and further description. Do not purchase elsewhere until you have examined this machine thoroughly. It is the cheapest Header in the market. We are sole agents for the Pacific Coast.

THE KING OF THE FIELD!

THE LATEST IMPROVEMENT!

The McCORMICK No. 3 STEEL MOWER

Our New No. 3 Mower is a World-Beater. Greatly Improved for 1887. No Mower in the market that can excel or equal it.

It is the LIGHTEST, STRONGEST, SIMPLEST and BEST MOWER in the World!

We solicit a critical examination of this superb mower, knowing that it possesses so many superiorities that it must commend itself to the intelligent farmer as far superior to any our competitors have in the market.

Before buying your Mower send for Circular giving full description of this model machine.

No. 3 Steel Mower, 4½ feet.....$80 00
No. 3 Steel Mower, 5 feet..... 85 00

The McCormick Harvesting Machine Company, of Chicago, Ill., have issued two beautiful Chromos of the battles of Shiloh and Mission Ridge, 26x36 inches, which we will mail to any one free on receipt of 8 cents to pay postage.

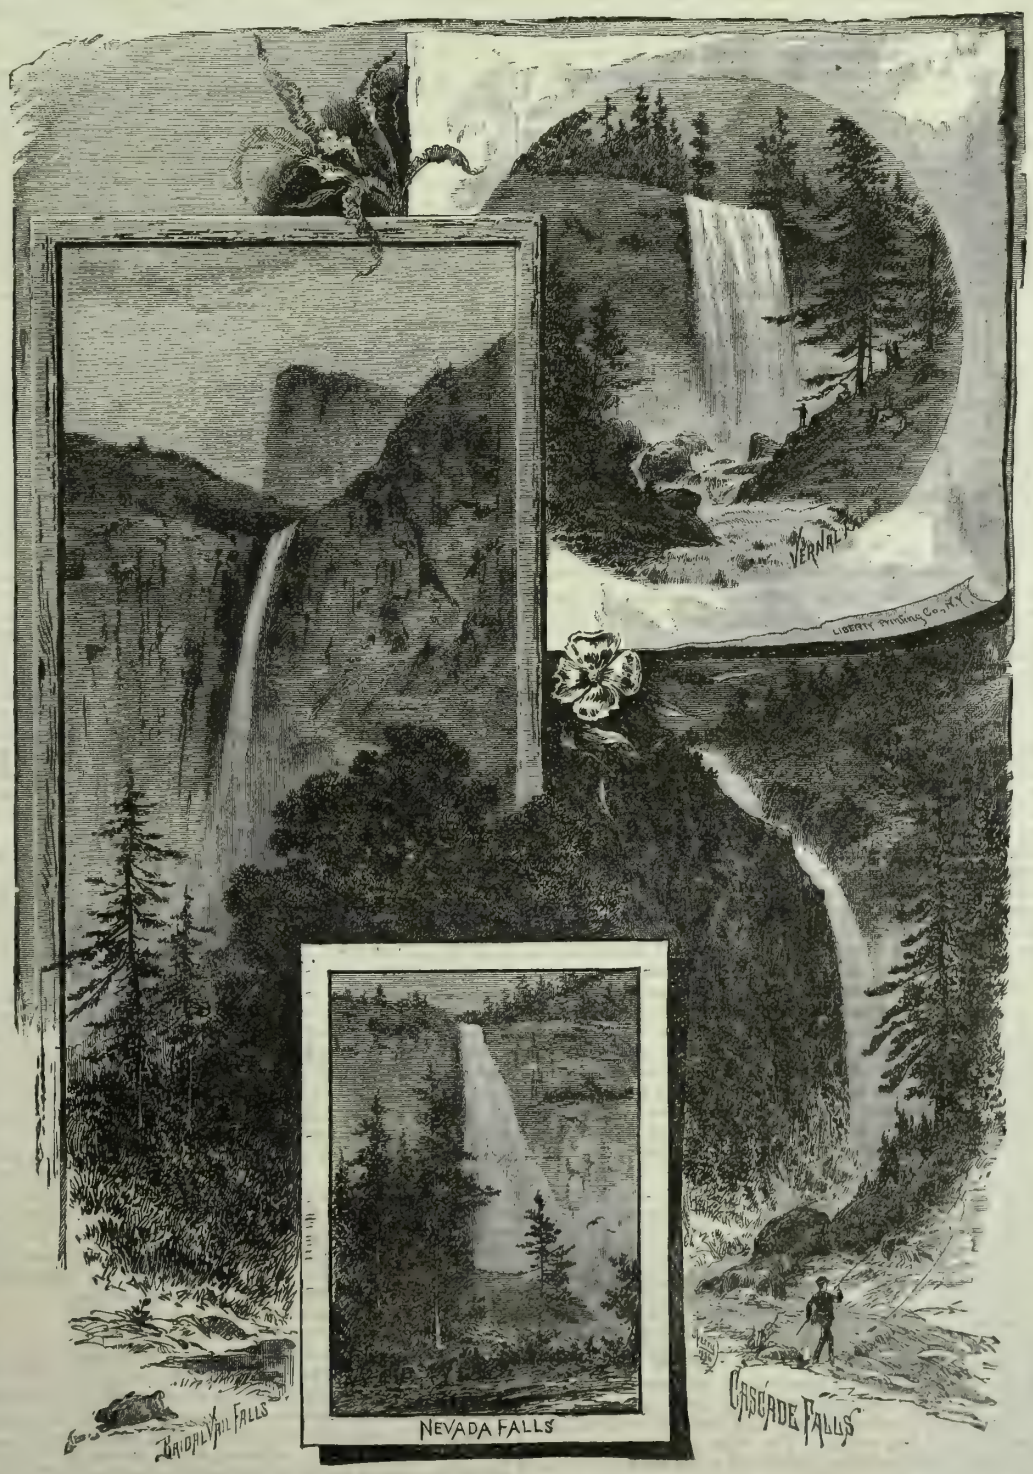
TWENTY-PAGE EDITION.

Vol. XXXIII.—No. 21.] SAN FRANCISCO, SATURDAY, MAY 21, 1887. [$3 a Year, in Advance. Single Copies, 10 Cts.

Wool-Growers in Council.

The National Convention of Wool-Growers which was held in St. Louis last week must exert a marked influence in convincing the wool-growers of the country that their voice is still heard, and that the replacing of their industry upon a favorable basis is still a living issue in our public affairs. The last few years have been full of discouragement for the woolmen, owing to the facility given to the introduction of foreign wools, and they will generally feel gratified at the firm stand taken by General Robinson, of Ohio, chairman of the convention, in his opening address, when, after showing by statistics the decrease in the production of wool and the decline in the interest, he earnestly advocated the reenactment of the tariff of 1867, which started our wool interest upon a new career, and made possible the greatness which it attained during the decade and a half preceding the enactment of 1883.



The resolutions adopted by the Convention had a similar ring. They recommend unanimity of action by all wool-growers, manufacturers and others interested in the production and sale of wool, to procure the repeal of the present tariff laws upon wool and the passage of a law protecting American wool interests. They also urge that certain remedial laws be enacted to prevent the use and evasion of the present law while in force, and to provide for sending delegations to Washington to attend the next Congress, to influence legislators in behalf of the wool interests. They also advocate the appointment of an attorney to represent the association before all United States courts and the treasury department. Members of the Wool-Growers' Association are urged to attend the conventions of the political parties, with which they respectively co-operate, and, so far as possible, secure the nomination of satisfactory candidates. The convention also earnestly requested the wool associations of the whole country to unite in demanding from the railroads proper freight classification of wools in transit.

It would be easy to unite the wool-growers of the country on these propositions, but the National Association cannot expect much help from the Pacific Coast in carrying out one plank of their platform in which they protest "against discrimination in railroad rates against Texas, Colorado, and other points in favor of California in the shipping of wool East." The California wool-growers deserve better of their Eastern friends than such action. It is a mistake to take some temporary advantage which the Pacific Coast may have enjoyed, and read it out as a discrimination against the States named. It would be far better to wholly unincumber their movements from such clauses which can only minister to strife and ill-feeling between the different sections. It is a matter in which the whole strength of the industry is needed.

In the Yosemite.

The flight of the seasons brings us again to the time for planning excursions to the Yosemite. It will probably be a year of unusual activity in the valley, for it will be only fair that our greatest gorge should share in the general boom. It may be commended as one corner of the State in which the real estate man has nothing to sell, but we do not know that that will commend it much, for our visitors seem rather to enjoy the real estate activity which now prevails.

We give on this page a view of four of the gems of the Yosemite, the engraving being reproduced from Major Truman's work, "From the Crescent City to the Golden Gate." The engraving is from recent photographs by Taber, and will, we believe, be regarded by our readers as one of the handsomest of the many views of the valley which have appeared in our columns. The falls shown have been frequently described, and it will suffice now merely to give the hight from which their water is poured into the valley: Bridal Veil, 900 feet; Vernal, 400 feet; Nevada, 600 feet. These are among the most beautiful falls of the valley, though the Yosemite surpasses them greatly in descent as it leaps 2526 feet from the crown of the ledge to the valley.

VIEWS OF THE YOSEMITE, FROM RECENT PHOTOGRAPHS BY TABER.

Gas Treatment for Scales.

We had a brief talk on Wednesday with F. W. Morse, of the State University, who has just returned from several weeks' experimenting to secure a vapor which will kill the cottony cushion scale without killing the tree which it infests. An application was made to Prof. Hilgard to detail an expert to conduct an investigation of this kind, all the expenses thereof to be borne by the applicants. Mr. Morse was selected. The investigation was under the patronage of A. B. and W. S. Chapman, L. H. Titus and J. C. Newton—all large orange-growers of San Gabriel, Los Angeles county. The experiments were chiefly carried on in Mr. Titus' orchard, and upon his inventive skill was placed the task of devising the hooding or ballooning of the tree, Mr. Morse confining his attention to the chemical branch of the work. He says that Mr. Titus invention for covering or inclosing the tree is very successful, and he will probably apply for patents upon it. As for the insecticide department of the work, Mr. Morse says they made about 50 experiments with different gases, or combinations of gases, a large number being necessary to determine what the tree would stand, as well as what the insects could survive. Among the gases tried were those of sulphydric acid, chlorine, sulphide of carbon, ammonia, carbonic oxide, carbolic acid and oxalic acid, volatilized by heat. Several of these would kill the insects if very concentrated, but failed when forced into the tent, thus becoming diluted with air. The only gas found effective was that of hydrocyanic acid (prussic acid). This, when pure, injured the foliage, blossoms and fruit, to some extent, when it was applied strong enough to kill the insects. In order to save the foliage, etc., Mr. Morse used hydrocyanic acid combined with carbonic acid, and this mixed gas killed the insects and did not injure the foliage.

In application the gases are generated outside the tent and forced under and through it with a pump. This secures permeation of the gas to every part of the tent which could not be secured otherwise. Pumping gives thorough distribution and circulation, and the gas is used over and over again by the pumping process.

The method of application is not fully perfected, but Mr. Chapman will proceed with the treatment and develop details. The gas does not kill the eggs, but does kill the living scales. Therefore it is expected that a second application will be needed to kill the later hatchings.

Mr. Morse is preparing a careful statement of his experiments and their results, which will soon be published. We give his experience with the combination of hydrocyanic and carbonic acid gases for the benefit of any who may be working upon the problem of gas treatment for scales.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions

Yolo County Notes.

EDITORS PRESS:—We are in the midst of a north wind which is anything but agreeable to the feelings and to the grain prospects, especially the late-sown. The number of days it has blown this spring is almost unprecedented, and it will curtail the general average materially. No perceptible effect is yet discernible on the fruit crop other than a pretty extensive thinning out of overloaded trees, which has been a benefit rather than otherwise. The wind has taken up about all the surface moisture, but early-sown grain still looks well, and cultivated fields are holding the moisture well; but how long we can stand it without feeling the effects on early-sown grain and early vegetables remains yet to be seen.

If Thorough Cultivation

Was ever needed, it is this spring. The ground should never be allowed to stand long enough to get hard on the surface, for if it does it is difficult to bring up the moisture afterward, and in some soils it cannot be done.

We have had two frosty nights lately which have injured vegetables and grapes considerably, especially potatoes and tomatoes. This has not happened in our locality (according to the best of my remembrance) for five years. I suppose that some of our "Boards of Trade," so called, might think that I had better suppress the last item, but I don't care to resort to the methods adopted by some to induce immigration to this coast.

Let it be known that there is frost in the Sacramento valley late in the spring *sometimes*, and in some localities, and enough to injure the first crop of grapes; but the second crop generally makes up the deficiency in quantity; and also that the north wind sometimes blows a week at a time, and sometimes thrashes out the grain after it is ripe in the field, as it did last year. Still, all things considered, our drawbacks will compare very favorably with other parts of this great country.

There are all sorts of questionable stories which Eastern people say are told them at the East. It appears to some that if immigration can only be assured, no matter what measures are employed, the ends justify the means. To such I would say: Be careful that that plan of procedure does not act as a boomerang, and reach farther than was intended. I do not think that anything substantial can be gained by such means. I could go into details if necessary. Let this suffice at present.

Morning-Glory Once More.

I wish to say that the means for its eradication employed here (as reported by me this spring) have proven impractical, for this spring it has made its appearance again. Whether it lay dormant last season or whether the gardeners watched it very carefully and kept it cut off, I cannot say, but there are some stragglers over the patch now.

I wish to say, in answer to my critic, that straw can be had for the hauling here, and the same is true anywhere I have seen the plant grow in the Sacramento valley. If the straw cost anything it would not be a desirable remedy. I have a small patch in my orchard, and am working on it with a weed-cutter, made on the plan of the Vacaville correspondent of two weeks ago, and I intend to go over the patch as often as once a week this summer. This seems to be the most effective remedy I know of at present. I wish to save my trees.

Summer Pruning.

I wish to say a few things in regard to tree training to those similarly situated as myself—that is, to exchange ideas on the subject. If there was more of it in the PRESS it would please me. In our locality all kinds of fruit trees are very prolific growers; it is no uncommon thing for a two or three-year-old peach or apricot to put on four feet of growth on its top in a season, and often they reach six feet, and on such trees while such growing is going on (which lasts sometimes and on some varieties to the fifth or sixth year) we scarcely get any fruit; and some varieties, under such conditions, never do bear, but grow and grow, and finally frost-kill in the winter, especially the peach. Now, every orchardist has a theory as to the cause, but few have a remedy, and, as one of many, I will give your readers the benefit of my ideas, if there is any benefit to be derived. It is of the peach and apricot I wish to speak particularly. Other varieties I think the same course can be pursued with, only not so extensively in the trimming. I wish to speak first about what I think are the causes of such heavy growth. First, the soil is very productive and will naturally grow any thing very prolifically, but heavy winter pruning and irrigating, whether winter or summer, will produce heavy growth without doubt. Now as to the remedy, I think that summer sprouting, beginning as soon as the sprouts are six inches long, and following it up all summer, leaving only such wood as you want to grow till September, then top them lightly and do no more with them till the next spring, when sprouting time comes again. In this way the trimming is done a little at a time and the tree does not mind it, while the winter trimming is too much of a change, and the more I see of the peach the more I am convinced that winter pruning will shorten its life five or ten years; while gradual pruning I think will lengthen its natural life if it is done judiciously and in the proper time. Failure of a crop is often the effect of climatic changes (during winter) beyond our control, and it frequently happens that an unusually dry year preceding will fail to ripen the fruit buds, and often indiscriminate slaughter of tops in winter will cause fruit to drop after it is the size of a marble, owing to the sap going to wood (to build up what it has lost) instead of fruit. More anon. J. R. SPRINGER.

Woodland, Cal.

Beardless Barley.

EDITORS PRESS:—While on a visit to a friend here I have discovered an agricultural product wholly new to me, and which, I dare say, may be so to many of your readers. It is a species of beardless barley, which, in luxuriant growth of the stalk and excellence of the matured grain, is not second to any I have ever seen. The heads are full and long, much resembling wheat while growing, and the kernels plump and full.

The superiority of this variety for hay, being free from the ugly beards on the common variety, is too apparent to need comment, and I predict that in a few years this beardless barley will altogether supplant the old varieties.

A limited supply of the seed can be obtained, after harvest, of Mr. J. M. Howell, Henleyville, Tehama county, who is growing it. I have no interest in it, whatever, beyond a little I have engaged for my own use, but felt so confident your readers would like to hear of it that I ventured upon this article. Before closing, I will say that this new beardless variety is *not* the same that was introduced under the name of "bald barley" or "goose wheat" a few years ago, which did not prove of much account. I would advise any who would like to try a sample of this grain to apply early to Mr. Howell, as his supply is limited. Still, as he is anxious to introduce it throughout the State, his price will be moderate.

A. M. GOODNOUGH.

Henleyville, Tehama Co.

[The grain, judging from the heads sent us, is the beardless or bald barley which is grown in a good many places and is generally thought well of for hay. Of course, it is not "wild goose wheat" or "giant rye," and any one who calls that "bald barley" errs seriously. The true bald or Nepaul barley, which is the kind Mr. Howell has, was sent out several years ago by the State University and is not so rare as our correspondent imagines. It is interesting, however, to find that the plant is well thought of for hay so far north as it is nearer the center of the State. It should receive further trial.—EDS. PRESS.]

Three Crops in One Year.

EDITORS PRESS:—That a succession of crops can be raised in many parts of the State is doubtless well known to most of your readers; but that three crops of the same kind can be grown may not be so well known. I have succeeded in raising three crops of potatoes and peas in the San Miguel canyon in one year.

On the 13th day of March, 1886, I planted a few Early Rose potatoes. June 15th a few were dug and planted, a few green weeds being placed in each hill. October 3d some of these potatoes were dug and were exhibited at the district fair. After my return from the fair I planted some of these potatoes on the 12th of October, and they grew to be good eatable potatoes before the expiration of the year, and I have now a fourth crop growing from the third crop of seed. The same has been accomplished with peas.

If every one having a small patch of ground to cultivate would try some such experiments, important results might be obtained.

Santa Rita, Cal. J. S. TIBBITS.

Sonoma County Notes.

EDITORS PRESS:—Your clodhopper correspondent, in Sonoma county, has been so busy the past fortnight that he could not find time for even a few "notes." The work of vineyardists has been very exacting the past few weeks; but it is now safe to say the rush of work in that direction is about over. Not in many years has the soil worked better than it did this spring. The vines are growing splendidly, and the promise of a full crop is very encouraging.

Pasture lands are yet furnishing abundant food for the cattle and sheep, and the consequence is plenty of fresh milk, butter, cheese, beef and mutton. Fat stock of any kind finds a ready sale at remunerative prices.

Grain crops in the county promise a good yield. Barley is mostly headed out. Haying has only been begun in a few fields where the volunteer crop is unusually advanced. There will be an average crop of hay—not so large as the crop of 1886, however.

Corn planting is well along. Potato planting comes next in order. The acreage will be about as usual. There are a great many acres of land in this county that are annually planted to pumpkins, beets and carrots. It has been demonstrated that thee crops pay well. It is surprising how many tons of rich and relishable food can be grown from one acre of good soil, when properly planted and cultivated to the above-named food crops.

Fruits of all kinds are promising. Cherries are in the market that were grown in Sonoma county. Gooseberries, strawberries, etc., are to be had in great plenty. The indications now are that the crop of tree-fruits, including pears, apples, peaches, plums and prunes, will be enormous. The several canneries are already putting themselves in shape for the handling of an immense quantity of fruit.

The proposed railroad from Santa Rosa to Benicia is not yet built, but the engineers and surveyors are earnestly at work, and the right of way is being secured as rapidly as possible. Property in and about Santa Rosa has already felt the boom, and is changing hands freely at considerably advanced prices.

Sonoma county has a very thrifty horticultural society that meets once a month. If the meetings were held oftener more work could be done, and the benefits to fruit-growers would be more thoroughly diffused.

The late showers have done much good.

Roads are in splendid order.

No damage from the north wind. Lumber-mills are all in active operation.

Sheep-shearing is in progress. The yield of wool is satisfactory and the price pays.

College and public-school entertainments are of frequent occurrence.

Little sickness in town. None in the country.

Picnics, excursions, camping parties and out-of-door life generally are the order of the day.

Santa Rosa, May 9, 1887. OCCASIONAL.

Why Do the Walnuts Drop?

EDITORS PRESS:—I have several fine walnut trees 30 years of age, thrifty in growth and apparently healthy; the fruit on these forms and remains until about the size of a marble, then for some unaccountable reason to us it falls off, with perhaps the exception of a dozen nuts, which few remain and grow to maturity. Will some of your readers, through your valuable paper, kindly explain the cause and give me a remedy for same. SUBSCRIBER.

Coloma, El Dorado Co.

Celery Culture.

EDITORS PRESS:—I saw mention lately of the new method of celery culture. Are any of your readers conversant therewith?

I tried last season blanching my celery by winding a sack around it, after tying it up, and I noticed in some gardens near San Francisco, others had adopted the same plan. Can it be that this is the whole of the new system? Who will tell us? EDW. BERWICK.

Carmel Valley.

THE STOCK YARD.

A Kern-County Breeding Farm.

EDITORS PRESS:—At the stock ranch of H. H. Fish & Co., 1½ miles southwest of Bakersfield, we had a recent interview with George Daggett, proprietor, and saw some very fine stock.

At the stables we were shown the fine thoroughbred Norman stallion, St. Leon (imported from France in 1885 by Theodore Skillman, of Petaluma), six years old; weight, 1700 pounds; color, black, with beautiful, light-colored flowing mane; highly prized by Mr. D. as one of the very fine horses of the country.

Mr. D. has recently had the misfortune to lose a model Norman stallion, raised by Theodore Skillman, named Model in catalogue, better known in the neighborhood as "Frank." He took sick suddenly and died with what seemed to be colic. He was a most valuable horse.

Mr. D. strongly believes in a cross between the Norman horse and ordinary mare. He states it as a remarkable fact that colts by a Norman horse are not as large in proportion as those by a Clydesdale. This circumstance favors the mother at the season of foaling, while at maturity the Clydesdale has but little advantage over the Norman in the matter of size. He thinks that as a draft horse, the Norman need fear no competitor. The Norman's good feet are also remarkable, and as much cannot be said of the Clydesdale, the feet of the latter being too flat and with too much resting on the ground. The Norman colts are not to be expected to make a show at foaling time, as they are small, but they rapidly develop in form, size, etc., to maturity.

Mr. D. pronounces Kern as one of the very best counties in the State for the rearing of the horse, because of its rich pasture lands and its fine climate suitable for this animal. The horse raised here has an attractive form and comes early to maturity.

Hogs.

Mr. D. has been experimenting in the propagation of varieties of the hog by both breeding pure and by crossing, using for the purpose thoroughbred Poland China, Berkshire and Essex. After extended trials he favors the cross between the Essex and Berkshire. The Essex takes on flesh readily and is easily domesticated, while the Berkshire adds length of body, activity and a stronger disposition to rustle for food. This cross affords an excellent combination of good qualities. Mr. D. has also a herd of cattle which we did not see.

Alfalfa.

Mr. D. informs us of his method of setting a field with alfalfa. After preparing the ground he sows it to wheat, barley and oats in November. He also sows on the same ground unmixed alfalfa seed. In the latter part of the winter and during the spring months, and on to the time of cutting, he pastures to horses and hogs. He showed us a tract that was so seeded last November, and is now thus running to pasture, from which he expects, this season, 2½ tons of grain hay per acre. It is irrigated and looks very well indeed.

Kern Co. McD.

A Great Cattle Combination.

It seems that the greatest thing in the way of aggregated industrial capital is to be in the agricultural line and that it is to be called the American Cattle Trust, with its interests centered in New York, Chicago and the great cattle ranches of the West. Not less than $25,000,000 has been invested in the concern. The object of this great "trust" is to largely increase, develop and encourage the raising and handling of cattle, the slaughtering of them by first hands and the placing of their products in the different markets of the world. The new venture is to be inaugurated upon an immense scale.

The projectors say that it is expected that it will secure the mastery over the great cattle interests of the country, which, however, they claim will be a benefit to all raisers of cattle. It is not meant that all the killing and packing shall be done near the range. The trust has control of a large number of establishments which it will run to the best advantage. The combination includes ranchmen from Texas to the British line, who believe they will be able to handle their cattle to much better advantage than has been the case of late, and that they will not be forced to put them on the market, but be enabled to do so only when the best profits are to be had

This may be all true for all we know, but we do not like these great aggregations of capital. We would much rather see 250 concerns with $100,000 each than one with $25,000,000. Competition is a better agency than combination—better for those concerned and for the whole people. It seems, however, that the organization may be in the interest of growers, and is formed to fight another powerful organization which has been very oppressive and dictatorial. At all events, Col. J. N. Hardin, a large cattle-grower from Nevada, made the following statement to an *Examiner* reporter on Tuesday:

Heretofore the butchers of Chicago have been virtually dictating every morning what the price of beef shall be all over the United States. I think it is about time it should stop. The men who produce the beef will now have something to say about it. It won't hurt the small growers at all, but raisers great and small will all be identified together.

Now, it might be said, and sometimes is, that Miller & Lux control the cattle market of California. Miller & Lux do nothing of the kind. Nobody controls it on the Pacific Coast, and the reason the market is a little high now is not because there is not lots of beef, but because the cattle of California, generally speaking, are in poor flesh; especially is this true in the south, on account of short grass.

The cattle of Eastern Oregon and Nevada are not fit for the market till the 1st of August, and California stock, as I have said, is not in a condition to sell. If my cattle were fat, I could put 5000 on the market at any moment. The present shortness in the supply will probably make better prices for Oregon and Nevada cattle that come in later.

No, I think we need not necessarily conclude that people will have to pay more for their beef on account of this combination. It is formed first to protect the big and little growers alike from the dictations of the Chicago dealers.

The combination is, according to latest advices, fully made and strongly made, and there is nothing to do but wait and see how it works.

The Cattle Ranges.

The Boston *Commercial Bulletin* last week published special reports from 13 States and Territories, on the cattle interest. It seems that previous accounts of winter losses have been considerably exaggerated. The only Territory in which cattlemen lost heavily was Montana, where the mortality proves to have been from 15 to 25 per cent. The losses in Colorado, western and northern Kansas were very light the past winter, running under 5 per cent of the average. Parts of Idaho and Wyoming suffered quite severely, particularly in the northwestern parts, but the average losses in the Territories were not excessive. Utah, New Mexico and Arizona were particularly fortunate. New Mexico correspondents write that the loss does not exceed 3 per cent in either of the Territories named. Texas reports some suffering because of drought, but the winter was much more favorable to stockmen than that of 1885-6. On the whole the conclusion is

that the past winter was a favorable one to the cattle-raising interests of the West, and that the hide and leather market will not feel the effect, noticeably, of what fallen hides will come upon the market.

From every section come reports of the encroachments of emigrants upon the grazing territory, and particularly upon Nebraska, Kansas and Colorado, where the cattlemen are being pushed steadily westward. It is the opinion of some correspondents that the cattle-raising industry has reached its hight. In several States it is becoming necessary to raise alfalfa and grass for feed. Without excepting a single State or Territory, the season has opened well, with abundance of rain and fine prospects for grass. Cattle-raisers in Montana feel much encouraged over the outlook and feel that this favorable spring will go far toward recovering their losses and prevent further mortality among weak cattle.

THE ORNITHOLOGIST.

Dr. Gally on Birds, Bugs and Real Estate Agents.

EDITORS PRESS:—Your San Luis Obispo county correspondent, in PRESS of May 7, 1887, says: "It does not take a smart man to answer his (my) question in regard to the birds." I do not see that any smart man has yet tried to answer me, although I freely admit that "F. U. N.," of Arroyo Grande, is a very clever fellow; but if he (or she) thinks or supposes that I do not know a mocking-bird when I see one with the feathers on, he, or she, is mistaken. I was born and had my "broughten up" near that isothermal line in North America immediately south of which the *Mimus polyglottus* is autochthonous. [NOTE.—It takes a fond parent's money to enable a dutiful son to sling such big words.] This *M. polyglottus* is the true mocker and seldom emigrates to the north of Mason and Dixon's politico-topographical line, although the isothermal lines, it may be here observed, are crooked by being bent northerly or southerly by elevations of the earth's surface or by currents of air. The opossum, the mocking-bird and the pawpaw, as a general rule, can exist in the same environment, provided it is a place where the pawpaw tree grows 10 to 20 feet tall. The mocker is also associated with that P. S. of A. the gum tree; not the eucalyptus, but the gnarly, native, unsplitable, real old genuine dead at the top, autumnal red-leaved gum of which some unrivaled Tennyson, bulging with the lyric ardor of a burning patriotism, has written,

"Oh! come to de ole gum tree
Whar de coons an' de possums prance;
O come ye darkies wid me-e-e
An' jine in de jovial dance."

I have petted the *M. polyglottus* and bred it in cages, in Virginia, long befo' de wa', sah. I have taught one talented member of the family to whistle

"Hey Jim along, Jim along Josey,
Hey Jim along, Jim along Joe;"

Also other sinful ditty airs, of a worldly character, including the first half of "Yankee Doodle;" but when I sought on Sundays to teach him the melodious solemnities of

"Come, ye sinners, poor and needy,
Weak and wounded, sick and sore,"

He would turn his head to one side and go off clucking to the little chickens, as a hen does to her brood after a shower of summer rain. I can't say that I ever clearly understood what *M. polyglottus*, Esqr., meant by that unless he intended it sarcastically as who would say: Oh, cheese it, and come in out of the wet.

The mocking-bird, of which I am now writing, is of an ashen-brown color above and white below, has a roach or rounded back, the upper beak curved, and, beside being a musician and comedian, is a very warlike and fightaceous character; but the miserable bird I wrote about —April 16th—is, as I then wrote, a greenish brown; his bill is long and straight, or nearly straight; he is one-quarter to one-half larger than a mocker; he is more like a catbird of Ohio and a good deal meaner.

But there is another mocker which I have not met east of the Rocky mountains, though it is numerous in Nevada and in Utah. It is a smaller mocker, not much larger than the red-throated linnet. It is a good singer and mimic of other birds' notes, and it is a pretty good bird, any way, for it belongs to the family of *Icteria viridis*, or fly-catchers. If this latter is the bird which "F. U. N." uses as part of the "judicious advertising" to boom the lands of Obispo, he has made a mistake, for the *Icteria viridis* is a bird that loves dry, very dry, land and rocks; yet it is a lover of clean water, but a very little water trickling from beneath the shady side of a desert cliff of rocks is sufficient. I think this must be the bird of "F. U. N.;" it is not found in this (Pajaro) valley—the land here is too rich and the air too humid for that bird. In fact this valley has no need to advertise for either birds or booms—it is, in Spanish lingo, the Bird valley, and its citizens have been refusing $300 an acre for plain lands for the last ten years. We lease our lands here at from $20 to $100 per acre per year, and do not shout about it, either. Valley lands *can* be bought here, but not cheap.

A Pajaro farmer on his 30 or 40 acres is like the Arab with his horse—you must get the consent of the weeping family before he parts with it. That ought to show that it is good land to own, because where anything merchantable is not pushed upon the market, it is a sign that it will do to keep. Senator George Hearst, when he and myself were in Nevada many years ago, and he was looking for a mine to purchase, said that he did not want to buy in a camp where every one was on the sell. I agree with George. If your correspondent wants to know how birds assist to fight bugs, let him shoot specimens of different birds, to be found in orchards and gardens, and hold a post-mortem examination on each—cut 'em open—and send you a list of the bugs he finds in the crops or craws. That ought to settle it.

I have found few bug-eating birds in California, and, curious to say, nearly all of these are death on our friend, the *coccinella*, or ladybug. The swallow families are all insect-eaters, the blackbirds, wrens, fly-catchers, woodpeckers, sap-suckers (though they never suck sap), crows, seagulls, road-runners and toads. The latter is a very useful bird of sedentary and studious habits, and the gopher-owl is his enemy. The gopher-owls and the cranes are useful birds to hunt gophers, but whenever the average small boy on a farm sees an owl or a crane, he runs home for the shotgun, for which he should be spanked. A gopher-owl is not a hoot-owl—more like what a Southern "cullud pusson" calls a squeech-owl, only larger, but not so large as a hooter.

When your correspondent quotes to me the testimony of "every real-estate agent," I think he is still harping upon mocking-birds, and I have nothing more to say. I may, however, add that I lately slept in the same room, on a Sunday night, with a Southern California real-estate agent. He had been to church and heard a sermon from a text about the New Jerusalem, where the streets are paved with gold and the walls are of sapphire and precious stones. In his sleep he dreamed, and in his dream he prayed: "O good Lord! take me up into heaven—quick—I want to strike that New Jerusalem on the boom! Ah Lord, streets paved with gold—hallelujah! O my Master, take me home to glory—walls of sapphire! Amen. God grant it! It's the biggest thing in the universe—Riverside oranges and a whoop in h——l to it! Now, O Lord, let thy servant depart in peace."

He awoke in a dripping perspiration, with his pulse jumping toward 120, and remarked that he had a vision of his good dead grandmother, warning him to join church and "flee from the error of his ways," and he was going to do it. But you can see that the real-estate agent was still in him. He did not know, though, that he had given it away in his sleep.

Pajaro Valley, Cal., May 7th.

THE VETERINARIAN.

Milk Fever in Cows.

EDITORS PRESS:—When we take into consideration the fact that the domestic cow is in an extremely artificial condition, in reality she is little more than a mere milking machine—I say, when we bear this in mind, it is not surprising that she is very subject to this disease. Undoubtedly in those districts where they are fed high, *i. e.*, upon material making much blood, they are more prone to milk fever. And I have repeatedly noticed that those cows that have been kept upon low diet are not at all, or at any rate very little, liable to this affection. It is hardly necessary to say that it occurs generally on the third day after calving. It is thought that when the young animal is born all that blood which went to supply it with nourishment being thrown back upon the system of the cow, if she is in a plethoric condition, produces this ailment.

Preventive Measures.

Let the cows be fed upon loose, cooling food about three weeks prior to calving—roots, bran mashes, little or no grain, and good hay. By what has been said, it is evident that feed and treatment must be such as will not encourage plethora. Some animals, like man, are liable to become fat and make a good deal of blood upon scanty food; in such instances it is advisable to remove blood from the system a day or two previous to calving. Some people may condemn me for advising blood-letting. But let me remind them that veterinary practice is very different from the treatment of human beings. Facts are very stubborn things, and I can prove that bleeding has saved the lives of a great many animals when adopted at the right time. Theory is all very well, but theory without practice is worthless. Our best physiologists show that milk fever is due to plethora, and let me ask any one who knows anything of medicine, if aconite or any drug will produce as marked an effect, and in so short a time, as blood-letting. Farmers have proved the efficacy of this treatment. It is good treatment to give a purgative drench three days prior to calving if the bowels are confined.

Treatment.—This is useless, unless at the very outset; for, at any rate, only a small percentage recover unless proper remedial measures have been taken early in the disease. I have treated a very great number of cases of milk fever in Europe, and seldom have I known an animal to recover when all nerve power of the muscles of the neck has been lost. If the head of the poor animal is lifted by the onlooker, and it falls helplessly, there is very small hope of recovery. Another bad symptom is absolute blindness, and taking no notice of any surrounding matter. It is called by some farmers "dropping after calving," and this is somewhat suggestive, as the animal really does drop, and is unable to rise. The treatment that I have found most successful is strong purgatives, followed by the administration of strychnine in proper doses; and undoubtedly this medicine, when used rightly, is a most useful nerve stimulant in this disease. It is necessary to remember that the bladder partakes of the general paralysis, and it is important it should be emptied by means of a catheter; and I may say that the operation of passing the catheter in the cow is not by any means a difficult matter, and in this and other diseases it is a source of much relief and benefit to the suffering animal.

She should be kept as quiet as possible. Where the animal has been valuable, pedigree stock, and the owner has felt inclined to go to the trouble, I have had ice applied to the head and have found much benefit to come from its use. Cows that have once been the subject of milk fever are always liable to a subsequent attack at the next time of calving.

Post-Mortem Appearances.—The brain and spinal cord are found to be the seat of much inflammation, and this may be said to be the only noticeable after-death appearance. Under this head I may state that there is nothing in the nature of this disease to render the meat of the animal unfit for human consumption, provided the cow is killed at the outset. And in some cases this is the most advisable plan, but after medicine has been given, it is very evident that the meat will be tainted in smell and taste. Although medical treatment is in some cases successful, it is to the prevention of milk fever that most attention should be directed.

ROBERT J. DAWSON,
Veterinary Surgeon.

225 Geary St., S. F.

THE DAIRY.

A Kern-County Dairy.

EDITORS PRESS:—We recently paid a visit to the Anderson dairy ranch, the property of Carr & Haggin, three miles southwest of Bakersfield, and had the pleasure of an interview with L. F. Johndrow, who has this ranch in charge. Although yet a young man of 31 years, Mr. J. has been engaged in the dairying business for about 20 years.

On this place there are 325 cows, principally of the Durham stock, graded. In order to keep the ranch stocked with the best of milkers, Mr. J. handles a great many cows, and if, during the first year of trial, one does not prove good, she is turned off. He is, by this means, enabled to keep a supply of the best for dairying purposes. He is now milking 145 cows, and from them realizes over 400 gallons milk per day.

While the Durham is a favorite cow with Mr. J., his opinion is more favorable to the Holstein for milk. He has eight bulls on the ranch, five of which are Durham and three Holstein. Of these Holsteins, one is four years old and the other two, three each. He runs three bulls with the milch cows on a pasture to themselves, alternating the bulls so as to have only one a day, the two not in use for the day being kept in a small lot by themselves. The dry cows are run in separate lots according to condition, etc.

The calves are run in lots assorted according to age, size, etc. The feeding shed has accommodations for 120 calves, each calf being provided with a stanchion and tin feeding pan, and so arranged that no calf can get at another's food. In feeding, skim-milk fresh from the De Lavel separator is used twice a day. The pans are thoroughly washed out after feeding, morning and evening. Thus, in two lots, milk is fed to over 200 calves. There are 100 others a little larger and now weaned. The calves are of Durham graded, run on good pasture, and make a handsome display.

Mr. Johndrow has well-established habits. He finishes milking, has the cows off to pasture, and calves fed by 7 o'clock A. M. (before breakfast), and finishes the milking and feeding at 15 minutes after 6 P. M., and very regular as to time in everything done.

Kern Co.

Cow Killed by Oleander.

Some time ago, H. S. Sargent, of this city, lost a valuable cow under the following circumstances: The animal got into the front yard, where the blue grass was several inches high and where an oleander was growing. She grazed in the yard for an hour or two before her presence was discovered. On the morning following the cow was sick. At noon she was much worse and a veterinary surgeon was called. He said the case was peculiar. The animal had no fever, its pulse was very high and undigested food came from its stomach through the nostrils. At sunset of the same day the cow died.

Mr. Sargent addressed a communication to the *Jersey Bulletin* detailing the facts above set forth, describing the animal's symptoms, and asking for information regarding the cause of the cow's death.

The *Bulletin* published the following diagnosis of the case, which we reproduce for the benefit of people who are not aware of the fact that the oleander is poisonous: "The hydrocyanic acid (prussic acid) in the oleander was the cause of the death of the cow. It is as bad as the wild orange, when eaten by stock, but is not partaken of as often as the orange. Every symptom warrants the above conclusion."—*Stockton Independent.*

METEOROLOGICAL.

The Weekly Weather Bulletins.

EDITORS PRESS:—The Chief Signal Officer, being convinced that the data collected in this office may be greatly utilized by those interested in the production of the staple crops, has decided to issue, beginning with Saturday, May 7, 1887, a special bulletin, with the view of promptly placing before the public each Monday morning reliable information relative to the climatic conditions which have existed the previous week in the agricultural districts of the country.

Sufficient information has been collected from signal-service stations for the determination of quite accurate normal values of temperature and rainfall, and as the growth of all staple crops depends so largely upon the amount of heat and moisture and their relations to one another, it is believed that these bulletins, containing the deficiencies or excesses relative to temperatures and rainfall during the growing season, will serve as a reliable basis for determining the conditions favorable or unfavorable for the growing crop.

When this information is compared with corresponding data of previous years, it will serve those specially interested in calculating the probabilities of expectations of the coming season and the influence of the same on the growing crops. These bulletins will contain departures from normal temperatures and rainfall in the agricultural districts of the country for the current week (to which special attention is invited), and also the departures from the normal temperature and rainfall from January 1st to the date of the bulletin.

The reports which are collected daily by telegraph will be charted and summarized at the close of each week and the results given to the press associations, as items of news, in time for publication in the Monday morning papers. These bulletins will designate the agricultural regions over which the meteorological conditions are favorable to the crop productions; will point out regions where the conditions observed during the current week have alleviated spells of drought and excessive heat, or ameliorated conditions of excessive moisture or prolonged cold; and the limits of late or damaging frosts. The modifying effects of such meteorological conditions upon the season can be reasonably conjectured by parties interested, especially as the bulletin will state whether the season is tending to increase or decrease the excesses or deficiencies of temperature and rainfall.

While it is recognized that temperature and rainfall are not the only meteorological elements which influence crop production, they are, for most crops, by far the most important, and serve to indicate the general character of the season, whether favorable or unfavorable. It is proposed to add to these elements, as soon as practicable, records of average cloudiness for each week of the growing season, from which the duration of sunshine may be closely approximated. It appears important that statistics of this character should be published for the benefit of all interested in the staple crops of the country, and while the bulletin must be general in its nature, owing to the limited number of stations from which reports are received, it will increase in value each season with increase of stations, and will ultimately place in the hands of the general public, as well as the farmers and dealers, facts which will serve to indicate several weeks in advance the probable yield, and, therefore, the probable value of the various crops.

Signal-service observers located at the principal commercial centers will be supplied with this bulletin weekly, and, in addition, with carefully prepared tables containing the detailed data at various stations, in order to furnish them to such commercial organizations as may desire to receive them. This new and experimental feature of signal-service work is at present attended by no other expense than that of a small clerical force employed in tabulating reports which are already collected for the general "indications" work of the service. If, after trial, this bulletin is found to meet the wants of those interested in crop productions, more detailed reports will be furnished covering special localities and applicable to special crops.

The Chief Signal Officer, in expressing his desire to extend the usefulness of this service, will be pleased to receive suggestions from those interested in the bulletin, with a view to improving the same, either as to the character of the information furnished or as to the form in which the reports are presented.

A. W. GREELY, Chief Signal Officer.

Signal Service, War Dept., Washington, D. C.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

The Grange in Maine.

Those who enjoyed the privilege of meeting our genial Bro. Field, of Maine, during his visit in California last winter, may be interested in the subjoined report of the condition of the Order in the Pine-tree State—a contribution by J. W. Lang, of Bowdoinham, to one of our Eastern exchanges:

In Maine we have above 200 live subordinate Granges, 16 county Granges (one to each county), and over 15,000 members in good standing. Worthy State Lecturer Thing is at work in Somerset county, flanked and supported by a good team of working Patrons. We expect results from the effort. In York county Deputies Geo. H. Boothby, Geo. M. Douglass and S. M. Blake have put in some telling work. A new Grange has been organized in Limerick in that county, and soon others will be organized or reorganized there.

In Kennebec county one new Grange has been organized, Clinton, 287, with 73 charter members, by State Deputy J. W. Lang and County Deputy S. C. Watson. More work is planned and being carried out in Kennebec. In the other counties not much is being done.

In Sagadahoc county a series of meetings have been held by Bros. Lang, Sprague, Brown, Edgecomb, Dinston, White and others for the good of the Order. Three new Granges have been organized and reorganized since the new year; one at North Woolwich, with 24 charter members, and which now has about 40 members; one at Ashdale, in Phippsburg, with 21 names, and one at Richmond Corner, with 41 names. This last was a revival and reorganization of a long dormant Grange. Other Granges are in embroyo, and the old Granges of the county have been revived and strengthened. Sagahadoc is the smallest county in the State; through it flows the Kennebec river, and it is indented by inlets from the sea. Three of its 11 towns are islands, but by persistent effort three Granges have been added to the five old ones, making eight at present.

There are 83 dormant Granges in the State, all, or nearly all, of which might be reorganized by proper effort of the Worthy State Master and his deputies, which we hope may be put forth. In Androscoggin county there are 3; in Aroostook county, 7; in Cumberland, 14, and 12 live Granges; in Franklin, 5; in Hancock, 3; in Kennebec, 3; in Lincoln, 4; in Oxford, 13; in Penobscot, 9; in Pascatquis, 3; in Sagadahoc, 2; in Somerset, 6; in Waldo, 6; in Washington, 1; in York, 4; in Knox none, but it has 9 live Granges.

We have one wholesale store at Portland, one life insurance society and two fire insurance companies. The Grange in Maine is noted for its three grand divisions, which are regarded in importance thus: Its social, its educational, and its financial aims or advantages. Maine sends greeting to its brethren in all other States through the medium of your columns, and we stand shoulder to shoulder with our brothers and sisters everywhere for every good word and work.

Contra Costa Grangers' Association.

The Contra Costa County Grangers' Warehouse and Business Association held its annual meeting in Grange hall, Martinez, May 4th. There were present J. Strentzel, President; G. P. Loucks, Secretary; J. Larkey, J. W. Jones, A. Boss, and J. M. Stone, Directors; and representatives of a majority of the stock, to wit, 1116 shares.

The President's report was duly made and unanimously accepted.

On motion of D. N. Sherburne, seconded by Wm. Caven, the Secretary was instructed to and did cast the vote of the stock represented for the old Board of Directors. Thereupon the President declared J. Strentzel, F. M. Warmcastle, H. M. Hollenbeck, G. P. Loucks, J. Larkey, J. W. Jones, J. M. Stone, R. O. Baldwin, and A. Boss, duly chosen Directors for the ensuing year.

After the meeting adjourned, the Board organized by electing officers as follows: President, J. Strentzel; Vice-President, F. M. Warmcastle; Treasurer, John Larkey; Secretary, Geo. P. Loucks; Auditing Committee, J. W. Jones, A. Boss, J. M. Stone.

Santa Rosa Grange.

EDITORS PRESS:—The annual celebration of Santa Rosa Grange will be held in Hahman's hall, Saturday, May 28th, at 10 A. M. The following program will be rendered: Music, by the Grange; address of welcome, S. T. Coulter; select reading, Miss Emma Mills; quartette, members of Sebastopol Grange; recitation, Miss Minnie Coulter; select reading, Bro. Cnopius; song, by Sebastopol Grange; select reading, Wm. Coulter, S. P. Whitaker; closing remarks, E. W. Davis.

JONATHAN ROBERTS, Chairman of Com.

Santa Rosa, May 15, 1887.

Grange Picnics.

At Beach's Grove.

In reference to the Grangers' picnic, held on Thursday, the 5th of May, at Beach's Grove, our Sacramento correspondent, "G. R.," writes that over 2000 were on the ground and the grove was lined with vehicles. Games of various kinds followed. The *Bee* adds that the weather was perfect, the management all that could be desired, and it is doubtful if a picnic were ever more thoroughly enjoyed.

At Clements.

The Grange reunion at Clements, Friday, May 6th, was celebrated in a lovely oak park on the bank of the Mokelumne river. Visitors flocked in from the surrounding country, Calaveras and Amador being well represented. Prominent Grangers from different parts of the State were present, and Bros. Johnston, Flint and Overhiser addressed the meeting. One of the features of the occasion was an old-fashioned barbecue on a grand scale, and there was a ball in the evening to wind up the festivities.

At Sites.

The Grange picnic at Sites, May 7th, proved highly successful. Large crowds went from Colusa and Maxwell, and everybody had a good time dancing, playing games and roaming over the hills.

At Hock Farm.

Wednesday morning's telegrams include a pleasing assurance that the 14th annual picnic of Sutter and Yuba County Granges, held on Tuesday, at General Sutter's old home, was a grand success. Many came also from Butte, Colusa and Sacramento counties, and the number in attendance could hardly have fallen short of 3000.

The grove at Hock Farm was in excellent order, and the weather perfect. There were two stands, one for dancing, the other for literary exercises. Col. John P. Irish delivered an interesting and eloquent address. He said Sutter county astonished him by its wonderful richness and fertility, and it had no superior in the State for productiveness. He advocated greater diversity of crops, culture of fruit trees and vines and a division of the large farms into small tracts, to be owned by actual cultivators, and expressed himself as greatly pleased with the homelike aspect of the country houses and their surroundings.

Governor Bartlett had been invited and had promised to be present, but owing to ill-health and his absence at Highland springs, had to send word of his inability. Beside all the carriages going to the picnic, the steamer D. E. Knight and barge were chartered to run from Marysville to the picnic grounds, carrying many hundreds of people. Two bands were in attendance, and the day passed off delightfully.

Children's Day in the Grange.

We find in the *American Grange Bulletin* this proclamation by the W. M. of the Indiana State Grange:

For the welfare of the Order of Patrons of Husbandry in Indiana, I, Milton Trusler, Master of State Grange, do appoint Saturday, the 4th day of June next, as "Children's Day," to be observed by the Granges throughout the State, and respectfully recommend that on that day the Lecturer of each Grange prepare a suitable program of exercises, of literary and musical merit, that will tend to interest and benefit the children of our homes. Meetings to be held at such hour and place as Granges may determine, meeting in open session in grove, church or hall, as may seem best for contributing to the interest of the children in the work of the Grange and in developing a love of rural life and agricultural pursuits.

This example of wise and beautiful observance is well worth following in all parts of the Union, California included.

"Only One Flag."

General Master Workman Powderly has addressed an official circular of the K. of L. throughout the United States, recommending that the members of the Order hold demonstrations and celebrations next Fourth of July in honor of the birth of the people's government. He says: "In the line of march and on the stands in public places use only one flag—the stars and stripes. Show to the world that no matter where a Knight of Labor citizen was born he respects and honors the United States flag. Show to the world that we are determined to find out what is wrong in our system of government and that we are equally as determined to right such wrongs as may exist by peaceful and legitimate means. I desire, also, that the question of the restoration of the people's lands to the care of the people be discussed."

TWO ROCK GRANGE observed the first Saturday of this month by decorating the graves of departed brothers and sisters. There were prayers, singing, recitation, and an appropriate and interesting address by Rev. Mr. Hayes, of Tomales.

SOUTH SUTTER GRANGE conferred the third and fourth degrees on two couples April 30th and enjoyed a Harvest Feast and speeches from Bros. Flint, Frisbie and others.

Thugs of the Saloon.

Under the title of "Another Act in the Great Drama," the *Farmers' Friend* says:

"At Haverhill, a small town in the eastern part of Scioto county, on the Ohio river, Dr. W. T. Northup, a prominent physician and vice-president of the Scioto County Medical Society, was brutally murdered yesterday afternoon by Thos. McCoy, a saloon-keeper, and his brother Alfred, the postmaster of Haverhill, aided by Pierson and James McCoy, sons of Alfred, aged 20 and 15 years respectively."

This brief dispatch, wired over the country on the night of April 28th, has aroused a feeling that the enemies of prohibition will find it difficult to control or pacify. The fact is, Dr. Northup, like Rev. Haddock, of Iowa, is a martyr to his convictions. Believing that the sale of liquor is injurious to the best interests of society, he labored to secure its suppression, or at least keep the traffic under proper restrictions. It does not appear, nor do his slayers aver, that in doing this he overstepped the boundaries of calm, dispassionate discussion, or resorted to any unfair means, or did anything which a good citizen and an honest, upright gentleman might not do with perfect propriety and without violating any of the amenities of social life. But the sequel shows that he was winning others to his way of thinking and adding strength to the ranks of the temperance army. As his arguments could not be answered, it was determined that his tongue must be silenced. To accomplish this the four McCoys lay in wait for him, and as he passed their den of concealment unarmed, attending to his professional duties, opened fire upon him from their hiding-place in the house of one of their number.

We do not wish to be understood as saying that all, or even any considerable number of those engaged in the liquor trade, approve the course pursued or condone the offense. But this tragedy, following so close upon the trial and acquittal of the slayer of Rev. Haddock, who was murdered for offensive activity in the cause of temperance and for doing precisely what every good citizen will and ought to do, endeavoring to have the law observed, shows an animus upon the part of the antagonists of the cause of temperance that needs to be removed.

No matter how greatly the more respectable members of the liquor fraternity may deprecate the conduct of these murderers, they can never relieve the saloon from the odium which must attach to the commission of crimes of this character. It was the saloon interest that incited to both homicides; in both instances the object was the same, and it is a well-attested fact that the murderers of Haddock owe their escape from the gallows to the saloon influence. The effect of these offenses will be to bring hundreds of thousands of men into active alliance with the friends of temperance who hitherto took but very little interest in the controversy, and who would most likely have voted in support of what they regard as a time-honored right and against the enactment of prohibitory laws. This high-handed usurpation, these open, deliberate murders of public men for no other offense than the expression of their honest opinions, will not be tolerated by the intelligent, order-loving citizens of this country. When popular indignation is once fully aroused—as it will be, unless these men are properly punished and this sort of conduct is abandoned—the entire liquor traffic will be wiped out as effectually and as thoroughly as was slavery. Those engaged in the trade in intoxicants owe it to themselves to frown down such heinous conduct; and they should be the first to demand that the slayers of both Haddock and Northup be made to suffer the extreme penalty of the law. If they do not take this course, or are found in sympathy with a verdict of acquittal, the day when prohibition will be a fixed fact in every State in the Union is not far distant. The trial of the murderers of Northup will be watched with great interest by the whole country, and the conduct of all concerned will be subjected to the severest scrutiny.

ABOUT SOUTHERN CENTRAL CALIFORNIA.—Brother J. V. Webster has promised to tell Temescal Grange "something that he knows" about home-building at Creston, San Luis Obispo county, and the new developments of Southern-Central California. The meeting opens at 2 o'clock, Saturday afternoon, May 21st, in Oakland. All Patrons are invited.

ALHAMBRA GRANGE SOCIAL.—We gratefully acknowledge a fraternal greeting from Alhambra, though Secretary Lander, with complimentary tickets to their social, to be held tonight, May 21st, and we wish a happy evening to all who can be present, whether we be of that fortunate number or otherwise.

BIRTHDAY PARTY.—The members of Temescal Grange gave a birthday surprise party to Mrs. Eliza Brooks at the residence of her daughter in Oakland last Thursday evening, further mention of which will be made next week.

J. S. TIBBITS, of Santa Rita, has just been commissioned statistical reporter to the Department of Agriculture for Monterey county.

BETWEEN $30,000 and $40,000 worth of eggs and poultry were shipped from Lompoc the past year.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

THE POMEGRANATE, says the Livermore *Herald* of May 5th, is making its appearance as a curiosity and ornament on many private grounds in our vineyard district. It flourishes, and we believe its cultivation, to a limited extent, would be profitable.

Amador.

FINE BARLEY.—*Dispatch*, May 14: We were shown some barley this week, raised on the farm of Mr. John Murphy, of Butte City, which compares favorably with the best produced in the valley counties. The stalks are about six feet high and the heads are very heavy and measure over four inches in length.

Butte.

MISCHIEVOUS CRICKETS.—Chico *Enterprise*: From Dr. Nelson Watts, who returned from Nelson on the 6th, we learn that the cricket pest has made its appearance among the grain-fields of that section, destroying the wheat as it heads out. The doctor brought with him a handful of grain, the heads of which were all nibbled, some being eaten clear down to the stem. The ravages of this pest have just commenced, but there is no telling where they will end. So far as observed, their depredations were all confined to the adobe lands, as an inspection of the sandy soil failed to show any signs of crickets.

SHIPPING CHERRIES from the Rancho Chico orchards has begun. Two hundred and fifty boxes were shipped by express the 13th, part for Denver and part for Chicago. The Rancho Chico cherries are famous all over the United States.

Contra Costa.

HOLSTEINS.—Oakland *Enquirer*, May 11: Wm. Hawes, of the Holstein rancho near Clayton, sold 100 head of cattle to Mr. Morse, of Texas, two weeks ago, and Mr. Morse took them to his ranch near Fresno, recently purchased. The herd included 18 calves and several yearlings. The price paid was $22 per head. There were a few graded Holsteins in the head, which sold the cattle at that figure. Mr. Hawes is an admirer of the Holstein breed, and has purchased from Mr. White, of Sonoma, seven head of imported yearlings, which he shipped to his ranch yesterday. The cattle are handsome and uniformly marked in the fashion peculiar to that breed, having white faces with white stripes across the shoulders and hips. The purchase includes one bull, for which Mr. Hawes paid $250. This will be a valuable acquisition to Contra Costa county, and our exhibitors at the District and State Fairs will have to look to their laurels.

AGRICULTURAL SOCIETY.—Martinez *Item*: The annual meeting of the Contra Costa Agricultural Society was held at Pacheco, Saturday, E. B. Smith presiding, and A. E. Dunkel secretary. The following named committee was appointed to formulate or suggest a new constitution and by-laws: E. B. Smith, James Foster, R. C. Terry, William Shaffer, G. P. Loucks, Henry Polley and E. A. Seaman, to report at a meeting to be held at Concord on Saturday, May 28th—to which date the election of officers for the ensuing year was postponed.

Inyo.

IRRIGATION PROPOSED.—*Independent*, May 14: The Supervisors at their recent meeting granted the petition for an election on the formation of an irrigation district. The election is ordered to be held July 23. The ditch for the proposed district has been fully surveyed and will carry water to irrigate about 45,000 acres. Much of this tract is as well suited to orchard and vineyard, and also to general farming, as any land in the State. The town of Independence is near the middle of the proposed district from north to south, but just outside the line of the district on the west. All of the land in the district slopes gently to the east, and will be very easy to irrigate.

Lake.

DISTRICT ASSOCIATION MEETING.—Lakeport telegram, May 12: The directors of the Twelfth District Agricultural Association, composed of Lake and Mendocino counties, met here to-day, decided to hold the fair this fall at Ukiah, and elected L. F. Long, of Hopland, president; C. C. Hamilton secretary, and John S. Reed treasurer, both of Ukiah. There was a considerable fight between Willetts and Ukiah for the fair.

Los Angeles.

CABBAGE VERSUS GRAPE.—Anaheim *New Era*: Mr. Leonard Kellogg has gone into the cabbage-head business, too. He took Deethman's cabbage patch off his hands on shares, just to accommodate him, you know, and now he says he will get $400 worth off the two acres. He advises vineyardists to dig up their vines and plant cabbages.

SERICULTURE.—Los Angeles *Times*: J. Wallen Smith has made arrangements to go into the silkworm business on a large scale. He has planted 20 acres in the San Fernando valley, near the Providencia ranch, with young mulberry trees, and has just received a consignment of eggs from the State Board of Silk Culture. The microscopic wrigglers are already beginning to hatch from the seed-like eggs. Mr. Smith has plenty of osage orange for them to feed on until the mulberries wax big.

PRECOCIOUS WALNUTS.—Anaheim *Gazette*, May 12: The objection to planting walnut

trees has heretofore been the long time between planting and fruition—generally ten years. But our friend, A. McDermont, of Orangethorpe district, has a large number of soft-shell walnut trees which he planted three years ago when they were one year old. These trees are now heavily loaded with fruit, and promise an abundant crop.

CHOICE ROSES IN VARIETY.—The *Times*, acknowledging the receipt of a huge basket containing 95 varieties of superb roses from Mrs. Leiber, of East Los Angeles, adds that that lady is very successful in raising roses. She has 300 varieties in her garden, besides countless other flowers.

CRYSTALLIZING FRUIT.—L. A. *Times*, May 5: The large square blue building on the west side of the track of the L. A. & S. G. V. R. R., just north of Raymond station, is the factory of the Pasadena Fruit Crystallizing Company, just finished. Work began there Tuesday, the first fruit crystallized being a large quantity of superb strawberries raised by P. W. Gates.

Monterey.

EDITORS PRESS:—The season is both dry and backward. About half the average annual rainfall has failed to connect. Grass is short and almost dry already. Hay crops are light. Grain in many parts of Salinas valley a total failure. In this valley light frosts are still observable some mornings by early risers. Fruit trees bloomed handsomely and fruit set well, but as moisture is deficient, it will probably be undersized. Cattle look well in most places and will fatten except on overstocked ranges. The feature of the season has been the north wind. Every little shower of rain was followed by a chilling, blighting norther, which neutralized much of the benefit of the moisture. The one remarkable growth of the year is the growth in the price of real estate. Neither frost, drouth nor norther checks it in the least; it will boom next June, and Monterey will reap the harvest.—E. B., *Carmel Valley, May 14.*

Napa.

ONE APRICOT ORCHARD.—Napa *Register*, May 6: Three or four years ago Le Grand M. Turner bought 50 acres on the Dry Creek road and immediately planted 4300 apricot trees (75 to the acre) of the Royal and Blenheim varieties, 360 cherry trees, 600 French prunes, 800 egg plums, some peaches, grapes and other desirable fruits. To-day a visit to Mr. Turner's place reveals as clean and thrifty a fruit farm as California can boast of; 75 pounds of apricots to a tree is all that the experienced horticulturist expects from trees of their size; but those figures might be trebled and still not reach the quantity of growing fruit. The process of thinning is now going forward. The plan of pruning followed gives the top of the tree a goblet shape, leaves the center open to the sunlight, and insures a growth of fruit very low down.

Sacramento.

TAME CARP.—Galt *Gazette:* About the most interesting sight on the wagon-road between Galt and Sacramento is Pete Miller's carp pond, at the Lake house, in which there are 18 feet of water and about 200,000 carp. The fish vary in age from hatching time to three years, and in weight up to five pounds—some of them being two feet long. A most interesting sight is to see the carp taking their meals. Mr. Miller feeds the fish daily about noon. As the hour approaches he repairs to a certain place on the bank, with a good supply of bread, calls the carp to him and casts the bread upon the water, and the fish swarm to the feeding-ground, as would a drove of hogs, at the sound of his voice. The scramble for crumbs at times becomes fearful; they even jump from the water to the bank to secure a morsel of food, and readily eat bread from the hand without manifesting the least fear. It is worth going a long way to see.

Santa Barbara.

EDITORS PRESS:—We have set the 27th, 28th, 29th and 30th of September next as the time of holding our Santa Barbara County District Agricultural Fair.—H. B. BRASTOW, Sec.

OLIVES AT LOMPOC.—*Record:* The olive tree at Elder Webb's home in Miguelito canyon bore a fine crop last year, and the fruit is pronounced excellent. There will be a great number planted in and about our valley the coming winter.

THE COMMON LINNET is the worst fruit pest known to our section, and although we dislike to encourage the destruction of even these birds, yet if they are not restricted in their ravages they will soon become unbearable. We believe it far better to organize and offer a bounty for the destruction of their nests than to wait till they are hatched and poison or otherwise kill them. The boys could be utilized in hunting up the nests and receive their reward accordingly.

LATE-SOWN MUSTARD is looming up grandly, and many fields which were thought beyond redemption without more rain are giving evidence of a substantial growth. McKay says that there are few, if any, crops of mustard that will fail, after a most careful survey of the crop in the valley.

BIG BEET PATCH.—J. W. Schoultz has 30 acres of cow-beets planted on his home place, and expects a yield of over 70 tons per acre.

Shasta.

ALFALFA ON RED LAND.—Cottonwood *Index:* On Tuesday last J. M. Alford, who lives on the South fork of Cottonwood creek, brought to this office a sample of alfalfa two feet and five inches long, grown this season on high gravelly red land. Mr. Alford has been experimenting with alfalfa, and says this is a genuine test and satisfies him that it is a success in this neighborhood without irrigation on the red land. He also has grapevines one and two years old that are so top-heavy they are breaking under their own load.

Sonoma.

ROSES.—Santa Rosa *Democrat:* Climbing almost every house, drooping down from tree-tops, peeping through fences, they seem to be ever present perfuming the air and lending joy, cheerfulness and fragrance to every passer-by. The rose, for whom our city was named, seems to have adopted it for her home, and even the great rose-growers of Europe confess that they never saw such a profusion and perfection of bloom. Hermosa gives us buds and flowers nearly all the year, and many of her sisters not less beautiful vie with her in fragrance and abundance of bloom. Banksia climbs our trees and glorifies them with myriads of violet-scented flowers. Cloth of Gold, La Marque and Marechal Niel, all so shy of growth and bloom in many places, here grow with astonishing rapidity and yield an abundance of flowers all summer—which means eight or ten months at least. Agrippina, Safrano, Gen. Jacqueminot, La France and all the old well-known varieties are seen at almost every turn loaded with glossy green foliage, perfect buds and blooms of the purest colors. Of all the roses known there is not one which will not thrive here, and most of them better than in their native homes.

Tulare.

IRRIGATED GRAIN.—*Delta*, May 5: During the recent dry spell in this county some indifferent farmers turned water into their ditches and left them standing full, to benefit the grain by seepage from them alone; others, a trifle less indifferent, turned the water into the low places and dry sloughs in their fields and left it standing in them as well as in the ditches; while others, realizing that water is easily converted into coin in a dry season, not only filled their ditches and kept them full, but likewise plowed furrows from them out upon the higher ground and to those places in the grain showing the need of moisture, with the result of a greatly improved appearance in their fields over those of neighbors who hoped that all would turn out well, but were negligent in the use of means necessary to that end.

FRUIT FROM THE STATE EXPERIMENT STATION.—Three Rivers Cor. *Delta:* Fruit trees are heavily loaded this year with some extra choice fruit from the scions sent from the State University. Prince of Wales prunes hang very thick in clusters. The Alberge de Montgamet apricots look fine and are larger than hickory nuts, but not ripe yet. All the University fruit looks well except the De Coulorge, and probably it is growing on too sandy soil, for the trees have been blooming for about two months, and now some of the fruit has just commenced growing, while there are a few good-sized apricots. Ira Blossom has two pecan trees in bloom.

TRANSPLANTED FROM INDIANA.—J. H. Demarree in *Delta:* On the 12th of March my brother took up a number of raspberry roots of the Gregg variety, which had no sign of bud or life, in Parke county, Indiana. He brought them here in his trunk and made me a present of them, and just one week from the day they were dug up I planted them. In 30 days from the day they were dug, they were blooming. My brother thinks this a wonderful country.

Yolo.

A MOTHERLY ROOSTER.—Cor. Dixon *Tribune:* A lady near Davisville lately lost one of her setting hens, just as the brood of 20 chicks were taking their first timid peep at this uncharitable world. Not one of the barnyard dames could be induced to act as foster-mother, and in this extremity she resolved on an appeal to the paternal instincts of chanticleer himself. Accordingly, the lordliest don of the yard was captured and imprisoned with the orphaned brood. At first his actions betrayed surprise and perhaps disgust, but no malice, and after a few hours, with a heart touched no doubt by the many appealing voices, he submitted to his fate and has since been most faithful to his trust, scratching as he never scratched by day and spreading his ample wings for their protection at night. But paternal care has banished pride, and he no longer crows nor resents the challenges of his rivals. Indifferent to his personal appearance, he goes to his daily toil with bowed head and trailing plumes, with apparently no other thought than the immense family intrusted to him.

APRICOTS GOING EAST.—Winters, May 18: Six hundred and sixty-one boxes of apricots were shipped from this place to-day for Porter Bros., Chicago. The shipment was made by G. W. Thissell, J. E. Sackett, W. J. Pleasants and Mrs. G. M. Blake. This is the first for the season of 1887.

NEVADA.

GOOD PROSPECTS.—*Lyon Co. Times:* The farmers of Mason valley are all looking forward to a summer and fall of prosperity. It is predicted that many more cattle will be fed in the valley this season than for many seasons past. This, of course, will necessitate the raising of larger crops. At least 1500 acres more of land have been put into alfalfa this year than heretofore, and this means that 7500 more tons will be harvested. Considerable more wheat and barley will also be raised, and the potato crop, in fact crops of all kinds, will be greater. The supply of water is not expected to be short.

WATER-STORAGE.—*Silver State:* The Nevada Land and Cattle Co. has built a dam for the storage of water for irrigating purposes in Willow creek, near the boundary line of Humboldt and Elko counties. It is a magnificent piece of engineering work, built between two bluffs, the foundation being on the solid rock. The reservoir covers a large area, and will hold enough water to irrigate several thousand acres. It is nearly full. The water is intended for irrigating alfalfa in Squaw valley, where several hundred acres were sown a year ago. This spring the company is increasing the acreage and expects in the course of a few years to rival the Big meadows in raising alfalfa. There are many localities in Nevada where the water-storage system can be adopted, and while it requires considerable capital to build reservoirs, the investment will prove profitable, as the value of every acre of land reclaimed from the desert is increased from the Government price to $30 or $40 per acre.

A Water-War Averted.

It is with feelings of relief that we note the latest news as to the canal troubles in Fresno and Tulare. Alfalfa fields, gardens, vineyards and orchards were threatened with blight and destruction through an injunction issued by Judge Cross, of Tulare; feelings had become embittered, and within the past fortnight the irrigators had organized armed opposition to the attempts of riparian agents to cut off their supplies.

The directors of the Fowler Switch canal, going to their headgates to shut off the water in compliance with the orders of the court, found 40 masked men under arms in possession, and determined to run the water. At the Centerville and Kingsburg ditch about 70 men similarly armed and disguised were found, who said that they were there to save bread for their children. So likewise the approaches to the head of the Seventy-Six ditch were guarded by a force of 50 men, heavily masked and armed, who forbade any interference with the gates.

Under these circumstances on the 16th the directors of the Fowler Ditch Co. and the Centerville and Kingsburg Co. appeared before the Superior Court of Tulare county, to show cause why they should not be adjudged guilty of contempt of court for diverting water from Kings river in violation of the injunction heretofore issued, and filed answers showing that there was a large supply of water in Kings river, sufficient to fill the canals and to supply all riparianists as well. The judge announced that if such was the case no injury could result to the riparianists, and fixed the 24th inst. for further hearing of the matter. As it is claimed there is abundance of water in the river for all, it is thought that the judge's ruling practically settles the controversy.

No wonder "there is great rejoicing at Kingsburg, Selma, and other points," that the apparent necessity of the farmers choosing between submitting to ruin or resisting even to blood has been averted.

Death of Hon. J. F. Black.

Hon. J. F. Black, of Livermore, an old and well-known resident of Alameda, died suddenly in San Francisco, May 9th. The following sketch of his life is given in the *Call:*

He was born in Burlington county, N. J., on April 1, 1835. On April 26, 1853, he sailed from New York on board the Crescent City for Panama, whence taking passage in the Golden Gate, he arrived in San Francisco June 1, 1853. Mr. Black located at once in Alvarado, Alameda county, and subsequently purchasing the farm now owned by S. P. Harvey, there farmed until 1856. Disposing of the ranch in that year, he moved to Dublin, Murray township, followed farming on the Dougherty ranch, and was the first, in point of fact, to till the ground in that locality. In 1863 he transferred his operations to the Bernal rancho, where he has since engaged in raising grain. In 1866 Mr. Black purchased the interest of the Bernal brothers in the ranch El Valle de San Jose, consisting of 7700 acres, part of which he retained and used for farming. Mr. Black, besides his large grain-growing enterprises, had many acres in vines and hops, and with the assistance of Chas. A. Wetmore he had established on the Arroyo Valle what promises to be one of the best dry wine districts in the State. In 1884 he was elected assemblyman from the district in the eastern end of the county on the Democratic ticket, and was a prominent figure in the Legislature of 1885.

WYOMING CATTLE KINGS FAIL.—The firm of Swan Bros., of Cheyenne, composed of Alex. H. and Thos. S. Swan, has made an assignment for the benefit of their creditors, without preferment. They were heavy operators in live-stock and in land. Their liabilities are about $1,000,000, and it is thought their assets will not fall behind. The firm was deemed solid, financially, and the failure occasioned no little surprise.

FOREST FIRES have been raging disastrously on Cape Cod and in the northern Michigan peninsula.

The State Fair of 1887.

The following circular has been issued to the Boards of Supervisors of the different counties. It contains important information concerning the coming State Fair:

We desire to call your attention at this time to the great benefit that would result to your county from an exhibit of its varied products at the State Fair of 1887. We are informed, and have reason to believe, that there will be a large influx of Eastern visitors at the State Fair this year. We are of the opinion that President Cleveland will pay this coast a visit about that time. A large delegation of veteran firemen from New York will also be here. And as it is our only desire to assist in every way to increase our population and enhance the values of land, we would most respectfully suggest that your honorable body make an appropriation sufficient to pay the expenses of getting an exhibit of this kind together.

The railroad company transports the same free of charge; and as you will be certain to receive a portion of the money appropriated by us, and may receive enough to remunerate you in full for the outlay, this money can be returned to your treasury, so that you will have the full benefit of exhibiting your resources to the world—have your county written up and advertised at so small an expense that it will not be noticed.

The State Agricultural Society is laboring to bring out California's resources. Much has been accomplished through their efforts in the past, and we should certainly be aided in the way of exhibits by the various counties who are to receive the direct benefit therefrom. We have appropriated $2000 this year for these county exhibits alone, so that all that is necessary for you to do is to collect and arrange your products for exhibiting, call on us for the premium awarded, and return home with the satisfaction that you have succesfully shown the productive qualities of your county; then you can well say, if immigration is not increased, it was through no negligence on your part. Appoint some one from your community who is enthusiastic upon this subject; give him the necessary instructions, with power to act. Appropriate from $300 to $500 to assist him, and we are positive that the people of the county will applaud your action. Apply for space at once, as we will devote the entire building to the display of county products, if necessary. We would urge you to awake to the proposition; get in line; keep up with the procession; that the benefits may be reaped by the people of your county, individually and collectively. You are more interested than we; hence, we say, the matter rests with you.

The State Agricultural Society has added a new feature to the premium list this year, in the shape of premiums for exhibits of grain in the sheaf. We call for 40 sheaves, 10 inches in diameter, of 10 varieties; not necessary to be grown by exhibitor, but he must name variety, locality, and producer. First premium, $40; second, $20; and third, $10.

This exhibit is for the purpose of showing our Eastern brethren the growth of cereals in this great State. Notice is given at this time, so that the samples may be gathered during harvest, and laid away. The following are the condltions relating to

County Exhibits.

The importance of an exhibit made by separate counties, showing the productive qualities of the various sections of our State, has become more apparent each year since the system was inaugurated by this board, Recognizing the interest made manifest in the past by both the public and the exhibitors, through whose energy and enterprise valuable agricultural lands have been brought to the notice of the world, and counties with small populations have increased in a manifold degree, by reason of the producer having come forward with his products that were of such quality as to enable him to meet all competitors, the board have deemed it proper to increase the premiums in this department, and to that end have appropriated $2000 to be distributed among the various counties making displays under the following provisions. To those who may have charge of the exhibits, we would call their attention to the fact that these awards will be made for the most extensive, perfect, and varied exhibit of farm products (exclusive of live-stock) exhibited as a county production. Thus it will be seen that it is to be wholly devoted to the products of the farms located in the county where the exhibit is made from, and does not include manufactured goods of any kind or character except those grown and raised in the county from whence the display comes: For the best display, as per explanation above, first premium of $500, cash. The remaining exhibits shall receive premiums in proportion to their excellence, as compared with that receiving the first premium. Competition to be between counties only. That is to say, that the entire exhibit made by one county must compete against the entire exhibit of another county. The premium awarded to each county exhibit will be paid to the committee in charge of said exhibit.

Address the Secretary for information of any character respecting the exhibition.

EDWIN F. SMITH, Secretary. L. U. SHIPPEE, President.

A Device for Irrigators.

A subscriber at Hill's Ferry having expressed a wish to ascertain what is used at Los Angeles "for stopping the holes in checks so that the water will not run through," we referred the matter to Mr. Garey, of Los Angeles, whose letter follows:

EDITORS PRESS:—In answer to your correspondent's questions regarding "tappoons," they are made of heavy sheet iron and of a semi-circular shape, thus: ∪ with the top mounted with a piece of wood 2x3 or more. They are made of different sizes, to correspond to the width and depth of the zanja or water-ditch in which they are to be used. In using them they are placed crosswise in the ditch at or near the point where it is desirable to direct the water upon the land to be irrigated. They are a success, and now generally used here.—THOS. A. GAREY, *Los Angeles, May 3, 1887.*

Her Letters.

[Written for the RURAL PRESS by FANNIE H. AVERY.]

Like bars of sunlight falling
Into a darkened room;
Like sweet bird-voices calling
At night, through chill and gloom:

Her letters come and make me
More strong to do and dare,
And for a season take me
Away from bitter care.

What though long miles divide us,
Far from each other's reach?
No matter what betide us,
Our love can span the breach.

Miss Phœbe Wheelock's Piece to the Papers.

My father was Deacon Jabez Wheelock, one of the most looked-up-to men in the church, and no connection whatever to those shiftless Wheelocks that live over to Cranberry Four Corners. Mother, she was a Crowell, and her folks as well as father's were from Rhode Island. That is years ago. I was born in New York State, right here in North New Salem, and in sight of Massachusetts. There was 10 children, but when I was four, they was all dead but me. I take after father, and all the Wheelocks have a nose and a temper. But they haint talkers, and I should never have tried to write this piece if Dr. Peck's sermon, last Sunday, hadn't worked me up past barin'. Besides, I was brought up orthodox, and taught that wimmen folks and children should be seen and not heard. And I'm not used to writin', as you'll all find out, and spellin' was always a dreadful chore, though I did once git to the head, and git a ticket for spellin' "dough."

I don't mind bein' called an old maid if it ain't said to be spiteful, fer I am one, and I presume I have notions, but as fer that, old wives have 'em, and old men. Jonathan Trowbridge was killed in the battle of the Wilderness, and I never saw no other man I'd marry, though I've had good offers. Somehow, to see wives or husbands ticketed off like the heads to a sermon, looks queer to me. Dr. Peck calls Mis' Peck, "My present wife," No. 2 he calls "My late wife," and No. 1—Sally Rogers she was, and she left him some money—he calls, "My first wife." I couldn't stand no such, and here I'm a lone woman with no kin folk nigher'n a sixth cousin in Oregon. I live in the little red house poor father built, and I've got all the things poor mother did with, and I own some stalk in the ax fact'ry, and I have stiddy work, fer the way the small boys in this town stram out their clothes is a caution. Best of all, I have Polly Trotter, and fer all I feel like a widder, and gittin' along without a man ain't allus handy, I'm happy. I've fetched Polly up by hand, so to speak, fer she's 11 and three months, and I've had her now it's going on seven years.

There ain't a girl better at her books or spryer in the house than she is, and I'm dreadfully thankful she ain't liable to grow up a drunkard, like her father afore her, who, after causin' all sorts of shame and miz'ry, beat his wife's head in with the choppin'-block and died three days after with the tremens. But it's awful to feel your father's lyin' in a drunkard's grave, and to see the man that helped him lie there, every day, through his livin' but three doors off, a carryin' on the same miz'ry-makin' business. "Nick's Place," it says in gold letters on the front door, as bold as brass, and it's the right name. The Evil One has full possession of the premises 'cept where Mis' Hadden lives herself. There oughter be a par of horns over that front door instid of over Joel Dent's, the taller and hide man's shop. Many's the time Mis' Trotter begged and pled with Nick Hadden not to sell her husband rum. But my! she might better 'a pled afore the hitchin' post. Nick, he said: "Bizness is bizness; let him stay away!"

There warn't no such a hole on the corner when poor father built here on Spruce street. It's a nice neighborhood now, but the Casket Works a-buildin' on Spruce street started the licker men and the cigar men our way, though anybody'd think grave clothes and coffins'd give men solemn thoughts. But they come right from planin' the planks that may hold 'em lifeless chunks of clay, to Nick's place, an' they spend so much money with him, he's jest put a big lookin'-glass jest inside his door with a mahogany frame broad as a sofa back. Whoever don't prosper or is stinched, 'taint Nick. Nobody gits up a strike on him, and it's 'nactual fact, Judge Plunkit's 'fraid of his influence 'durin 'lection.

Well, two weeks ago, the W. C. T. U. had a big meetin' here. I never heard a female talk before, and when one got up in the town-hall and begun like a man, my heart was all a flutter. But it fluttered 'nother way, directly, for 'twas Miss Sanders, Dr. Sanderses' wife, from Chicago. Her daughter's gone on a mission to heathen parts, they say, and is a reg'ler built doctor. My! how that woman did talk! All the thoughts that had been half-thoughts like in *my* head, she set in order, as neat as a row of hooks 'neyes. She begun by speaking of how everything touches wimmen if they do stay home and keep house. "If a drunkard suffers," says she—which I myself don't believe many of 'em do—"what does his wife and family suffer? The saloon man spreads his trape, and talks about free gov'ment, but the wimmin folks hain't no freedom to keep temptation away from their sons and husbands. Wimmen folks is half the folks there be. They're taxed (I know that), and put in jail, and hung. Their work helps to make the world richer; their rights ought'er be the same as the men folks." There was lots more I can't give straight off, and I don't believe in tellin' things you remember sort'er permiscuous.

The next Sunday our pastor, Lycurgus Peck, D. D., preached to the wimmen. He's a dreadful good man, Dr. Peck is, and can tell the Hebrew and Greek for everything in the Bible, and he's wrote a book, and if ever a man was gifted in prayer, and affectin' at funerals, he is; but if I do say it, I don't think he knows so well what I was made for as I do myself, and I guess the rest of the wimmen think so, unless mebbe 'tis Mis' Peck.

These were his pints: "Wimmen," says he, "hain't no right to vote, 'cause they can't fight. That was firstly."

"Secondly, votin' would interfere with their bizness."

"Thirdly, their votin' would make things worse than they be now."

I wrote those pints down the minute I got home in my diamond dye almanac. Of course there was flow'ry talk all around 'em, but pints are pints.

I've always stood by the pastor, and we've had some few fusses in our meeting; but truth is truth, and ought to be spoke, if it does hit somebody. In the first place, Dr. Peck couldn't lick a chickin, leastways one 'twould peck hard (though I mean no disrespect to my pastor's name). He's only a little over five feet, and is jest about as thick as the narrer way of a case knife. He can't do a single chore around the house, even to gettin' coal and kindlin's for his study. Mr. Clutterbuck, the druggist, told me himself, that the strengthnin' plasters he's sold that dear man would paper the meetin'-house. If it was ever necessary, I could double Dr. Peck up in a package, and put him in my satchel bag, without half tryin'. So, for such a man to say votin' goes with fightin', and that I must stay home, and it's proper for him to go down to Dexter's hall, and vote for his wife and me, and Polly, and the 16 lone wimmen on this street, is jest ridiclous. We have p'lice, for which Dr. Peck don't pay a cent of tax, but I do, and 12 other widders on this street. During the war, Dr. Peck staid right here in North New Salem, never losing a meal of vittles or a wink of sleep.

But I follered Jonathan, and worked in the hospitals, and watched, and tended, till I was clean beat out. Jonathan fit for me, I know, but somebody fit for Dr. Peck, and Squire Barnes, and Judge Plunkitt and a sight more I won't mention. But their ain't no talk of *their* not havin' no bizness to vote, though they did save the Union by dep'ty. If Dr. Peck *had* gone to the war, he'd a-learned that if wimmen don't fight they have consid'able to do with a war, when there is one. And if he'd a-read the papers, instid of so much 'riginal tungs, he'd a-learned that men are gettin' the idee by degrees (nobody learns everything t'onst) that matters can be settled without men a pitchin' at each other like a pack of wild catamounts.

Wimmen are awful busy. But most men are handier round a house than Dr. Peck, and wimmen git out to sewin' s'cieties, and missionary meetin's and prayer meetin's, and if some on 'em want to talk gossip they've hours on hand, and yit I don't see no men ner children a sufferin' in North New Salem from wimmen's neglect. I don't know no woman, and I have sewed by the week for 'most everybody in town, that wouldn't be willin' to stir 'round a little faster 'lection day for the sake of puttin' down saloons. They do go to political meetin's, and that takes enough sight longer'n 'twould to vote. There was a big missionary meetin' over to New Salem Junction last week, and wimmen from four States was to it and it was a blessed time, and I don't believe any work was left that wouldn't keep. If wimmen are too busy to vote it's for them to say so, not for men.

The last pint was the most upsettin' to me, because Dr. Peck said right after it, "The female sect is the upliftin' force of the world," which don't jibe with there bein', as he says there is, one or two or three bad wimmen represented by every bad man that votes. I asked him for his figgers the minute he come down from the pulpit, but he put his chin up in an aggervatin' way he has, and said he never lets himself git into discussion with the female sect. *I* shall be glad to know if there *are* any figgers to back him up. A bad man may represent one or two or three bad wimmen, jest as he says; but it don't take Solomon's wisdom to know them same bad wimmen may represent an unaccountable lot of bad men. This ain't pleasant to talk about, but I ain't to blame for it.

The Mormon wimmen, Dr. Peck said, all voted to keep polligamy a-goin'; and he seemed to think he'd made another pint. He didn't seem to know that his own mother—one of the saints she was, too, but a good deal juicier'n the doctor—would, if she'd a had a sixth or a sixteenth of a husband, a-voted to keep him. What would those poor benighted wimmen be called, and what would their children be called, if they voted away all the husband and father they had? Dr. Peck's always talkin' about invyrnmint, but he forgot it that time. Mormonism is a sample of the wickedness and smartness of men, and marryin' and unmarryin' laws is another. Though I don't know's I ought to throw up too many of men's faults at 'em at once. I git dreadful worked up when I think of the doin's that can be done. Dr. Peck's own brother-in-law, a low-lived kind of smart lawyer, went to Chicago and staid over night, and when he come back he was divorced from his wife, and Mis' Allen was divorced from her husband, and the two got married as bold as brass, and Dr. Peck did it. I don't make no comments.

And Dr. Peck he said wimmen would vote for whisky. Some might, but I never seen 'em, any more'n I've seen the sea-serpent. But I won't deny the one nor the other. Everything ain't in North New Salem. Mis' Hadden wouldn't; she's offered to do anything 'f Nick would shut up his miz'ry fact'ry. Ner my washerwoman when I have one, Mis' Staub, wouldn't, though she goes and buys her man, as she calls him, a mug of beer every night of her tired life. "He will haff it," she says, "und if I don't git it Hans will go hisenself, und mit dose mens he puys more as tree peers, und siggars, und he will pay for dose uder mens, besides hisen peers, und spend more as I can earn, und work hart all tay."

The only woman I know that gits drunk is old Sally Martin, and she takes opium. She says she can't stand her "heart scaldin' sorrer" without it, and no wonder. Her man was hung fer killin' a man when he was drunk ('twas years ago when killin' was killin'), and her two boys are two of the worst on the face of the earth. When they ain't at Nick's place, er stealin', they're in jail.

Now bein' most 50 years old, earnin' my own livin' an' payin' taxes, and askin' no odds of nobody 'cept neighborin', and havin' Polly to look after, and she's as pretty as a peach, and sure to git married, makes me feel there ain't no sense in my position.

To be sure I couldn't go to war and shoot off a gun, but I could tend the wounded, and do their cookin', and knit and mend and make for the well ones, jest as I did four years, more'n 20 years ago, and I guess that's more'n Dr. Peck and lots of men did. My mind's made up that I had oughter vote. I'm perfectly contented to stay home in my little red house and cut and press little jackets and trowsers, and tend to Polly, and Bildad, our yellow dog. I couldn't make a speech if I wanted to, for I stutter some, if I'm put out any. But I want somebody on the school board that'll dreen out the ma'sh behind the schoolhouse, or do somethin' to make the buildin' healthier, and I want somethin' done to put down the saloons, and I want to say my say as to who shall go to Congress. Our representative ain't a man no good woman would touch with the tongs. Ef Polly ain't liable to grow up a drunkard, she's liable to marry a man who'll turn into one. And I think a sight of the young folks growing up, the children of my old friends. Of course Polly is first, the dear. Words can't tell my feelins fer that child. But I love 'em all, an' 'most of all the young folks call me Aunt Phœbe, and seems if they couldn't do nuff for me.

Now Hans Staub votes, an' he can't speak a dozen words of English, and don't know no more of America than he does of Africa. Pat Ryan votes, whose wife takes boarders to support him, and he knows about as much as Hans Staub. There's most a thousan' jest such in North New Salem. But there's a hundred more wimmen in the township than there is men, an' as most wimmen think of nothin' all their lives but makin' some man an' his children good and happy, I guess what's good fer the men is what they'd vote fer, ef they had the chance. I hain't got no husband, to be sure; but ef I had one I'd want to be proud of him, it's nater. But I must close. The gist of the whole matter is I feel quaky fer Polly, and I want the saloons put down, and I find on givin' the subjec' a jineral view, I ort to vote. This is my first piece, and it shell be my last. I ain't one to waste my breath.—*The Union Signal.*

A LEGAL PROBLEM AT THE WHITE HOUSE.—Col. Lamont is wrestling with a great legal problem. In the White House mail the other day was a letter from a rural Mississippian, inclosing a lottery ticket which had drawn a handsome prize. The back of the ticket bore the announcement that "no ticket will be paid unless it bears the President's signature." The president of the company was meant, of course, but the Mississippian thought it meant the President of the United States, and he was very urgent in asking that Mr. Cleveland indorse the ticket and hurry it back to him. The Colonel's first impulse was to return the ticket with a polite little note of explanation; but, on second thought, it occurred to him that he could not do so. The Revised Statutes provide, in very plain language, that "no letter concerning lotteries shall be carried in the mail;" and that "any person who shall knowingly deposit or send anything to be conveyed by mail in violation of this section shall be punishable by a fine of not more than $500, nor less than $100, with costs of prosecution." This clearly prohibits the Colonel from sending back the ticket. He does not see how he can even communicate his troubles to the owner of the ticket, as he can send nothing through the mail concerning it. He is undecided between telegraphing the man to come on to Washington and sending the ticket to him by special messenger.—*N. Y. Sun.*

Saved by Kindness.

John Roach, the famous shipbuilder, believed in the law of kindness in dealing with erring men. Out of the 25,000 men employed by him first and last, there were 70 found guilty of criminal conduct. He saved 60 of them. This is his story of the way he reformed a "confirmed drunkard." The man was a "master workman."

"He had terrible sprees, and had them pretty often. He would come raving into the shops, disgracing himself and disgusting everybody. When sober he was penitent, and I forgave him, and took him back again and again. I appealed to him until there seemed to be nothing else to appeal to. One morning he came in after one of his sprees, and said: 'Mr. Roach, I want you to discharge me. You can't make anything of me. I have broken my promise, and abused your trust over and over. You took me up when I had nothing to do, and you learned me your trade and paid me good wages, and bore with my faults till it ain't human to ask you to bear any more. Now discharge me.'

"'Mike,' says I, 'I won't discharge you, but I'll let you resign. I'll write your resignation,' for an idea struck me. I went to my desk and wrote:

"'John Roach—Sir: You helped me when I was penniless. You gave me work when I was idle. You taught me when I was ignorant. You have always paid me well. You have borne with my infirmities over and over. But I have lost my self-respect, and have not enough regard for you or love for my wife and children to behave like a man, and therefore I hereby withdraw from your employment.'

"I gave it to him and said, 'I want you to promise me one thing—that you will always carry this with you, and that, when about to take a glass of liquor, you will take this out, read it, and sign it and mail it to me before you drink.' He promised solemnly that he would. He stayed in my employ for years and was never drunk again."

About a Mortgage.

The editor of the Santa Ana *Standard*, having just succeeded in paying off a mortgage on his ranch in Orangethorpe, rejoices in the full ownership of "61 acres of as fine land as California boasts." His experience with the "dead pledge"—now so happily past—moves him to wise reflections, as follows: "A mortgage is a queer institution. It makes a man rustle and keeps him poor. It is a strong incentive to action, and a wholesome reminder of the fleeting months and years. It is fully as symbolical in its meaning as the hour-glass and scythe, that represent death. A mortgage also represents industry, because it is never idle and never rests. It is like a bosom friend, because the greater the adversity the closer it sticks to a fellow. It is like a brave soldier—it never hesitates at charges nor fears to close in on the enemy. It is like the sand-bag of the thug—silent in application, but deadly in effect. It is like the hand of providence—it spreads all over creation, and its influence is everywhere visible. It is like the grasp of a devil-fish—the longer it holds, the greater its strength. It will exercise feeble energies and lend activity to a sluggish brain, but no matter how hard the debtors work, the mortgage works harder still. A mortgage is a good thing to have in the family—provided always it is in somebody else's family. It is like a boil—always a good thing on some other fellow. It makes one sour, cross, selfish, unsociable and miserable, and rarely does him any good, only to exercise him. In that respect it is equal to Vigor of Life or the latest patent medicine. We've had our last one as far as we know ourself. We would rather have the ague than have a mortgage. Adieu, old death pall, a fond adieu."

BEECHER'S VOICE NOT DEAD.—In the house of Edison, the inventor, there is a remarkable memento of Beecher. The inventor's phonograph for impressing on a soft metal sheet the utterances of the human voice, and then emitting it again by the turning of a crank, has never been put to any very valuable use, and Edison has only gained from it a few thousand dollars in royalties from exhibitors. But he utilized it to make a collection of famous voices. Since he became famous, his visitors have included hundreds of celebrities. Instead of asking them for their autographs or photographs, he has, in two or three hundred instances, requested them to speak a few sentences into a phonograph. He has kept the plates in a cabinet, and occasionally he runs some of them through the machine, which sends out the words exactly as uttered. Edison is probably the only man who can revive the silenced voice of the great preacher.

"AH, parson, I wish I could carry my gold with me," said a dying man to his pastor. "It might melt," was the consoling answer.

An April Walk in El Dorado County.

[Written for the RURAL PRESS by S. R. S.]

After a very heavy rain,
The sun comes out so bright and warm again;
And freshening breezes wafting o'er
The pine-clad forests to restore
All nature to its wonted bloom.
I wandered down the canyon steep,
With charming views, at every peep,
Of distant hills and planted land,
And nearer still, and close at hand,
The cosy foothill ranches
'Mid the peaches and the vines,
With the tinkling of the cowbells
Sounding like evening chimes;
And then into the rocky gorge,
Where the rushing waters ever forge
Their rugged way.
The moss-grown boulders here and there
Disclose green tufts of maiden-hair,
And small white lilies add their share
To nature's treat so rich and rare;
While nobly waving overhead
The towering feathery cedar branches spread;
And rounded oaks of evergreen
Mirror'd in pools of silver sheen,
With massy ferns whose drooping frondes lave
In every passing mimic wave;
And near the side, tho' none the less,
The useful, simple watercress.
In the torrent's uneven bed
The rich veins of gold lie hid,
Waiting the hand of patient toil
Their sunken treasures to despoil;
And ever and anon is heard
The gentle murmur of the humming-bird,
The tapping of the woodpecker
And startled rush of quail.
In the forest's deepest shade
The shy deer are seen to hide;
The hare starts across the way,
Unmindful of the screaming jay.
Here to the tired traveler,
Fresh from the ice-bound East,
Is spread for him a lordly feast
Of deer and game and purest wine;
Together each and all combine
In pressing welcome.
Come, oh, come,
And make with us your happy home.

BE TRUTHFUL TO CHILDREN.—I want to say a few words to mothers. At church I occupied a pew with a lady who had a beautiful little girl about two years old. Baby was restless, but mamma, trying to quiet the wee one, told several—well, let me tell you, and you name them. First she said, "If you don't keep still that man (the minister) will come and get you." Baby looked frightened at mamma, but after a momentary pause went on as before; then mamma said, "See that big dog under the seat; it is going to bite you if you don't keep still," and several other things of like kind; but enough. Some of you are turning away, but, my dear sisters, this is too important to turn hastily from. A mother's integrity and the confidence that baby, as she grows to womanhood, is to have in her mother are at stake. These are too precious by far to trifle away. In talking with an eminent Christian lady recently, she said: "My mother never told me an untruth. When I asked my mother many questions (as girls always do) that she did not wish to answer at that time, she said: 'I will tell you when you are older; you cannot understand it now, but do not ask any one else the question you have asked me to-day, but trust mother to tell you in her own good time.'" I never saw a better example of confidence between mother and daughter than the one of which I speak.

A SAGEBRUSH STOCK-WOMAN.—The Sierra Valley (Cal.) *Leader* of a late date has the following: Miss Ellen Callehan sold to James Miller the other day 46 head of beef cattle at 8½ cents a pound. This is the highest price paid in this valley in two years for beef cattle. Miss Callehan received $2312.75 for her cattle, and has a band still growing. Some 12 or 15 years ago her brother died and left her two good ranches and a band of cattle and horses. Since then she has managed the ranches and stock herself as sole proprietor. She is a noted character here for her peculiar manner in attending to her household affairs as well as caring for her stock and gathering in her large crop of hay, etc., all of which she personally superintends. She can harness a team, run a mower, break wild horses, or do any of the work on a ranch. She shows great charity for tock, as she has often been known to take the young calves, colts, chickens and ducks into the kitchen to save them from the inclemency of the weather for several weeks at a time. She would not take good bank checks or gold notes from Mr. Miller for her beef, but must have the coin, which she took home with her in a barley sack. The banks, she says, are all swindlers.

A FEMALE PILOT.—Mrs. Louise Daniels, wife of Captain Daniels, of the Lake Champlain steamer Water Lily, has just received a license as pilot of that steamer. She had passed in a most satisfactory manner the usual examination before the United States Inspectors, and was examined by Dr. A. P. Gunnell, Dean of the Burlington Medical college, with reference to color-blindness or other defects of vision. Her eyes were found to be perfect. She stood at the helm of the Water Lily recently on her first trip through the lake and received many encomiums for the skill she displayed. Mrs. Daniels, who has spent the past ten years of her life on the lake during the summer, is 42 years old and is the embodiment of womanly grace and vigor.

YOUNG FOLKS' COLUMN.

"Much Ado About Nothing."

[Written for the RURAL PRESS by MARION SAMSON.]

"Clara! Clara!" called a sweet voice to me across the lilac bushes.

I was gathering roses in the bright, dewy morning, mixing all kinds of wonderful dreams with my pretty posies, when mother could save money enough from her paintings, that were so much admired, to send me to college, and I in turn should grow rich enough to hide her brushes and palette and let her rest. Mother had worked so hard all winter that she was at present an invalid. We were spending the summer in a little mountain town in California. I was her only petted child. By the time I had picked at least half the blushing roses in the garden I had made quite a heroine of myself.

"Clara!" again called the voice.

I recognized my mother's voice now, so, hurrying over the rosebeds and violet patches into the house, I found mother seated upright in bed, her eyes bright with excitement, and two rosy spots on her pale cheeks.

"Mother! mother! What has happened?" I exclaimed, springing to her side in a moment. She thrust a letter into my hands, and, reading it quickly, I discovered that a distant relative of the family had just died, leaving us a legacy of a thousand dollars. The letter informed us that it was now at our disposal in a prominent San Francisco bank. Imagine my joy if you can! I, who had never owned $10 in my life.

"O Clara!" said dear unselfish mother, "you shall go to college next term and have some pretty new dresses to replace those shabby ones you wear."

I had completely forgotten college, shabby dresses; in fact, everything in the excitement of the moment. A thousand dollars all to ourselves to spend on candy if we chose! I actually believe I was growing light-headed over our good luck.

Mother called my scattered senses together by cautioning me to lock up the precious check very carefully. After considerable planning and discussing, it was decided I should take the early train to San Francisco next morning and return home the same evening. You may be sure it cost mother many a pang and even tears to let me go alone, but there was no one we could trust with our treasure, and as mother could not even leave her bed, there was no alternative.

It is necessary to add that I was only 16 years old and had never been absent from my mother's side before. Such a thing as traveling alone was unheard of in my experience. I suddenly felt real old, and walked upstairs quite sedately to investigate my limited wardrobe. I carefully brought to light my one best dress of navy-blue cloth. It was quite perfect, even to the creamy lace in neck and sleeves.

How pleasant it was to go to San Francisco just like a real young lady, for what could be more grown up than to travel alone?

"It was very simple, after all, and mother was very foolish to worry about me," I concluded satisfactorily to myself.

The eventful morning came at last. Mother kissed me good-by at least a dozen times, begging me between each kiss to be very careful and not get lost. I saw tears in her sweet blue eyes, so I tried to look quite brave, and assured her I would be back safe and sound that evening a thousand times richer. Another kiss and I was gone.

When I took my seat in the cars I tried to look as unconscious as possible, and amused myself reading over for the twentieth time the directions I had received. Then I examined my traveling companions and finally buried myself in a book until the familiar suburbs of Oakland came in sight.

Oakland depot at last! To be sure, my heart quaked just for a moment when I found myself elbowed and jostled by so many strange people. I arrived in San Francisco quite safely, however, drove immediately to the bank, received my money, stopped only for a light lunch, and in another hour was seated comfortably in the return train home.

I felt quite proud of myself. I had actually come to San Francisco by myself—a whole eight hours' ride. How lovely it would be to tell the girls at school! I was sure they would treat me quite differently in future.

The cars rattled on faster and faster, keeping even time with my busy thoughts.

We presently arrived at a station more brilliantly lighted than the rest; between gongs, high-pitched voices, and shrill engine-whistles, I discovered it was supper. I did not dare risk leaving the train, so I peered out into the darkness; every one was flocking into the dining-room. How tempting the well-spread tables looked! It seemed so stingy to sit still reading a book, just as though I could ignore the fact that I was hungry in the face of traveling nearly eight hours.

The people opposite me began eating sandwiches and grapes.

How I longed for some, but I would soon be home, and mother, I knew, would order a dainty little supper for me.

"Will you have a sandwich, Miss?" said a kind voice at my side.

The gentleman opposite had actually taken pity on me.

"No, thank you," I replied, blushing profusely, "I'm going in to supper."

"You'd better hurry, as the train only stops 20 minutes," he answered, disposing of the discarded sandwich himself.

The deed was done. I gathered up my few parcels with desperation and remorse tugging at my heartstrings.

I did not enjoy my supper very much, although there were plenty of good things on the table, but amid so much confusion it was impossible to obtain anything. I contented myself with lukewarm tea and stale biscuits, leaving the fried chicken and steamed oysters for the luckier ones within reach.

"After all," thought I, "it was rather foolish of me to leave the cars, but then I could just follow the rest of the people and it would be all right."

Again I found myself seated in my old seat as safe as possible. In another hour I would be home. I laughed quite heartily at myself for being so nervous.

"Tickets, Miss!"

The conductor eyed my ticket quite carefully, turning it over and around several times, then handed it back, saying: "You're on the wrong train, Miss. This train goes to L——, arrives there to-morrow morning. You should not have changed cars at the last station."

"To-morrow morning! Changed cars!" I stammered, my heart almost ceasing to beat. "Why, I must get home to-night," I continued excitedly. "Please let me off; I will take the next train back."

"Impossible, Miss," answered the conductor. "You're on the express, and we only stop at M—— to-night. You might stay there at the Goth house and take the first train back to S—— in the morning," he concluded, moving on.

M——, the very name made me tremble. The roughest town on the road. *I* stay there all night, alone in a strange hotel.

Impossible. The very thought was ridiculous. All kinds of mad ideas danced through my brain. I would walk back, I would.

"M——!" screamed the heartless conductor.

My tears fell faster than ever, but I stepped on the platform, and was confronted by a fierce-looking man, who threw the full light of a lantern on my tear-stained face, at the same time calling out, "This way to the Goth house." Yes, that was the name the conductor had given me, so I followed my guide. We walked along a dark, narrow street until I became quite nervous.

This was a strange way of arriving at a hotel. In my limited experience I had always been driven up with something like style.

Did this man, aware that I carried money, mean to murder me?

I had quite decided to run away from him, when we arrived at a rather pretentious house, lit up with several coal-oil lamps, and over the door I spied "Goth house," in large gilt letters.

I absolved my guide from any dishonest intentions, and walked into the office feeling very timid.

At least 50 rough-looking men were smoking, drinking and chatting.

On my entrance their voices ceased, all eyes were turned on me; some boldly, some indifferently, but all curiously.

What nest of murderers had I fallen into?

By the time I had reached the desk, you might have heard a pin drop.

"I would like a room, please," I commenced nervously. "I took the wrong train at ——."

"Give this lady room 88," interrupted the clerk.

Why was he so imprudent as to scream the number out so loud with all those horrid men staring at me? I wondered if they ever saw a young lady before. I felt my fate was decided now. I should be robbed and murdered that night, thanks to the imprudence of this reckless clerk.

I followed the boy upstairs, wound through numberless passages, until we arrived at a small room at the farthest end of the darkest hall. What a grand place for a murder, thought I, shuddering.

"Here's your room, Miss," said the boy, presenting me with the remains of a wasted candle.

Bang went the door, and I was alone. First I viewed the premises. The room was very small, with one window, but it was entirely too high to be of any service. I next spied a transom, which made me feel very uneasy as I recalled the tale told me by a friend, of her uncle who had been chloroformed, then robbed, by means of a transom.

I was growing so nervous I could hear my heart beat against my ribs. My last and worst discovery was that my room connected with another by a single thin door.

Now was it not most probable that one of those savages downstairs would engage this adjoining room and in the middle of the night rob and perhaps murder me?

I might scream forever in this far-off corner.

Feeling at least convinced there were no trap-doors, etc., I settled myself as comfortable as possible bolt upright in a chair, with the bag containing my precious treasure clutched tight in my hand.

I had no intention of even shutting my eyes for a moment, but I soon agreed with the disciple, "the spirit is willing but the flesh is weak," for I was suddenly awakened by subdued voices talking in the hall; soon the voices and accompanying footsteps grew nearer, until finally the door of my connecting room was opened and some one lit a sickly light.

The last moment had come, then! I *was* to be robbed. I thought of my poor darling mother, alone and ill; it seemed as though my heart would break. How could she live without me?

Who would break the news that I was murdered? Horrible thought! I felt so miserable that I was quite resigned to die.

The occupant of the next room was opening his window, I suppose to see if it was convenient to enter my room by that means.

I listened attentively. Now he was trying the connecting door. My heart gave slow, painful throbs, my teeth chattered miserably, for my last ray of hope had fled.

Suddenly I heard a low, murmuring sound as though the robber was enraged.

What could he be doing! I stole cautiously from my chair and crept to the door.

If he was sharpening up his knives and razors to slaughter me, I would at least be brave enough to make one attempt to escape.

The murmuring became louder, more savage.

With one grand, final effort, I summoned up my remaining courage, knelt cautiously at the keyhole, and peeped in.

There knelt my robber, my murderer, his hands clasped, his eyes upturned to heaven in deep and earnest prayer, as unconscious of me as though I were out of existence.

I think I never saw a more beautiful or honest face.

My overstrung nerves had been tried, so I burst into hysterical sobs.

Let those mock at prayer who will! They may call it weak-minded and ignorant; all I know is that my fears vanished like vapor in the morning sun. I wasted no more time in chairs that night, but jumped hastily into bed and slept as happily as though my mother's arms held me fast.

I did not awake until the sun shone straight in my eyes.

A few hours more I was clasped to my mother's anxious heart, and between many tears I told my adventure.

I will confess something to you I never told her.

I think I have ever since been hopelessly in love with my handsome robber friend.

Alameda.

DOMESTIC ECONOMY.

A Permanent Meringue.

EDITORS PRESS:—Seeing in your paper a request for a meringue that will not fall, I am glad to have the opportunity to give some one the benefit of my experience.

After beating your eggs until the dish may be turned upside down without spilling its contents, beat in your *granulated* sugar, a spoonful at a time. Allow, say seven minutes of beating after each spoonful, or until the sugar is all dissolved—the longer the better. Make it as sweet as desired, and spread upon your pie. Some do not like it very sweet. I do. Use your own judgment. When you have it smooth on the pie, sift powdered sugar over the top lightly; this forms a crust when the meringue is baked, and excludes the air from the egg. Meringue made in this way will keep stiff several days. It never becomes leathery. Be careful not to get too much sugar on the top. A scarcely perceptible crust is most desirable.

MINNIE LYONS.

Sacramento.

WAFFLES.—One pint flour, 1 teaspoonful baking-powder, one-half teaspoonful salt, 3 eggs, 1¼ cups milk, 1 tablespoonful butter, melted; mix in the order given. Separate the eggs, beat both whites and yolks and add the whites to the other ingredients at the last moment after beating to a stiff froth. The yolks are mixed with the milk and salt, and then added to the flour and baking-powder. Waffles must be crisp or they are not nice The secret of having them crisp lies in putting in the butter at the last and having it very hot. Have the waffle-iron very hot, and butter thoroughly so the waffles will not stick. In opening the waffle-iron, always open back, over the stove. New irons will always stick. They must first be cleaned by boiling in a kettle, with cornmeal or potato parings. Then scrub thoroughly, grease, and let them stand for a few days. Another thorough washing will probably make them smooth.

Sauce for above.—Some like butter and syrup on the waffles; but a good sauce may be made of one cup sugar and one-fourth cup water, boiled together for a few minutes, to which is added juice of half a lemon and a teaspoonful of butter.

GINGER SNAPS.—Mix one pound of flour and three quarters of a pound of white sugar. Rub into it half a pound of butter, two eggs well beaten and an ounce of ginger ground fine. Beat all well together, roll out the dough to the third of an inch thick, cut out the cakes and bake them. These are far superior to ordinary ginger snaps.

SCALLOPED ONIONS.—Boil, and if large, cut into quarters. Put into a shallow dish, cover with white sauce and buttered crumbs, and bake until the onions are brown.

IMITATION APPLE-PIE.—Four teacupfuls of water, six soda crackers, two cups of sugar, juice of two lemons and rind of one.

The Week.

As we anticipated in our last issue, the early reports of frost injuries have been proven to have been greatly exaggerated. Even in districts where the harm was acknowledged to be greatest, later observations show fewer suffering vines, or less injury to vineyards which were quite hopelessly spoken of. Still there remains enough of the visitation to cause it to be remembered as unwelcome. Aside from vines, garden stuff suffered most and summer forage crops were in a few places cut back to death. This will require a replanting of corn and other tender growths in individual cases, and this is the more unfortunate as moisture supplies in the soil are not excessive. There are, however, some instances of considerable loss, for one correspondent writes: "We have lost about everything in the ground but the stones—grapes, fruit, vegetables—a clean sweep." To such there is nothing to say except words of sympathy and encouragement; that the ills but seldom come, and will soon be forgotten.

Showers have lurked about the State during the week, but wide apart and usually little in weight. Haying progresses and has been but little interfered with. Our reports are of light or moderate cuts generally. The grain is late this year.

What Judge Reagan Thinks.

We are glad that the Interstate Commerce Commission had the courtesy to invite the opinion of Senator Reagan concerning their contemplated indefinite suspension of the fourth clause of the new Interstate law. Of course, as the father of the measure and its careful trainer until it reached its majority on its enactment by Congress, Senator Reagan was properly entitled to a hearing when so important action as suspending one of its leading clauses was imminent. As might be expected, we find Mr. Reagan taking general grounds against the suspension, claiming that needed relief is already provided for without such radical action, and that to suspend the fourth section would devitalize the law in many important respects. It is announced by telegraph that Mr. Reagan will make public this week quite a voluminous reply to the request for his views. Concerning the suspension of the clause in a general way, he will say:

In deference to the opinion of others, we inserted a provision in this section, that upon the application to the Commission such common carrier may, in special cases, after investigation by the Commission, be authorized to charge less for the transportation of passengers and property. * * * It was never suggested in the Conference Committee where this section received its final shape, or elsewhere, that I know of, that under this language the Commission might suspend the section and adopt, instead, the exception for the rule, but it was inserted that in case it should turn out that the rule might work hardships in special cases, the Commission could, under this exception, give relief against such hardships, and it was under this idea that the committee inserted the provision and exception to that rule, simply to enable the Commission to relieve injustice in special cases if it could be made to appear that injustice was being caused by the enforcement of the rule.

This is a very important interpretation. In the case of the Pacific Coast interests it would seem that needed relief was quite possible, as Judge Reagan states in his last sentence as quoted above. Of course the strangling of important industries would be certainly an "act of injustice," and such was not intended by the framers of the law. Again, in a still more specific manner, Judge Reagan states that the words "under substantially similar circumstances and conditions," which some companies have been endeavoring to show enables them to make cheaper rates for large shipments than for small, were not intended to carry such significance; they were put in solely to enable the railroad to give special facilities for the expeditious transportation of fruit and other perishable goods in order to prevent loss or injury. Here, according to the author of the law, we have then provision for the relief needed by our fruit-men for example; the companies could, under the law, arrange both cost and speed so as to prevent the ruin of an industry, but rather to so arrange them as to promote it.

Of course the main provisions of the measure and the principles of regulation which underlie them, are things which we have long contended for and we are disposed to favor any means of securing them without injustice to any one. The measure must be based upon justice both to the companies and to their patrons, or it cannot stand. It is to right wrongs, not to institute new wrongs, and such, we trust, it will be clearly seen to do.

In the matter of water carriage of produce, Judge Reagan in his reply, alluded to above, has the following forcible utterance:

It would be a criminal disregard of the rights of the people for Congress or the Commission to so manage as to deprive the people of the cheaper transportation afforded by water-ways. This can only be done by allowing the railways to carry freights below the cost of transportation, thereby causing unjust exactions on way freights to make up loss of revenue by the roads and to pay for depriving the people of cheap water transportation. No Government on earth would dare to pass a law to prevent the carriage of its commerce on natural water-ways, and yet that is what, in substance, your Commission is asked to do by the railroad companies.

It is a suspicion of such a policy on the part of our overland lines which has given the idea of railroad regulation much strength on this coast, and certainly the maintenance of water traffic is of the utmost importance to the prosperity of this coast. Judge Reagan closes his appeal for the preservation of the new law in these words:

I have tried to show, first, that the Commission has no power to suspend the law of Congress; and, second, if they had, as a matter of discretion, the power to do so, it would be a great wrong and injury to the public, and to a large extent it would destroy the purpose of Congress to protect the people against wrong and oppression. Ever since the passage of this law the railroad corporations have, through their officers, agents, lawyers and hired newspapers, been engaged in a most extraordinary conspiracy to secure the nullification of one at least of its most important provisions. Millions of people with interests involved of thousands of millions of dollars, and with political interests far greater than any money interests at stake, with bated breath are looking earnestly and anxiously to see whether the Commission is to be misled and their rights and interests sacrificed, or whether the law is to be sustained and their pecuniary and political rights preserved.

Eastern Fruit Shipments.

As the fruit crop is hurrying toward maturity, the subject of greatest import is the Eastern outlet, both for its own sake and for the relief which free shipments will bring to local markets. We have taken special pains to gather what news we can up to the hour of our going to press on Wednesday evening.

From day to day there has been an outlook for a final settlement of the rates by the traffic managers' convention which is still in session in Chicago. Various rumors have reached this coast, most of them of an encouraging character, but Wednesday evening's telegram from Chicago says, "no rate on fruits has yet been made." Previous to the Chicago meeting, as we announced recently, the following rates were offered by the Southern Pacific Company: By passenger train to Chicago, $500 per car; by slow freight train to Chicago, $250 per car; special train rate of 10 cars to Chicago, $400 per car. The "special train" is guaranteed to run on passenger time. This last rate includes all local freight charges on the S. P. system. For example, Vacaville shippers will pay a local charge to Elmira, but none from Elmira to Sacramento; Santa Clara would pay a local to San Jose, but $400 would cover all the balance. There are some good points in this schedule, but it is expected that the Chicago meeting will consent to something better.

From H. A. Fairbank, secretary of the California Fruit Union, we learn that progress is being made by Mr. Blowers in establishing local agencies at the East. He has selected agents as follows: Kansas City, M. Tanner; St. Louis, Gerber & Signaigo; Minneapolis, Pratt, Gilman, & Francis; St. Paul, B. Presley & Co.; Chicago, Porter Bros. & Co. More are to be appointed. It is not expected to have agents in Boston, New York, Philadelphia or Baltimore, but if through-car shipments can be arranged to those points, the fruit will be sold at auction there to the highest bidders.

There are some new provisions in the arrangements made with agents this year. Every local agent appointed by the Union is required to give bonds, thus not only guarding shippers against such losses as might occur from sending produce to irresponsible parties, but also securing them against the casualties to which the most honorable consignees are liable. In glancing through one of the contracts to be used this season, the following changes are to be noticed: That the remittances, which are to be made promptly, shall be accompanied by an itemized account of sales showing *in detail* in what manner and for what prices the shipments have been sold.

The agent is bound, within 24 hours of the receipt of each shipment, to notify by mail the person for whose benefit it was made of the receipt thereof, its condition, the prices at which like products are then selling, and, if any portion thereof has been sold, the portion so sold and the prices realized therefrom and the portion on hand.

The local agents at the East are precluded, so long as their contract remains in force, from handling any California fruits except as shipped through the Union; and are also responsible for the amount of all sales, taking their own risks regarding collections. Provisions are also made for selling by auction, and for terminating the contracts at the option of the Union.

Eastern shipments of cherries and apricots are now beginning.

Southern California.

NUMBER 2.

[Editorial Correspondence.]

There is no mistaking the fact that California, as an entire State, is just entering upon a new departure in its development and growth. Its advance from mining stimulus ceased many years ago, since which time, until within the past two years, business and population has been nearly at a standstill, or at best of very moderate growth. Mining has not failed to be an important industry, but it has ceased to draw, and agriculture has taken the lead. Our agricultural productions have gone far up beyond the hundred millions, and more than quintupled the output of gold and silver. But until quite recently wheat has formed almost the only product of the field which has attracted much attention abroad.

In process of time, however, the wheat market became more or less demoralized. Competition from India and South America began to be feared and felt. There was a noted falling off in the acreage yield. Extensive fields, costly machinery and large capital were required to reach success. Many farmers of small means were compelled, year after year, to mortgage their crops in advance to provide a living for their families and seed and cultivation for their fields. Dry seasons were sure to come once in three or four years, and all the little gains of the intervening years were swept away by a single year of drouth. Then again the large holdings of land-owners, their disinclination to divide up their holdings into small farms such as might be within the reach of newcomers with small means, and other untoward circumstances, had a tendency to discourage immigration. As a sequence, agriculture followed the course of mining, and in turn failed to draw.

A New Industrial Era.

But American energy can never be kept down so long as there is coal or water to turn a wheel, or an acre of ground untilled. California had practically reached and passed its climax in the production of precious metals and wheat, and there was need that some new and more profitable branch of industry should be sought out to give employment to idle hands already here and operate as an inducement for the tide of immigration to once more set in this direction. A few far-seeing people had in the meantime been giving their attention to fruit-growing as a more profitable pursuit than wheat-raising. Fine peaches and pears, apricots and plums, etc., began to make their appearance in the market in greater profusion than before, and, above all, the viticulturists began to make a fine showing of both fruit and wine. While this branch of fruit-growing was gradually being developed in the northern and central portions of the State, new life was also infused into the hitherto slow-going population of Southern California, in the line of producing citrus fruits. It was soon found that Southern California was capable of producing the finest oranges, lemons and olives in the world. Hundreds of thousands of orange trees were planted and the home market was soon overstocked.

Just at this time the overland railroad came to the assistance of the fruit-grower, and special rates were established under which fruits of every kind could be placed upon the Eastern market at a profit to the grower. A new and vast field of enterprise and industry now dawned upon California, which in time will far eclipse the product of the precious metals and wheat combined. Fruit-growing is, moreover, an industry in which the small grower can quite readily cope with his wealthier and more extensive producing neighbor. It, moreover, possesses a peculiar charm and interest, such as scarcely any other industry can equal. It will draw—it will attract immigration where scarcely anything else will. It is to this new feature in our industries that the California of to-day owes the boom which is now sweeping over the entire State from north to south, and which has created an excitement and feverish desire for emigration thither from the East, such as has not been seen before since the great gold excitement of '49 and '50. There is now a general waking up all over California. The press is everywhere writing up the special advantages of their several localities, and the people are talking. Immigrants and visitors

are pouring into the State by thousands. Our hotels are full and often to overflowing. More hotels have been built or have been put in progress of construction the past year than during any previous three years, and still there is call for more. All this means immense gains in prosperity, wealth, and population to the State. California seems to be fully alive to the great advantages of her position, and to the wealth of her resources. And yet, intelligent tourists from the East have repeatedly assured the writer, during the last few weeks, that we, as a people, do not even yet fully appreciate our opportunities, or realize the extent of the excitement which exists at the East in regard to the movement in this direction.

The City of Los Angeles.

This new influx into the Golden State made its first appearance at Los Angeles. It was there that the boom commenced, and probably no single locality in the State has been so much benefited. Nowhere else has there been such an advance in the price of land; nowhere else has there been such an increase in population or in growth of city or town. The population of Los Angeles in 1880 was about 10,000. Now in a little over seven years it has increased to over 40,000, and the increase is still going on as rapidly as at any previous time. How long this boom is to continue no one can tell. Certain it is, there is no present evidence of its cessation. There are many conditions that favor this rapid growth, all of which indicate permanent prosperity. Its railroad connections, already extensive, are being constantly augmented. One continental road has its terminus there, and a second makes it one of its chief terminal points. Short lines of rails are being pushed out in every direction, to bring in the wealth and business of the surrounding valleys. It will soon be in direct communication with San Diego, by a line along the coast. The Government is spending vast sums of money to perfect one of its harbors—San Pedro; while private enterprise is equally active and energetic in actually creating another at Ballona. The constant rush and haste, the coming and going of trains and making them up at the Southern Pacific railway depot, is something quite remarkable, and gives evidence of the transaction of a large amount of business. There is constant and direct steamship connection between San Pedro, the principal port of Los Angeles, and the entire Pacific Coast, and it is confidently expected that steam communication will soon be established with other countries. One of the representative men of Los Angeles, Walter T. Maxwell, will leave for Europe June 4th, to purchase a steel steamer with a capacity of 1800 tons, to meet the growing demand of Los Angeles for coal. Although crude petroleum has supplanted coal in all manufactures and for all steam-making there, the coal trade of the section, mainly to supply the interior demand, has become so enormous that it cannot be handled with the present facilities. The new steamer will ply from Port Moody, B. C., to Southern California ports. Huge coal-bunkers will be erected at San Pedro, Port Ballona and San Diego. The draft of the steamer will be only 15 feet, which will save lighterage at San Pedro, and will drop coal at $2 per ton here. After discharging coal here she will carry cargoes of fruit and other Southern California products to Port Moody for shipment over the Canadian Pacific.

The city has recently spread out enormously over all the surrounding country, a fact which has called into existence a most extensive system of street railways. Two cable roads are already in operation, and one electric motor, while ordinary one and two-horse cars are seen in every direction through the city and its environs. Probably no city in the Union, of its size, has such a thorough and well-equipped system of street railroads. In regard to

The Architectural Beauties of the City,

And the rapid advance which it is making in everything which pertains to the permanent growth of a large city, we have neither time nor space to do the subject justice. That work speaks for itself. Every work of that character, either in progress or being projected, is of a substantial character and is being planned and carried out with the best architectural and engineering skill. The environs for miles in every direction around the city, and especially its picturesque hights, are being crowded with large and elegant residences and villas, which bespeak both the wealth and taste of the owners.

With the advancement of the city of Los Angeles, the suburban towns and the rural districts in every direction are marching onward in growth and prosperity. Already some of the whilom towns and villages are taking on the semblance of cities. The wave of Eastern immigration and tourist travel appears to be constantly on the increase, and we are assured by those now here that the excitement at the East in regard to California is constantly increasing, and will continue to increase into the indefinite future.

Institutions of Learning.

Los Angeles is fast becoming noted for its institutions of learning. A branch of the State Normal School was established here in 1881, by an appropriation of $50,000, to which was added five acres of land, by the city, on a beautiful site worth fully $20,000, to which $10,000 have already been added in beautifying the grounds.

The University of Southern California, also located here, gives a full college course in all the leading departments of study, including law, medicine and theology. This university has four associate colleges, as follows: Chaffey College of Agriculture at Ontario; Maclay Theological Institute at San Fernando; College of Arts, Literature and Science at Escondido, San Diego county; and one is to be established in the form of a technological and industrial school at Colton.

There is also a college for young ladies established here, under the supervision of Rev. D. W. Hanna, one of the most gifted and able persons who could have charge of such an institution. Their commencement exercises for the beginning of the term 1886–7 represented a higher order of attainment than is usual among this class of colleges. They have a new and enlarged building, with modern improvements in the class and lecture-rooms, dormitories, gymnasium, etc. An uncommon degree of success no doubt awaits the future of this institution.

The public schools of the county are under a most excellent management. The total number of children under 17, according to the school census of 1886, was 26,653. Total enrollment, 12,616. Total valuation of school property, $545,509. There are 11 frame schoolhouses and 4 brick.

DESTITUTION IN TEXAS.—Within the past 40 days copious rainfalls have been reported, at three different dates, from those Texan districts which had been suffering from drought so many months. Although the stress of want had driven some of the inhabitants to giving up their homes and fleeing to the Pacific Coast, it is hoped that better times are dawning for the regions so long parched and afflicted. But the effects of such a protracted water-famine are not to be overcome in a hurry, and a recent dispatch from Austin says the Governor has just received a petition from 70 officials of Medina county, asking for a special session of the Legislature to provide for the suffering people in the central and southern portions of the State. The great mass of people are represented as having no money, no credit and no crop prospects. Many are living upon half rations of corn and tank-water, and in some precincts men, women and children are already in a famishing condition and will soon starve unless help is furnished.

FOR THE STATE FAIR.—The *Record-Union* says that George W. Hancock, of the State Board of Agriculture, is visiting various counties in the central portion of the State, urging competition at the next State Fair in the matter of county exhibits, for which premiums to the amount of $2500 have been offered.

AGRICULTURAL SHOW IN RUSSIA.—The U. S. Consul-General at St. Petersburg has informed the State Department that an agricultural exhibition will be held at Khaskoff, Russia, next October. Americans can compete in exhibits of horses, cattle, swine, poultry and agricultural implements and machinery.

THE old English mill, near Reno—put up many years ago, when the mining excitement in Washoe was at high tide—has just been sold, with all its belongings, and will be turned into a wool-scouring establishment. It seems probable, too, that a woolen-mill will shortly be erected on the premises.

Interior View of a Rose-House.

The growth of roses for sale as cut flowers is increasing in the city and in suburban towns. We have no such market as is found in the great Eastern cities. This is owing, first, to our small number of flower-buyers we have as compared with the East; second, to the ease and abundance with which the choicest blooms are produced here by amateurs, the result being that most of our citizens grow themselves their own decorative material. Notwithstanding these drawbacks to the commercial aspect of our flower industry, it is making due progress, and we have quite a number of florists' shops, and the demand upon their stock is making a market for a certain amount of material beyond that which they can grow themselves. It seems to us that one who can grow good flowers, and is content to begin in a small way and not run in debt for expensive buildings and accessories, may build up quite a satisfactory business in producing acceptable supplies for our florists.

We give on this page an engraving of a rose-house in Philadelphia which is devoted entirely to the growth of the new rose Puritan, which was illustrated in last week's RURAL, and the stock of which is now owned by the B. A. Elliot Co., of Pittsburg, Pa. We give the engraving especially to convey a hint of the way in which at least some prominent rose-growers construct their houses. It is, as seen, a very simple and inexpensive house; the grand conservatories are for the Government and for wealthy amateurs. The one who pursues flower-growing as an industry uses much simpler and cheaper construction and gets a house which is not so handsome, but is often much better suited to the demands of the plants.

INTERIOR OF ROSE HOUSE SHOWING PURITAN ROSE IN BLOOM.

Plant-houses in California may be even simpler and cheaper than at the East. We have no zero temperature to fight off; we have no freezing to disturb foundations nor snow-banks to contend with. The plant needs but little persuasion to make it believe that summer has come at any part of the year in California. We believe that even with the grand success of open-air floriculture in California, the flower-lover will be repaid for the little expense and effort which are required for conservatory work in this State. Then, too, as we have said, if the grower can easily get the flowers to the city in good condition, there is a chance of a moderate increase of pocket money as the reward for the time and outlay.

AGRICULTURAL EDUCATION. — Efforts for special education in agriculture are gaining ground in public esteem all over the world. We notice in a London exchange that the Lords of the Committee of Council on Education have directed that the title of the office of Lecturer in Agriculture held by Prof. Wrightson in the Normal School of Science and Royal School of Mines should be altered to that of Professor in Agriculture. This happily raises agriculture in respect of status among the other branches of education conducted under the Committee of Council on Education.

BUTTER, CHEESE AND MEATS GONE ABROAD. —The Bureau of Statistics states the total value of beef and pork products exported from the United States, for the 6 months ended April 30, 1887, at $41,342,856; in 1886, $37,841,791. Dairy products, for the 12 months ended April 30, 1887, $9,057,284; in 1886, $9,939,166. Cattle, for the 10 months ended April 30, 1887, $8,217,807; in 1886, $8,949,986. Hogs, for the 10 months ended April 30, 1887, $418,877; in 1886, $499,460.

THE VINEYARD.

Wine Colors, and Color-Wines.

At the late Viticultural Convention I exhibited a table of measurements of the color of a number of wines of the vintage of 1886, in order to emphasize the fact that California can produce wines with abundance of color, and that with proper attention to this point in the selection and proportioning of the varieties constituting a vineyard, the dealer need not even be exposed to the temptation of using artificial colors, unless for the purpose of "stretching" by the addition of water, etc. This table is reproduced below, with some additions which add weight to the evidence, and also allow of some generalizations regarding the depth and permanence of the tints belonging to the various classes of wine grapes, and the influence of locality and soil.

The "color at pressing" (column 1) can of course be given only for the wines made at the viticultural laboratory. Column 2 gives the color-intensities as observed on or about March 1st, in a number of wines sent in for examination, as well as in a number particularly of the deeper-tinted wines made at the viticultural laboratory. Column 3 gives the decrease of color that has occurred between the time of pressing and March 1st, *in per cents of the color originally observed;* while column 4 indicates the tint or shade of color last observed.

TABLE SHOWING INTENSITIES, SHADES AND PERMANENCE OF WINE COLORS.

No.	Variety.	Grower.	Place of Production.	1 Color at Pressing.	2 Color March 1.	3 Percent of Loss.	4 Present Tint.

*Wines made at the viticultural laboratory; §average of three analyses; †average of four analyses; ‡average of wines from grapes from Vina, Sacramento, Davisville and Patchen; p. r. means purple red; ¶University Experimental Plot.

In commenting upon the above figures it may be proper to restate their basis, as explained in the Report for 1886, pages 26 and 133. The standard of comparison is the French color-scale devised by Chevreul and adopted by the Government as well as by manufacturers in France. A portion of this color-scale, represented by 10 little silk discs, and including the tints of most red wines, forms the basis of comparison, the colors running from simple "purple red" through five numbered shades of the same to "red," and from this through numbered shades toward orange-red. The comparison is made by measuring the thickness of the column of wine that will make its color and intensity, viewed toward a white silk disc, exactly equal to that of one of the type discs; which thickness will, of course, be inversely proportional to the intensity of the wine's own color. A convenient numerical expression of these ratios is obtained by assuming the color-intensity corresponding to a wine-layer *fourtenths of a millimeter*, or the sixty-second part of an inch in thickness, as 100. On such a scale the colors of all ordinary wines can be readily expressed in percentages falling below 100; while a very few special color-wines will rise above, so that their colors have to be given in figures over 100, expressive of their extraordinary intensity.

It should be farther understood that on such a scale, the color-intensities of deep-tinted commercial wines will range between 20 and 30; ordinary red wines (*e. g.*, most Zinfandels) between 10 and 20; while any wine below 10 will be classed as "light red."

Taking 20 as a satisfactory figure for clarets intended to be used as table wines, and still showing a handsome tint when diluted with water, it will be seen that column 2 shows quite a number possessing many times that amount of color, while all but the Burgundy group range above 20, and could therefore be used to bring up the color of lighter, valley-grown wines, by blending. In nearly all these cases, the analysis as well as the tasting test shows that these same wines will also serve to complement the deficiencies of the last-named class of wines in other respects, especially as regards tannin and bouquet.

The most prominent color-wines shown in the table are, in the order of their intensity, the Petit Bouschet, Mondeuse, Sirah, Verdot, Merlot, and Cabernet Franc. Contrary to the general impression, the two samples of *Lenoir* do not show any extraordinary merit in this respect. The Livermore sample, it is true, gave quite a high reading at pressing, but lost nearly half of its color between that time and March 1st. The Fresno sample gave even less at the latter date. At the same time it will be noted that the tint of the Lenoir is altogether different from that of the Bordeaux varieties. At first a full red, it rapidly fades toward the orange-red as it deposits its color, and at this time the latter is almost identical with that of unadulterated "cherry-juice." But if the Lenoir possesses no special merit in the way of either kind or quality of color, it is difficult to see on what ground it should be preferred to a dozen other varieties here enumerated that give as much or more color of the right tint, fading much less, and unassociated with the peculiar flavor that always clashes more or less with the Bordeaux type at least; while it is not a heavier bearer, to say the least, than several of the noble Bordeaux vines have now proved to be.

The latter, it will be noted, all fall within the "purple-red" shades of color, which is also shared by the Teinturiers, as well as by the Jura and Piedmontese grapes; and of course this, and not a red or orange-red, is what is looked for in wines representing these types. Hence the Lenoir has not a proper place among them, upon that ground alone.

As shown on Table 6 of the Viticultural Report for 1886, the Pinots proper, including the Meunier, all run into shades of red; and the intensity of their tints is quite low relatively to the Bordeaux varieties, being somewhere between 10 and 15, which is only about one-third of the general average of the varieties shown in the above table. Among the latter, the "Crabb's Burgundy" holds quite a high place, both for the intensity and permanence of its *purple-red* tint; and this, with its habits in fruiting, may be considered as definitively removing it from among the group of "Burgundies," even in the widest signification of that much-abused term. On the other hand, the peculiar tint of the Robin Noir or "Pfeffer's Cabernet," as well as its relatively low intensity, would assign it a place near the Pinots, and shows that it needs to be blended with some one of the purple-red varieties in order to make its wine take a place among the Bordeaux type which it otherwise resembles.

The influence of locality upon the intensity of tints is very strikingly exemplified in a number of instances, but more particularly in the case of the wines from Doyle's level upland vineyard at Cupertino, and the same from McIver's hill land at Mission San Jose; also between the latter and Gallegos' level upland at the same place. In the cases of the Malbeck and Cabernet Franc, and especially in that of the Sirah, the color is markedly higher in McIver's wines than in Doyle's; but in the Verdot the color is the same from both places. As between Gallegos and McIver, the latter's Mondeuse exceeds Gallegos' nearly one to three, and in the case of the Merlot, five to three; but the Beclan from both is identical, and Gallegos' Zinfandel exceeds McIver's in color by eight points, on an average of four and three samples respectively. It thus appears that local superiority in color does not necessarily hold good for *all* varieties, however great the difference may be in some of them.

The most intensely colored wine of all thus far observed is McIver's Petit Bouschet, which has in effect the appearance of red ink, and exceeds by 92.5 per cent the deepest tint otherwise noted at the same date. This wine can be diluted with six times its bulk of water and still retain a deeper tint than the majority of Zinfandel wines in the market; alongside of it, cherry juice dwindles into insignificance, and can only hold its own on the score of its 19 and odd per cent of untaxed alcohol. At the last measurement, made April 18, this wine still held 124 out of the 154 of color observed March 1st.

It does not, of course, follow that this grape will carry the same, or any similar proportion of color elsewhere. No other sample of its wine of the same vintage has been received, and consequently no direct comparison can be made; but the remnant of wine from Natoma grapes of 1884, recently measured, shows but 13.0 of color, and was noted at the time as somewhat disappointing expectations in this regard. It is obvious that with respect to color, as well as other qualities, different localities will need to be specially tested, in order to determine the varieties that will yield a satisfactory outcome.

But whatever may be the experience of a given locality, it is certain that with wines such as these and a number of others in the table, noted for their abundant bearing, there can be no excuse for the use of either cherry juice or aniline dyes, under pretense of catering to the public demand for color. With due care on the part of vineyard-owners, and fair offers for color-wines on the part of wine-blenders, there need be no lack of color in California wines.

Permanence of Color.— While column 2, above, shows at a glance the highest degree of color existing at the time of last reading, column 3 is also very instructive in showing the relative degree of *permanence* in the several varieties. Here the smaller figures, of course, show the greater degree of permanence; and among them we find the Gamay Teinturier with a zero to its credit—meaning that from the time of pressing (September 30th) to March 1st, or during five months, it had lost no appreciable amount of color; that color being, moreover, quite double that of the common run of deep-tinted wines. Doyle's Teinturier, which at first showed 10 points more than the Gamay, had, on March 1st, fallen 4.4 points below it, losing 26 per cent; while Feely's Teinturier, starting with 75, in falling to 67.7 had lost only 10.0 per cent.

It here seems that locality had materially influenced not only the original depth of tint in the same variety, but also its permanency; both may, however, have been somewhat influenced by different degrees of maturity. Yet, in the two samples of Grossblaue, No. 516, the earlier sample, gathered barely ripe, and showing only 40.8 of color against 57.1 of the more mature sample No. 545, has maintained its color so much better than the latter that on March 1st it stood four points above it, thus indicating that the gain in color by greater maturity is not always maintained.

The full record of observations on the colors of 47 red wines made from different varieties of grapes at the University laboratory in 1886, is reserved for future publication. It is very evident, however, from the facts here shown, that so long as the public demand for deep-tinted wines continues, the detailed study of the behavior of each variety in this respect in different localities, under different treatment, and especially in different combinations or blends, will remain a matter of considerable pecuniary interest to growers.

E. W. HILGARD.

Berkeley, May 12, 1887.

SULPHURING VINES.—We receive too late to print an eight-page publication by the State Board of Viticultural Commissioners entitled "*Oidium* and the Use of Sulphur." It is a full discussion of sulphuring vines by John H. Wheeler, Chief Executive Viticultural Officer, and should be read by all vine-growers. Send to the office of the Commission, 204 Montgomery street, San Francisco, for a copy. It will be mailed free to applicants.

THE PACIFIC RURAL PRESS, published at San Francisco, is the most valuable agricultural paper of the United States. Although in its 33d volume, it seems not to have matured, as it is continually improving. Its conduct evinces the proper spirit for a paper; as it prospers financially, it improves, so as to extend a *quid pro quo* to its patrons.—*Clear Lake Press.*

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources of their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.

THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitor anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. A NEW FEATURE has been added to the Premium List this year, in the shape of awards for a Sheaf Display of Cereals. Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor. Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

General Agent for Pacific Coast,
120 FRONT ST., SAN FRANCISCO.

Jackson's "ACME" Stacker, Loader and Rakes.

The "Acme" stacks hay, grain or straw, or loads it on wagons, at about one-third usual cost. It takes the hay from the swath (or from the cock or windrow) and puts it on the stack without manual labor. It builds high and compact stacks, which turn the rain, and the rapidity with which a crop can be harvested insures its safety. Six men and ten horses put up 100 tons a day. They have been tried in every kind of hay and grain; are a success in reaped grain. They are the best for unloading header wagons with nets, for which purpose a net attachment is used. Improved and adapted to this Coast. Every improvement tested and every machin guaranteed.

The Rakes are the best in the world! they carry from 300 to 1300 pounds, and dump the load automatically. The driver's weight balances the load so it can be carried easily. The Stacker weighs 1700 lbs., costs $150; the Rakes weigh 650 lbs., costs $50 each. Net attachment to unload header bed weighs 640 lbs., costs $50; Nets, $6 each. Satisfaction guaranteed. Write me for circulars, free. I own for this Coast the original patents covering this plan of stacking. Beware of infringements. Address

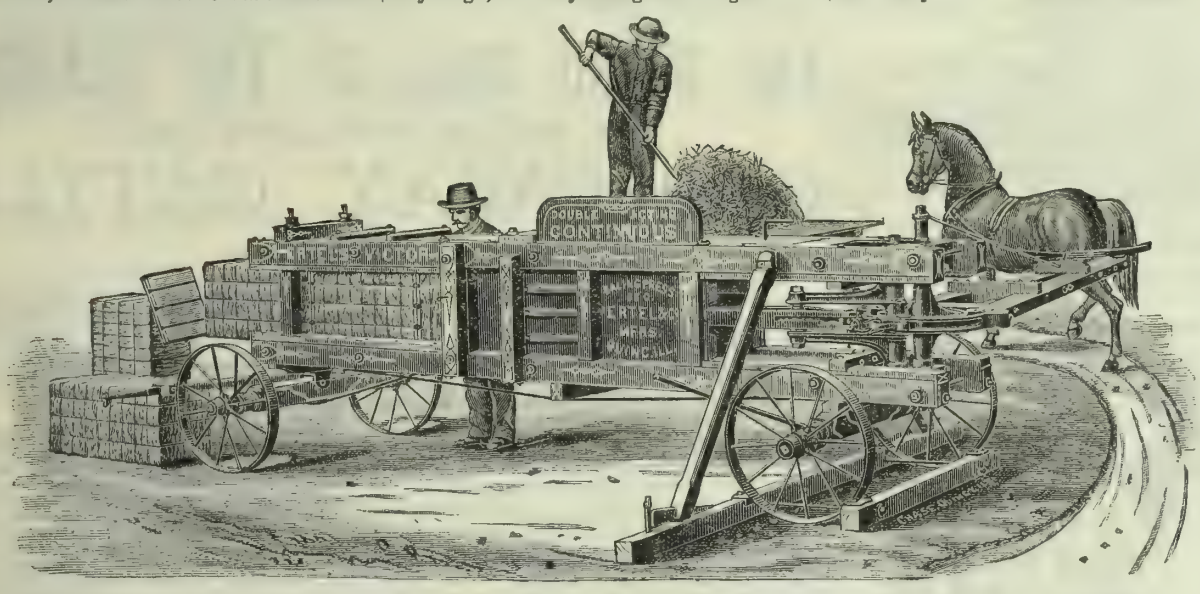
Ertel's Victor Hay Press.

We give on this page Geo. Ertel's latest achievement in hay presses, which he has properly named the Victor. The patents covering its design bear the recent dates of February 16, 1886, May 25, 1886, and September 28, 1886, and yet we are assured that the press has made a good record, and aside from its success at leading fairs in 1886, won good opinions by practical use in private hands last season. The speed of the introduction it has secured may be judged from the following, which we quote from a letter from the manufacturers:



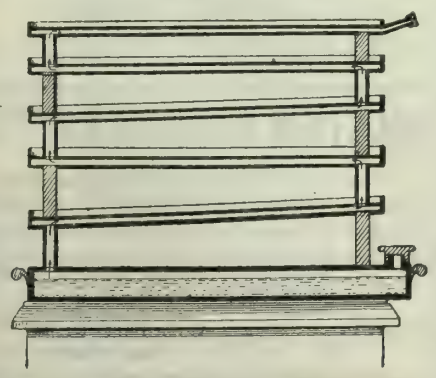
Mr. Sidney Stevens, of Odgen, Utah, having lately seen one in operation, came to our works to arrange for the selling of them, which was quickly effected, and he at once bought a carload. Bartram Robinson & Co., of Dallas, Texas, last season sold 24 of these presses, and write that this year they will sell no less than 50 Victors in their territory, the northern half of Texas. L. E. Parsons, of Cumings, Dakota Territory, has three of them in use for himself, and says he "would not invest in any other, the Victor being by far the best of them all."

No doubt a new design by a man so well known as George Ertel will command attention from California pressers. His new circular can be had by addressing George Ertel & Co., Quincy, Ill. We have not space to enter into a full description of the new press, but advise all interested to send for the circular. In connection with the engraving, however, we quote a few of the points of excellence claimed:

The Ertel Victor baling press is properly 15 feet long, mounted upon four wheels, either wood or metal, 30 inches in diameter with tire three inches wide. It is thoroughly braced and supported with truss rods running its entire length, and is built of three sizes, making bales 16x18, 16x20 and 16x22 inches, and of variable length to suit. The machine in its work is double-acting, or, in other words, a charge of hay or straw is fed into it at each turn of the horse or team which travels back and forth upon less than half a circle. It is continually discharging its bales as they are made and tied through its open bale chamber, all of which is done without stopping. Its compound power is most scientifically arranged and improved, no wood nor cogs, pulleys, belts, sheaves, chains or rope about it, simply three links are used connecting the power head to the pitman. The knuckle arms being of one piece, and both knuckle arms and power head having bearing surfaces upon separate shafts, and extending from lower to upper frame, thereby not only avoiding friction, but is also the strongest, most effective and durable power ever placed in a baling press without any exception. We use the extended pitman (patented to Geo. Ertel, and of which we are the sole owners), which, combined with the improved power head, gives the plunger a longer instroke, and fast travel in the start, while the pressing material in front of it is in a loose condition, and as the hay or other material becomes more dense or compact, the power increases proportionately until the pitman passes the center. By the compound lever power used in this press, the team has a leverage of 132 to 1, or, in other words, if the horse or team pulls 1000 pounds, a pressure of 132,000 pounds is placed upon the material being pressed when the pitman is drawn over the center, thereby insuring bales very compact and of great density.

Unlike any other reversible presses, the Victor is provided with a folder, automatically overlapping and folding down large or small charges of material most completely, thereby dispensing with all doors and attachments necessary to operate them, besides saving much time and hard labor in feeding it. The machine is fed with fork from top with perfect ease, or the operator can stand on a bale of hay with his body protruding through hole in table, arranged for that purpose, and thus feed the press by hand very successfully, without stooping or lifting the hay, a decided advantage in windy weather. It is also provided with diagonal openings across the bottom of feed-chamber box, allowing the seed, chaff, and dirt to fall through it while baling, in the most satisfactory manner, and is also further provided with an automatic yielding brake lever, most firmly receiving and holding the plunger at its extreme outward position when thrown back by the expansion of the material, not only preventing shock by rebound of plunger, but also enabling the operator to use the entire feed-hole in operating the machine.

The press-box in each Victor baling press is now lined on all four sides with iron or steel, fitted and fastened in a neat manner, which not only greatly reduces the draft on team, but is indispensable in baling wet or damp hay or straw (often used for paper-mill purposes), besides adds ten-fold to the lifetime of press.



THE VICTOR—NEW PERPETUAL, DOUBLE-ACTING PRESS, BY GEORGE ERTEL & CO., QUINCY, ILL.

A New Fruit Evaporator.

The evaporator of which we give a sectional diagram on this page is apparently a "new departure" from all previous inventions for curing or desiccating fruit and vegetables. It is claimed for it that it dries fruit in less than one-tenth of the time now occupied by many other driers, and that its cost is about one-fourth of those commonly in use. This evaporator was patented last spring, and was placed upon the market for the first time in the summer of 1886. The results, it is claimed, far exceeded the most sanguine wishes of the manufacturers, and it is reported that 12,000 machines were sold in a few months, and that orders are coming in for many more than could be furnished at so short notice.

To explain the diagram it may be said that water is in the lower pan or steam generator, and that the steam passes up the conducting tubes successively from one tray to another, each tray having a steam chamber, the bottoms being double. The steam heats the trays to 212°, and each one alike, but it cannot go beyond this, therefore it is impossible for the fruit to be burnt, which is liable to happen with most evaporators. This machine of six trays can be operated by placing it upon any cooking stove, or it can be extended indefinitely by building two light parallel brick walls, say 2½ feet high, and of any length, with a furnace at one end and a smokestack at the other. If necessary, the smokestack can be in the middle and a furnace at each end, for very large operations. These brick walls are covered with sheet iron supported by iron bars, upon which the evaporators are placed side by side, six trays high, the trays being six or eight inches apart. The whole should be built under a light shed.

The whole thing being open and the process so rapid, it is claimed that no discoloration can take place, the steam being at once dissipated in the air. It is claimed that apples can be perfectly cured in 1 hour, peaches in 1¼ hours; plums 1½ hours, etc.

Sectional View, "Common Sense Evaporator."

The hollow pans are so arranged that most of the steam is self-condensing, falling through the upright tubes into the generator, and at the feeder is a contrivance which is self-regulating, notifying the operator when more water is required by a continued whistle.

The "Common Sense Evaporator" seems to be a model of simplicity, and there will no doubt be a general disposition among fruit-growers to examine into its merits. As will be seen in our advertising columns, the sole proprietors and manufacturers for California are Messrs. Bachelder & Coates, of Napa. Mr. Bachelder is a gentleman of great experience, who has patented and introduced many machines for various purposes, which are now used all over the world, and Mr. Coates is well known as one of the charter members of the California State Horticultural Society, and one of its directors. It is the design of the firm to secure immediate introduction of the drier, so that its claims may be fully tested on this year's fruit crop.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours.

THE "OVERLAND" FOR MAY.—The *Overland Monthly* for May contains articles upon "The Mission of the Knights of Labor," by Irving M. Scott, treating of the various phases of the labor movement; "Causes of the Piute and Bannock War," by Maj.-Gen. O. O. Howard—the first of a series of Indian war papers; "The Mineral Resources of Southern California," by Henry De Groot, a treatise of the mines and mining interests of the southern half of the State; "Grandma Bascom's Story of San Jose in '49," by M. H. Field, a vivid and picturesque sketch of early times in the Santa Clara valley; "Agriculture along the Rio Grande," by O. E. Cromwell, an interesting article upon the capabilities of the central New Mexican valley. "In a Mining Kitchen," by "I. H. B.," is an interesting sketch of pioneer days; "Puntacooset Colony" and "Chata and Chinita" are continued; short stories, sketches, poems, reviews and a supplement upon Albuquerque and the region tributary thereto complete the number.

THE STANFORD UNIVERSITY.—The corner-stone of the Leland Stanford, Jr., University was laid at Palo Alto last Saturday. No formal invitations were issued, and the whole affair was conducted in a very quiet, unostentatious way. Beside Senator and Mrs. Stanford, 18 of the trustees, and about a dozen other gentlemen specially interested, there were ladies, school children and neighbors present to the number of 300 or 400. The ceremonies were simple and impressive. Dr. Stebbins offered a prayer; Judge Lorenzo Sawyer, President of the Board of Trustees, made a fitting dedicatory address; and Senator Stanford himself deposited in the foundation a copper box of documents relating to the endowment and establishment of the institution, and with hammer and trowel laid the corner-stone in place above it.

Our Agents.

THE COMMENCEMENT EXERCISES of Field Seminary, Oakland, Cal., were held in the First Congregational church, Friday evening, May 20th. The graduating class was as follows: Misses Emma E. Cable, Lily Cockrill, Katie L. Cornwell, A. Lizzie Henry, Bessie S. Meserve, Christine F. Rengstorff, Bertha L. Rickey, Anna M. Simpson, Mabel E. White. The graduating exercises of this seminary are always of interest. As one of the worthy educational institutions of the Pacific Coast we are glad to state that Field Seminary is now in a very flourishing condition, its pupils numbering over 90.

FREIGHT RATES AGREED UPON.—It was telegraphed from Chicago, Wednesday, that the following rates of freight were fixed: Wool, scoured—New York, $2; Chicago, $1.65; Missouri river, $1.40; St. Louis, $1.54. Hops, carload—Chicago, $1.95; St. Louis, $1.85; Missouri river, $1.75. Barley—Chicago, 75c.; St. Louis, 72; Missouri river, 65.

A Popular Stopping Place.

The Winchester house, an advertisement of which appears elsewhere, has, under the efficient management of its present proprietor, Col. John Pooley, fast forced its way into public favor. The house is strictly "temperate"—no liquor being sold on the premises. The proprietor claims to set the best table in the State for the price. The location is most central and could not be better. It is but a half block from the junction of Market, Kearny and Third streets, the three principal streets in the city. Hot and cold baths are free and a free laundry in the house for the use of families. The Winchester house coach is at the depot on the arrival of every train, and carries passengers free to the house. Col. Pooley is an old resident of this State, and well known throughout Nevada, Placer, Santa Clara and other counties of California; also at Virginia City, Pioche, Candelaria and Carson City, Nevada; also Tombstone, Arizona; being interested in mines previous to entering the hotel business some years ago.

Thoroughbreds by Auction.

Elsewhere will be found an advertisement giving particulars of a large auction sale of thoroughbred live stock to take place in a short time, Killip & Co. being the auctioneers.

THE *Russian River Flag* is no more, having been sold to and merged in the Healdsburg *Enterprise*.

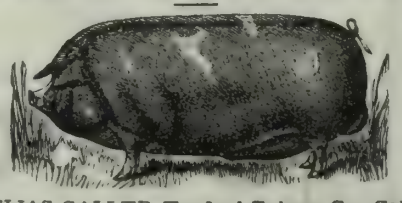
KENDALL'S SPAVIN CURE.



PHILADELPHIA, PA., March 18, 1885.

DR. B. J. KENDALL CO.—Gents: I had occasion to test your Kendall's Spavin Cure about a year since in the following manner. We had a horse which had been used by the Frankford and Southwark Fifth and Sixth Streets Philadelphia City Passenger R. R. Co., that developed a Ringbone, and after some months became so lame that we were compelled to put him away by selling, which we did to a party who took him to the country, and said party commenced a treatment of the horse with your Kendall's Spavin Cure which he followed up for the space of about three months with such results that at that time they put him to work, and a little later succeeded in entirely curing him, leaving the part perfectly smooth, which circumstance warrants me in saying that I have a great amount of confidence in your Kendall's Spavin Cure. Yours truly, GEORGE F. RICHER, Assistant Stable Foreman of Frankford and Southwark Fifth and Sixth Sts., Philadelphia City Passenger R. R.

Price $1 per bottle, or six bottles for $5. All Druggists have it or can get it for you, or it will be sent to any address on receipt of price by the proprietors, Dr. B. J. KENDALL CO., Enosburgh Falls, Vt.

SOLD BY ALL DRUGGISTS.

THE GRAND SALE OF THE SEASON!

OF IMPORTED AND NATIVE-BRED

GALLOWAY CATTLE

ON JUNE 10th and 11th,

At GEO. L. GOULDING & CO.'S City Stock Yards, Denver, Colorado.

LEONARD BROS., of Mt. Leonard, Mo.,

—AND—

BUSH & MORSE, OF WINDSOR FARM, DENVER, COL.

Will hold a joint public sale of **Imported and Native Bred Galloway Cattle.** The lot consists of 100 head of males and females of the choicest breeding and individuality, embracing selections from four different importations by the Leonards, who (it is a well-known fact) brought over only the best that money could buy and careful judgment select. Most of the cattle offered by Bush & Morse, of the Windsor Farm, are direct descendants of the stock imported by the Leonards, who, in breeding the same, combined some of the best strains of blood in their herd. It is once in a lifetime that such an opportunity is offered to the public of purchasing such a splendid lot of cattle, and the undersigned feel no hesitancy in endorsing what is claimed for them—"that they are the finest lot ever offered at public sale in the world." The fact that they were all imported or bred by the Leonards is sufficient guarantee that the stock is as represented—"the very best that can be found." Nearly all the young stock are by the famous sire, "British Nero," 1877, and the females are bred to that grand bull, "Borderer of Drumlanrig," 2628, whose cut appears above.

In the breeding are found such popular strains of blood as represented in the tribes of Drumlanrig Semiramis, Lady Satnley, Forest Queen, etc., embracing such famous sires as Black Prince of Drumlanrig Harden, Moss Trooper, Montague, Scottish Borderer, Pretender, Guardsman and others equally noted for their show-yard careers and the grand quality of their get

All necessary assistance will be furnished to buyers from a distance in loading and shipping their stock. Terms of sale, cash, or four months approved paper bearing 8 per cent interest. Catalogues furnished on application.

GEO. L. GOULDING & CO.

COL. S. A. SAWYER, Auctioneer.

NOTE.—During the sale there will be on exhibition some steers and bulls bred from Thoroughbred Galloway Bulls out of Shorthorn Cows. Cattlemen will be able to judge for themselves as to the result of the cross.

S. F. Market Report

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, May 18, 1887.

The past week has been cool, with a moist wind blowing over the greater part of California, gladdening the hearts of many farmers. Reports of frosts to the fruit crop were greatly exaggerated, indeed the damage is hardly perceptible. Wheat at the East and also in Europe has been advancing. To-day's cables from London are as follows:

LONDON, May 18.—Cargoes off coast, quiet; cargoes on passage and for shipment, quiet but steady; Cal. wheat off coast, 39s 3d; Cal. wheat just shipped, 40s to 41s bid for May-June shipment; Cal. wheat nearly due, 39s 6d; French country market, strong; Liverpool wheat, spot, rather more inquiry; Liverpool wheat, Cal. 7s 10½d to 8s 1½d.

Foreign Review.

LONDON, May 16.—The *Mark Lane Express*, in its review of the past week, says: English wheat is firm. The sales during the week were 47,527 quarters at 33s 6d, against 67,127 quarters at 31s 11d, during the corresponding period of last year. The wheat crops are making a fast and healthy growth. Foreign wheat is quiet; values are weaker under the belief that the Chicago "wheat corner" will collapse and throw immense consignments on the English markets for cash realizing. The English flour trade is nowhere. Some of the largest millers are closing out and becoming agents for American flour, because they cannot grind wheat at a profit under the law affecting American flour, and the English milling industry is threatened with extinction. Eleven cargoes of wheat arrived; 5 cargoes were withdrawn and 5 remained. At to-day's market wheat was quiet. Sellers asked 6d advance, but buyers rarely responded. Flour was steady. Corn was weaker. Egyptian brans were 6d cheaper. Barley and oats were steady.

Eastern Wheat Markets.

NEW YORK, May 15.—Wheat has ruled fairly active, and prices have advanced irregularly on manipulation, dry weather, unfavorable crop reports, stronger foreign markets, and a free export demand. Spot closed quiet, at ¼c higher for the week: May, 96½c; June, 96¼c; July, 95⅜c; August and September, 93c.

CHICAGO, May 14.—Only a fair business has been transacted in the wheat market during the week and prices were somewhat irregular. Operators have shown less disposition to trade, and outsiders were rather light. Speculative operators are rather distrustful of the market, and outsiders have heard so much of manipulation that they are afraid to risk trading to any great extent. A good many outsiders, too, who were interested in May futures, learned a lesson which they will not readily forget, and having been caught once will be disposed to trade cautiously for the present. June wheat closed at 87c.

NEW YORK, May 18.—12 M.—98c for cash; 96¾@96⅞c for May; 96½@96⅝c for June; 96½@96⅝c for July; and 92⅝@93⅛c for August.

CHICAGO, May 18.—12 M.—87c for cash; 87¼c for May; 88⅛@88¼c for June; 85½c for July; 83¼c for August; and 83¼@83⅜c for September.

California Fruit in Chicago.

CHICAGO, May 14.—Oranges are in liberal supply, and the market is rather easy. Choice fruit has fair sale, while the ordinary lines are slow. California fruit: Bright Riverside, $3@4; San Bernardino, $3@4; Santa Ana, $2.90@3 25; St. Michael, paper rind, $3@3.50; Orange, $2.50@2.75; Los Angeles, $2.50@2.75; Navel oranges, according to quality, $3@4.50; San Gabriel, $2.50@3; blood oranges, fancy, $4@6; culls, $2. Lemons are easy at $3@4 ₱ box.

Fine California cherries were moderate, the sale being at $4 for 10-lb boxes of black ox-hearts, and at $4@4.50 for white sweet. Only fancy fruit-dealers care for cherries yet.

In the dried fruit market a steady, firm feeling prevails. The demand for apples, which is fair, is at the same time confined mainly to choice stock. Peaches remain quiet on account of there being no new fruit offered, and the old stock is not cared for. Of California dried fruit there are no stocks left, except a few plums and some raisins. Prices rule steady as follows: Plums, pitted, ₱ lb, 11@12c; Raisins, London layers, 20-lb boxes, ₱ box, $1.40@1.50; loose, Muscatel, ₱ box, $1.20@1.30; California layers, ₱ box, $1.25@1.35.

California Products at New York.

NEW YORK, May 15.—Beans are moderately active, the limited receipts strengthening prices. California Lima, $1.80.

Fresh Fruits—Choice California cherries cost $1 a box; tangerines bring 75 cents a dozen.

California honey quiet but firm, at 5½@6c.

Seeds—California mustard is in demand. Sales are reported of 600 bags of yellow at 4¼c, and 300 brown at 4½c. Yellow is quoted at 4¼@4½c; brown, 4½@5½c.

New York Hop Market.

NEW YORK, May 15.—In 1886 hops there was a fair trade. Quite a number of moderate orders have been on hand. Buying displays no particular vigor, however, and indicates nothing more than ordinary purchases by brewers, or for filling contracts. Still there is enough to hold prices steady on fine quality 1886 goods. Domestic or foreign, 16c to 18c cash and 18c to 20c on time, brewers' trade being general. Old hops have very little call.

Dried Fruit and Canned Goods East.

NEW YORK, May 15.—Canned—Tomatoes are showing rather less strength, as supplies are offered quite freely in lots to suit at $1.05. Lima beans are very scarce and firm. Corn is wanted, but nothing is offered under $1.10. Peas are dull and plentiful and prices favor buyers. The demand for California canned fruits is improving somewhat; supplies are limited, and full prices are demanded. Peaches, $2.50@2.75; pears, $2.50@3.25; plums and grapes, $1.75@2; apricots, $2@2.25.

Dried Fruit—Raisins are in better demand and prices are steady. Two-crown loose Muscatel, California, $1.25@1.35. Three-crown loose Muscatel, California, $1.50@1.70. California London layers, $1.50@1.75. Prunes—Turkish are moving out fairly well, most sales being at 3⅜c, but in instances 3¼c cash has been accepted. Bohemian is less inquired for, but nothing is offering under former prices. French, quiet at 6½@7c. Currants—Good jobbing demand at 5c. Citron neglected; Leghorn quoted at 16¾@17c.

Eastern Wool Markets.

BOSTON, May 17.—Wool is quiet but steady. Ohio and Pennsylvania extra fleeces, 32c; do XX, 33c; do XX and above, 34c; Michigan extra, 30c. Other grades are unchanged.

NEW YORK, May 15.—The wool market seems settled down to small business transactions, as no encouragement comes from the cloth manufacturers. Interest reported dull in fine grades, but the values of other descriptions are steadily held and comparatively high prices are asked. The stocks of medium and coarse wool are not large, and the industries consuming these are generally prosperous. The sales of a week included 22,000 lbs spring California at 20c; 18,000 do at 18@20c; 15,000 Eastern Oregon at 21c; 30,000 Montana at 29@30c; 35,000 Oregon on private terms; 25,000 Montana do; 75,000 Territory do. Northern California spring quoted at 20@25c; fall, 14@17c; Southern California spring 14@18c; do fall 11@12c; Colorado and New Mexico 14@22c.

In the Philadelphia markets the business last week was small. Manufacturers complain of current prices and buy only for urgent demand. Dealers are cautious in buying new wool, believing that the high opening figures will not be sustained later on. Among the sales were 1500 lbs Montana fine at 22c; 2000 lbs Montana fine medium at 25c; 13,000 lbs Montana fine medium at 26c; 3000 lbs Territory medium at 22c.

NEW YORK, May 17.—Wool is quiet. Domestic fleece, 30@37c ₱ lb; pulled, 14@34c; Texas, 9@24c.

Local Markets.

BAGS—The demand is fair, with sales made in a small way at 5½@5¾ for standard size Calcutta.

BARLEY—The market has ruled steady throughout the week. Dealings in options on Call have been fairly active, with slight fluctuations reported. Today's sales are as follows:

Morning Session: Buyer season—400 tons, $1.10¾; 100, $1.10¾. Buyer 1887—200 tons, $1.25½; 100, $1.25¾; 100, $1.25; 600, $1.24¾; 100, $1.24½; 300, $1.24¾; 100, $1.24⅞. Seller 1887—100 tons, $1.10¾; 500, $1.10; 100, $1.09⅞; 200, $1.09⅝; 900, $1.09½; 500, $1.09⅜; 1100, $1.09¼; 100, $1.09⅛ ₱ ctl. Afternoon Session: Buyer season—500 tons, $1.10¾. Buyer 1887—400 tons, $1.24⅜; 200, $1.24¼. Seller 1887—600 tons, $1.09¾; 100, $1.09⅛; 1100, $1.09; 300, $1.08¾ ₱ ctl.

BUTTER—Continued packing with a good trade demand cause a higher market. Pickled butter has made quite an advance during the week. Receipts are free but not fully up to requirements.

CHEESE—The market is weaker but not quotable lower. Lower overland freights work against the market.

EGGS—Heavy receipts of Eastern have created a still demoralized feeling. The market closed fairly steady even for gilt-edged.

FLOUR—Several mills have shut down owing to light supplies of wheat. The market is strong.

WHEAT—Transactions on Call the past week were fairly active, with fluctuations light. Today's sales are as follows:

Morning Session: August—200 tons, $1.82. September and October—100 tons, $1.80. Seller 1887—100 tons, $1. 79¾; 100, $1.79⅜; 300, $1.79¾; 1300, $1.79⅜; 1100, $1.80. Buyer 1887—200 tons, $2.04⅞; 200, $2.04¾ ₱ ctl. Afternoon Session: Buyer season—100 tons, $1.81½. Buyer 1887—500 tons, $2.04¼; 200, $2.04⅛; 400, $2.04. Seller 1887—200 tons, $1.79¾; 400, $1.79⅝ ₱ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

Crop advices are fairly favorable from Great Britain, France, and Germany, but in the United States they are, taken as a whole, below an average at this season of the year. It now looks as if the crop in this country will be over 50,000,000 bushels short of last year's, which, taken in connection with India's short crop, and the low average stocks throughout Europe, will make itself felt in the markets of the world later on in the coming season. On this coast our Oregon and Washington Territory advices continue favorable, with harvesting expected to commence east of the Cascades toward the last of next month. In this State our advices are of a more favorable character, owing to cool, moist winds drawing moisture up to the roots of the plant.

The market the past week for wheat has been inactive, owing to the very limited obtainable supply outside of the syndicate's holdings. Several ships were taken last week to load wheat for U. K. These vessels are reported to be loading for account of the syndicate. Several mills have shut down, owing to their not being able to compete in selling flour with mills that purchased wheat at lower prices than now current.

Barley ruled fairly steady, with a strong tone throughout the week. The supply in sight is reported to be well concentrated, which necessitates consumers to bid up so as to have their wants met. It is now claimed by well-informed parties that the coming crop will not be much if any over 375,000 tons, against a crop of 530,000 tons last year. Brewing barley is scarce and commands high prices. A vessel is loading feed-barley for Valparaiso.

Oats ruled strong up to Monday, when a weaker feeling was manifested, due to the lower overland freights allowing shipments of Eastern oats to this market. The consumption is light, owing to the high prices ruling.

Rye is in light supply, with the market strong at full quotations.

Buckwheat is weak and in buyers' favor.

Choice grades of white corn are in request at a slight advance. Other grades are barely steady.

From our leading European exchanges we condense the following general information: Wheat on passage for United Kingdom May 4, 1887, equaled 15,360,000 bushels, against 16,400,000 bushels May 5, 1886, and 25,800,000 bushels May 6, 1885. Stocks and reserves of wheat and flour throughout Europe are smaller than at any time in four years, and in the United Kingdom are less now than the average of stocks taken for six years on July 1 and December 31. The United Kingdom, May 1 to August 31, 1887, will require to purchase in and ship from all foreign countries, in time to arrive out by August 31, 1887, about 50,000,000 bushels of wheat, including flour; France will require, April 15 to August 31, 1887 (Paris advices), a minimum of 22,000,000, perhaps 34,000,000 bushels; Belgium, Holland, Germany, Switzerland, Italy, Greece, Spain, and Portugal, will have also to supplement their own wheat crop with importations. The United States, United Kingdom, France, Russia, British India, Australasia and Austro-Hungary in 1884 produced 1,645,297,403 bushels of wheat; in 1885, 1,953,055,857 bushels of wheat, and 1886, 1,453,647,323 bushels of wheat, or 192,241,546 bushels less in 1885 than in 1884, and 191,650,080 bushels less in 1886 than in 1884. In the two years, 1885 and 1886, therefore, there was a diminished production of 382,891,626 bushels. Exports of wheat from Russia are expected to be small from May to September in 1887. Holding price of wheat at St. Petersburg is too high for shipment to the United Kingdom. Russian exports from southeast Europe go mainly to Mediterranean ports. Total Russian exports in calendar years have been, in 1883, 85,200,000 bushels vs. 69 432,000 bushels in 1884, 94,530,000 bushels in 1885, and 53,790,000 bushels in 1886. The Austro-Hungarian net exports of wheat and wheat flour in the six months ended January 31, 1887, equaled 6,388,745 bushels, against 6,680,047 bushels the corresponding period of 1885-86. British Indian wheat crop, 1887, is deficient, and the exports thence from January 1 to April 16, 1887, have been 2,068,000 bushels less than for corresponding period in 1886. India in 1886 (calendar year) exported to Europe 43,160,000 bushels of wheat, of which the continent took about 54 per cent. This year India may possibly export 25,000,000 to 28,000,000 bushels in her crop season, of which more than 50 per cent will go to the continent of Europe. The Australasian wheat crop is also deficient, and Europe may perhaps obtain, in 1887, entire, from that source 5,600,000 to 6,000,000 bushels.

Fruits.

Oranges and lemons appear demoralized under free supplies and heavy receipts of other fruits. From up north there is still a good demand.

Cherries continue to shade off daily under increasing receipts. The crop will be as large as last year, owing to more bearing trees this year.

Gooseberries are slow at the low prices.

Strawberries are coming in more freely, but their prices keep well up, which does not allow canners to buy.

The stock of dried fruits is very light. Advices received indicate that the quantity to be dried this year will be all of twice as many as there were dried last year. One man in Santa Clara county has purchased the products of quite a number of orchards to dry the fruits. At Los Gatos he paid 1½c ₱ lb on the tree for apricots, prunes and plums. Fully one-quarter of the orchards of the State is said to be sold to canners and driers. Prunes and plums are now held higher, but at the advance no one will buy.

Private advices indicate a very much larger grape crop than last year.

Raisins continue to rule strong for choice, which are scarce.

Robinson Bros., of Vacaville, sent the first Royal Ann cherries to this market, and Antonio Roger, of San Antonio, the first currants.

Live-Stock.

Bullocks continue to press the market, and consequently slaughterers dictate prices. The consumption is light, owing to more fruits being consumed. Mutton sheep are fairly steady at quotations. Calves are steadier. Hogs, except for the block, are slow. In horses there is a continued fair trading. Quite a large number of medium sized are being taken for railroad building. The inquiry for general utility horses continues good, with sales made as high as $750 ₱ span. Carriage teams, well mated, sell well, fetching from $500 to $1000 ₱ span.

The following are the wholesale rates of slaughterers to butchers:

BEEF — Extra, 8c; first grade, grass fed, 7@7½c per lb.; second grade, 6¾@—c; third grade, 6c.

MUTTON—Ewes, 6c; wethers, 7c.

LAMB—Spring, 9@10c.

VEAL—Large, 6@8½c; small, 6@8c.

PORK—Live hogs, 4¾@5c for heavy and medium; hard dressed, 7½@8¼c per lb; light, 4½@5c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Feedstuff.

Bran is lower and easy at the decline. Middlings are barely steady. Ground barley and other ground feed are steady, with a fair trade calling ruling.

New hay is coming in slowly, due probably to farmers believing that better prices will rule later on, owing to the light crop. Choice old hay is still wanted. The consumption continues large.

Vegetables.

New potatoes continue to come in freely, and as the quality is improving they are fast taking the place of old both for shipping and local use. The market is weak. Old are lower and weak under liberal supplies and lessened demand.

Onions, if choice hard old, sell readily at good prices, but other qualities are slow. New onions are improving in quality, but buyers bid down.

Green peas continue to be taken by canners at low prices. They clean the market up at about 65c ₱ 100 lbs. Tomatoes are coming in more freely, but prices are still steady. Asparagus continues to rule strong. Summer squash is in light supply. Cabbages and cauliflowers are in free receipt, but sell readily.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	246,832	240,870
In port, disengaged	110,039	32,403
In port, engaged	11,208	23,432
Totals	368,079	296,705

The above gives a carrying capacity as follows: 1887, 588,926 short tons; 1886, 474,728 short tons; increase over last year, 114,198.

Turkeys are weak and lower, as are ducks and geese. But choice hens, roosters and broilers are strong.

Honey continues scarce and high.

Wool continues to move off freely. Some choice clips were sold at over 23c ₱ lb, the past week.

Hops are firmly held, owing to light supplies.

San Francisco, May 18, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

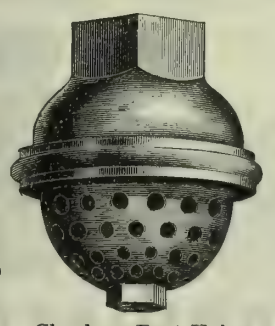
DEEP WELL PUMP

Standard, Cylinder and Footvalve!

NOTICE.



To make these Standards pump, it requires a cylinder, pipe, rod and coupling. These Standards have no valves in them; the valves are in the cylinder. Parties desiring pumps fitted up complete, with pipe, cylinder, etc., all ready to place in position, will please give full particulars as to kind of pipe (black or galvanized iron) required; depth of well; depth of water in dry times; diameter of well; amount of water required; whether for hand or windmill; we will fit the pump so that everything will go together in perfect shape, and at bedrock prices. Write for prices. Descriptive Circular and Illustrated Catalogue mailed free (postpaid) upon application.

We are making a specialty of Pumps, and carry in stock a full assortment of styles specially adapted to the Pacific Coast.

Cylinder.

Check or Foot Valve.

Fig. 407—Force Pump Standard.
Three outlets; for hand or windmill; flanged base.

EXAMINE our PRICE LIST carefully, and DISCOUNTS, before buying elsewhere.

Special Announcement.—Our Pumps are for sale by all Windmill Manufacturers, Agents and Dealers, Agricultural Implement Dealers, Hardware Dealers, Stove and Tinware Dealers, Plumbers, etc., etc., on the Pacific Coast. If you cannot find our Pumps at your dealer's, write for Catalogue and prices.

Who Has DUPLICATED Our Cut and Tried to IMITATE Our PUMP?

GOULD'S SPRAY PUMP, WITH BAMBOO EXTENSION AND SPRAY NOZZLES COMPLETE.

Each Pump is fitted with our latest improved Metallic Valves, dispensing with all leather and rubber, as used heretofore, making the valves perfect in every respect. This Pump we have got up expressly for spraying vines, fruit trees and other shrubbery infested with the destructive insects which inflict so much injury in orchards, vineyards, etc. It has been adopted and recommended by the State Horticultural Society. The working parts are constructed entirely of Brass, and will not be affected by the corrosive solutions used in them. THE BAMBOO EXTENSION is an admirable invention. The operator of the Pump, by the use of this extension, can get to all parts of the tree while on the ground; also saving himself from getting his hands and face burnt from the solution. Our SPRAY NOZZLES will save their price within a day, as the amount of liquid saved is two-thirds over any other style in use. It throws a very fine mist.

We are sole agents for the IMPERIAL, SAN JOSE, and CYCLONE NOZZLES. Price, each, $1.00. Bamboo Extension, $3.00.

OUR CHALLENGE SPRAY HOSE.—We are now manufacturing a very superior Spray Hose that will resist the powerful solutions that are generally used for spraying purposes. Have something now that will give the best of satisfaction. EACH FOOT GUARANTEED. Not genuine unless word Challenge is stamped on hose.

We make a specialty of these goods, and are prepared to put you in nothing but first-class articles. Send for special prices and circulars before purchasing elsewhere.

THE

Common Sense Evaporator

(Of NEWARK, OHIO).

Where known Drives all other Fruit-Driers out of the Market.

Patented 1886.

12,000 ALREADY SOLD,

And orders for 34,000 more. Perfection of simplicity, cheapness and rapidity of work. **Thirteen Dollars will Buy a Machine** that will do better work and more of it than any $50 Evaporator ever offered for sale, and in like proportion to an indefinite capacity.

Remember this is an Entirely New Departure,

Which completely revolutionizes the dried fruit industry. All fruits perfectly cured in from one to two hours, and with

No Possibility of Burning and No Need for Sulphuring.

It may seem incredible, but it is a fact. For circular and full particulars, address

DISBROW M'FG CO., Rochester, N. Y.

DEATH TO MILDEW!

And Insects that prey upon Grapevines and Plants of all kinds.

In Hamilton's Pest Exterminator we are enabled to offer to the public the most valuable and useful article ever discovered for the effectual annihilation of mildew and pests of every kind, that infest our vines and plants. This valuable compound, whose merit has been fully established, is used in a Fumigator as represented in the cut, and is therefore easy of application, and does its work thoroughly.

It Leaves No Noxious Vapors.
It Cleans the Vines or Plants.
It Destroys all Pests and Parasites.

It leaves the plant in perfect health, thus largely increasing the yield of fruit. One trial will convince the most skeptical of its merits. Orders promptly attended to.

Price $5. Patent applied for.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOEBIG—Dear Sir: I have analyzed your sample of **"Nitrogenous Superphosphate,"** with the following result:

Soluble Phosphoric Acid	12.90 per cent
Reverted Phosphoric Acid	.95 "
Insoluble Phosphoric Acid	2.83 "
Potash	2.23 "
Ammonia	1.87 "
Nitric Acid	2.95 "

The above amount of **Nitric Acid** is equal to 0.85 per cent **Ammonia**, therefore, total of Nitrogen calculated as **Ammonia**, 2.72 per cent.

This **Fertilizer** is a **Valuable Manure** for vineyards, orchards, gardens, farms, and I **recommend** its use by the cultivators of the soil **generally**, in **California.** Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

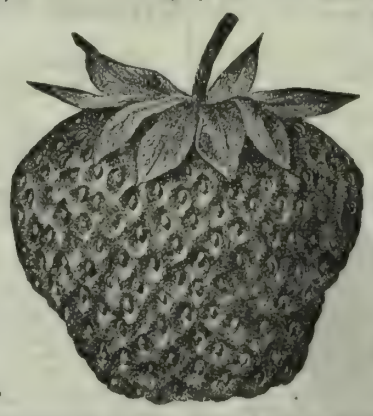
BERKELEY, Nov. 20, 1886.

DR. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the **"Nitrogenous Superphosphate"** Fertilizer, analyzed by him at your request. It is a **high-grade article**, and as such returns the user a better money value than a low-grade fertilizer. It is **especially well** adapted to use in **California**, on account of the **predominance** in it of **Phosphoric Acid**, which is generally in small supply in our soils. Yet it is desirable that **"complete"** fertilizers be used in our orchards and vineyards, and **yours is of that character** in furnishing Potash and Nitrogen as well. Very respectfully, E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of **Phosphoric Acid**—the chief element of all plant food—in combination with the necessary quantities of **Potash** and **Ammonia**, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from ½ pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,



On board cars at Sobranto, Station of the C. P. R. R., 20 miles north of San Francisco, at $30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

COME LOOK AT THIS!

The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

Fruit Engravings, The finest, best and cheapest Photographs and Engravings of Fruits, Vegetables, Houses, Farms, Landscapes, etc., made by S. F. PHOTOENGRAVING CO., 659 Clay St., S. F.

FRESNO COUNTY.

BRIGGS' SELMA TRACT.

This most desirable tract, comprising 1280 acres of first-class gray ash and sandy loam land (situated one and one-half miles from the fast-growing town of Selma, the second in the county, and two miles from Fowler, both being S. P. R. R. towns), has been subdivided and will be sold in 20, 40, 60 or 80-acre farms. The distributing ditches are now constructed, and convenient roads are laid off. The main canal is 60 feet in the bottom.

THE WATER RIGHTS

Consist of stock in the canals and entitle the owner to one-eighth of 2 feet 6 inches of water, to 20 acres, being 2½ times the usual amount supplied for colonies. The owner of the water stock has a pro rata vote in the management of the canal, and the expense per year is $3.75 on a 20-acre lot.

A school-house is to be erected on the land this year, and it has two within two miles of it at present. Fresno, Selma, Fowler and Kingsburg are good local markets for produce. Opportunities to labor with or without teams are abundant, and land can be rented for wheat-growing in the neighborhood. The health of this region is perfection, and, in common with the plains generally, is an excellent sanitarium for persons affected with pulmonary and rheumatic complaints.

The best raisins in the world, wines unsurpassed, the finest grapes, the best peaches, apricots, plums, prunes, nectarines, figs and olives, and in fact all the choicest fruits and vegetables of the world are grown in this favored region. Raisin vines three to six years old yield per acre from four to seven tons, and increase to eleven. Wine grapes three to six years old yield from four to eleven tons per acre. Alfalfa is cut from four to six times a year, and yields from one to two tons per acre at each cutting.

Two good cows and 100 hens furnish more than half the living for a family, and can be kept, with a team, on three acres of alfalfa, the growth of which is incredible in this favorable combination of soil and climate.

A comfortable house for a small family can be built for $150.

The low price, taking into consideration water and transport facilities, should especially recommend this to seekers of homesteads. One-half already sold. The cheapest Colony land in the county, on very easy terms to actual settlers.

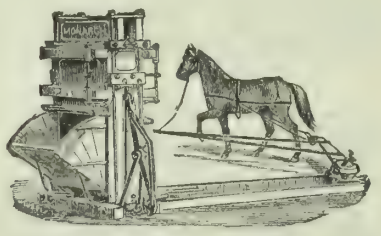
HAY PRESSES.

THE HURRICANE,
A Mounted Double-Ender Baling Machine, capable of baling 40 tons per day.



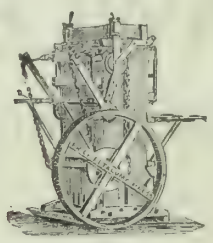
ITS RECORD

For the first year of its existence is as follows: **Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.**

Two sizes: Compressed bales and common bales. **Improved this year so that it is nearly one-quarter faster than before, and the back-and-forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.**

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., **$1000.**

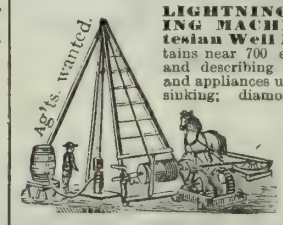


THE JUNIOR MONARCH
Does its own Tramping. Feeds at Side, near the Bottom.

HAS THE FOLLOWING RECORD:

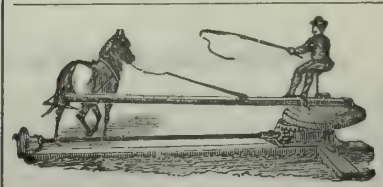
33 tons in one day; 105 tons in 3½ days; 20 tons, and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., **$500.**



—THE—
Genuine Price Petaluma,
With Latest Improvements.

Made under the supervision of the inventor, JACOB PRICE. Too well known to need further description. First-class material and workmanship Capacity, from 10 to 18 tons per day. Hay must be tramped in press.



Price, at factory, San Leandro, Cal., **$350.**

☞Send for large illustrated Catalogue of above presses. **Office and Factory, SAN LEANDRO, CAL.** Address

THE LATEST

IMPROVED RANDOLPH HEADER

IT HAS THE LIGHTEST DRAFT! IT HAS THE BEST ELEVATION!
IT IS SIMPLE IN CONSTRUCTION! IT IS THE MOST DURABLE!

In the "Improved" Randolph Header for 1887, manufactured expressly to suit California farmers, we will offer a PERFECT HEADER, second to none on the Coast.

NOTE THE FOLLOWING POINTS:

Simplicity of Construction.—It is the most simple in its gearing of any Header on the Coast, consequently it is less likely to get out of order.

Superior Elevation.—The Spout is thoroughly ironed off, and is extra long. Having two Drapers in it, the grain passing between them makes the elevation positive at any desired angle, **and entirely prevents the wind blowing grain away** as it is being elevated, as is the case with all other machines. Every farmer will recognize that this is a point of superiority, and a real grain-saving device, which in quite windy weather will save enough grain each day to pay for running the machine. **Lightest, Easiest Handled and Most Economical Header ever sold on this Coast.**

THE RANDOLPH HEADER IN SOUTHERN CALIFORNIA.

SAN BERNARDINO, CAL.

MESSRS. TRUMAN, ISHAM & HOOKER, San Francisco—Gentlemen: Our 12-foot "Randolph Header" which we purchased of you last season, worked alongside of the Hodges-Haines, they using 6 horses, while we only used 4 small horses, we averaged 28 acres per day, they averaging 23, and it was on very rough, hilly ground. I think the Randolph the lightest running, and the best for lodged or broken down grain on the Coast; you can cut almost as close to the ground with it as you can with a mowing machine. We calculate to cut all our hay this year with it. You will thus see that the "Randolph Header" will pay for itself in one season over any other Header on the Coast.

Yours very truly, FRANK MOIR.

Send for prices and further description. Do not purchase elsewhere until you have examined this machine thoroughly. It is the cheapest Header in the market.

THE McCORMICK

—IMPROVED—

NEW STEEL HARVESTER & BINDER

WITH SQUARE PIPE FRAME.

A SUPERB MACHINE! A COMBINATION OF IMPROVEMENTS OF RARE EXCELLENCE FOUND ONLY IN THE McCORMICK.

THE LATEST NOVELTY.

The improvements are so numerous and so important on the McCormick Harvester and Binder for the coming season that we find it difficult to condense a description of them in reasonable bounds. We want to assure our friends that the McCormick can be implicitly depended on not to introduce any new feature of improvement without first testing it in the harvest field so thoroughly that no shadow of doubt remains as to its real and positive worth. This is one of the characteristics of the McCormick that has caused it to be so much relied on in every emergency.

IMPROVEMENTS.

The Main Frame is made of two-inch square pipe, a form that secures the greatest strength from a given amount of metal. This frame is strengthened at the corners by malleable iron joint plates, abundantly securing it against any tendency to twist out of true, a weakness so common to frames made of round pipe or angle iron, and which accounts for many of their defects.

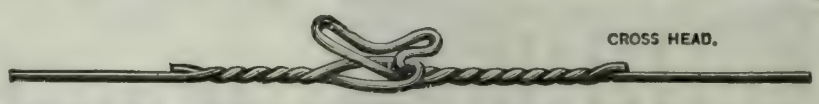
HAWLEY BROS. HARDWARE CO.

—AGENTS FOR—



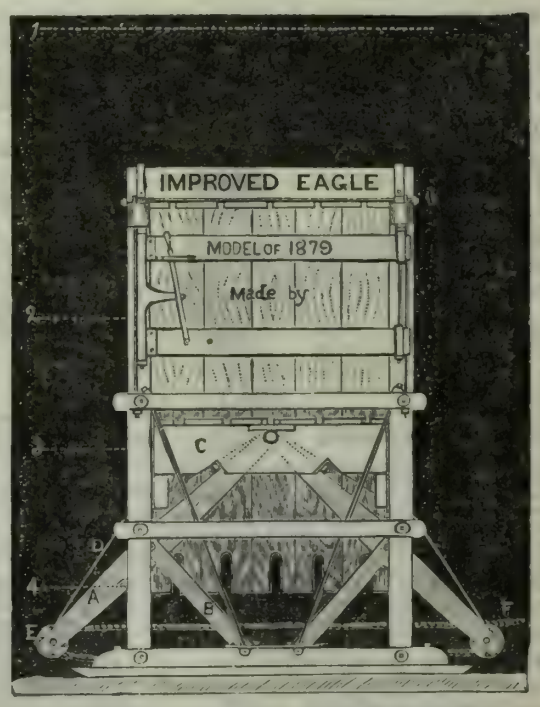
DEDERICK'S TOP-FEED REVERSIBLE LEVER PERPETUAL PRESS.

Price of Reversible Power Perpetual Press (17x22, Variable Length, Mounted on Truck, Weight, 4700 pounds) $450.

These Presses may be operated by either one or two horses, and they press two sections to each half turn and reverse of the horse, which is twice as fast as any other Press, operating half-turn and reverse. The power is reversed by the reaction of the pressed material, hence the movement of the horse either way presses a section of a bale.

Washburn & Moen M'f'g Co.'s Patent Steel Wire Baling Ties.

Comparative Cost of Coil Wire and Prepared Bale Ties—Experience will teach that the same number of tons of Hay can be more safely secured and at less cost by our prepared Ties than by the use of coil wire. In the use of coil wire, one or two sizes larger is required, and then the wire is not reliable at the fastening; add to this the bother and loss of time in its use, the loss of wire, cost of re-pressing and loss of Hay in transit and in the market by reason of broken bales, and we are certain wire cannot be economically used.



Why waste time making Ties in the field, when you can buy them ready made almost as cheap as the wire in the coil? We have on hand a large quantity of Steel Bale Ties, ready for immediate delivery, of the following sizes:

No. 14 Wire, 8 feet long, No. 14 Wire, 8½ feet long, No. 14 Wire, 9½ feet long.
" " 8¼ " " " " 8¾ " " " " 9¼ " "
" " 9 " "

PRICES GIVEN ON APPLICATION.

We believe we are fully justified in saying that in respect to the **Convenience of the Fastening, Quality of Material, and the Uniform and Excellent Manner in which our Bale Ties are made,** nothing now in market equals them, and that all who have occasion to use a Hay Press should give them a fair trial before purchasing any other binding material.

THE IMPROVED EAGLE HAY PRESS.

The Improved Eagle Press, as now made, is only a little more than eight feet high, and yet the box for the reception of hay is one foot deeper than formerly. It is a rapid and effective machine, and is in extensive use on this Coast, and in sections where hay is not to be transported long distances, and for that reason does not require to be baled so very solid, it will be found to answer the purpose as well as more expensive machines. It is very rapid, the capacity being from 10 to 15 tons per day. Its weight is about 2520 pounds, and it makes a bale 26x26x50 inches. Price, $250.

TICHENOR'S HAND-POWER PRESS

No. 2.—Height, 6 feet; weight, 1000 pounds; depth of box, 66 inches; bale, 36x24x20 inches; weight of bale, 125 to 155 pounds; price, $175.

No. 3.—Height, 6½ feet; weight, 1200 pounds; depth of box, 72 inches; bale, 44x24x24 inches; weight of bale, 175 to 250 pounds; price, $200.

SEND FOR CATALOGUE.

Vol. XXXIII.—No. 22. SAN FRANCISCO, SATURDAY, MAY 28, 1887. $3 a Year, in Advance; Single Copies, 10 Cts.

The New Pavilion at Stockton.

Agricultural District No. 2, as defined by the last Legislature, comprises the counties of San Joaquin, Stanislaus, Merced and Tuolumne. This district has its headquarters and holds its annual fairs in the city of Stockton. The district has long needed a pavilion and for the lack of it the annual fairs have often been deficient in indoor displays. Last year a creditable effort was made and a good pavilion show was secured in a temporary structure. This year the district will be grandly and permanently equipped, for, through the enterprise of the people, a pavilion is now in course of construction which will soon present the appearance shown in the engraving on this page, which is made from the drawing of the architects, Beasley & Son, of Stockton.

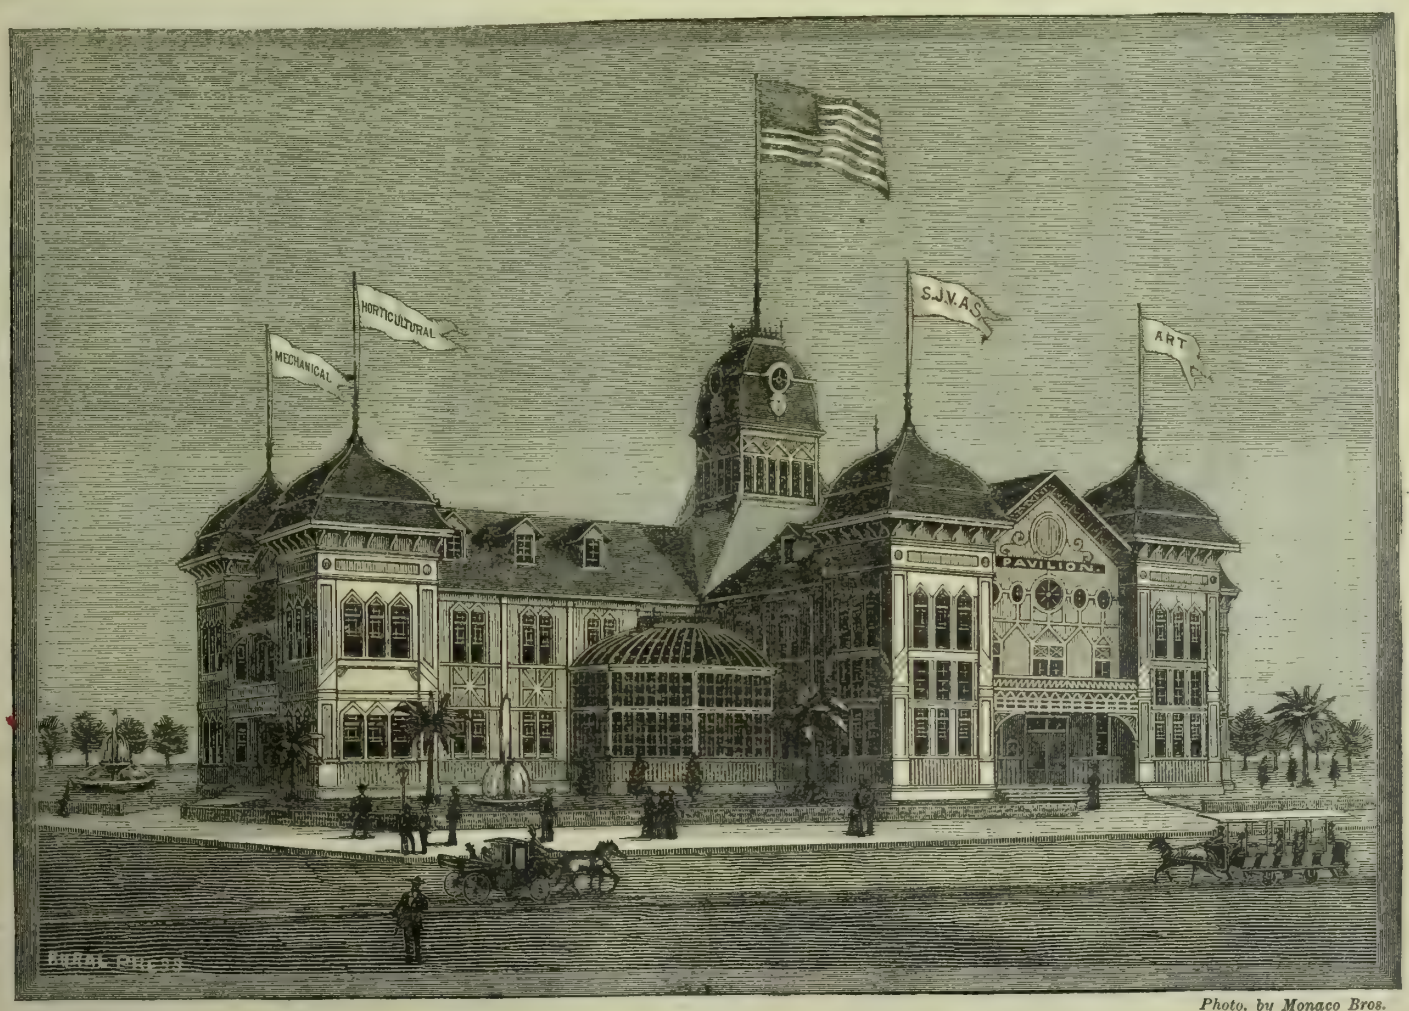

Photo. by Monaco Bros.

NEW PAVILION FOR AGRICULTURAL DISTRICT NO. 2—NOW BUILDING IN STOCKTON.

Stockton and the San Joaquin Valley Society have waited long for the pavilion, but the engraving shows that their waiting has not been in vain. Of quite a number of pavilions constructed for local and district societies during the last few years, that of Stockton is the handsomest, and will be a credit to the city and the State. It will be centrally located—a short distance from the plaza and the county courthouse. Street-cars pass the door, and wharves and railway station are not remote. We expect the erection of the new pavilion will rally to the support of the society much force which has not hitherto been mustered, and mark an era in the history of the society. It is estimated that the pavilion and adjacent improvements will cost upward of $50,000.

Agricultural District No. 2, as now organized and officered by State appointment, is the lineal successor of the old San Joaquin Valley Agricultural Society. It was organized at a citizens' meeting, held in Stockton, January 28, 1860. Col. H. T. Huggins was president, Austin Sperry, vice-president, and Geo. H. Sanderson, secretary. On February 4, 1860, a district was formed of the counties of Calaveras, Tuolumne, Stanislaus, Mariposa, Merced, Fresno, Tulare and San Joaquin, and a constitution was adopted February 11, 1860. The organization was made permanent by choosing John McMullen, president, with two vice-presidents from each county; General P. E. Connor and E. B. Bateman were elected secretaries. Capt. McMullen was obliged to resign on account of private business interests, and March 19, 1860, Dr. E. S. Holden was elected president, and held that office until he resigned, March 11, 1867. During that time Gen. P. E. Connor, Rev. Jas. A. Anderson, John C. Reid and H. T. Compton were secretaries. Mr J. Sartis succeeded Dr. Holden as president, and at the end of the year was in turn succeeded by I. K. Doak; the latter retaining the office till November, 1872, with H. T. Compton secretary during the time. Col. Caleb Dorsey was elected president at the annual meeting of 1872, but held the office only one year, Mr. L. U. Shippee being unanimously elected president at the adjourned annual meeting held Dec. 6, 1873. With the exception of less than one year, when Mr. F. Arnold was president, Mr. Shippee has been president to the present time. His secretaries have been H. T. Compton, H. W. Weaver, J. M. La Rue and J. La Rose Phelps. Without disparaging the services rendered by others, it must be stated that the moving spirits in the organization during recent years have been L. U. Shippee and H. M. La Rue.

Taking into account the new pavilion and the excellent Agricultural Park, of which an engraving is given on a subsequent page, District No. 2 is one of the best equipped in the State for the holding of industrial fairs. The effort to build the pavilion enlisted wide interest, as is shown by the subscriptions to life memberships, which have reached a large sum. It now remains for all in the district to make early preparations for a grand display this year. It will be a good year to make unusual efforts at the fairs, in view of the general interest in California and the thousands seeking homes here. Each district should do its very best in 1887.

London Purple.—We hope none of our readers were misled by a recipe for application of Paris green or London purple which said use "one pound to two gallons of water." There was a misprint in a bulletin from the Michigan Agricultural College, and we notice that some California papers copied the statement without correction. Prof. Cook, of the Michigan college, intended to advise "one pound to two barrels or about 100 gallons of water." Even this dose is pretty strong, according to experiments made at the University orchard, and which we described in the Rural of May 14th. If the Paris green or London purple is as rich in arsenic as that analyzed at the University it should be used about one pound to 200 gallons of water if one does not desire to burn the foliage.

The Irrigators Score a Point.—It is telegraphed from Visalia that Judge Cross, after hearing testimony Tuesday as to the volume of water flowing in Kings river, dismissed the contempt proceedings against the Fowler Switch Canal Co. and the Centerville and Kingsburg Ditch Co.

Freights on Fruit for the East.

Advices from Chicago indicate that the fruit-growers have secured a number of reductions in rates on fruit overland, and advantages in manner of carriage for this year's shipments. The Chicago meeting of the traffic managers, to which we have several times alluded, was, we understand, quite besieged with telegrams from influential citizens and organizations of California urging the granting of the rates which the growers asked for.

From communications addressed to R. B. Blowers, Eastern agent of the Fruit Union, by J. C. Stubbs, of the Southern Pacific, who was attending the Chicago meeting, we learn that the following rates were finally agreed upon:

By freight train to Missouri river points, per 100 pounds, $1.10; by passenger train to Missouri river points, $2.10; by freight train to Chicago, $1.25; by passenger train to Chicago, $2.50; by passenger train to New York and Buffalo, $3.12½.

The above are rates for single carloads. For such shipments it is the intention of the railroad companies to make fast time, approximating passenger train speed, but time will not be guaranteed so as to make the carriers responsible for damages in case of accident or failure after reasonable efforts are made.

The arrangements for special fruit trains of 10 cars seem to cover an agreement that passenger time or better will be insured. Mr. Stubbs in his letter says: "We mean that the train shall leave ahead of the passenger train on the same day, and shall not be overtaken en route by said passenger train." For such trains, *in addition to ordinary freight charge as above*, the charge will be: Sacramento to Missouri river, $1275 for a train of 10 cars containing 121 tons or less, and a proportionate rate for the excess over 100 tons in said 10 cars. To Chicago from Sacramento for similar special service a charge of $1500 will be made for a train of 10 cars containing 121 tons or less and a proportionaterate for the excess over 100 tons in said 10 cars.

The rate on passenger trains to New York will be $625 per car of 100 tons; or if special trains not more than 100 tons be required, the rate will be $400 per carload.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

A San Joaquin View of Mixed Farming.

EDITORS PRESS:—The true wealth of a country consists in each producer therein furnishing his quota toward the general product of the various industries, and this proposition has particular force in the farmer's case. He should produce on his farm, and in the majority of cases by the industry of himself and family alone—because of limited means—nearly all that he needs in the way of food for home consumption, both for family and stock; fruit of various kinds, berries, vegetables and forage, both green and dry, which may be abundantly done in comparatively small space by means of irrigation; and right here it may not be out of place to speak of the misleading tendencies of many plausible theories advanced in many cases, I'm afraid, by people who know of them solely by extensive reading and perhaps conversing with other theorists, and so believe themselves fully and correctly informed in the matters of which they treat. They do not always mislead, it is true; but a statement of facts, the knowledge of which is acquired by actual experiment, is much safer to follow and surer to result as promised, provided the necessary conditions are complied with. Allowance must be made for difference in climate and soil, for what is proper and good in one locality may not be in another, and so, unless one is a scientific farmer, educated in the matter of soils, etc., and their capabilities, he must commence with the observance of the general rules for farming until he can inform himself by actual and intelligent experiment both as to what his land will produce to the best advantage, and the best method of cultivating it to secure full results.

One should guard against indulging in rosy visions of large incomes to be rapidly acquired on small farms, or for the matter of that on large ones either, at present, or he will be at the least very liable to disappointment; but it is coming to be more generally known that a family of ordinary size and requirements can be supported quite comfortably on 20 or 15 acres and a little laid by each year for future needs, and the principal requirements for this are, first, intelligent selection of soil and climate for what you desire to cultivate, and then proper and thorough cultivation and irrigation, where irrigation is possible, for, although with thorough cultivation good results may be secured without irrigation, still they are fuller and more complete when water is to be had.

The product of each small farm should be varied so that if the market prove indifferent for one product it may prove favorable for another, and a little profit on each aggregates a fair profit on the whole. With a proper attention to these matters and the practice of thorough economy and continued industry, comfortable and pleasant homes may be had by all who desire them, even if their means are small.

I am watching with considerable interest the operations of a friend of mine in this direction. His farm consists of 15 acres, fenced and subdivided for hay and vegetables for three cows, one horse and 500 hens; about 400 fruit trees, a half acre of grapes and berries and the 500 hens yarded and housed in lots of 15 to each house and yard. The fruit trees are just coming into bearing, and the hens are producing yearly a fine and paying lot of young fowls for the high market, besides an abundance of eggs; and I am pleased to say that he is slowly but surely making a success of getting a living and adding to the value of his place each year. What he needs most now is a more plentiful supply of water which a coming ditch will probably supply this season, and whether he succeeds or fails, and how, may form the subject of a future contribution if desired.

Lodi, Cal. T. B. GEFFROY.

Washington Territory Notes.

EDITORS PRESS:—Western Washington Territory, especially the Puget sound basin, viewed in all its aspects, presents wonderful prospective advantages. How a region of such varied resources could have remained so long in a primitive condition, seems passing strange. Her commercial advantages, her fisheries, her vast timber tracts, her mines of coal and iron, with a soil of remarkable fertility on her river bottoms, indicate a country that will, at no distant day, take a front rank among the sisterhood of States. It is a region capable of supporting a dense population, and when its resources are fully developed, a civilization second to no other will spring up on these shores. For those of limited means, or who have to create their capital by the labor of their hands, it is a country that offers superior inducements, and will for some time to come be the place for poor people to secure homes.

I will, however, add that it takes plenty of muscle to develop a place in this Territory. There is no use in a person in delicate health coming here and undertaking to hew out a home in the wilderness; but for the young man, or the hardy immigrant from the Northern States, I know of no section of our broad domain that, all things considered, possesses a superior soil. Those who have resided any length of time in California find the winters here too cold and wet; but Eastern men from the Northern States think it the most delightful climate in the world.

There is rivalry among the towns of the sound as to which shall be the great commercial metropolis of the Northwest. Seattle has the lead at present, but whether she will maintain her supremacy is a matter of doubt among more thoughtful minds.

The reason is that a railroad has been projected to run from here to Bellingham and Semiamoo bays, to connect with a branch of the Canadian Pacific Railway, from New Westminster, on the Canadian Pacific R. R. Wherever the Northern Pacific and Canadian Pacific Railways unite—whether on the shores of Bellingham bay or farther north at Drayton harbor, on Semiamoo bay—it requires no highly prophetic mind to discern that at their point of junction is to be the future great city of the Northwest. General Sherman in one of his reports to the War Department, said: "A railroad from Lake Pend'Oreille through the Skagit pass, to the shores of Bellingham bay, will become a national necessity." A line of railroad from that point would shorten the line of the Northern Pacific some 300 miles.

Whatcom county contains a greater area of rich bottom lands than any other three counties of Western Washington. Whatcom, the county-seat, is situated on Bellingham bay. A number of Eastern capitalists have recently bought a large amount of lands and invested heavily in coal and iron mines in this county.

There is a gap of half a mile to complete of the Cascade branch of the Northern Pacific. Travel to and from the East is already going that way.

It is one of the coldest springs ever known here, and vegetation has been retarded, being a month to six weeks later than usual. Cold winds and rain have prevailed during the first week in May, which makes one think of the flower-clad hills of fair California.

O. F. SHAW.

Seattle, W. T., May 9, 1887.

Southern Calaveras.

EDITORS PRESS:—Springtime once more in this fair old county of the foothills spreads a wealth of shining leaf and fragrant royal bloom over every hill and into every plain. Where once the earliest pioneer saw in its wild uncultured pine-lands, its rocky river-beds, its cool, deep canyons, a harvest of gold for the eager pick, the sober home-builder now beholds its wild grasses crushed by the roaming herds, bright green stretches of foothill grain, and on its rugged hills already torn and marred by the vanished prospector, orchards of blooming trees that promise to droop in the red beams of autumn sun with heavy clusters of luscious fruit. The old glory of the mines, the excitement of good strikes and rich pockets, is over and gone with the rushing throng of miners who first penetrated its wastes of forest, and now begins the second era of gold—gold in the shape of ripened fields and tempting burdens on the bending trees. This season promises a good yield in almost every section. For the last two or three years the crops have been poor, owing to frosts and the destroying army of grasshoppers that fell like a scourge on the face of the fair fields, and now although this year is but an average one, it seems particularly good compared with preceding failures. In the southern part of the county, near Milton, where wind-swept hills border on the broad treeless region of rolling plains, the hayfields needed rain before harvest, but it fell in the shape of a light shower which was over in a short time, and then came the warm weather that rapidly dried the grass, so the ranchers began mowing and now hope that the anxiously looked for rain will not come until their hay is all in.

Farther up toward the hills, in Salt Spring valley, the ranchers are cutting the grain, and it lies in fragrant mounds over the shorn fields, and the mowers and rake-drivers are busy from dawn to twilight. It is here that a wonderful improvement is noticed in the past three years. Fences are built, wild grazing lands cultivated for hay, and many new homes established. In Copperopolis there is great advancement—the rumor that the copper mines are soon to be worked again has given much encouragement to the farmers and stock-raisers, and consequently there is a rise in the price of property and a general revival in all kinds of business. There is twice as much fencing as there was a few years ago, the barbed wire and stone wall being more common among new fences than other kinds, the old brush fence growing rather scarce. There are scores of new grain patches that produce bountiful crops, the waving barley heads reaching almost up to the top of the fences and growing thickly all over the whole field.

Gardens also receive much more attention than formerly. One small garden in Copperopolis, belonging to Mr. Wm. Turner, shows what good results can be obtained in a short time. This garden has been planted within the last five years, and now contains fine thriving trees, many of them seedlings, and yields a splendid crop of fruit in proportion to its size. Peach trees, only four years old, bear excellent large peaches that were pronounced perfect in flavor last year, and this season they are again loaded so that the branches threaten to break with the increasing burden. Walnut trees grow in this garden and bear well; orange trees also thrive and resist the light frosts that sometimes come. There are other new gardens here, one young orchard belonging to the Moore family showing remarkable growth in a short time. This increase in cultivation, the new windmills and busy gardeners, greatly add to the attractiveness of this little town which has so long been merely a sleepy old place, dreaming of its restless past when those great old sheds and massive buildings were full of rattling machinery and busy workmen unearthing tons on tons of glittering blue ore that now lies about in mountainous heaps unused. This place is on the route to the Yosemite valley, and the travel is large, many tourists preferring it on account of their opportunity to pass through the famous foothills of Calaveras and Tuolumne, the very heart of the southern mines. The stages pass twice a day and the travelers are accommodated with lunch going up and breakfast going down, served in elegant style at the Union hotel, kept by Mr. and Mrs. Mely. The tourists are generally delighted to reach this interesting old place, holding much of its former glory yet in its large, handsome hotels and fine public buildings so vastly superior to those in other towns of its size, and breathing yet of its unfading past in the queer old buildings and falling ruins. Capt. T. B. Meader is proprietor of the Meader house, situated in a beautiful garden of blooming roses away from the business part of the town. This hotel is a favorite resort for summer boarders, and also accommodates private travel.

A new feature has arisen in horticultural interests in the favor that is being shown to the planting of orange trees. In the warm climate of this lower foothill country they grow so well that many are setting out young trees, hoping to raise as fine specimens of fruit as were grown last year on the old Stausic place, where one tree about 15 years old produced over 400 oranges, large and sweet, of excellent flavor and brilliant color.

Thus each succeeding year the hills burst forth into unexpected bloom and beauty, leaving unfelt the destructive hand of time that tears down and crumbles into ruins the products of man's labor, when tender nature's gentle touch so kindly restores the loss in hillslopes blossoming with fair, frail flowers and twining leaves, ripened golden fruits dropping from the loaded boughs, and blooming clusters of the purple grape. MAY BLOSSOM DAVIS.

FORESTRY.

Government Promotion of Tree-Planting.

We have received from the Department of Agriculture two circulars which will be read with interest by the many who are working to extend the forest area of our State.

Forestry in the Schools.

Allow me to call your attention to the necessity for all concerned in the public welfare of giving serious thought to the growing importance of the forestry question to the country as a whole and to the individual States. I trust that the warning voices pointing out the dangers to the welfare of the country, arising from an indiscriminate destruction of forests without adequate provision for their restoration, have been heard by you, and also the suggestion that, in order to arrest the tendency to wastefulness in this particular, it is necessary to look first of all to the aid of public schools and other means of education.

To show that the subject is a serious one, considered only from a material point of view, let me submit to you a few striking figures which seem to approximate the state of affairs as arrived at in the preliminary investigations carried on by this Department.

The forest area of the United States seems to be less than 450,000,000 acres, of which more than 10,000,000 acres yearly are destroyed by fire, and to supply the needs of fuel, ties, lumber, etc., it is estimated that certainly not less than 10,000,000 acres are denuded, altogether an area of over 60,000 acres per diem, the product representing a value of more than $700,000,000 per annum.

The consumption of the forests in supplying our railroads with ties is enormous and increasing with the rapid extension of the roads. It is estimated that the building of existing roads has taken the available timber from an area as large as the States of Rhode Island and Connecticut, and that to keep them in repair by replacing decayed ties with new ones requires annually the yield of more than 500,000 acres.

In 1853 the forest area of Ohio was 55.27 per cent of the area of the State. In 1881 it was but 22.53 per cent. A similar rapid consumption of the forests has taken place in other States. In many cases the flow of streams has been lessened or made irregular by the removal of the forests from their vicinity. Floods and drouths have become more frequent and destructive from the same cause, and agriculture and manufactures have suffered greatly in consequence. The consumption of the forests so far exceeds their growth that, if no effective measures are taken to check the decline, the forests would entirely disappear within a hundred years. The great pine forests of the Northwest will hardly last till the close of the present century.

I will only allude to the more complicated and sometimes disputed influences which the forests exert upon the agricultural and hydrological conditions of its surroundings. Your acquaintance with the history of older nations, and the observations recorded on this continent, will convince you that this is at least a subject which requires serious attention.

This Department in its Forestry Division has been charged to obtain such information as may form a basis for intelligent action, and to exert, by the diffusion of accurate knowledge on the subject and otherwise, its influence in leading to a reform in the present methods of using the forests and to secure their renewal.

This most desirable work, however, is only inadequately provided for by the appropriation given by Congress for the purpose. And the difficulty of obtaining precise and reliable information as to actual conditions and needs is great.

Knowing that there is no body of men in the country, as a class, more intelligent and more capable of aiding this important work, nay, more interested in it, than the educators of the coming generation, perceiving also that the two purposes of obtaining and diffusing information for which this Forestry Division was constituted are subserved at one and the same time by the following plan, I would respectfully ask your consideration and support of the same.

It is proposed, 1st. To engage the force of teachers under your superintendence upon the ascertainment of facts in regard to forest areas, their distribution, utilization, etc., in their immediate precincts. 2d. By thus directing their attention to the subject and supplying them with such information as the Department may be able to give in regard to forestry, to have their own and their pupils' interest excited, and thus by indirect influences to arouse a desire to understand the questions involved.

It is not proposed to introduce a new branch into the course of studies, but simply to create a moral sentiment which will do its share in enlarging the views of those soon to become citizens.

Nor is it believed that such work, properly laid out and directed from here, will involve much time or undue attention on the part of the teachers, but while bringing them into sympathy with a national undertaking will afford them not only pastime and recreation but the consciousness of performing an important duty of citizenship.—B. E. FERNOW, Chief of Division.

A Circular to Educational Men.

The Forestry Division of the Department of Agriculture, primarily created to promote a popular understanding of the vital interests which are centered in the forest wealth of the United States, has directed its principal effort hitherto toward investigating the conditions of the forest areas of the country, and the rapid decrease of the most valuable sources of supply, and has shown the need of inaugurating a new system of forest management and reproduction, by which alone the perpetuation of an ample supply of forest products, so vital to national prosperity, can be secured.

The array of statistics collected and reported already by this agency should suffice to awaken greater popular interest in the solution of so momentous a national problem than has thus far been manifested.

Hitherto we have destroyed our forests for the sake of immediate pecuniary gain or convenience, with reckless disregard of consequences or of the future supply of a material so valuable and even necessary for almost all pursuits and for the comfort of all classes. The history of other countries, which by the denudation of their forests have lost their agricultural fertility and which have suffered also from great climatic changes, should be sufficient warning to an intelligent people like ourselves to guard against a similar experience by taking measures in season to arrest the course of destruction which has prevailed and to adopt a system of wise forest conservation.

In marking out the line of future work to be undertaken by the Division of Forestry, the Commissioner of Agriculture deems it of great importance that those to whom the shaping of the intelligence of the coming generation is intrusted should be specially invited to take a calm consideration of this long-neglected subject.

Schools of every grade, without departing at all from their proper work, can supply some practical lessons in regard to the object and use of forests, the nature and growth of trees, and the significance of their existence or absence, awakening thereby the interest of pupils in a kind of knowledge too little fostered in the schools of the agricultural classes.

In schools of the higher grade it can be united with instructions in botany and natural history in general. In colleges, forestry should be presented in lectures on its various relations to arboriculture, agriculture and political economy.

Engaging thus the popular and higher education, we may establish a popular system of forestry suited to the peculiarities of our country and its people. We shall foster at the same time sympathy with rural objects, which will tend to make our youth content with rural life, instead of being overcome by the attractions of the great cities.

The Commissioner calls special attention to

the value of object lessons in any branch of study, and recommends to all heads of the higher educational institutions, as far as in their power, to cause the grounds of their respective institutions to be planted with collections of forest and ornamental trees and shrubs, grouped in accordance with their botanical relations or with a view to successful growth by a system of judicious mixing of kinds for mutual protection.

A general adoption of this recommendation would soon convert the much neglected grounds surrounding our colleges and schools into park-like groves of great attraction, the exponents of correct taste in ornamental planting, and perpetual volumes of forest botany and arboriculture.

In like manner might the study of botany be promoted and popularized by the culture of representative kinds of plants united in accordance with their systematic relationship. Botanical parterres of plants, both economic and ornamental, might easily be introduced into the school grounds of the country, through which much useful information, both practical and scientific, would be imparted, assisting rural life in its onward course to a higher plane of culture.

The Commissioner will take pleasure in promoting the adoption of his recommendation, as far as in his power, by contributions of plant material, and has especially instructed the Western agent of the Forestry Division, Prof. M. G. Kern, of St Louis, Mo., a professional landscape gardener, to correspond with all who desire further information or advice in the design and improvement of the grounds of Educational Institutions. NORMAN J. COLMAN, Commissioner of Agriculture.

FLORICULTURE.

Roses and How to Grow Them.

[Written for the RURAL PRESS by a GARDENER.]

In the first place, let me say that this article is only intended for those who love their flowers, and, loving them, have patience to give them care. Roses, like children, cannot be put off with a slight amount of attention once in a while, but need a constant daily watching and overseeing to insure fine blooms and healthy plants.

Everybody admires flowers; few love them well enough to do the work necessary to produce them, and a great many who say "How I do love roses!" do not love the care necessary to grow them.

There are a great many, too, who say to me, "How beautifully your roses bloom. How do you get such fine, large ones? I am always fussing over mine, yet they come small and imperfect." It is those who are willing to "fuss all the time," but who, through ignorance of what is needed, fail to make their roses do well, to whom I write.

There are a few kinds which seem to grow vigorously or bloom well through every sort of disadvantage in the shape of poor soil and neglect, but they *are* few. As a rule, roses will not do well unless thoroughly cultivated, judiciously watered and carefully watched to prevent attacks from aphis, mildew and the like.

Planting.

If you are about to plant roses, be careful to dig the soil deep and thoroughly soft before putting them in; then give them a thorough soaking, so that the ground is saturated for a foot deep. Then cover with dry earth to keep the ground from packing in the hot sun. It is best to do your planting at night, in order to give the plants the long, cool hours in which to revive. The same rule holds good in watering; always, if possible, water at night, as when done in the daytime the sun packs the earth around the plants, often so hard as to make the task of softening it no small one. Beside this, if the plant is small, in trying to break up the caked surface the roots are very often disturbed, retarding the growth, if not killing the plant. A great many hold, too, that the chill of the cold water on the plant, which is heated by the sun, has a damaging effect, though of this I am not so sure.

Watering.

Do not sprinkle your plants with a mere spray from a rose nozzle—that is time wasted. Give them a thorough soaking-down once a week; it does them more good than a dozen sprinklings. If you have young rose plants come by mail, soak them in lukewarm water for a short time before planting, soften and wet down the earth well, and shade them for a few days. Water freely for a short time, but do not keep them muddy. After their roots have taken a hold in the ground, save all the tea and coffee left in the table-urns, all the grounds left in the cups (even the children's "white tea" added helps), and put around them. I have found this the most delicate fertilizer for tender roses of anything I have tried. Little plants on which it is used, if they are not kept too wet, will bud out and grow amazingly in a few weeks. For stronger and older plants use soapsuds. If you have your washing done at home, keep all the washing suds and soapy water for them. Instead of throwing out your greasy dish-water, take it out and put it around your roses. The grease and dirt only add to the value and do no harm. The trouble is slight in comparison with the benefit to the plants, for soapsuds seem to contain the very essence of roses, so to speak, and the increase of brilliancy in foliage and flower, the rankness of growth and profusion of bloom, will quickly convince you of the truth of the statement if you will try it. Wood ashes and pounded charcoal are also excellent if dug in around their roots, but care must be taken that the ashes are not too fresh, or they will burn the plants, making the leaves shrivel and dry on the edges and the buds come imperfect.

Pruning.

Prune vigorously, and never be afraid of hurting a rose by too much cutting. You may cut it so close that it will take a good while for it to come into bloom again, but when it does it will astonish you by the profusion and persistence of its flower buds. Not only does cutting back throw the strength into the remaining shoots, but it forces the plant to rest for a time from the exhausting process of flowering. In a small garden where there are but few bushes it is advisable to thin out all the old wood every fall (though in addition to this I should advise frequent cutting at the tips as well), but in a large place, where the number of roses is too great to admit of this, a severe cutting back on all sides with a pair of garden shears does quite well enough. This is the method, I understand, which is pursued at Mountain View cemetery, the vast number of plants precluding the possibility of much individual attention.

I would especially impress on amateurs the necessity for this severe cutting back every few months. Without it your roses will give you but few or poor blooms. If a bush has blossomed steadily for a good while and begins to give imperfect or small and scattering buds, take the shears and clip off the ends of the shoots for some six or eight inches. This will rest and strengthen it for fresh efforts in a short time. If your yard is very small and you need to crowd your plants, it may, perhaps, be better to trim them to a tree-shape with a single stalk, but where you have plenty of room it is preferable to let them grow bushy and thick, as it saves staking and they are more apt to be thrifty and vigorous.

Fertilization and Care.

Sometimes a rosebush will seem to be healthy, and yet keep putting out blighted flowers, which rot before they are fully open. It is not always possible to tell what is the matter, and therefore the only thing to do is to have patience and keep trying different remedies. As a general rule, however healthy they may appear, there is some defect, for healthy bushes should produce perfect flowers. Cultivate thoroughly, give them a good wetting-down at intervals, put a little well-rotted manure around them if you have it, prune unsparingly, and wait. When it gets into a healthy condition the bush will bloom in an orthodox fashion, and not before. Some varieties of roses, too, do not bloom perfectly until they attain a certain maturity, therefore if a bush absolutely refuses to give good results after careful attention paid it for some time, do not destroy it, for it may, if you persist in your attention, all at once astonish you by lovely blooms.

Another thing essential to the production of fine roses is the removal of all dead or dying ones as they appear. It is not necessary to set apart a certain day on which to spend hours for this purpose, but when walking among your bushes or picking from them, get into a habit of pulling off the wilted flowers and half-formed seed pods as you see them. The process of forming seeds is a very exhausting one, and should be prevented as much as possible.

Insects and Diseases.

There are many insect enemies of the rose, all of which will generally yield easily to the right treatment if persisted in. Sometimes the young shoots will be perfectly swarming with the small green aphis, causing great alarm in the inexperienced breast, though in reality doing no great harm. These may be gotten rid of by syringing with water in which a little whale-oil soap has been dissolved, or lacking this, strong soapsuds will do very well. If very strong, the plant should be rinsed with clear water. Slugs may be done away with by the same remedies if thoroughly applied. The red spider often attacks roses indoors, though I have never seen him on those outside. In any case, moisture and cold are fatal to him, and a thorough drenching with cold water several times (taking care that the under sides of the leaves are wetted), generally does the business. The mealy bug is seldom very troublesome, but may be killed by the application of a drop of alcohol at the base of the leaf where he nestles.

Red roses seem to be more liable to disease than any other kind, judging from my own experience. As a rule, always plant crimson or red roses in the hottest sun for best results. When planted in a shady or partially shady spot, they are apt to be attacked by mildew—a whitish blight which curls the leaves and retards the growth of the plant. This, however, by careful attention in the way of digging around them, and maybe a little pruning, can generally be overcome or outgrown. Some recommend powdering with sulphur as an antidote for the disease. Scale is sometimes found on roses which grow near fruit trees, and takes a more powerful remedy. Use the kerosene mixture recommended for fruit-tree pests, and the scale will quickly disappear. This kerosene mixture is a remedy for all rose parasites where in severe cases other remedies fail, and used judiciously will not injure even tender plants. This kerosene mixture is made as follows, although this recipe will make a large amount and should be proportionately decreased: Kerosene oil, 1 gallon; milk (fresh or sour), 6 pints; water, 6 pints; add 4 pints of milk and 4 pints of water to the oil, and when the mixture begins to thicken by churning or beating, add the balance. By churning from 15 to 45 minutes the whole turns to a creamy, butter-like substance which may then be diluted in water as much as is desired. It will sour or curdle, but may be stirred up again. One pint of the kerosene butter to six quarts of water is the proportion used on badly affected fruit trees. For roses, 1 pint in about 8 or 9 quarts would be the right proportion. This kills every sort of parasite so far as I have tried it, though its making takes some trouble.

Varieties.

The best kinds of roses for the average small garden are those which bloom constantly and take the least care. The more delicate varieties are very beautiful, but if few can be grown it is more satisfactory to have those few bloom constantly and prettily the year round. The Madame Bezanque of pretty, pale peach color and perfect shape; the Hermosa, a deep rose color, always a good bloomer; the old Cels Multiflora, loaded with blush buds; the Safrano, rich salmon yellow, a vigorous grower and constant bloomer; the White Daily, as its name implies, a daily bloomer; and the sweet-scented, vigorous Jules Margottin, with big, deep crimson buds—these are all satisfactory. Besides these there are a great many which do well with a slight amount of care, and under favorable circumstances bloom beautifully and constantly. Of these I will mention the Devoniensis, Niphetos and La Marque of the white, the Bon Silene, Catharine Mermet, La France and Arch Duke Charles of the pink shades, the Jacqueminot, the Empress of India and the Andre Schwartz in red, the Solfaterre, William Allen Richardson, Chromatella, Isabella Sprunt and Perle des Jardin in the yellow tints.

The number of fine roses amounts to thousands, so that in a small article it would be impossible even to mention them. Those I have named are, however, good, and will in a small garden make a fine showing with quite a variety. Hundreds of varieties may be found in the lists published by rose-growers. I am therefore not attempting to take up the subject of variety in full.

By using the simple precautions I have named, by keeping the bushes well dug around and giving them plenty of sun, by pruning severely and judiciously and watching and studying the causes of sickness in individual plants, there is no reason why those who love roses should not grow them to as great perfection in their own gardens as do the professional florists.

N. Temescal, Alameda Co.

POULTRY YARD.

Timely Notes.

EDITORS PRESS:—After a long rest from following the quill for these columns, I would like to call the attention of those interested to some of the small things about the poultry yard that need looking after, and some of them ought to be brought into daily practice.

Now, first of all I would say that theory looks well on paper, and often sounds well to the ear, but oftentimes that which looks and sounds best in the poultry business is only doomed to have, in the near future, the word failure written for its later end.

To distinguish between practical and theoretical, requires experience; to gain this I would advise commencing with but a few fowls, and let your flock grow with your experience. Too many figure on the theory that if one fowl will do so much in a year 1000 will do 1000 times as much; they go for the 1000 birds, and in 99 cases in 100 fail, where if they had started with 100 fowls they might have succeeded.

Another thing: we are too apt to fail in keeping (particularly with large flocks) fowls, houses, and runways very clean; filth is sure death to fowls; your fowls will die from other causes than the ax if filth is allowed in coops and runways for any length of time.

I really doubt if there is one farmer in 20 on this coast that takes proper care of his fowls to get best results from them; they say it doesn't pay. Well, that is their theory, but it is not so, for there is nothing in the shape of stock on the farm that will pay so well as hens with good care. Many farmers are letting enough slip through their hands each year to nearly, if not quite, pay the taxes, by thinking that hens are of no account on the farm.

By the way, the Interstate law if carried out will be a great help to all on this coast in the poultry and egg business, as it puts a stopper on Kansas and Utah eggs being shipped out here, and while the consumer will have to pay a larger price for eggs, yet the quality will be much better. Eggs that are collected once a week or 10 days in setting time, and then shipped several hundred miles, will not be likely to suit most tastes; yet eggs of that kind have made the price of good eggs go way down years before, till it would tempt one to go out of business in April, May and June. This year is proving better on account of advance in freights on eggs.

Again, as the warm weather is at hand don't fail to provide a plenty of shade and pure cool water, and a goodly supply of feed for your fowls, both old and young, and give them a chance at fresh plowed land, even if you have to use the spade to turn it over.

I find it pays well to go to the meat-market once or twice a week and get bones with a little meat on them, and let the chickens, old and young, pick the meat off, and after this break up the bones as fine as possible with a hatchet, keeping a large, flat stone in the yard to pound them on; don't cook the meat or burn the bones, for you will lose half the good by doing it, and lose your labor beside.

This bone and meat talk is both theoretic and practical. Try it and see for yourself; not for a week, but six months or more, and, my word for it, your old hens will pan out eggs, and young chicks will grow quick and better than any year before. But lest I tire you with too much at once, I will close with the promise of more anon. E. C. CLAPP.

Pasadena, Cal.

POULTRY-HOUSES RULED OUT.—Geo. D. Goodhue writes to the *Willamette Farmer* as follows: Perhaps friends will think that the poultry editor has stepped down from his high ladder when he asserts that a chicken-house is an abominable thing in a poultry yard, and a regular nuisance for at least nine months in the year. We confidently assert that there have been more fowls killed by lice in hen-houses than there have been by coons and foxes in the whole Willamette valley. Imagine, reader, our 16 years fighting lice out of hen-houses, and then having to come down to pure air of heaven and a good fir tree for our fowls to roost in. Imagine further, our mechanical and cozy breeding-houses all torn down and used for other purposes, while a simple roost in the center of each yard about two feet high, and two boards tacked together against the fence and on the ground, forming a box for laying purposes, end our ornamental display of poultry fixtures. We prefer to keep a good Collie dog, and discard our hen-houses ornamented with lice and unhealthy chickens. We find our fowls all healthy and they lay 50 per cent better. Our chicks are raised with but little loss, and we have the satisfaction of knowing that our time is not spent in vain. We have not been killing 10,000,000,000 lice to-day and get up and find 10,000,000,000 at their funeral.

ENTOMOLOGICAL.

The Fresno Wash for Scales.

EDITORS PRESS:—The absorbing and agreeable topic is the great amount of good the late rains have done in reviving sickly looking grain and administering new life to vegetation generally, the wind at present and temperature indicating more humidity.

The prospect for fruit is not so flattering as for cereals and hay. Owing to the great number of scale-infested trees, people thought them beyond saving and dug them out root and branch, and will consequently be deprived of a considerable income from that source, previous insecticides being valueless, as the tough scale killed the trees. But our Nevada Colony neighbor, Mr. N. Stutzman, thinks he has found the dead shot on the crustaceous scale, the remedy having been told him by a neighbor, and is of the following formula:

Tree Wash.

Place in a heater 50 pounds unslacked lime, 20 pounds of French sulphur, 15 pounds rock salt, in 20 gallons soft water; boil until sulphur is well dissolved; when cold apply with spray-pump; can be used hot, before trees are in bud, and will effectually kill the scale and not injure the tree. Mr. S. experimented with this solution while hot on a full-blossomed cherry tree. It burned the beautiful white clusters wherever it touched.

Mr. S. is wonderfully elated over the triumph and this discovery, as he has a fine variety of fruit and depended upon it for his income. This remedy may have appeared in the columns of the RURAL previous and I not have known it, as I have failed to receive several copies. A. L. A.

Temperance, Fresno Co.

THE EFFECT OF CERTAIN ODORS.—The aroma of red cedar is fatal to house-moths; the aroma of black walnut leaves is fatal to fleas. It is a matter of common observation that persons engaged in the business of making shingles from odoriferous cypress timber in malarial districts are rarely, if ever, affected by malarial diseases, and that persons engaged in gathering and distilling turpentine do not suffer from either malarial diseases or consumption. It is said that when cholera was epidemic in Memphis, Tenn., persons working in livery stables were entirely exempt from it. It is affirmed that since the destruction of the clove trees on the island of Ternate the colony has suffered from epidemics unknown before; and in times when cholera has prevailed in London and Paris those employed in the perfumery factories have escaped its ravages.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Display by Pomona Grange, No. 3.

[Written for the RURAL PRESS by MRS. W. D. A.]

At the entrance of the S. J. V. District Fair, Sept. 24, 1886, first to arrest the eye was the faultless lettering, "San Joaquin County," of wheat varnished to gold on an arch of maroon plush; below, on a field of white, evergreens and red berries heralded "Pomona Grange" display, with its abounding plenty.

Around the parallelogram-shaped cottage with four receding tiers of shelves, chief were the 50 jars of varieties of grain, from nearly all soils of the county—some with samples attached, all with name of kind, raiser and locality. A large field, winter sown, on the Calaveras, "Salt Lake Club" yielded 40 bushels to the acre. Barley, bearded and beardless, from 30 to 70. French Camp, sandy, sent fine bald barley. Peat land of Roberts island, fine chevalier. Seven kinds of corn. Large field corn from Bellota and near the Mokelumne; Spanish corn, too, that strikes root as the ground dries and yields without watering. Pink corn, Stockton adobe land, Mrs. Beecher. Rice and red popcorn, which is easily raised and sells well; and, curious to all, an ear of original maize, each kernel covered by a husk but no husk on the ear, from Kentucky—Mrs. McAfee.

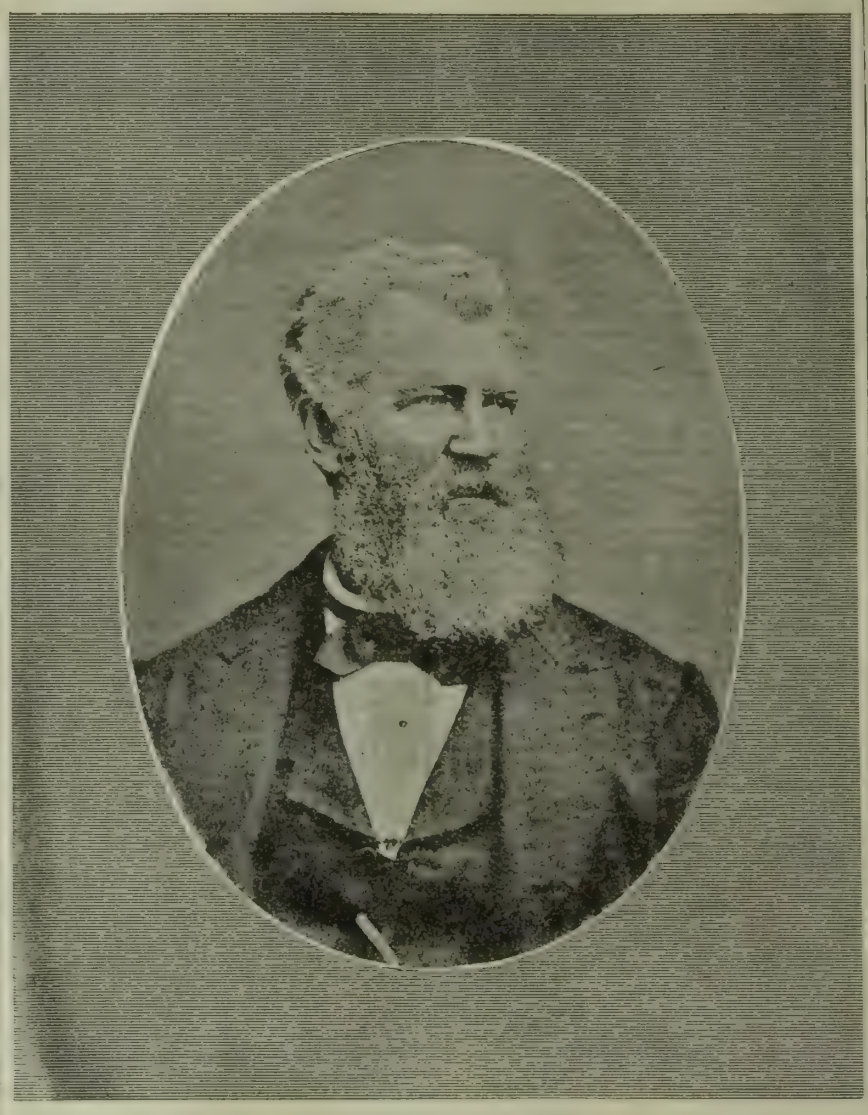
Beans of their kind, of which large quantities are raised here for market. Peas of their kind. Seeds of the garden. Sage—a lady once raised and sold $15 worth one summer. Fruit pits. A neat case of 165 varieties of flower seeds, Mrs. Beecher. Immense gooseberries, in acid, green and fresh, Mrs. Root. Don Pedro figs in spirits bigger than evil spirits, Ezra Fiske.

West and north side, jars sealed fruits; two large ones of peaches from Hale's island orchard, Mrs. Hale. On the corner, Mrs. Adams' snowy Bartletts of two years ago.

Above these, pickles and jellies, good and cheap enough to supply an Eastern market. Mesdames J. L. Beecher 36, Merrill 18—in all, 104 of every fruit. Pickles—Mesdames W. H. Post, E. Sabine, C. Allison and others. Mrs. J. Adams, pickled capers, seed sent out by Berkeley College. Above these hung Mesdames Williams and Coggswell's fine sweet and field corn, Mrs. Sabine's fine flaxseed, E. Fiske's Propo wheat, Emde's samples of tobacco and peppers, grasses by J. D. Hoffman and others, branch barberries, R. Howes; sheaves of splendid white Australian wheat, T. E. Ketchum; E. Elliott, seven varieties wheat.

North side, beautiful sun-dried fruit and figs attest the quick drying of this sunny valley. Ten boxes crystallized fruit, Mrs. W. B. West, perfection! Fine samples by Mrs. J. Adams. The large exhibit of almonds by West, Learned, Root, Alling, Ashley, Allison and others showed them to be a profitable tree. W. B. West's fine French walnuts and dried potatoes, good for sea or land journey. Fifty-two kinds of grasses festooned the awning from which hung Black Morocco, Black Prince, Tokay and Hamburg grapes nearly as big as plums, firm for packing, superior for table, from Stockton, Woodbridge, Lodi, Linden and the Mokelumne, by West, Learned, Williams, Woods, Walls, Ketchum, C. Bamert, S. C. Waters. Great clusters of Muscats, by J. Adams, which make fine raisins. Grapes are not watered. General Ketchum exhibited beautiful fruit. Hudson Bros., from fruit raised 2½ miles from Stockton, showed great bunches of grapes, noble white and Crawford peaches, plums and pears. Putnam's nursery, Clements Station, eight kinds of apples that would compare without shame with Eastern apples; also, grapes and Petite d'Agen prunes. Woodbridge made a fine show from her alluvial lands.

Mrs. Overhiser had two tasteful baskets, one each of fruit and vegetables. Mrs. Kuhl had great egg-plants, flax and many fine vegetables to show what a woman can do. D. Sheen, a box of Mohomic potatoes, sweet potatoes, and great squashes from Woodbridge. E. G. Williams, from there, helped fill the tables with Trophy tomatoes and all kinds of vegetables.



Sperry's mills furnished flour now rated best in the State; also the Crown mills. Five bales of paper from Stockton paper mills. Chicory in all its stages from that factory. Brooms of all kinds from broom-corn raised here. Crates of boxes from the planing-mills. Strong, neat, cashmere-goat mats showed that industry. Beeswax-soap, the veritable soft-soap used to lubricate the wheels of opposition along with the blarney stone, but white enough to wash my lady's dishes or cleanse the family linen, Mrs. Dustin, Lodi.

Pretty, stout mats of rags showed pennies saved. Miss Russel, Linden, had a quilt of 5422 pieces. The show-cases were full of work to please the esthetic eye, and near, Glick's revolving jewel-case flashed the light of pearls and opaline gems, the color of amber and glitter of diamonds in pins and watches, as if to rival nature's perfect fruit and flowers, and show that "Beauty was made the bride of Use." D. A. Learned, Stockton, deserves special mention for raisins, and five boxes of grapes; also our young ladies for their useful and artistic works, and Putnam, Clements station (which held the palm for best pears and apples) for his great bale of hops; and Martin, of Lodi, for hemp as tall and strong as "Missouri hemp" and a cotton-plant with big, opening bolls. T. Clement's 14-feet corn and hops on poles had to be laid down with hollys of 20 feet, with Allison's tall oats, castor beans, said to be obnoxious to gophers, and other view-obscuring stalkers. The famed Lodi melon, with C. Beecher's "Giant" and W. F. Sibley's "Cuban Queen," Stockton, lay near J. D. Peter's bug-destroying Buhach. Near it, Thompson's beets couldn't be beat by even his quinces and grapes from Woodbridge.

The south of the large inclosure beyond the two long fruit tables, was the cynosure of eyes, young and old. Here stood the "Miniature Farm," complete in detail even to "Darby and Joan" enjoying their "own." Got up by Woodbridge Grange with great trouble and considerable expense by Mesdames McIntosh and White, and Mr. and Mrs. E. G. Williams, who kept it bright and fresh with its stuffed poultry and lambs at Stockton. In front on the fruit table, S. C. Waters and C. Bamert showed what Washington Grange with Mokelumne soil can do.

Pomona Grange, No. 3, had just organized, with Ezra Fiske at its head and 12 public-spirited officers; hence had no money to carry on this unselfish work of showing up the many resources of this county till the county Granges stepped forward and bore their ratio of outlay and trouble by collecting and making the most varied show of products in the State. And Mrs. Beecher's lofty zeal and perseverance was the push of the enterprise in the face of people who couldn't see the point of showing without premium, those too mean to give or lend, those too lazy to take the trouble, and those who "forgot" promised articles. But with such men as Ezra Fiske, Hoffman, Elliott and Williams, and such women as Mesdames McIntosh, Adams, Ransey and Williams, who reached into their pockets, obstacles flew like feathers, and the good wrought for the county is appreciated and somewhat remunerated by the society's award of $100 and the Sacramento premium.

In front of this multifarious collection, beneath the cerealia in bottles and bouquets, was fastened a handsome plow of wheat ears by Mrs. E. S. Beecher, Stockton, emblematic of turning the teeming soil to yield its grain and fruit and flowers to feed and clothe the body of man and lift his soul to the Giver of plenty and beauty.

DR. C. GRATTAN, OF STOCKTON.

DISPLAY BY POMONA GRANGE, NO 3, AT THE LAST STOCKTON FAIR.

Dr. C. Grattan.

There are times and occasions in the lives of men that present opportunities, especially in a new country, that develop the highest type of manhood. The subject of our sketch is a pioneer whose sympathetic nature, genial disposition and open-hearted generosity makes him popular among his comrades, and by common consent a leader and counselor in local, municipal and State affairs.

Dr. Grattan is a descendant from the well-known family who have figured so prominently in the history of Ireland. He was born in Dublin in 1824, and with his father emigrated to America when he was one year old. His father, who was a civil engineer, resided in New York City and assisted in surveying the Pottsville & Reading railroad, it being the second one built in Pennsylvania. At the age of 21 he graduated from the New York Medical College. After three years of practice, he emigrated to California, determined to abandon his profession. For a short time he was at the head of a large company in manufacturing lumber, and afterward a very successful miner in "Old Tuolumne." In spite of his determination to give up the practice of medicine, his reputation as a physician followed him, and his sympathetic nature prompted him to devote to the sick and afflicted a large portion of his time, so that he was induced to open a hospital in the city of Stockton, where rich and poor were admitted, without question. He was elected a member of the Council of the city of Stockton in 1852 1854, 1856 and 1872, and not only took a lively interest in municipal affairs, but was very active in procuring State legislation for the advancement of the city of Stockton and the San Joaquin valley.

It is generally conceded that by his efforts and determination as a presiding officer a railroad job was defeated and the city of Stockton saved the sum of $250,000.

Dr. Grattan owns large estates in the San Joaquin valley, and has been prominently associated in several enterprises and industries, among which is the Stockton Combined Harvester Works.

Breeding fine horses and farming have engaged his attention for some years, and in this connection he has invented and patented several agricultural implements. Among his improvements is the band brake for combined harvesters that are in general use. During the late conflict he was a warm supporter of the Union cause, and was among the first to publicly and openly take a decided and notable stand against secession.

He is a member of the San Joaquin Pioneers and has been a member of the I. O. O. F. since 1844. At the first inception of the Grange movement he took an active part, and has been one of its trusted, leading and active members since. He has been repeatedly elected Master of Stockton Grange and a member of the Executive Committee of the State Grange. As a pioneer passing through vicissitudes, with a steadfast faith in the growth and development of the San Joaquin valley and the city of Stockton as a great inland emporium, it has called out the best efforts of his life to consummate his great desire to see this, his chosen home, the seat of empire, and happy homes the length and breadth of this vast domain. He is genial, affable, and generous, ever ready to assist his fellow-men or inaugurate great enterprises to benefit his neighbors or the commonwealth.

The Gridley Monument.

The monument soon to be finished and dedicated in Rural cemetery, Stockton, in honor of the hero of the famed "sanitary sack," is thus described in the *Independent* of 19th inst., according to the plans and specifications:

The monument is to be made of California granite and Italian marble, and will be 20 feet high. The bottom base is to be of Penryn granite, 6 ft. square by 2 ft. 4 in. high, neatly finished with a patent hammer, 8 cuts to the inch. The second base is to be of Crystal Lake or Rocklin granite, 4 ft. 11 in. square, by 1 ft. 8 in. high, neatly finished with a patent hammer, 10 cuts to the inch. The third base, of Italian marble, 4 ft. 1 in. square, by 1 ft. 6 in. high. The same to be polished with the name of "Gridley" inscribed thereon in letters raised 1 inch. The die to be made of Italian light vein marble, 3 ft. 3 in. square by 5 ft. high. The columns and die to be cut in 1 piece and polished. The inscription is to be in finely cut raised letters. The plinth of Crystal Lake or Rocklin granite, 3 ft. square by 10 in. thick, polished. The cap of Rocklin granite, 3 ft. 11 in. square by 1 ft. 10 in. high. The face of the cap polished on four sides.

The figure to be made of the best light vein Italian marble, 2 ft. 6 in. by 2 ft., by 6 ft. 10 in. high. The same to be cut from a photograph of Mr. Gridley, so as to closely resemble him.

The concrete foundation is to be 6 feet 8 inches square and not less than 6 feet 6 inches deep. The monument will be reared in the Grand Army plat, which has been graded for the purpose. The contractors, Knealey, Spellman & Co., have completed the foundation in a manner entirely satisfactory to the committee, and are only waiting for the arrival of the statue from Italy to finish their work.

The Secretary of the Treasury has just written the committee that there are ample provisions in the statutes to authorize the free entry of the statue. An effort is also being made to secure from Alcatraz 14 pieces of ordnance, to be used in further ornamentation of the plat in which the monument is to be erected; and as Gen. Howard and ex-Congressman Louttit have interested themselves in the matter, there is some hope of obtaining the coveted cannon.

The collections already made lack but $77 of the amount needed to pay for the monument, and there will probably be no trouble in obtaining the balance. The veterans intend to give two entertainments at the Avon theater on the evening of Decoration Day and the evening following, the proceeds, after the expenses of Decoration Day are paid, to be turned into the Gridley fund.

Birthday Greetings.

An agreeable and genuine surprise was tendered Mrs. Eliza Brooks at the home of her daughter, Mrs. Jones, on Tenth street, Oakland, on Wednesday evening of last week, by members of Temescal Grange, of which she is the eldest member, having completed her 82d year.

Songs, recitations, instrumental music and speeches, interspersed with general conversation enlivened with good humor and ready wit, made the evening very enjoyable to all. A noticeable feature of the occasion was the presence of four generations of Mrs. Brooks' family, including three great-grandchildren. During the evening refreshments were served by the hostess, Mrs. Jones, assisted by her daughters and little granddaughter.

Until a late hour, the friends lingered with the noble woman whom all delighted to honor as one who, having buffeted the vicissitudes and changes of 82 years, stands erect, cheerful and happy, growing old gracefully and beautifully—a grand example for all to follow. The esteem in which she is held found expression in substantial tokens and varied gifts left by many friends.

EDEN GRANGE has invited Temescal Grange to join in the conferring of the fourth degree on a class of five, meeting at Haywards at 10 o'clock A. M., Saturday, May 28th. Pleased to note the progress of their nearest neighbors, Temescalites will delight to respond to so agreeable a call, even on short notice.

BRO. SAMUEL CLIFF, a member of Temescal Grange, has been appointed justice of the peace and notary public at Creston.

Gridley and His Sack of Flour.

[Written for the RURAL PRESS by MRS. W. D. A.]

In the spring of 1864 fairs were held all over the land to recruit the funds of the Sanitary Commission, which had already used over $3,000,000 in following up the advance in readiness for battle; in bearing, from the heaps of dead and dying, the wounded to quarters of comfort; and on the retreat, ministering to agonized men who begged for water or to send a few words home.

Meanwhile, the need for money to keep up the work was pressing, and none felt the piteous appeal of soldiers helpless, hapless, on the field, more than the sympathetic war-Democrat Ruel Colt Gridley, who bethought him to auction his sack of flour for the commission—each one buying it, to put it up again for sale. He had borne it, trimmed with streamers and flags, through the main street of Austin, from Upper Austin to Clifton, a mile and a quarter, to the air of "John Brown," to pay a wager that the "Democrat nominee for mayor would be elected."

I am indebted for the facts to an ably written pamphlet issued by Rawlins Post, G. A. R. Dr. Herrick accepted the wager, and if he lost was to carry the flour from Clifton to Upper Austin to the tune of "Dixie." A witness of the jolly good time says it was the best of fun, enjoyed by old and young in those happy-go-lucky mining days. Rich and rabble made up the procession, lookers-on cheered and steam-whistles blew.

THE GRIDLEY MONUMENT.

First came the city officials elect; then 36 mounted men followed by 10 musicians; then Dr. Herrick carrying Mr. Gridley's hat and cane; then the tall, shapely form of Mr. Gridley himself, with the flour from his store; beside him, his son of 13, with a flag; then the Democratic City Central Committee, two of them carrying banners, another, a pole with a great sponge at the top, and another a broom, followed by the delighted people; while boys and Indians brought up the rear. The crowd lustily rang out the song chorus and encouraged Mr. Gridley in true miner spirit. At Clifton, Mr. Gridley, with the dignity of defeat, gave up the flour, and Dr. Herrick took it with a winner's courtesy. The flag was surrendered and the sponge handed over, signifying the right to absorb all offices; the broom, too, acknowledging a clean sweep.

After expressions of mutual good-will arose the query, what to do with the flour? The proposition to make Republican griddle-cakes, allowing Democrats none, drew protests of fealty to the Union from Democrats. Mr. Gridley tested the crowd's vaunted loyalty by the plan of auctioning the flour for the soldiers.

Wild cheers greeted this proposal. T. B. Wade, auctioneer, cried off the first bid to Mr. Gridley for $300, a Republican $350; Mr. Buel, beaten candidate for mayor, bid a certificate of the Indian Department, $1115, but all bids were payable in gold coin, and the munificent offer was rejected. Five thousand dollars was paid over and two blocks of lots in Watertown—one given by Mr. Buel.

With Mr. Gridley on a fine horse, the procession formed again and escorted the hero in triumph home. He paid the express charges and sent the money to the commission.

Gold Hill wanted a chance, so on May 16th a procession, with Mr. Gridley, formed through the main street to Maynard block, where "silver-tongued" Tom Fitch spoke, and the flour realized $5225. The procession was christened "The Army of the Lord," as it marched through the canyon with flags and music to Silver City, where in all $1375 was raised; thence to Dayton, where $1847.50 footed up for the fund on Carson river.

Through all the Washoe mines it was sold, till $22,000 more was placed to the credit of the Midas sack of "Austin Sanitary Flour." Virginia City outdid all others, contributing $12,995 in coin and considerable mining stock. To Sacramento and San Francisco he took the magic sack, selling and reselling it, till when he started East $63,000 stood to its account, with three blocks of lots in Austin, worth $7000, and a house and lot in Dayton.

Through all his journeying, he bore his own expenses and the expressage of money, and raised in coin $275,000, in all nearly $300,000.

Returning with neuralgia in his limbs, to retrieve his business losses, he had to be moved on a bed to a warmer climate. Getting a little better, he opened a small store, which he left his family, at his death, in Modesto, Nov. 24, 1870.

Religion and love of fellow-men was the basis of his life. From his seventeenth year he had been a member of the Methodist Episcopal church; sometimes class leader, and sometimes Sabbath-school teacher.

In our country's need he raised this unrivaled help; yet rich in peace, dulled by plenty, she heeds not the call for a few thousands for the wife who cheered him on and the children made poor by the father's patriotism and early death; and to Stockton, unaided, is left the honor, under Rawlins Post, G. A. R., of moving his remains to the army lot and erecting a monument, where around him will sleep his family, and around them the soldiers he loved.

His work, more glorious in its results than story or granite can tell, does him infinite honor; yet we may perpetuate our gratitude through coming generations by rescuing his name from oblivion, and his deeds shall be told as long as our country's history is read.

His eldest daughter was buried a few years ago. The second one, with health broken by going out to sew steadily, has gone, accompanied by the youngest daughter, to the little mountain ranch of the son, who can only take care of his own family. Her doctor hopes that the air and rest will save her from rapid consumption. The youngest daughter worked in a candy factory.

Stockton, May, 1887.

FROM SAN LUIS OBISPO COUNTY.—Brother J. V. Webster spoke at some length in Temescal Grange, on Saturday last, giving an interesting account of the progress of improvements at Creston, where he is cultivating a fruit-farm, and Brother Cressy is establishing a large stock ranch. The growth of trees and vegetables has proved very favorable by good cultivation. The summer-fallowed crops now growing alongside of winter-sown grain are quite surprising to some of the old inhabitants. Brother Webster's remarks were listened to with much interest, and created a desire on the part of many to visit that rapidly developing section of the State. Interesting remarks were made by other Patrons, and a recitation given by Miss Jessie Weed. The meeting was well attended, and regrets expressed that Brother Webster must so soon return to San Luis Obispo.

State Grange of Oregon.

The State Grange met in the Capitol at Salem, May 24th, with a full attendance of delegates from Oregon, Washington, and Idaho.

Gov. Pennoyer welcomed the Patrons, remarking that it was peculiarly appropriate for the Chief Executive officer of the State of Oregon to bid the State Grange welcome to its Capitol, inasmuch as agriculture was by far the chief industry of the State. He alluded to the fact that in the earlier days of the republic, agriculture was the most profitable industry of the nation, but now it was the least profitable. He attributed its present condition to vicious class legislation of Congress, which had always been adverse to the farmer. He quoted figures from the last census, showing that with more than $10,000,000,000 invested in agriculture, the yearly products only amounted to $2,000,000,000, while with less than $3,000,000,000 invested in manufactures, the yearly products amounted to $5,000,000,000, and that the average profit of farming was only 12 per cent of the capital invested, while the profit of manufacturing exceeded 36 per cent. He said that while the manufacturer was protected by law from the competition of cheap labor, the farmer had to sell his wheat in competition with such cheap labor. He alluded to the great wrong perpetrated by the Federal Government; a wrong unparalleled in all history, of collecting its taxes from the industry instead of from the wealth of the country, and declared that the farmers should unite with the laboring men in demanding a graduated income tax, by which the wealth of the country would be compelled to aid in bearing the burden of taxation.

Grand Master R. P. Boise's annual address showed the Order to be in a flourishing condition in the northwestern jurisdiction.

The Grange in Nevada County.

The Grass Valley *Tidings* last week, noting the movement to establish a subordinate Grange at Nevada City, took occasion to say a good word for the Order, as follows:

The farmers and fruit-raisers of this county are awaking to a realizing sense of their importance as a great factor in the future prosperity of the pioneer mining section of the State. And they are also beginning to realize that to exert the most good, to obtain the best prices for their produce, in fact to accomplish the best results in anything and everything they undertake, organization is imperative. The fruit-raisers in particular are interested in this matter. In the last year or two the fruit-raising industry has come to the front as being peculiarly adapted to the lands and climate of Nevada county, and the fact has been evolved that "there's money in it."

As an evidence of the interest being taken in the matters spoken of above, we will state that the Grass Valley Grange, a fraternal organization of agriculturists and fruit-raisers—Grangers, as the name implies—is increasing its membership at every meeting. Many who withdrew from its ranks years ago have returned, and many new recruits have been gained. The Order is strictly non-sectarian and non-political, its sole objects being to promote and foster agricultural and fruit-raising interests, and, by co-operation, secure special privileges and immunities for its members.

There can be no reason why such an organization should not be effected at the county seat. Its members, by co-operation, by counseling together, by precept and by example, would, in a few years, make a decided change for the better in the aspects of things in Nevada township. As that township also enjoys a large and steadily increasing fruit business, the influence of a Grange cannot be overrated.

DANVILLE GRANGE'S young people gave a party on the evening of the 13th. "M. J. S." writes the Martinez *Item* that the hall was decorated beautifully with long festoons of flowers, under which 25 couples kept time to the merry strains of Schwartz's band.

WHEATLAND GRANGE hold their annual strawberry festival to-day (28th), and have kindly invited Yuba City Grange to participate.

Residence of Andrew Wolf.

In our Home Circle columns upon a following page may be found an engraving of the elegant modern-style residence of Andrew Wolf, of Stockton. The many friends of Mr. Wolf and his estimable family, who have not been able to visit them in their home, will be glad to know that they are so nicely domiciled. Mr. Wolf is an old resident of Stockton, and has been prominent in various industrial enterprises. He is a pioneer member and Past Master of Stockton Grange, and a popular business man of long standing success. A sight of his home should teach all the duty of expending liberally and tastefully, if it can be afforded, to place one's family in the midst of delightful surroundings.

On San Joaquin.

On San Joaquin, on San Joaquin,
How rolls the tide of living green;
How sweeps the wind through billowy grain,
How falls the long-lent loving rain.

O San Joaquin, so wide and free,
How swells thy distance like the sea!
Soft winds that love thee, speed away,
No barrier waits thy perfumed sway.

O gentle skies, so blue above,
The valley of my leal and love,
How fair art thou, though burnished clear
Or hung with rainclouds drooping near!

On thy horizon far and fine,
The mountains stand in dim outline,
Whence rivers slow descend, to keep
Their strong long currents to the deep.

Oh, toss thy billows, San Joaquin,
Thy lifted waves of sunlit green.
O flowering stretches, glow and shine,
The homage of my heart is thine.

I know how sweet the mornings rise,
Borne westward from the radiant skies,
With misty vail, all fresh and fair,
Entangling bird songs in the air.

I know how calmly night looks down
Clear-visioned in her starry crown,
Whose moonlight all the distance fills,
And trails the far-off western hills.

On San Joaquin the rustling grain
Bears on the joy of toil's refrain;
The vines sway low, and clover meads
Unroll the wealth that toiling speeds.

On San Joaquin! On San Joaquin!
The world thy beauteous tides has seen
The circling years shall bring to thee
Great glory for thy destiny.

—*Lillian H. Shuey, in Record-Union.*

Kitchen Angels.

[Written for the RURAL PRESS by MRS. J. M. K.]

We frequently see the busy housewife and mother spoken of lately as a kitchen slave; but when a writer in a late RURAL alluded to her kitchen help as a "ministering angel," many thoughts were suggested to me. Dare I express them?

It seemed a strange reversing of terms, that one who worked in her own home for the comfort of her own loved ones should be a kitchen slave, while she who worked among strangers for hire was a ministering angel.

Who would not wish to be the angel of the kitchen as well as the lady of the parlor? What higher aim can we have than the training of our daughters to bless through the simple ministry of the kitchen?

In what sense can the mother be the slave, the help, the angel? Doubtless because through ignorance and want of strength the poorly executed work was a burden to which conscience, like a cruel taskmaster, was ever urging on.

The angel we suppose knew just how, and was endowed with buoyant health, loved her work, hence seemed only stooping to bless.

I do not read of kitchen trials without sympathy, knowing by experience the whole sad story of overwork, and the difficulty of getting desirable help at such wages as a small farmer or mechanic can afford.

How delightful it would be could we each install in our kitchen an angel. Then our daughters might spend their days with music, painting, and embroidering, the mothers find relaxation from intellectual pursuits working in gardens of roses and lilies. But this Utopian condition of things will not come in our day.

While the farmer pays the taxes he does, and sells his products for so small a margin of profit; while the mechanic and day-laborer toil so many hours for scant wages, shall their wives feel that fate is unjust to them if they must do the housework?

It is no more than our rightful share. That so many of us find it a heavy burden demands inquiry as to causes.

First, insufficient training for the responsibilities we have assumed.

Second, less health and strength than our grandmothers had—than a well-endowed woman should have.

Third, too great demands of fashion, in dress and living.

Sisters, can you candidly scan this list and not acknowledge that in some combination of these causes your difficulty lies?

One of the most serious problems for the mothers of to-day is "How shall we raise our daughters so they can carry life's responsibilities more easily?" The subject of training for these includes right views of labor and its relation to higher culture.

Often as we hear it asserted from platform, pulpit, and newspaper, that labor is honorable and the workman worthy of all respect, we still find the sentiment cropping out almost everywhere, that a knowledge and taste for housework is not natural for ladies of refinement and education—that it is ever a cruel fate that exacts it from them. This sentiment fills the young housekeeper with self pity, until she unconsciously poses as a martyr for the sympathy of others. The same is to blame that nearly all the intelligent women who would be companionable in our homes, prefer harder situations at starvation wages.

The most weighty and difficult part of our problem is that of guarding and promoting the health of our daughters that they be not bankrupt in vitality before middle life.

The third cause of our slavery, demands of fashion in dress and living, we can all at once deliver ourselves in some degree from this bondage. It is gratifying to know so many are working along this line. The demands must be brought down to the capacity of the average woman. Experiences in this line are all interesting. Still I dare not give my own lest Mrs. Grundy read this page. As results, however, I secure from one to two hours a day for reading—have just finished the C. S. L. C. readings for the year, find it very interesting, and hope to continue.

Life's duties present themselves to my view rather differently now, viewed through spectacles.

First seems your own health, as so much hinges upon that. Next some means of continued mental improvement. There must be some way found out of this slavery of ceaseless toil.

If we can afford to engage an angel, by all means let us do so, being sure to accord her the consideration she deserves. If not, after pressing what service each can give from husband, hired-man and children, let us, if need be, as some one has said, "Eat off the head of a barrel and dress like John the Baptists" all the days of our lives, rather than work ourselves into an early grave.

Tracy, Cal.

BETTER LATE THAN NEVER.—A recent convert of the Salvation Army went into a shop in Sedalia, Mo., and asked the proprietor if he remembered what axes were worth in 1872. "About $1, I guess," was the reply. "Well, then," said the Salvationist, "I want to give you a dollar. In 1872 I stole an ax that was displayed in front of your store."

RESIDENCE OF ANDREW WOLF, ESQ., OF STOCKTON. [For description see preceding page.]

The A B C of Astronomy.

[Written for the RURAL PRESS by ASTRON.]

It is a very humiliating fact that many persons of somewhat enlarged culture are utterly ignorant of the simplest elementary truths of the science of astronomy.

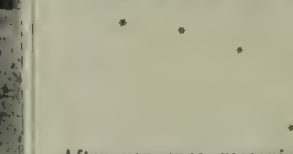
Many years ago I was aboard a steamer on the Mississippi river, admiring the rising moon, and observed to a gentleman fellow-passenger: "What a magnificent sight it must be to the inhabitants of that little orb, if she has any, to observe an earth rise, a body appearing to them four times the diameter the moon appears to us; or, as the diameter of a large dinner-plate to that of a gentleman's watch."

What was my astonishment to have this man, respectably dressed in black, in the garb of a minister of the gospel, turn upon me like a demon, covering me with the vilest abuse, so as to attract the attention of a large crowd on board, who inquired what was the nature of our violent disputation. I recited to them my little essay on the moon and earth, which had caused this tempest in a teapot, and for the remainder of the voyage I became the lion of the party. My opponent was in the sulks till the last day of our being on board, when he came to me extending his hand and saying: "Young man! I have forgiven you, and have prayed to God to forgive your heresy. Be not wiser than the word of God. Recollect that moon that you lectured on, a few nights since, in company with the stars, are only lights for our earth. Does not the holy Bible say, in the 16th and 17th verses of the first book of Moses called Genesis, 'And God made two great lights, the greater light to rule the day, and the lesser light to rule the night; he made the stars also. And God set them in the firmament of the heaven to give light upon the earth?'"

We parted, he commending me to the mercy of God, and I pitying him for manifesting such hopeless ignorance.

I could add many more examples to illustrate and confirm my assertion. I know a professor in a medical college, an expert in sawing off legs, cutting for calculi in the bladder, etc., yet standing appalled before the mystery of the fixed position of Polaris, and why Venus is sometimes a morning and sometimes an evening star. This professor was my teacher in anatomy and surgery, but became my pupil in elementary astronomy.

I owned at that time a refracting telescope, a little over three inches objective in diameter. I took the same to his house and showed him and his estimable wife Jupiter and his four moons, and Saturn and his rings (the telescope was not powerful enough to show his moons), also the moon nearly full; and if I told you the intense surprise and pleasure these good people manifested, you would perhaps hardly believe me. It opened to them a new field of thought. I explained, as far as I was able, how astronomers arrived at the present conclusions in astronomical science. This is what I purpose doing in these elementary lectures. I do not intend them to supersede regular treatises on this noble and fascinating science, but only to give a mere glimpse of the promised land, so that readers of this newspaper, ignorant of this great department of human knowledge, may be diverted for a moment from reading an account of racehorses, baseball and Interstate Commerce Acts, and perhaps cut out these simple offerings and place them in a scrap-book for future reference. Amen.



All the sciences appear to have arisen from chance or mysticism—witness astronomy from astrology, chemistry from alchemy, galvanism from a frog, steam-power from the lifting of the cover of a teakettle of boiling water, geology from the observation of the rending of rocks, displaying minerals, etc. In fact, geology for a long time was considered only a branch of mineralogy until such men as Humboldt, Werner and Lyell changed its place in the great circle of the sciences, ennobled it, and made mineralogy a subordinate science.

Astronomy is a much nobler science than its title would indicate. We owe the name to the Greek language; *astron*, a star, and *nomos*, a law or rule. Modern astronomy, with its instrumental appliances—the telescope, spectroscope, camera obscura and the higher mathematics—enables puny man to measure and weigh our sun and his attendant orbs; to gauge the heavens and tell us what the various configurations the constellations and groups of stars will assume millions of years hence, pierce the mysteries of the great Cosmos, showing new systems forming from nebulous masses in space, and according to some astronomical pessimists, not only their birth, growth, and maturity, but their old age, decay, and final death. Surely such a science is worth studying.

In this preliminary lecture let us try to get on a little with "A." First, let us look up into the great concave above us; wait patiently for an hour or so and observe. We shall soon be rewarded by a comparative familiarity with those brilliant gems. We shall soon notice that some are much brighter than others. If we could be transported on the wings of light to any and every part of our planet, we should find only about 20 of these very effulgent orbs in space, called stars of the first magnitude, and among them one particular star outshines them all. It is named Sirius in the constellation of *Canis Major*, or the Big Dog.

Now borrow or buy a pocket compass. One end of the needle with the arrow-point will direct you to the north. Lift your eyes in that direction to the heavens and nearly midway between the horizon and the point directly over your head, you will notice a star not a very bright one; this is the pole star, "Polaris," in the constellation of *Ursa Minor*, or the Little Bear.

If you continue gazing lower down toward the horizon, you will notice a particular group of stars, named *Ursa Major*, the Great Bear, the Great Dipper, or Charles' Wain. Seven of the stars of this group form the most remarkable constellation in the northern heavens.

After you once recognize them, they will never be forgotten. With this group you will be able, by what is technically called alignment, similar to a base line in surveying, to make acquaintance with all the constellations in the northern and many in the southern hemisphere.

Mr. Bowser's Experiment.

Well, the long agony is over and our pig is dead. One day last fall Mr. Bowser suddenly turned on me with:

"Mrs. Bowser, why don't we keep a pig?"

"Because we have no pen, no place for one, and don't want the nuisance."

"We have plenty of room for a pen. I can make one in half a day, and we might as well raise our own pork as to buy it. The kitchen stuff you give away would fatten three pigs."

I talked and argued, but it was no use. I brought up our poor success with hens, but he choked me off with:

"Mrs. Bowser, perhaps you may not know the difference between a lean, old, heartbroken hen and a choice pig, but I do and we shall keep a pig."

"Well, don't ask me to bother with it."

"No one intended to! On the contrary, I hope you will keep as far away from him as possible. You can also buy your own pork chops next winter."

During the next three days Mr. Bowser was pig-hunting and pen-building, and at length a terrible squealing in the alley informed me that his purchase had been made. I went out after a bit and found a thin, cadaverous, wild-eyed beast, weighing about 50 pounds, in the pen.

He uttered a "woof!" and made a spring at me as I looked over, and Mr. Bowser came from the door and roared out:

"What are you doing there? Do you want to scare that pig to death?"

"I was simply looking at him."

"Well, you simply keep away for awhile! That pig is strange. He's got to have time to look around. Any one knowing bran from broomsticks wouldn't go rushing up to a pig-pen like that!"

"What breed is he?"

"Shorthorn, of course. You don't think I'd fool away my time on a common pig, do you?"

"Why, I never heard of a Shorthorn pig before."

"Oh, you didn't! There are a great many things you never heard of, Mrs. Bowser, and probably never will!"

"He's very thin."

"Thin! Of course he is! If he was fat he couldn't hold half our kitchen stuff."

"Just hear him take on!"

"Go away with you! It's your voice that excites him! Mrs. Bowser, if that pig bursts a bloodvessel you will be to blame for it, and it will cost you $8 in cash!"

I went into the house and the pig seemed more quiet. Mr. Bowser fed him corn, potatoes, apples, swill, cold biscuit, a rib of cold beef, peanuts, grass, half an orange, and a banana. When he came in he rubbed his hands and chuckled:

"Seems almost like being on a farm again! I ought never to have been anything but a farmer."

We had scarcely finished supper when the pig began to squeal. Mr. Bowser went out and walked seven times around the pen without being able to find anything wrong. The pig had a good bed and an abundance of food, but he stood in the middle of the pen and kept up a doleful squealing, and it was not until Mr. Bowser knocked him down with a fence-picket that we got an interval of rest. He squealed from 8 to 9 without a break, and when Mr. Bowser came home at the latter hour, he punched him with a hoe-handle and secured another respite. We had just got to bed when the doleful music began again.

"He's the uneasiest pig I ever saw," I ventured to observe, "and I wonder you didn't get some other breed."

"Mrs. Bowser, did you ever own a pig, shoat or hog in all your life?"

"No."

"Then don't give me any more talk! When I want your advice I will ask for it."

"But is he to squeal all night?"

"If he wants to."

I think he did. He got a little hoarse about 2 o'clock in the morning, but he managed to make his voice heard all the same. Mr. Bowser went out and fed him cut loaf sugar and some Saratoga potatoes, and for an hour or two he stood in the corner of the pen and seemed buried in reflection. Then he suddenly appeared in the back yard and rooted up six dollars' worth of new sodding and two beds of flowers, and the cook and I had no sooner got him into the pen than he began squealing again. During the afternoon Mr. Bowser remained home and worked the fence-picket racket so vigorously that by night the pig got it into his head that the less he was heard from the better.

The next day the animal got out twice, and it didn't take but 12 of the neighbors to get him back. After the first night and from that to the night of his death, he rested one hour and squealed the next, as regularly as clockwork. The day he didn't get out of the pen was a dull day in our house. The night we didn't wish him dead and threaten to murder him in the morning was a rare exception. On several occasions I said to Mr. Bowser:

"I believe that man cheated you on the pig. I never saw an animal act as he does."

"Cheated me! Oh! yes. I've lived in this world 45 years to be taken in by a farmer who doesn't know whether Julius Cæsar was a blacksmith or an alderman!"

By and by the pig got his appetite, and a pail of swill was only a mouthful for him. Mr. Bowser sent up corn and meal and buffalo feed and several other sorts, but the more we mixed the more the pig ate, and the more he ate the thinner he got. It somehow got out that we had a Shorthorn pig, and, after hearing hundreds of comments from people who sneaked up the alley to see the creature, I said to Mr. Bowser:

"I can't find anything in the agricultural papers about Shorthorned pigs."

"Oh, you can't! Did you find anything about a slipshod woman going around the house with her mouth full of hairpins and her ears open to catch all the gossip?"

That was the last time I ever mentioned the pig to him. I slipped out to the pen now and then and saw that the beast was growing thinner and hungrier and more wild-eyed, and my ears told me that his squeals had become four tones sharper. The other morning as we sat down to breakfast the cook announced that the Shorthorn was a corpse.

"What! dead!" shouted Mr. Bowser.

"Yes, sir."

"Then, Mrs. Bowser, you can countermand that order for the cloak! You were determined from the outset to drive that pig to death, and you have finally accomplished it!"—*Detroit Free Press.*

YOUNG FOLKS' COLUMN.

Fables.

[Written for the RURAL PRESS by "NETTLE."]

I.

The Lion and the Men.

A lion was once walking in the edge of a forest, when a wounded stag called to him and begged him to put an end to his sufferings. The lion was not hungry, but was perfectly willing to kill the stag, and did so, afterward walking off. He was soon pursued by a party of men, and not being able to escape called to them that if they would spare him he would never again trouble either men or men's property. The men retorted: "We have found a noble stag just slain by you and left. Do you suppose you would find it possible to keep your promise? It is best you should die."

"But," the lion said, "I killed that stag only because he was in pain from a wound and wanted me to end his painful existence. You can see for yourselves that what I say is true, because I did not attempt to carry off the carcass."

The men smiled in derision, and immediately decided that what the lion said was not true, because it did not sound reasonable. They attempted, therefore, to kill him, but, making extra exertions, he succeeded in escaping. Wanting revenge, and knowing the men would return for the stag, he hastily went by another route and hid the stag in the bushes, and then, as he lay concealed, enjoyed the pleasure of seeing the men surprised and disappointed at not finding the stag.

Moral: The world may judge wrongly, yet be not thou alarmed; the right shall eventually triumph.

II.

The Spider and the Fox.

A spider was once making a meal off a fly when a fox watching her said: "Strange you cannot let a poor, worthless, innocent fly live! What harm did that little creature ever do you?"

The spider replied: "I saw you carrying home a hare yesterday; you are supposed to have superior wisdom, but what were you going to do with that poor, innocent creature?"

The fox did not immediately reply, and the spider continued: "We each sustain life in the way it was intended we should, but if you think a reform is needed your efforts may have more weight if you reform yourself first."

Moral: First be sure that you do not need just as much as they the advice you give others.

III.

The Small Birds and the Hawks.

The smaller birds once held a convention to devise measures by which they could protect themselves from the hawks. One after another suggested plans, but none were thought worth adopting, until finally a solemn-looking bird rose and said: "It seems to me, Mr. Chairman, that the best way to protect ourselves from the depredations of the hawks is for us to color our feathers gray, and then as we shall be less conspicuous the hawks will not be apt to catch as many."

This advice was considered good and was carried into effect, but after a very short time the birds found themselves in a worse strait than ever, as now they could not, at a distance, distinguish between friends and enemies, and when the hawks had approached near enough to be identified they were too near for the small birds to escape.

It was then found that the bird who had given what they thought such good advice was a young hawk, who had disguised himself for the purpose of entrapping them.

Moral: To judge by appearances is far more than foolish; it is dangerous.

Haywards, Cal.

What Florence Thinks of Fresno.

DEAR EDITOR OF THE RURAL:—We have just moved to Fresno City and we are delighted with the place. It has beautiful flower gardens, and beautiful avenues lined with beautiful poplar trees. We live on Poplar avenue. Fresno City has seven churches and a beautiful courthouse. It has two schools. The public school has about 800 pupils.

The country around Fresno City is occupied with beautiful vineyards; among them are the Fresno vineyard, the Eisen vineyard, the Barton vineyard, the Butler vineyard, and others that are too numerous to mention. There is quite a tide of Eastern immigration coming into Fresno every day.

Papa has been taking your paper for five years; we would hardly know how to get along without it. It is a welcome visitor to our house. Papa is trying to get every one to take your paper. You will please excuse the shortness of my letter. I will try to write more the next time if you think this letter worthy of a space in your columns. This is my first contribution to a paper. FLORENCE POOL.

The Story of the Golden Chain.

[Written for the RURAL PRESS by HUBERT CHAPIN.]

I was lying snugly beneath the earth with some of my companions, when I felt a dreadful pain. I had just enough time to look around and see a peculiar creature with some kind of a tool pegging away at me.

He soon found my comrades, and dragged them from their hiding-place. We were then carried up out of our home in a kind of box. Some of these creatures then took us to some kind of a place where they melted us in a large kettle. Then some stuff came out of us and settled at the top. The creatures called this dross. We had to go through innumerable processes before we felt very comfortable. After a good deal of torture, we were formed into little ringlets. We were afterward fastened together and received the name of The Golden Chain.

Where has the Cent Gone?

A goes to market with 30 eggs and sells 2 for 1 cent, receiving 15 cents. B also sells 30 eggs, but at the rate of 3 for 1 cent and receives 10 cents. C goes with 60 eggs and sells them at 5 for 2 cents. Thus C receives 24 cents for the same number of eggs sold at the same rate as A and B combined, while A and B receive 25 cents for theirs. What becomes of the remaining cent?—J. H. WHITE, *Danville.*

Answer next week.

A Giant Oak.

From the frequent mention of our monster redwoods and big trees, and the pictures of large logs from these trees, one at a distance might imagine that we do not have other large trees. The engraving on this page shows a giant oak which grew about two miles from Stockton. The size and weight of the monster may be inferred from the host of animals mustered to transport it. Large oaks are quite numerous in some parts of our great interior basin and give the country a fine, grove-like appearance.

BIG DAMS.—Among the largest dams in the world for the purpose of storing water for mining purposes are the dams in Nevada. One is 425 feet long and 100 feet high; another is 576 feet long and 75 feet high.

DOMESTIC ECONOMY.

A Grange Essay on Bread.

Mrs. Lizzie McCormack, of Glendale, Ohio, recently read the following at a local Grange meeting:

To make good bread, three things are essential—good flour, good yeast and the proper amount of heat to produce fermentation.

I am now speaking of making bread in the winter, as in the summer, if your flour and yeast are good, it is sometimes difficult to keep the sponge from souring. Having my flour and dry yeast ready in the evening, I boil three large potatoes, pour the water off into the yeast crock, mash the potatoes very fine, and add the water; stir in flour until quite thick. When this is milk-warm add to it the yeast-cake that has been soaking in a little warm water; or in place of the cake I take a teacupful of the liquid yeast and add to the potatoes and water; then stir in my flour. This amount will be sufficient for eight loaves.

Place the yeast crock where it will keep moderately warm over night. In the morning sift the flour and put it in a warm place to take the chill off; this will hasten the bread rising.

When the flour is ready, pour the yeast on the flour in the bread bowl, rinse the crock with lukewarm water, or, better, sweet milk, and add this to the yeast with sufficient salt to flavor and a lump of lard as large as a hen's egg; mix quite stiff, and knead thoroughly, and place to rise.

When sufficiently light, make out into loaves. Right here, many make the mistake of using too much flour. If the yeast has been good, and the dough kneaded to the proper consistency, it should be smooth and elastic, requiring only a suspicion of flour on the board to mold the loaves.

As I place the loaves in the pans, I grease the sides of each loaf with a little melted lard, and when sufficiently light to go into the oven, I grease the tops of the loaves, thinking thereby to retain a more tender crust.

And now having the bread safe in the oven, let us give a thought to the flour we use. Have we gained anything by the new process? It is true we have beautiful white flour, which is delightful for biscuit, cake, and snowy white bread, but have we not lost the sweet, moist, nutritious bread that we made from our old-time flour? It is well to know that bread made from the new-process flour becomes dry and hard sooner than loaves made from the old-process flour.

SPONGE CAKE FRITTERS.—Six or eight square (penny) sponge cakes, one cup cream, boiling hot, with a pinch of soda stirred in; four eggs, whipped light, one tablespoonful cornstarch, wet up in cold milk; one-quarter pound currants, washed and dried. Pound the cakes fine and pour the cream over them. Stir in the cornstarch. Cover for half an hour, then beat until cold. Add the yolks, light and strained, the whipped whites, then the currants thickly dredged with flour. Beat all hard together. Drop in spoonfuls into the boiling lard, fry quickly, drain upon a warmed sieve and send to table hot.

POTATO BISCUIT.—Eight potatoes of medium size mashed very fine, four tablespoonfuls of butter melted, two cups of milk lukewarm, one cup of yeast, flour to make a thin batter, two tablespoonfuls of white sugar; stir all the above ingredients together except the butter, and set the sponge until light; four or five hours will be required; then add the melted butter, with a little salt and flour enough to make a soft dough, set this aside for four hours longer, roll out in a sheet three-quarters of an inch thick, cut into cakes; let them rise one hour and bake.

CROQUETTES.—Half a pound of cold meat, three tablespoonfuls finely chopped suet, three tablespoonfuls breadcrumbs, three tablespoonfuls of chopped parsley, one egg, salt and pepper, a little gravy made from the bones. Mince the meat finely, chop the suet, add all the dry ingredients and seasoning, mix well, moisten with a little gravy and make up into balls or small rolls. Dip each into egg and breadcrumbs, fry in hot lard. Serve with fried parsley.

CABLE PUDDING.—Bake in two layers. One cup butter, two cups sugar, one cup milk, 3½ cups flour, three eggs, one-half teaspoonful soda (strong), one teaspoonful cream tartar. Use yolks in cake; save whites for top. Beat white to stiff froth with sugar. After spreading on the whites, put cake in oven and let it brown. Cut and sugar pineapple, or any other fruit in season, several hours before using, and put between cake when hot.

The Week.

The turn of the kaleidoscope brings into view this week some of the prominent signs of progress in the rich region tributary to the city of Stockton. Our object in specializing is to bring the various parts of the State into more definite view by grouping their leading characteristics. As conditions favor the effort we will do for other regions as we do in this issue for the district named. Whatever temporary advantage any district may enjoy is overbalanced to the regular reader by the opportunity of becoming acquainted with the many and diverse charms and resources of the whole State.

Our National All-Souls Day.

It was long the custom in the early church to go out into the cemeteries and under the drooping willows and gloomy cypress, say mass for the dead, pray for the repose of their souls, and lay garlands of flowers upon their graves. It is still a fit and beautiful custom for us at special times to remember the dead, not from any foolish fancy of making their future any better, but to brighten more vividly the blessings of good we have received from them, or to so far revive the memory of evil they did that in our broader light we may learn how to excuse their follies and mistakes and rescue their names from the shadow of reproach.

To remember our own dead is easy and natural, and full of sweet fragrance. Their dear images steal upon us in silent and even in busy hours, glide through our wakeful thoughts and night visions, so that it is hardly possible to tell when they are absent from the mind. The loved dead are very real to us. They are as near to us as we are to ourselves, for they are a part, and a very large part, of ourselves. They are talked about more than the living. They inhabit the rooms, occupy the chairs, sit at the table, greet the household in the morning, and in the evening bid us the old pleasant good-night. The aroma of their presence is upon everything. They speak to us in every book, in every album; look down upon us from the pictures upon the walls, and come to visit us in snatches of old songs. We love to visit the silent spot that hides their dust and hold there our sacrament of thought and tears. But while all days are days of remembrance for the dead, the loved, the good, the beatified, it is well and salutary to have some special moment when we may recall the memory of those who were fellow-soldiers in this vast army of toil, care, struggle and temptation. For this purpose it has long been the custom in Catholic lands, and among some of the Protestant churches of Europe, to observe what is called All-Souls Day.

At the close of our Civil War there sprang up spontaneously all over the land the sentiment of remembering our brave dead by sprinkling flowers over their graves. In the heated passion and resentment of the hour, each side remembered only their own dead, but as time passed on passion began to cool and reason to regain sway, and now, quite generally throughout the country, the sweet hand of charity, in their graves to higher opportunities and grander achievements. Hence the best monument to our patriotic dead will be a people elevated and cemented by their sufferings, and the fittest decoration of their million graves the growth in their survivors of a better political ambition and a warmer fraternal feeling. Let us then rejoice that with each recurring year the memory of the great strife falls further into the background and will soon become to a happy, prosperous people, a sad and grand reminiscence its floral tribute, makes no distinction between friend and foe. Death glorifies the brave and true-hearted in whatever cause they may fall, and hence the 30th day of May has become our National All-Souls Day.

But while the object of preserving the recollection of soldiers' valor, patriotism, fortitude and self-sacrifice seems a noble one, still it is doubtful if the ceremonial observance of Decoration Day will become an established custom. It may gradually pass away with the present generation, as time levels the hillocks and mats all graves with one common sod. And perhaps it is well it should. While it is beautiful for the mourning friend to drop a flower on the grave of one dear to him, cut down in battle for a cause he feels was sacred, it still remains a serious question whether it is wise and beneficent for a whole nation to keep perpetually alive the memories of such a war by such a ceremonial tribute to its crumbling warriors. Disguise it in pretty words as we may, this day is a great company of shadows hovering over a terrible memory of national trial and agony. Of a civil war, a fratricidal war, forgetfulness of the past is best for the peace and welfare of the whole country. Let the dead past bury its dead. The distinction between right and wrong cannot be made clearer by sentimental observances. As in nature, the last year's leaves and stalks enrich the ground for the year's growth, so in the progress of men the generations have lain down that we might mount upon

RESIDENCE OF JAMES M. McCARTY, ESQ., STOCKTON.

The Home of J. M. McCarty.

The engraving of the residence of Mr. McCarty, on this page, shows that Stockton is a place of neat and comfortable homes. The design of the house bespeaks commodiousness and comfort. The grounds, with their growth of trees and ornamental plants, attest the adaptation of the Stockton climate to the luxuriant thrift of vegetation. It takes an exceeding short space of time to adorn and beautify a residence with beautiful environment, and the view of Mr. McCarty's home attests the fact that Stockton people appreciate the joys and benefits which come from enlisting Flora and Pomona in their home decoration.

EXCURSION TO THE SANDWICH ISLANDS.—On Tuesday afternoon, by the fine steamship, Australia, quite a number of prominent Masons, headed by Grand Master Atkinson, of Sacramento, and attended by members of their families and friends, left for an excursion trip to the Sandwich islands. The members of the party expect to be absent from one to two months. A large number of friends assembled at the wharf to bid the voyagers good-by. Honorable Wm. Johnston, Master of the State Grange, and his wife were among the joyous passengers. Mrs. Johnston hopes to improve her health by the voyage and change of climate. She will have the hearty wishes of all who know her, that her recovery may be speedy and complete. Mrs. Judge J. C. Merryfield is among the party from Dixon. Mr. Tyler Beach, proprietor of the St. James hotel, San Jose, was also among the well-known citizens aboard. We wish them all an agreeable voyage, profitable visit, and safe return.

The Wheat Situation.

The excitement in wheat holds up well, and the telegrams from Eastern centers continue to expatiate upon the operations of the bulls and bears, these animals seeming to have largely forsaken other gambles and confined their attention to the great cereal. In this market the situation is still strong, and so far as can be foreseen a good price will rule for the coming crop. There is every reason why this should be the case. There will be a wide falling off in this year's aggregate, as compared with 1886. The upper part of the great basin, or the higher counties in the Sacramento valley, are the most fortunate this year, and if no disaster overtakes the crop these counties will yield very respectable aggregates. Opposed to this, however, is the great wheat region of the San Joaquin valley, which, excepting favored localities in the northern and eastern edges, will harvest much less than last year. Leaving out the "west side," so called, much of which will not even give a cut of hay, some of the districts which produced the heaviest crop last year will lose 50 per cent of the weight this year. This, of course, leaves only one conclusion—that supplies for export will be reduced, and that the price should be improved. The price of wheat has for a long time been very low and the world's crops large. This year the turn of affairs sets in; other regions than California are short-cropped, and a step in an ascending scale of prices is to be expected.

It is impossible without a better system of reporting than now exists to arrive at a correct understanding of even the present condition of the crop in this State, more than we have outlined. The reports gathered by some daily newspapers and paraded with a great show of detail and definiteness are really more apt to mislead than instruct, unless they are read by one who is accurately informed as to the various regions named. The general public is not so informed, and the circulation of such reports at a distance from the State often does much harm to growers by depressing prices through spreading exaggerated views of prospective supplies. The reader sees, for example, two points named, one reporting a large percentage of increase, the other a large percentage of decrease, and he balances one off against the other. It is more than likely, as in recent cases we have noticed, that the locality reporting a large increase does not produce grain enough to supply its own needs, while the locality reporting decrease may be one yielding usually a vast surplus for export. The reader offsets one against the other—while in fact the small percentage of decrease in one case might mean as much wheat as 1000 per cent increase would in the other. It is because of the danger of misleading that we have always followed a very conservative course in reference to the various crop estimates which are put forth. They hurt the growers' interest nine times out of ten. The reports are tinged by the boom idea in many cases, and this should never enter a statement of crop prospects. There are agencies enough interested in bearing prices without allowing the real estate idea to lessen the value of what a farmer has worked for, and should get full value for in the market.

Until a *full* system of crop reporting is inaugurated by Government authority in this State, it is not likely that we shall have trustworthy reports. The Department of Agriculture is extending its work in this direction, and may, in time, cover the ground. It appears from recent reports, however, that conclusions are, of necessity perhaps, based upon insufficient data, and the estimate of this year's crop as compared with last is placed altogether too high.

WE are obliged to defer accounts of the Santa Cruz and other floral fairs, for which we hope to find room another week.

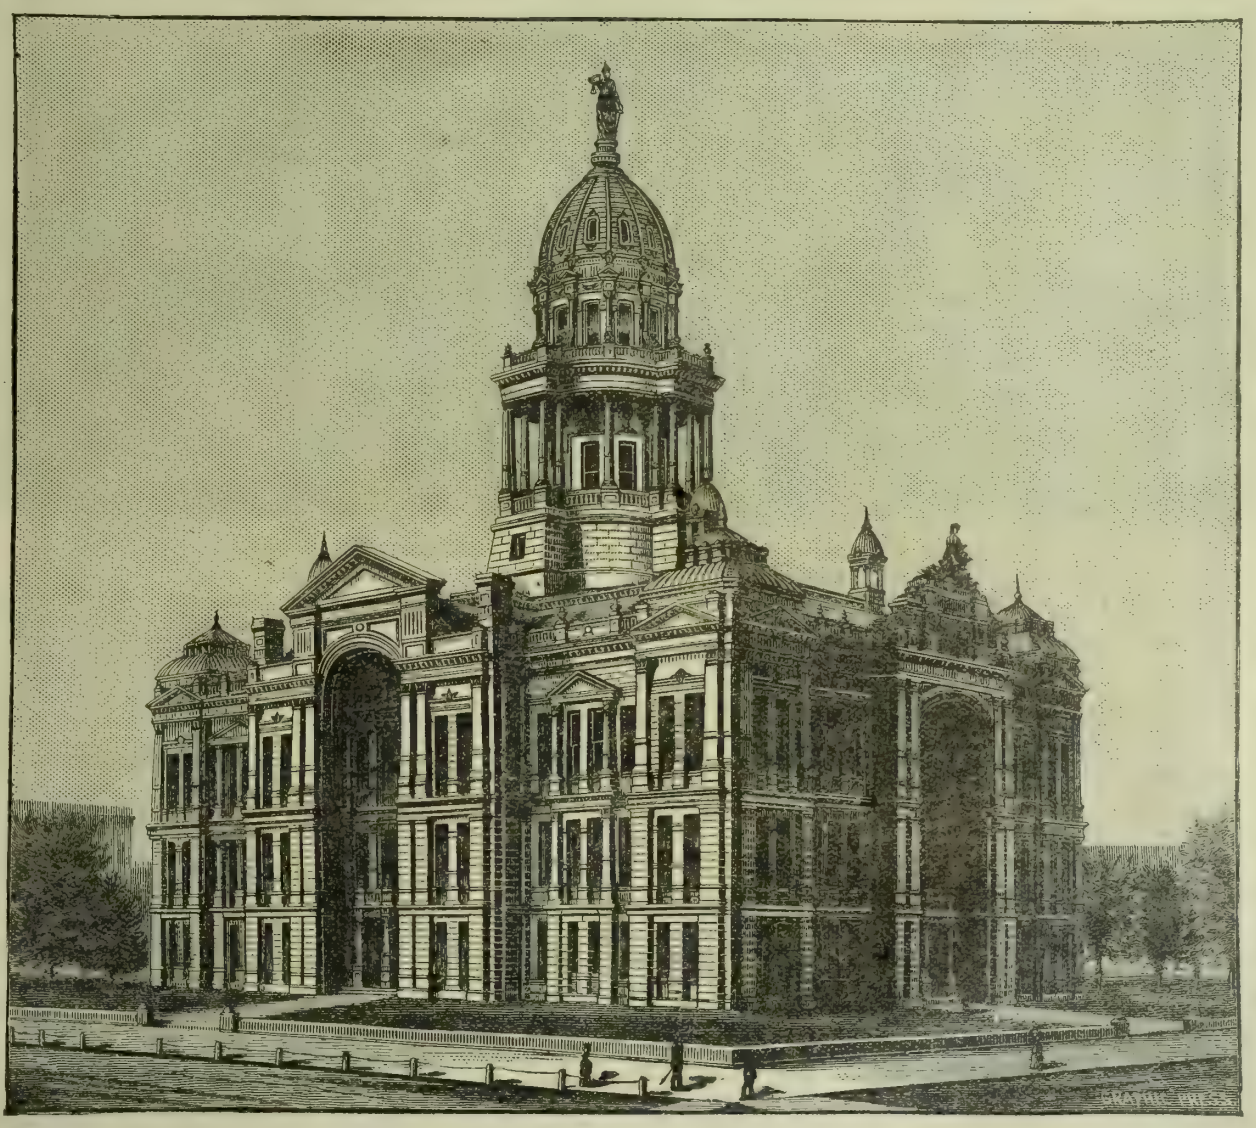
SAN JOAQUIN COUNTY.

The Basin of the San Joaquin River, Its Soil, Climate and Varied Productions.

STOCKTON AND ITS ENVIRONMENTS.

Its Industries, Trade, Commercial and Business Importance.

The Great Interior Basin.



What is known as the great interior basin of California was once an inland sea 500 miles long, walled in by the Sierra Nevada and Coast Range mountains. It is drained by the Sacramento and San Joaquin rivers, whose united waters at some remote period burst through the rocky barriers of the Coast Range and helped to form the Suisun, San Pablo and San Francisco bays, spacious harbors where all the warships and merchantmen of the civilized world may find safe anchorage. It was here that gold was first discovered that gave a new thrill to finance and adventure; and the still greater discovery made that the soil was unsurpassed in rich and varied productive capacity. The mountains abound with gold, silver, iron, and copper; quarries of granite, sandstone, slate and marble, and in the great timber belt the hum of the sawmill will be heard for generations to come.

San Joaquin Valley.

That portion of the great interior basin that is drained by the San Joaquin river is known as the San Joaquin valley. It is the heart of the great basin. This region has been so often and graphically described by Col. N. M. Orr, the late lamented John Gettis and other writers that we can do little more than coin over old silver, with the risk of imparting to it some alloy. This valley contains the largest body of arable land in one connected body in the State of California. It stretches from the dividing summit of the Sierra chain of mountains on the east to the Coast Range on the west and the dividing waters of the Sacramento on the north, and embraces the counties of Kern, Tulare, Fresno, Merced, Stanislaus, Mariposa, Calaveras, Tuolumne and San Joaquin. It is in the shape of a parallelogram, whose greatest length is 250 miles and greatest width 140, with an area estimated at 24,000 square miles or 17,560,800 acres. At the low estimate of 20 bushels of wheat per acre, this valley might yield 351,200,000 bushels per year, worth, at the low figure of 75 cents per bushel, the sum of $263,400,000. The fruits, wine, wool, stock and other productions would aggregate many millions more. In addition to the fertile and extensive area of valley lands there are immense tracts in the foothills of the Sierra Nevadas capable of yielding a great variety of products. The choicest quality of fruits, grapes and vegetables come from these sunny slopes, and command the best prices in the San Francisco market. Throughout this whole valley a wonderful amount of energy and skill has been displayed in developing its unlimited resources. In some parts vast tracts of arable land have been made more prolific through the agency of irrigation, and now, under the recently enacted statutes, important schemes are in process of development for utilizing the element that nature has plentifully provided for moistening the soil, and crowning the labors of man with joy and greater abundance.

San Joaquin County.

This county has been called the right ventricle of the heart. The appellation is fitting, for, though not the largest county in the valley, it occupies the most important position, from its situation at tide-water and accessibility to all the markets of the world. It takes its name from the principal river that flows through it. The average length is about 40 miles and the average width about 35 miles. The area is 873,195 acres, containing a population of 30,000—about 1 to every 29 acres. It is almost entirely devoted to agriculture. At one time there was considerable placer mining carried on in the northeastern part of the county, but little or nothing is now done in that direction. This county occupying the lowest depression in the great San Joaquin valley, the metalliferous formations, except along the eastern border, have been buried so deeply beneath heavy masses of alluvium and detritus, washed from the mountains, as to be placed beyond mining use. So deep is this deposit that an artesian well sunk to the depth of 1000 feet failed to touch the bedrock.

SAN JOAQUIN COUNTY COURTHOUSE, AT STOCKTON, NOW IN COURSE OF CONSTRUCTION.

The total number of acres of land assessed in this county in 1886 was 874,123 acres, and that under cultivation was proportionately about as follows:

	Acres.	Yield.
Wheat	300,000	4,500,000†
Barley	45,000	900,000†
Rye	6,000	120,000†
Oats	200	6,000†
Corn	500	20,000†
Potatoes	3 000	150,000†
Onions	200	10,000†
Sweet potatoes	300	12,500†
Hay	8,000	12,000‡
Watermelons	1,000	2,500‡
Beans	1,000	2 000‡
Grapes	1,200	4,800‡
Fruit orchards	2,000	5,000‡
Hops	300	2,000§

† Bushels. ‡ Tons. § Pounds.

The real estate and improvements of San Joaquin county were assessed for 1886 at $26,891,132, while the total assessment of the county, including personal property and railroads, was $34,073,882. The rate of taxation for county purposes was 44 cents upon each $100 of valuation. The average rate of taxation for the last 13 years is 67.7 cents. There is perhaps no county in the State that can make a more favorable showing.

There is a great variety of soil in this county, but none that is utterly barren or unproductive. Even the rugged, mountainous land in the southwestern part furnishes fine stock ranges, and is susceptible of profitable cultivation. About 150,000 acres of the swamp and overflowed lands in the western portion of the county have been successfully reclaimed, and where a few years ago were impenetrable bogs of flag and tule, the paradise of frogs, wild hogs and other mud-loving vermin, enormous crops of wheat, barley, potatoes, and all kinds of fruits and vegetables, are produced. In richness and variety of yield these reclaimed lands equal, if not excel, the famous delta of the Nile. Four crops of splendid alfalfa hay are usually taken from this land in a year. The alluvial soils along the Mokelumne and Calaveras rivers possess marvelous fertility, and are capable of producing an almost endless variety of crops. Corn, 60 bushels to the acre: and barley, 50 bushels to the acre. Hops and potatoes, the choicest variety of fruits, and all sorts of garden truck in unparalleled prodigality. The great body of adobe lands in the center of the county is strong and rich, generally from four to eight feet in depth, but a little inclined to be ugly and unaccommodating in the rainy season. Even the sand-plain lands, once supposed to be of little or no value, instead of being soon exhausted as was anticipated, have improved in quality under cultivation.

Though the cereal products have long been the chief industry, fruit-raising is beginning to attract considerable attention. Peaches, pears, apricots, plums, quinces, indeed almost every kind of fruit peculiar to temperate and semi-tropical climes, may be successfully and profitably grown. The orange, lime and olive trees thrive and yield a fine quality of fruit in some parts of the county. The strawberries, blackberries and raspberries that grow around Linden are the beauties of the San Francisco markets. The district embraced between the Calaveras river and the French Camp creek contains some of the finest grape land in the State. Mr. George West has the oldest vineyard in the county and has demonstrated grape culture to be one of the most remunerative industries. It is believed the time is near at hand when the great wheatfields will be divided to make room for a larger population, and homes garlanded in flowers and surrounded by orchards and vineyards will give a picturesque charm to these plains and make the atmosphere of the valley fragrant with peace, plenty and happiness.

"While upon much of the land of this county a great variety of products can be raised without irrigation, should it be found necessary to adopt a system of irrigation the water supply is easily obtained from the rivers that flow through the land it is proposed to irrigate. There are extensive gardens and orchards near Stockton, where almost every kind of vegetables and fruit is raised, where the only water supply for irrigating comes from wells, from which it is raised by windmills. There are also several flowing artesian wells from which large streams of water are obtained, in the central portion of the county. There is vineyard land in this county which yields its fortunate owner from $100 to $200 per acre net profit each year. There are thousands of acres of land unimproved which can be purchased at sums ranging from $25 to $100 per acre. While it takes time and money to change a wheatfield into a productive vineyard, the prospective benefits to be derived are a sufficient inducement to cause the work to be done. And the rich lands of San Joaquin county will not much longer be devoted solely to the cultivation of wheat.

"The county has close connection with the great railroad system of the State, a branch of the Southern Pacific passing through from the north to the south. A branch line runs from Stockton to Milton, in Calaveras county, and Oakdale, in Stanislaus county. The western and southern divisions of the Southern Pacific intersect at Lathrop. The San Joaquin & Sierra Nevada narrow-gauge railroad runs through the northern portion of the county from Bracks landing on the Mokelumne, past the villages of Woodbridge, Lodi, Lockeford, Clements and Wallace into Calaveras county. This road intersects the Southern Pacific at Lodi. At present the county is being visited by many persons from the East, who are making a thorough examination of the county with the purpose of making investments, and considerable land is being sold."

The City of Stockton.

Stockton is the shire town of San Joaquin county, and the largest city in the San Joaquin valley. It was born of a mining spasm, cradled in a prairie schooner and christened after Commodore Stockton, who commanded the United States naval forces on the Pacific Coast during the war with Mexico. It has been nicknamed "The City of Windmills," and it would have pricked the courage and heated fancy of that valiant old knight, Don Quixote, could he have seen at a distance on a windy day these Briarean giants twirling their fingers as if spoiling for a fight.

A Bird's-Eye View.

The topographical site and surroundings of Stockton can hardly fail to make a favorable impression upon a stranger. As he surveys from some vantage position the bold outlines of Mt. Diablo away to the west with its inexhaustible wealth of coal, the snowy crest of the Sierras away to the east containing the world's supply of gold and silver, the vast sweep of the San Joaquin valley, dotted with fields, orchards and

vineyards, all tributary to this market, and the deep, navigable channel to the sea, he will conclude, as Matt Carpenter did after riding over Chicago, that when the Almighty made this country He meant business. If he should happen to strike this city on Saturday, the stir and hubbub of sounds would naturally attract him to Hunter's Square. For a moment he might be inclined to suspect that the insane asylum or the San Francisco Stock Board were holding an outdoor-meeting here, but would soon discover that this was a market overt or a sort of open-air bazaar, one of the peculiarities of the place. The loads of wood, hay, watermelons and cartloads of garden truck, the number of horses, mules, and cows tethered around, the huddle of farmers' tools and utensils, household goods, pictures and bric-a-brac, the clamor of the auctioneer, the strident voice of the patent-medicine vender, the organ grinder and his monkey, groups of farmers chatting about crops and the prices, and the antics of the politician as he flits and buzzes around the dear people, all combine to make a typical picture he is not likely to forget.

SCENE ON MAIN STREET, NEAR THE PLAZA, STOCKTON, CAL.

A Few Pointers.

But Stockton will bear close inspection. It is amply supplied with pure water from three flowing artesian wells and others of a less depth. The old courthouse well has been pouring forth its crystal stream for 25 years, with no perceptible abatement in the discharge. Pure water may be obtained most anywhere by boring not to exceed 100 feet; and as there are no rocks or bowlders, the work is easily and cheaply accomplished.

From the extensive works of the Stockton Gas Company radiate about 17 miles of mains to the different parts of the city. The streets are well lighted at the various intersections. The electric light has recently been introduced and many of the principal streets and large business-houses are lighted in this way.

The fraternal Orders flourish here, which is a good sign. There are two Lodges of F. & A. Masons, a Chapter R. A. M., and a Commandery of Knights Templar. The Masonic Temple, owned by a joint stock company, is one of the most notable ornaments to the city and a credit to the taste and enterprise of the owners. The Odd Fellows have two Lodges and an Encampment. Their temple is a three-story structure, a valuable piece of property, commodious and well arranged. The Ancient Order of United Workmen, the Knights of Pythias, the Improved Order of Red Men, the Chosen Friends, the United Order of the Pacific, the Ancient Order of Druids, the Ancient Order of Hibernians, the Independent Order B'nai B'rith and Good Templars, all have organizations here and are in a flourishing condition. This is enough to show that a large portion of the population are bound together in a more beautiful and endearing bond than mere gain and thrift.

The church edifices are numerous, and some of them are costly and imposing structures. There are three Methodist, two Baptist, one Presbyterian, one Congregationalist, one Episcopal, one Catholic, one German Reformed and one Jewish synagogue. The membership and attendance is as large as is usual in cities of a similar size. Broad-gauge Christianity has never taken root in this soil; whether that is a merit or not, we leave to the doctrinaires to determine.

Stockton at a very early day became noted for the excellence of its public schools. The school buildings are six in number, imposing structures valued at $185,000, including all improvements. During the last school year 40 teachers have been employed, and the average daily attendance of pupils was 1503. The total number enrolled was 2495, of which 88 were in the High school, 441 in the Grammar grade, and 1976 in the Primary grade. During the year, $34,605 was paid for teachers' salaries, while the total expenditures, including amounts paid for sites, buildings and new furniture, were $51,924.61.

The Free Library is a noble adjunct to the schools. It occupies commodious and well-arranged rooms on the lower floor of the Masonic Temple, has about 9000 carefully selected books on its shelves, and is supported by the city government at an annual expense of nearly $4000.

The State Insane Asylum located here is an immense brick structure with extensive wings and outbuildings, erected upon the most improved models for such establishments. It is sequestered in a beautiful grove of ancient oaks on the edge of the city. The 100 acres set apart for this purpose have been made very inviting by ornamental trees, choice plants, shrubbery, and parterres of flowers. The grounds are penetrated by broad avenues and walks, and liberally furnished with seats and arbors.

Four fire companies stand guard over the property of the city, with a splendid equipment of fire engines, one large Babcock extinguisher, and one hook and ladder company. Though these companies are volunteer, they have the reputation of being well trained and responding promptly when their services are required. The drivers and engine-men, in constant attendance at the engine-houses, are paid salaries by the city.

Stockton has five banks, all reported to be doing a profitable business. The Stockton Savings and Loan Society was incorporated in 1867, on a subscribed stock of $100,000, 10 per cent paid in, but has now a paid-up capital of $500,000, with deposits exceeding $1,500,000. Under careful and shrewd management it has become one of the most successful monetary concerns in the State. L. U. Shippee, president, F. M. West, cashier, and S. S. Littlehole, assistant cashier. The San Joaquin Valley bank was organized in 1868, and has a paid-up capital of about $160,000. C. G. Leach, president, and C. E. Perkins, cashier. The First National bank of Stockton was organized in 1872, and has a paid-up capital of $200,000. H. H. Hewlet, president, and P. B. Frasier, cashier. The Stockton Savings bank was organized in 1882, and has a paid-up capital of $300,000. H. S. Sargent, president, and Sidney Newell, cashier. The Bank of Stockton has since 1882 been doing business under the National Banking law, but is just now arranging to organize under the State law. Robt. K. Reid, president, R. W. Tully, cashier. There can be no better clue to the richness and prosperity of the city and county than the vitality of these financial pulses.

Stockton has two daily newspapers; the *Independent* occupying the field as a morning, and the *Mail* as an evening paper, both enjoying a large circulation and ably conducted. The *Commercial Record*, the *Banner*, a German paper, and the *Union*, a temperance journal, appear in weekly editions and are well supported.

The hotels are excellent and well patronized. The leading hotels are the Yo Semite, under the management of Sharp Bros.; the Grand Central, kept by John Henderson; the Commercial, by A. and J. Hahn; the Mansion House, conducted by Schmeider & Hoch; the Eagle hotel, by Ben Van Ness; and the United States, by H. C. Holman.

Street railroads are in operation upon some of the principal streets, and the advantage of this mode of transit is being gradually extended. There is a line running to the Agricultural Society's park, a short distance beyond the eastern boundary of the city, and to the cemetery, a mile north of the city.

The San Joaquin Agricultural Society has not only aided greatly in developing the agricultural interests of the county and valley, but also in inspiring confidence in the future of Stockton. They have leased one of the public squares, and just let the contract to erect a pavilion that will cost about $40,000. It will be the pride of the city; and when the square is adorned by trees and shrubbery it will be one of the most charming and inviting spots.

Stockton has one theater, the Avon, that is a gem, and will compare favorably with the best structures of the kind in larger cities. There is just now a great amount of ozone in the business atmosphere. The streets and sidewalks have been improved, and many substantial business houses and dwellings are in process of erection. A new courthouse will soon be constructed of granite at a cost of about $250,000. It will be one of the finest structures of the kind in the State, and, as it is centrally located, it will greatly enhance the many charms of the city. Stockton is a city of cosy cottages, comfortable, social-looking homes embowered in flowers and shrubbery. The people seem content and happy. They sometimes go away in the summer to Santa Cruz, Monterey and other watering-places, but are always glad to get home again. They have evidently come here to stay.

CALIFORNIA "PRAIRIE SCHOONER" LOAD OF WHEAT AT STOCKTON LANDING. *Photo. by Spooner.*

Stockton's Transportation Facilities.

Stockton possesses many advantages for removing freights. As aforesaid, no one can carefully survey its position and surroundings and fail to see that Nature premeditated business when she planned the situation. It is the natural entrepot and shipping point for an immense fertile, agricultural region, all of which, together with the vast mining and fruit-growing counties lying beyond, must draw from it most of their supplies. Of course, the advantage of direct water communication with San Francisco is the most important factor in promoting the growth and prosperity of this city and giving confidence in its future success. No corporate capital can monopolize this route, and it is not likely that the navigation of the San Joaquin river will ever be seriously obstructed by the flow of mining debris, as in other navigable waters of the State. Free competition assures cheap transportation. So hot was the rivalry the past year that wheat, flour and other commodities were carried from Stockton to San Francisco, a distance of 120 miles, as low as 25 cents per ton. Passenger fares on opposition days were often as low as 10 cents. Of course this was only a spiteful spasm, but the average rate from 50 cents to 70 cents per ton is as cheap as such products can be moved in the most favored localities of the United States. It is said that 18 steamers with 16 barges are now busy plying between Stockton and various points on the San Joaquin and the interior waters of the State. Two lines of steamers run daily between Stockton and San Francisco. During the year 1886, 40,000 passengers, and more than 500,000 tons of freight, were transported by steamers between these two points.

Then Stockton is in immediate connection with the great railway system of the State. One branch of the Southern Pacific runs directly through the city, connecting it with Sacramento and the northern counties, and on the south and west with Oakland, San Francisco, San Jose, and the southern counties. Stockton also has railway connection with Calaveras, Stanislaus, and Tuolumne counties, and the

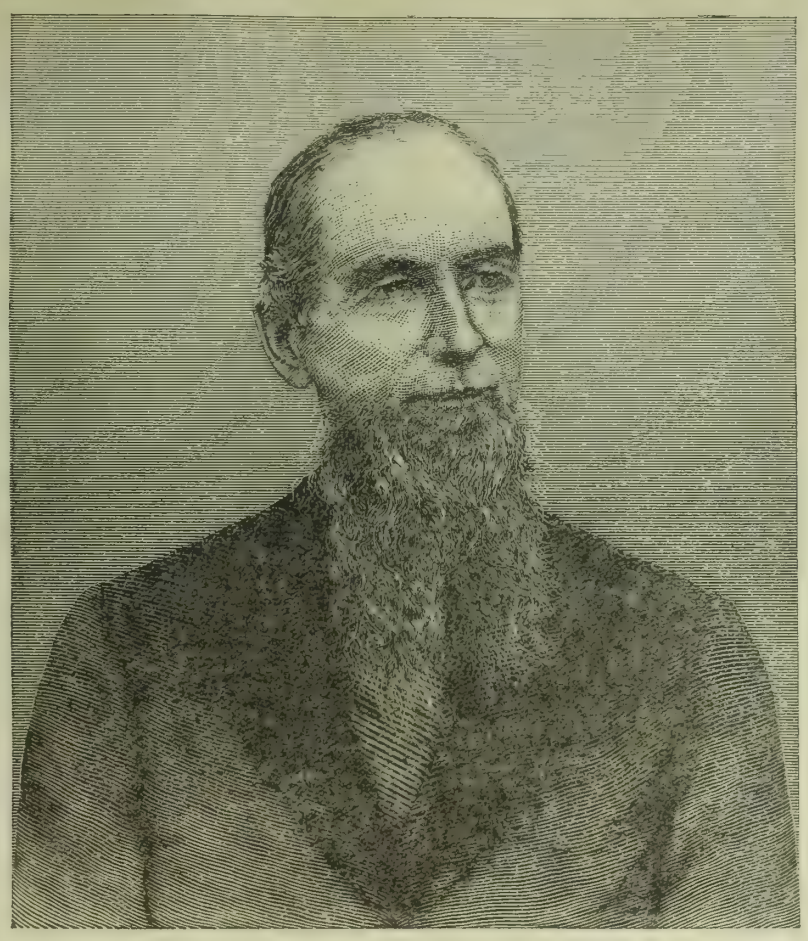
eastern portion of San Joaquin by means of the Stockton & Copperopolis and Stockton & Visalia railroads. Other lines are contemplated, and the prospect is encouraging that the time is near when Stockton will enjoy railroad facilities possessed by no interior city of the State. A large amount of wheat and other staples come to tide-water over these roads, because of the cheaper facilities of reaching San Francisco, and directly and incidentally add greatly to the business importance of the city.

Fourteen or fifteen years ago a company was organized to cut a ship canal 12 miles long from Stockton to Venice, on the San Joaquin river, below which point the channel is 20 feet deep and 100 yards wide. This canal could be constructed by Stockton capital alone, and certainly should be made soon. The arrival of the first sea-going vessel at the Stockton wharves would give the city a boom that would make even a Los Angeles real-estate man dizzy-headed.

Stockton Trade.

The business development of Stockton has not been one of fits and starts. It has been as steady and normal as the growth of trees. The early settlers of Stockton were rather a slow-coach race, inclined to sleep over their natural advantages. They waited for Jupiter to come and give them a lift. In the meantime, Sacramento and Marysville forged ahead. But the era of waiting has passed. They have found out that the gods help the people who help themselves, and the result is, that Stockton plays second fiddle to no inland city of the State.

The wheat trade has been the most important factor in promoting the growth and prosperity of this city. The first lot of wheat shipped from this point was in 1858, and since then the business of dealing in grain has gradually grown till it is enormous. In 1859, 1500 tons of wheat were stored away in a little old adobe building. The storage capacity of the different Stockton warehouses now aggregates about 115,000 tons. The location of these warehouses alongside of navigable channels enables the owners to move their wheat at any time when prices are satisfactory. J. D. Peters, Geo. Hart, I. S. Bostwick, Smith & Wright and the Farmers' Co operative Union are the leading buyers, distributing from $2,000,000 to $5,000,000 annually among the wheat-growers of the State.



The larger portion of the lumber supply for the valley towns and farms is brought to Stockton from the coast counties, Oregon and Washington Territory. From 40,000,000 to 50,000,000 feet of lumber are annually distributed by Simpson & Gray and Moore & Smith, throughout the valley, even as far as Arizona and New Mexico.

The handling of fruit, vegetables and other garden produce is fast becoming an important business. As already stated, it is apparent that much of the land of San Joaquin and adjacent counties can be more profitably employed in the production of fruit, grapes, vegetables and the like than in cultivating the cereal crops, and as the market for these staples is more steady and reliable, this industry is destined to assume immense proportions.

Situated in the midst of an immense agricultural area, Stockton enjoys an extensive and profitable trade in hardware and agricultural implements. The grocery and provision houses have an extensive trade with the interior dealers, though none have gone exclusively into the jobbing trade. The aggregate sales in this branch alone, it is said, will aggregate $1,225,000 annually. Many of the dry goods and clothing establishments will compare favorably with the best of the kind seen in larger cities. Some of them are doing quite a large jobbing business in connection with their retail trade.

Stockton as a Manufacturing Center.

Owing to the high price of labor and the habit of depending upon the East, manufacturing industries were slow in starting in California. But the people of the State gradually awoke to the fact that the highest industrial thrift and prosperity can only be reached where agricultural production and the manufacturing arts go hand in hand. Unless the market is brought to the door, they must ever remain a race of vegetable dealers and fruit peddlers. Stockton has fully shared in this awakening. It is no longer a mere distributing center. So great has been its self-reliant growth that its mechanical and manufacturing enterprises now furnish employment to at least one-twentieth of the population. Foundries, carriage factories, furniture factories, tanneries, flouring-mills, planing-mills, woolen-mills, paper-mills, harness-making, boot and shoemaking, wagon-making, stone and marble cutting, the manufacture of tinware and all kinds of agricultural implements, are all now solidly planted, profitable and growing industries. The aggregate annual product of these varied industries it is said will exceed $5,000,000, and the benefit conferred upon the city by stimulating other kinds of business can hardly be overestimated.

L. U. SHIPPEE, PRES. CALIFORNIA STATE AGRICULTURAL SOCIETY.

[See next page.] *Photo. by Spooner.*

No better illustration of the business prosperity of this city and environs can be given than by particularizing some of its leading manufacturing establishments. The Pacific Tannery, owned by Kullman, Wagner & Co., expend about $100,000 a year for raw material, and produce a quality of leather that is in great demand in every market where it is known. The paper-mill on Mormon channel is the most extensive on the coast, turning out from 4 to 8 tons of news, manilla and wrapping paper per day, and giving employment to about 100 persons. The woolen-mill, started in a small way in 1870, by Messrs. Lambert, Dougherty & Patterson, has now an output of about 7000 pairs of blankets and 150,000 yards of flannel annually.

The planing-mills of White & Thomas and P. A. Buell & Co. are large establishments, and possess facilities for doing all kinds of work in their line. The Stockton wagons, carriages and buggies are models of taste and elegance, and are in great demand, for the reason that they are made of timber thoroughly seasoned in an arid atmosphere and stand use better in a dry climate than vehicles constructed in a more humid clime. William P. Miller, M. P. Henderson & Son, Holt Bros., and Joseph Hansel are building up the reputation of Stockton in this line, and the product of their skill and enterprise finds a market not only on the Pacific Coast, but extends as far as Idaho, British Columbia, New and Old Mexico, and the islands of the sea.

Stockton flour now feeds thousands of hungry mouths in Great Britain, France, China, Japan and elsewhere. The Sperry mill requires a capital of over $500,000, has a capacity of 1400 barrels of flour every 24 hours and gives employment to over 60 men. The Crown mill, under the management of J. M. Welsh, the present Mayor of Stockton, has a capacity about equal to the Sperry mill and about the same amount of capital invested. These mills, located in a grain district equal to the best wheat belts of the world, possess superior facilities in selecting choice wheat, and their brands will ever be a favorite in the market.

Stockton leads all other centers in its manufactories of agricultural implements. The Stockton headers, combined harvesters and thrashers, plows, harrows, seed-sowers, derrick-forks, and other farm utensils are growing in demand; they not only embody the latest ideas of inventive genius, but are found to be more serviceable than those manufactured in moister climates. Mattison & Williamson have long been in this business, have extensive shops, and their sales of agricultural implements are said to exceed $100,000 a year. Daniel Houser, after experimenting for some time, commenced the construction of harvesters in 1881. In 1883 the Shippee Harvester Works were established, and recently the Shippee and Houser companies have been consolidated. They combine the best features of different patents, and seem to meet all the needs of the grain-producers. This factory gives employment to 150 men, and the total value of its output the past season was over $300,000.

Hoult & Son have also an establishment where a limited number of machines are constructed each year. The Pacific Agricultural Works, G. Lissenden, proprietor, are also engaged in the construction of agricultural implements, plows, cultivators, etc., and the plows from this establishment are in great demand. The H. C. Shaw Plow Co. also do a considerable business in the manufacture of a gang plow which is much used in the San Joaquin valley. E. J. Marsters has for the past nine years done an extensive business in the manufacture of self-feeders for thrashing machines (his own invention and a great saving of labor), derricks, nets, windmills, tanks, etc., and during the past season has constructed a combined header, with some important improvements of his own invention. Many other manufacturing firms are doing well. The total amount of capital invested in the various manufactories of agricultural machinery and implements in Stockton is about $700,000, and about 250 persons are employed in that industry, while the annual product of the different establishments will exceed $450,000.

During the last five years, in sinking artesian wells for water in this vicinity, petroleum and gas have been found in small quantities at a depth of 1250 feet. Geologists and experts are almost unanimous that here is a great oil-bearing and gas-producing tract. A company from Philadelphia is boring a well within half a mile of the corporate limits of Stockton, for gas and petroleum to be used for light, fuel, and manufacturing purposes. If this enterprise proves a success, it will tend to revolutionize this section of country in a manufacturing point of view, and add greatly to the eminence which it has already secured.

VINEYARD OF GEO. WEST, ESQ. (VITICULTURAL COMMISSIONER), NEAR STOCKTON.

A "Rural" Representative made a flying visit to the California poultry farm of L. M. Cutting, at French Camp, San Joaquin county, a few days ago. During the last year substantial improvements have been made by him in additional compartments and the importation of several new varieties of land and waterfowl. To those who have never seen a system of raising poultry exclusively it is quite a curiosity. It is a growing industry and Mr. Cutting is receiving orders regularly from all portions of the State, Sandwich islands and Australia.

Formation of Diamonds.—A Swiss physicist, Prof. Simmler, maintains that diamonds have been formed by the taking up of soluble carbon by liquid carbonic acid, and its subsequent deposition in a crystalline form on the evaporation of the acid. This could only take place in rock cavities strongly compressing the carbonic acid, which would quickly disappear on release from the pressure.

L. U. Shippee.

The pushing, restless pioneers of our State, who have by indomitable energy and industry changed the face of nature and seized the opportunity to build up a great commercial manufacturing commonwealth, in a few years have made a record that is unrivaled in the history of any community. The men who have guided, builded, and thus shaped the marvelous growth of this new civilization are self-made men who have commenced in the lower walks of life.

Such is the career of the subject of our sketch. L. U. Shippee was born in Rhode Island in August, 1834. His father died when he was seven years old, leaving a large estate to his family, consisting of his wife and seven children. His ancestors on his father's side were sturdy Protestants from the north of Ireland, who emigrated about the year 1640 and settled on a neck of land in Narragansett bay, which has been held by descendants since that time, and is called "Shippee hollow."

His mother was one of the family of Spencers Friends or Quakers, who came from England, a name that has been held in good repute for successive generations in New England.

He lived with his mother until he was 12 years old, when that independent spirit which is characteristic of his whole life asserted itself, and he hired out to a neighbor (who carried on several enterprises) at $5 per month, for seven months. His family predicted his early return to his home of ease, but, contrary to their expectation, he not only fulfilled his contract, but by his tact and reliability became the trusted agent in his employer's affairs. His father was a machinist, and at his death held responsible positions as superintendent in several establishments. For two and one-half years he worked as a machinist, but found that it was unsuited to his restless nature. At the urgent request of his mother, he took charge of one of the farms belonging to his father's estate, but the plodding and contracted system of New England farming did not suit him, and against the earnest protests of his friends, he started for California in his 20th year, arriving in 1856. Commencing business in Stockton, in a small way, and finding that with what little capital he had he could not cope with older and larger firms, he sold out, sent what money he had on hand home, and commenced as a salesman in a grocery store at $60 per month, continuing for a term of six years, and resigned his position when he was receiving $200 per month, during which period he never lost a day at labor. At this time, by rigid economy and attention to business, he secured a sufficient sum of money to embark in business, and the firm of Shippee, McKee & Co., wholesale and retail grocers, was formed, which continued for a term of years. Mr. Shippee did not confine himself exclusively to this business, but as early as 1866 commenced farming and stock-raising. He was among the first, and one of the largest, importers of fine sheep, as also of horses, cattle, hogs, jacks and jennies. As an index of the extent of this enterprise, for two successive years he imported over $60,000 worth a year, previous to 1874, of merino sheep and other live-stock. In 1867 he associated himself with others in forming the Stockton Savings and Loan Society, which was one of the first, and is now the largest savings bank outside of San Francisco, and of which he has been a director since the formation, and president for the last 10 years.

Mr. Shippee has never accepted any office except as councilman for the city of Stockton, but has been president of every corporation or association in which he has been interested. For 13 years he has been president of the San Joaquin Valley Agricultural Association and also a director of the State Agricultural Society, being the oldest officer in the board; and at the annual election held in February, 1887, he was elected president of the State Agricultural Society. At an early date he took a deep interest, and was one of the leading men, in building gravel roads out of Stockton, and is now president of one. He was the chief organizer of the Stockton Combined Harvester and Agricultural Works, with a capital of $300,000, whose sales, in agricultural machinery and combined harvesters, were over $286,000 in 1886. He is a positive man, of a genial nature, of few words, quick perception, and grasps opportunities for advancement that men of slower thought would lose.

His sympathy for those who are making an effort to better their condition in life has been intensified by his own struggles, and to help one of this class he gives lavishly without publicity, and charity-seekers are always anxious to get Mr. Shippee to head the list.

His education, long experience, and keen perception enable him to handle questions of finance and business affairs with an intuitive knowledge and quick dispatch; and although he is interested in farming, stock-raising, breeding fine horses and various industrial enterprises in several counties, each one seems to be carried on without friction and in an efficient and masterly manner. He has a happy faculty of gaining the confidence of his employes and associates in business, and to this in a large measure he owes his success and the position he occupies as a business leader. He is one of the largest sheep-men on the Pacific Coast, and stocks from 25,000 to 40,000 each year; as also one of the largest breeders of fine stock of horses, and has now over 300 head of horses and colts.

Time has dealt gently with him, although his life from boyhood has been one of continual activity and mental strain. He is tall and erect, nearly six feet in hight, and has an elasticity in his step that betokens years of active labor.

His executive ability and sagacious management as president of the State Agricultural Society warrants us in anticipating one of the most successful State Fairs this season ever held in this State.

MESSRS. MATTESON & WILLIAMSON, one of the oldest agricultural implement manufacturing firms in Stockton, have one entire block covered with buildings. Over ten years ago, combined harvesters were built by this firm, and a machine that was built by them in 1876 has been used continuously, and with some changes made in 1886, was operated with satisfaction, and did efficient work the whole season. In 1886 they perfected a new machine called the "Harvest Queen," which has gained great favor among grain growers. It is of light draft, easily handled, and is well adapted to the wants of ranchmen who do not care to use more than ten horses. During the season of 1886 a farmer and his wife ran one of these machines alone over two weeks, the wife driving the team, while the husband attended the separator and sewed and dumped the sacks.

MILL OF THE CALIFORNIA PAPER CO., STOCKTON.

CUTTER SALMON'S ARTESIAN WATER AND GAS WELL, NEAR FRENCH CAMP. [See page 474.]

LOCOMOTIVES AND RAILROAD BRIDGES.—The great increase in the weight of the locomotives which have recently been put upon railroads for hauling freight trains, requires firmer roadbeds, heavier rails and much more substantial bridges than those heretofore constructed when lighter locomotives were used. It is said that the iron and steel bridges on the Pennsylvania railroad built several years ago prove to be too flimsy for the 60-ton freight-haulers recently put on — 118,000-pound engines — and new structures of stone or heavy steel are replacing all others so far as practicable.

Stockton Paper-Mill.

We give herewith a sketch of the buildings of the California Paper Company, which are well located on the banks of Mormon slough, in the city of Stockton. The property consists of two full blocks of land. The buildings are one and three-story brick structures, with a large frame warehouse for storing the stock used in paper-making and the finished product. There are also smaller buildings for blacksmiths, carpenters, etc. The warehouses have a capacity of 2000 tons.

The California Paper Company was incorporated in 1877, and the president from that time until the present has been Egbert Judson, the well-known and enterprising capitalist. The founder of the business was R. B. Lane. The capital invested amounts to $300,000. The capacity of the mill at the start was but two tons of paper per day; the present capacity is ten tons per day. The original speed of the machines was 80 feet per minute; now it is 180 feet per minute. The principal products now are straw-wrapping and newsprinting paper, but some book-paper is also made. During the last three years very large expenditures have been made, and the appliances and processes have been brought up to the standard of the most improved mills. In fact, the product of to-day is claimed to be without a superior of its class in the country. The recognition of this quality has brought a demand which taxes the capacity of the mill to its utmost, and it is now from two to three months behind its orders, even though the mill runs continuously from midnight Sunday night to midnight Saturday night, with only an occasional stop for repairs. This encouraging state of the business causes the company to contemplate the introduction of more machinery, which will increase the capacity of the mill 65 per cent. The present monthly product reaches 250 tons of paper, and the enlargement will increase it to 400 tons monthly, or 4800 tons per annum.

The management of the company believes in the future of the State, that increase in population will signify growth in culture, and realizes that this growth will create a demand for increased supplies of reading material, and to meet this the increased capacity of the mill will minister. One of the specialties is rolled printing paper, and many of the large San Francisco dailies are using the make of the Stockton mill in preference to any other.

The California Paper Company employs 80 hands. The water supply from artesian wells 600 feet deep is excellent and ample. The situation in Stockton gives the company every advantage in transportation by rail and water routes. The enterprise, so far as an outsider can judge, is conducted with much skill and enterprise, and it is certainly a kind of manufacturing progress which must be kindly regarded by all who delight in the upbuilding of varied industries in the State.

FREEZING WINES.—In a short time the Viticultural Commission will institute an investigation to ascertain the effect of intense cold on wines after fermentation has ceased. The experiments will be under the direction of John H. Wheeler, the Chief Executive Officer, and will be similar to those carried on in France, but on a more extended scale. Results of French experiments have been satisfactory. The liquor is exposed to cold, produced artificially if necessary, and it is then drawn off from the ice thus formed. The effect is almost exactly the same as that produced by fortifying, as far as the quantity of alcohol is concerned, and after 24 hours' treatment the wine becomes clear and brilliant and its flavor is greatly improved. The operation also kills the fermentation germs, and they are precipitated together with other heavy matter. The experiments will be begun at the earliest possible date.—*Napa Reporter*.

PIUTE squaws at Virginia City do a great business in water cress, which they bring into town and sell at one bit a bunch.

The Worthington Pump.

The Worthington pumping machinery is now recognized as the most efficient where high duty is required. For city water works it is specially adapted. The new type of the Worthington duplex is a very perfect machine. One of these pumping engines has been on duty at New Bedford, Mass., for over a year and showed on its test a duty of 118,000,000 pounds of water raised one foot high with 100 pounds of coal, on the basis of an evaporation of 10 pounds of water with one of coal. One has been running for several months at a station of the United Pipe lines of the Standard Oil Company delivering 25,000 barrels of oil in 24 hours, against a pressure of 1000 pounds to the square inch. This is the largest "direct-acting" pumping engine in the world. It has 41-inch high pressure cylinders, with 82-inch expanding cylinders driving 12-inch double-acting plungers.

An engine in Montreal was recently tried, and is in active service pumping at its contract capacity, 10,000,000 British gallons in 24 hours, lifting the water about 200 feet, including friction in the pipes. This equals about 420-horse power.

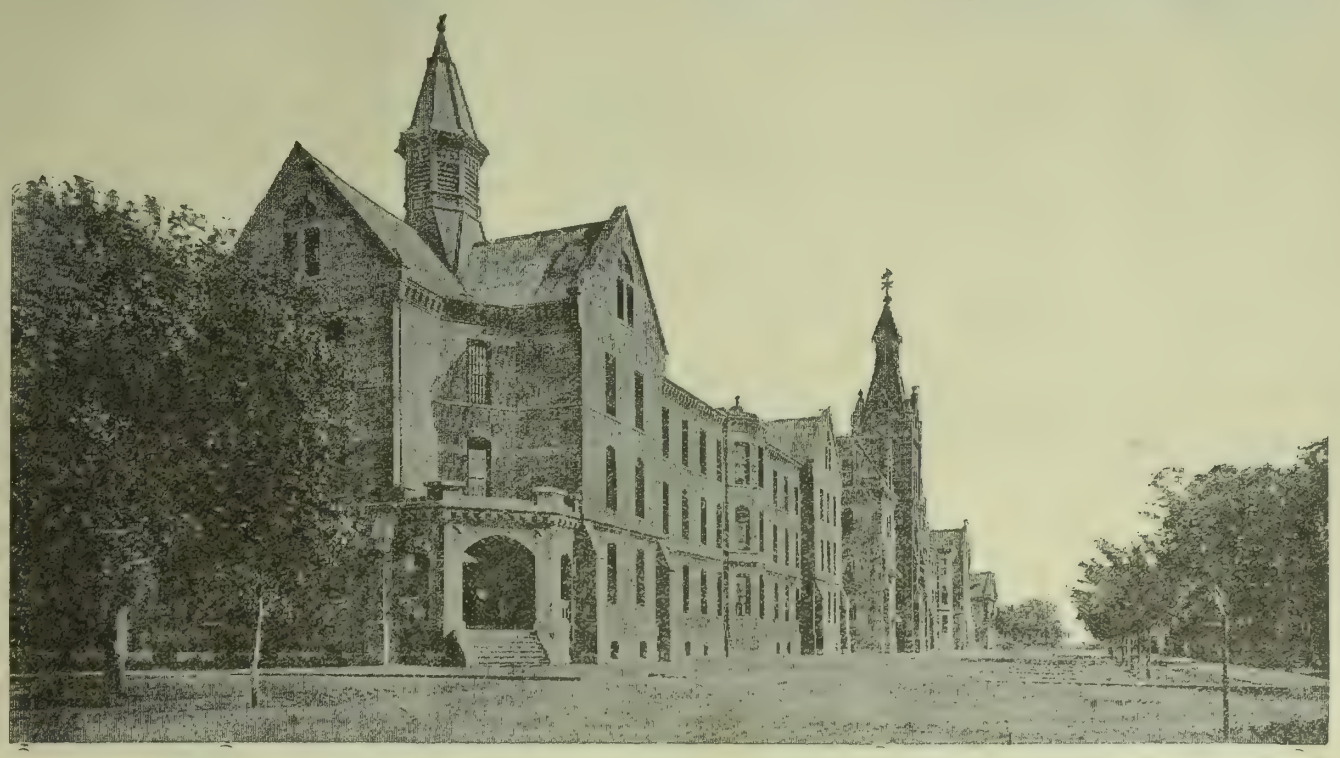
Besides the above-named engine in Montreal, high-duty engines of the Worthington type have been furnished, or are under contract for, at the following places: New Bedford, Mass., 5,000,000 gallons in 24 hours; Gravesend, L. I., 2,000,000 gallons; Jersey City, 5,000,000 gallons; Abbington and Rockland, 5,000,000 gallons; Davenport, Iowa, 6,000,000, and Kansas City, Mo., 9,000,000 gallons in 24 hours. In trying this engine at Montreal, a gentleman amused and interested himself and others by balancing a coin on edge on the frame which holds the high-duty attachment, where it remained undisturbed by any jar; a very severe test. The engine, while running up to full speed, was stopped as suddenly as it was possible to close the steam-valve, and started again almost as quickly without any trouble or noise whatever. It was also slowed down to less than one-sixth of its full speed without altering any adjustments, at which slow speed the strokes maintained their regularity of motion and length. The length of stroke at all times could easily be observed by marks on the cross-head-sides to be within a sixteenth of an inch or less of the contact of the pistons with the cylinder heads. When so desired, the pistons were allowed to actually strike the heads with so gentle a blow as barely to be heard or felt, or more pronounced at will, showing the complete and delicate control the engine was under, and the small amount of power left at the end of the stroke.—*Montreal Gazette.*

A Fine Valley Residence.

Some idea can be had of the comfort and delightful environment which may pertain to a residence in the San Joaquin valley by the engraving on this page, which shows the domicile of Dr. W. H. Mays, the highly-esteemed superintendent of the State Asylum for the Insane at Stockton.

SCALEBUGS DISAPPEARING.—A correspondent of the Los Angeles *Times* at Orange says it seems to be a settled fact with orchardists that the scale is dying out. The cause of this sudden change is a mystery, as up to this spring the different washes used appeared only to destroy the trees, while the bugs rapidly increased in numbers.

Southern California.



[NO. 3.—CONTINUED.]

[Editorial Correspondence.]

California is an empire of itself, both in extent and importance. It is over 700 miles in length, and has an average breadth of over 200 miles. It is four times as large as the great State of New York, twice as large as Italy, and nearly as large as France. There is no wonder that the above facts, considered in connection with the greatly elongated form of the State, should suggest the idea of

The Formation of a New State

Out of the southern part of California, which portion is now growing so rapidly and so fast coming into separate commercial importance. Should such an event occur, it is probable that seven counties would go off, viz.: Los Angeles, with a population of about 80,000; San Bernardino, with 20,000; San Diego, with 18,000; Ventura, with 7000; Santa Barbara, with 16,000; San Luis Obispo, with 14,000; and Kern with 7500, making a total of 162,500 for the new State, with an assessed valuation of over $100,000,000. The area of these seven counties is 57,000 square miles, or a little less than one-third of the total area of the State. The proposed new State would exceed in extent that of Pennsylvania, and would be nearly as large as all New England together. The population would be three times that of Nevada and equal to that of Oregon, while the productive power of the soil and the wealth-producing elements of the region will compare favorably with those of almost any State in the Union. "Coronado" has been suggested as the name of the new State, as more suggestive and more euphonious than "South California." The name signifies "The Crowned."

THE NEW BUILDING OF THE STATE ASYLUM FOR THE INSANE AT STOCKTON. *Photo. by Spooner.*

The Santa Ana Valley.

To the south of the city of Los Angeles, which formed the subject of our last letter, there is the large, level and fruitful Santa Ana valley, which takes its name from the Santa Ana river. Near the center of the valley is located one of the earliest colonies in Southern California—Anaheim. The story of the settlement and growth of this colony is well known to most of our readers. It is now, and for many years has been, an incorporated town, and has become quite a business center. The business portion of the town is well built up with substantial buildings. The streets are wide and very generally bordered with willow, pepper or sycamore trees, and present an appearance which is rarely excelled for picturesque and rural beauty. The waters of the Santa Ana river are largely utilized for irrigation, while in most portions of the valley artesian water can be obtained at very little expense. The climate of the entire valley is very equable, though generally moist from its close proximity to the ocean. The monthly average of the thermometer rarely ranges outside of from 50° to 72°. This, like all the other localities in Los Angeles county, is experiencing the general boom. The construction of the Atchison & Topeka railroad is giving an increased impetus to business generally. Real estate is rapidly advancing in value, and new settlers are constantly coming in. What has been done and is now being done in the San Gabriel and San Bernardino valleys will soon be repeated in the Santa Ana valley. There will be a succession of towns and villages all through the county. Already Tustin City, Orange and Santa Ana have so grown together that they practically comprise one community. They are now building a system of street railroads to more readily move from one section to the other of these lovely towns and villages.

Through the San Gabriel Valley.

The San Gabriel valley, however, is the great attraction to visitors, and, in connection with that of San Bernardino, forms the crowning beauty of the county and the State as well. This charming valley, all the way from Los Angeles to the foot of old Mt. San Bernardino, a distance of over 70 miles, is dotted with beautiful towns and villages, while one almost continuous line of orange groves and vineyards extend throughout the entire distance. The valley is traversed by two railroads and the route for a third is now being surveyed. The mountain scenery by which it is surrounded is both beautiful and grand. These mountains have been carved into picturesque masses by the action of aqueous erosion upon their yielding material. Mostly devoid of any vegetation, save low shrubbery and chapparal, the smoothness of their slopes gives full play to the effects of light and shade caused by the varying and intricate contour of the surface. Prof. Whitney in speaking of this peculiar characteristic of the mountains of California near the sea, says: "In the early spring these slopes are of the most vivid green, the awakening to life of the vegetation of this region beginning just when the hills and valleys of the Eastern States are mostly deeply covered with snow. Spring here, in fact, commences with the end of summer; winter there is none. Summer, blazing summer, tempered by the ocean fogs and ocean breezes, is followed by a long and delightful six months spring, which in turn passes almost instantaneously away at the approach of another summer." At frequent intervals all along the base of these mountains, there is found a multiplicity of warm and cold springs, whose healing waters of various character beckon the invalid to seek and secure a new lease of health and life.

RESIDENCE OF DR. W. H. MAYS, SUPERINTENDENT OF THE STOCKTON INSANE ASYLUM.

The Tide of Travel

From the Eastern and Northwestern States, which once sought shelter from the winter snow and ice and piercing winds of March, in Florida and other southern retreats, have found that they purchased their sunbeams at great cost of comfort and with but little benefit to health. These people are now taking annual wing for the beautiful country which we are describing. Here they find a truly healthful climate, without any of the disadvantages which are to be met with among the lowlands and everglades of the Gulf States. Here they find a warm welcome from both climate and people. Here thousands of our Eastern friends are establishing homes in our fertile and perfumed valleys, where they can live and thrive all the year round, gaining health and strength for a good old age, by growing, for either profit or pleasure, oranges, lemons, grapes, figs, peaches, pears, etc. It is well, and there is room for all. Hotels, the finest in the world for visitors; fertile fields which may be easily converted into beautiful homes for those who come to stay. The construction of the new railroad from Los Angeles to San Bernardino is opening up

A Great Number of New Towns.

As the cars of the San Gabriel road leave Los Angeles, they pass through a section of country dotted with villas and orange groves, which is rapidly filling up with beautiful homes. The first important place reached is

Queenly Pasadena,

Which already has a world-wide reputation. Situated on the higher ground of the San

(*Continued on page 476.*)

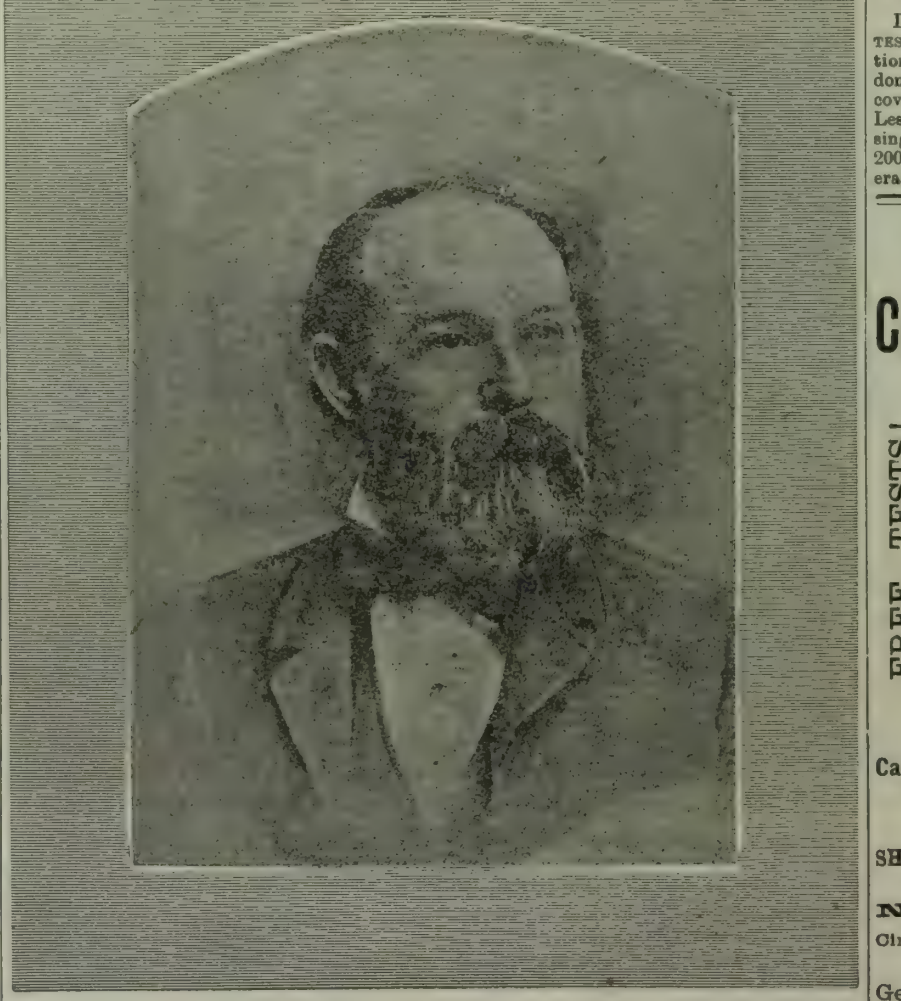
Artesian and Gas Wells.

Within a radius of 10 miles in and around Stockton there are a goodly number of artesian wells. The cut on page 472 gives a view of the surroundings of the artesian well situated on the Cutler Salmon farm, seven miles south of Stockton. It is 1250 feet deep and discharges 300 gallons a minute from a seven-inch pipe. In sinking at 280 feet the auger passed through a layer of timber and rotten debris 20 feet thick.

From this point the water was dark-colored, brackish and unfit for use. When the well was finished the water rose 22 feet above the surface, and it was by accident discovered that this great volume of water was strongly impregnated with gas. A gasometer has been placed in the building, seen in the cut, and light and fuel are supplied for the residence. In the winter season the gas is kept burning all night. At a depth of 800 feet, the water is tapped and brought to the surface in an independent pipe. This is a mineral water and has been found very valuable as a remedial agent in the treatment of rheumatism, gout and kidney complaints. Persons troubled with asthma have been cured by inhaling the gas from this well, and there is such confidence in the virtue of this gas that, under advice of physicians, the gas is gathered and carried to adjoining counties to be inhaled by invalids suffering with asthma. Mr. Salmon has visitors from all over the Pacific Coast to see this phenomenal well and test the virtue of the water in eradicating disease.

We learn that Mr. Salmon has refused $75,000 for this well, including ten acres of land adjacent thereto. We herewith give a list of some of the prominent

Artesian Wells.



Name of Well.	Distance from Stockton.	Depth. Feet.	Flow in Gallons per 24 hrs.

GREEN AND DRY TIMBER.—A discussion is going the rounds of the press as to the relative strength of wet and dry timber. We do not believe there is much to be made out of the discussion. Some kinds of timber are stronger when dry, while other kinds are stronger when wet or green. It is safe to say that all woods are harder and less liable to bend when dry than when wet or green. But most hardwoods when wet will possess more tensile strength than when dry. Timber thoroughly seasoned is more brittle than when green, and with the necessary force will break square off, while the same timber green would stand about the same pressure by bending more or less without breaking. Take a hickory sapling that is almost impossible to break in its green state, although it may bend double, and thoroughly dry it, and you may easily break it almost "square off," as the boys say. So with almost any kind of timber. Drying makes it stiffer, more unyielding, but in very few instances stronger.

J. A. WILHOIT & SONS, real estate agents and searchers of records, are the oldest house in this business in the city of Stockton. Their experience and private records afford them facilities for passing on titles with dispatch and reliability. Parties wishing to invest in land in the San Joaquin valley should avail themselves of the services of this old-established firm.

H. C. Shaw.

There are in every community unassuming men who have an innate modesty and sensitive nature, who avoid public honors and office. This is characteristic of the whole life of Mr. Shaw. During a long and successful career as a merchant he has gained an enviable reputation as an upright, generous and public-spirited citizen. His occupation has placed him in close relations with farmers and producers the length and breadth of the San Joaquin valley, and through adversity and failure of crops he has all these years stood by and assisted many worthy but unfortunate farmers and producers. He emigrated to California from Steuben, Me., arriving at the age of 18 years, and entered the service of his brother, George N. Shaw, as clerk, who then kept a general commission house in San Francisco. Like most old Californians, he tried his hand at placer mining, but after a few years drifted back to his former business. In 1861 he settled in Stockton and has followed the business of manufacturing and importing agricultural implements and machinery, and is now engaged in the same business. He has been urged frequently to accept office and has persistently refused, although at one time an active member of the State militia. He is a member of the F. and A. M. and a very popular member of the Knights Templar. On the subject of California farming he is an enthusiast and has given this subject a great deal of attention, especially in importing and manufacturing improved implements, machinery and equipments for ranchers, who put out and harvest from 10 to 5000 acres of grain each year. His high sense of honor, forbearance and universal generosity among his neighbors have given him a popularity and respect that is seldom accorded to a person in the common walks of life. Mr. Shaw has an exalted opinion and an abiding faith in the resources, productiveness and future growth of this section of our State, and believes that the city of Stockton with her natural advantages in a commercial point of view is destined to be the great inland city of the State and the center for manufacturing agricultural machinery and equipments. He is a fine specimen of physical and mental manhood, commanding presence, and great influence in the local affairs of this section of our State.

H. C. SHAW, ESQ., OF STOCKTON. *Photo. by Spooner.*

THE CALIFORNIA STEAM NAVIGATION COMPANY'S WHARF AT STOCKTON. *Photo. by Spooner.*

California Steam Navigation Co.

This is now the most enterprising of the companies running steamers on the California rivers. They have four fine, large steamers—the Mary Garratt, City of Stockton, Centennial and Alice Garratt. These steamers are speedy, well fitted and arranged for the comfort of passengers. They are stern-wheelers, with abundant power for fast running. This company is now constructing one of the largest warehouses at the city of Stockton and making other improvements for facilitating the handling of freight. W. T. Garratt is president of the company, James Gillis (of Stockton) vice-president, and Wm. Martin secretary. The enterprise of this company has done much for Stockton in many ways. It is a very pleasant trip up the river on the steamer at any time, and the boats are always well filled with passengers. It has become a very popular route for the traveling public, as they board the steamer in the evening and find themselves in Stockton on the following morning. The above cut represents the steamer Mary Garratt loaded at Stockton with freight and passengers for the down trip.

LAKE FORMED BY FLOODING FROM AN ARTESIAN WELL.—The project of flooding a portion of Algeria from the sea has been abandoned, but it seems that large tracts may be covered with water from other sources. De Lesseps reports to the French Academy that a single artesian well bored in 1885 is yielding some 2000 gallons a minute, and has formed a considerable lake 30 feet deep.

☞ Separate Parlor for Ladies, who will be waited upon by skilled and polite lady attendants.

BE SURE THE NAME "A. J. HODGES & CO." IS ON THE HEADER.

No Header ever sold on the Pacific Coast has given such satisfaction as the Headers made by A. J. HODGES & CO.

POINTS OF SUPERIORITY:

1. Frames all made of thoroughly seasoned hard wood.
2. Center Pitman, thereby giving a steadier motion to the Sickle.
3. Lever Balance Springs, instead of iron weight on lever.
4. Self-adjusting Reel.
5. Long Guards, two inches apart.
6. Sections on top of Sickle Bar, same as on Mowing Knives.
7. Forty-inch Drapers.
8. Rollers under Elevator Spout, to roll on Header Wagon bed.
9. Tight Bottom under Draper behind Finger Bar.
10. Breast of Finger Bar ironed.
11. An additional Roller in top of spout, to prevent any grain from being carried down by Draper.
12. A New Clutch on Cross Shaft by which the motion of Draper can be stopped at will, while the Header remains in motion.

HAINES' IMPROVED SINGLE-GEAR HEADER.

WEIGHT IN CASE.		
3240 pounds.	10 feet, Hodges' Iron Wheel, Single-Gear, with 40-inch Draper	$300 00
3400 pounds.	12 feet, Hodges' Iron Wheel, Single-Gear, with 40-inch Draper	325 00
3700 pounds.	15 feet, Hodges' Iron Wheel, Single-Gear, with 40-inch Draper	350 00

IMPROVED "CHAMPION"
DOUBLE DRAPER LIGHT HEADER.

Made by A. J. Hodges & Co.

12 feet Champion Light Header, weight in case, 2900 lbs., $300 00.

This header, as made for this season, has been greatly improved, and we feel confident will meet with the wants of the farming community. It has the long guards and reverse section sickle, so popular in the Hodges' Single-Gear and Hodges' Case Headers.

The sickle is flush with top of bar, and the bar itself is sloped or beveled back, so that the grain will fall back on to the Draper.

The Elevator Spout has been lengthened two feet, making it ten feet long instead of eight feet, as heretofore. Long rollers have been put under the spout, to prevent chafing on the edge of the Header Wagon bed; the spout is raised or lowered by a series of pulleys and ropes, thoroughly at the command of the driver, who can easily manage it with one hand.

The Grain Wheel has a tire five inches wide, and the grousers on the main Drive Wheel are put on at an angle, to prevent sliding when cutting on a side hill. The Header is center stroke, with brass Pitman Box. Has the Chain Driving Gear, so popular among farmers, improved and strengthened.

It has Double Elevator Drapers, which are a great advantage in short grain and high wind.

THE GENUINE HAINES' HEADERS,

After over 20 Years' Trial and Competition, Still Stand at the Head of their Class. Are Better Made, More Durable. Improved to Keep Up with the Times and Demands.

Every farmer of California knows that of the thousands of Headers sold in this State, none have ever been equal to those made by A. J. Hodges & Co., at Pekin. Owing to the efficiency of these Headers, many manufacturers and dealers have put upon the market various imitations made by Wood, Case, Weyhrich, and others, but to-day the proof of the superiority of the genuine Hodges' Headers ABOVE ALL OTHERS, IS THEIR RAPID AND READY, AND GREATLY INCREASING SALES.

HODGES' HEADERS ARE THE BEST IN THE WORLD. DO NOT FAIL TO SEE THEM BEFORE YOU BUY.

(*Continued from page 473.*)

Gabriel valley, 900 feet above the level of the sea, girted by towering hills and lofty mountains, she is warmed by a golden wealth of sunshine, and fanned by perpetual summer breezes. With a natural scenery not surpassed by Alpine lands, she is embowered in groves of orange and other tropical trees, and perfumed by flowers of every hue and shade, to which is added innumerable palace homes and beautiful cottages, which are crowned with that gem of human art, the "Royal Raymond." No place is more justly famous on mesa, plateau or valley. It constitutes a beautiful park, and every traveler who visits it cannot fail to carry away most pleasant recollections, as of a visit to some fairy land.

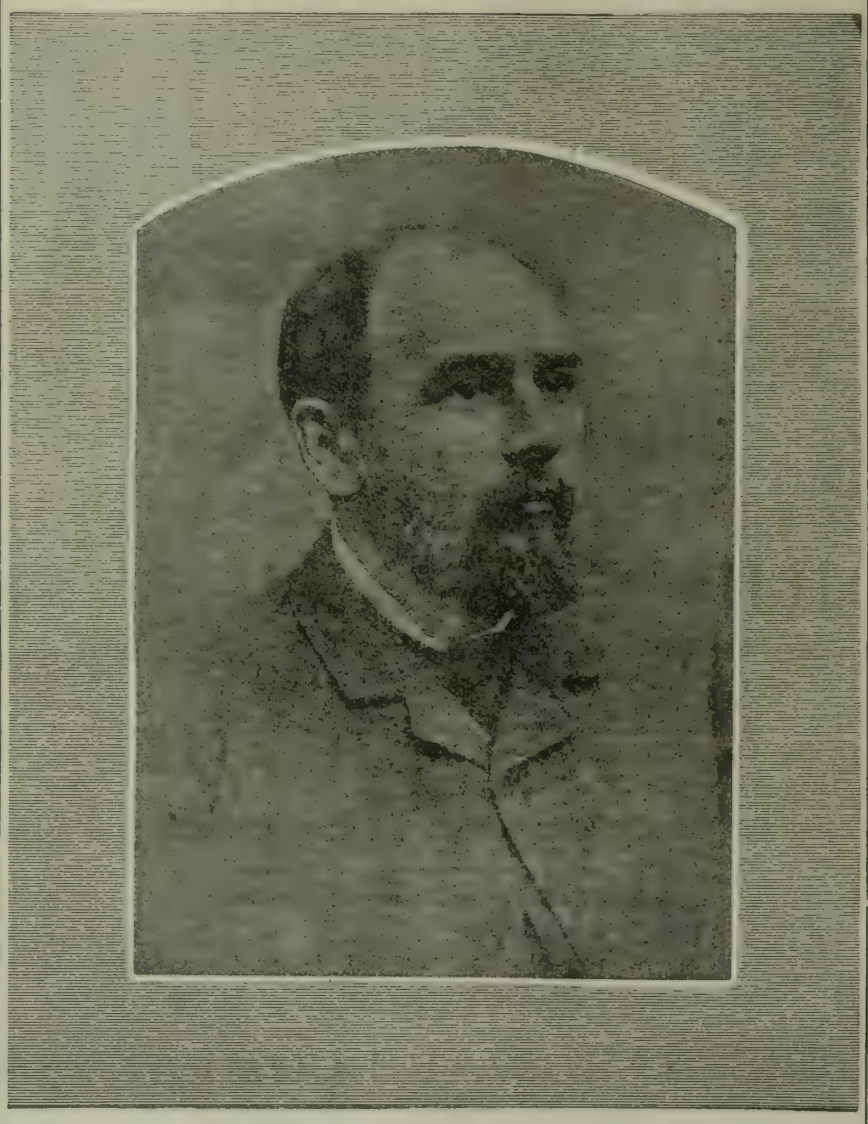
Leaving Pasadena.

The next town reached, some four miles distant, is pretty little Lamanda Park. One mile further and the cars reach a spot where a new depot is to be erected, which will be the stopping-place for travelers going to the Sierra Madre villa and the new town of Huntington. The train stops next at Santa Anita, 17 miles east of Pasadena, from which point the traveler speeds on over a beautiful panorama of towns, villas, orchards and vineyards, through Baldwin's famous grants, to Monrovia and Duarte, until he reaches Azusa, 24 miles from Los Angeles. From hence a succession of towns, new and old, are reached in the following order: Gladstone, 26 miles from Los Angeles; San Demas, 28; Claremont, "the beautiful," 30; Pomona, 33; Ontario, "the foothill paradise," 38; Lordsburg, 40; Cocomungo, 42; San Bernardino, 60.

The Village of Pomona

Is located on the line of both the Southern Pacific and the Atchison & Topeka or California Southern railroads. The town is poetically and most appropriately named. It is romantically situated, in a charming spot, with beautiful surroundings, while industry and intelligence are constantly adding new charms to the locality. The fruit grown in Pomona is of a superior quality. It is also celebrated for its vegetables, some of which yield three crops a year. The Hotel Palomares is a recent addition to the architecture of the town. It is delightfully situated near the business center, has innumerable corners and ends, countless and quaint little windows. It has been suggested that if the building was only a little older it might be suggestive of Hawthorne's "house with seven gables." The interior is as unique as the exterior—rooms all furnished alike, with odd little hallways that run in all directions and toy-like windows through which the light peeps in from every point.

San Bernardino.



The San Gabriel valley at its eastern extremity gradually merges into what is known as the San Bernardino valley—a circular area of some 15 to 20 miles diameter. Near the center of this valley is located the city of San Bernardino, upon one of the most delightful localities a person can well imagine. The fertility of the soil, an abundant supply of the purest water—both river and artesian—a most genial climate, in connection with the delightful scenery which meets the eye in every direction, serves to render this a most desirable place for residence. In addition to the above natural advantages, art and enterprise have united in giving to the city

Commercial and Industrial Advantages

Of a most important character. Located in the midst of a most fertile valley, made up of a great variety of soil characteristics, it presents to the agriculturists who would locate therein and become tributary supporters to the city opportunities for producing the widest range of products. The mesa lands along the foothills, which almost entirely surround the valley, furnish the most desirable soil and climate for the culture of citrus fruits which can be found in the State—perhaps we might say in the world. The grape flourishes here to perfection, either for wine or raisins. All the mesa lands have to be irrigated, for which an abundance of water can be obtained from the numerous streams which flow from the adjacent mountains. These streams can also be supplemented and their volume of water kept up during the dry months of summer by

A System of Mountain Storage

For which large and convenient mountain valleys are found, which may readily be converted into huge reservoirs of winter water, which, without such storage, would pass off into the ocean during the winter and early spring months, without benefit to industry or commerce. One such system has already been perfected by the Bear Valley Water Co. Others are possible and will be provided as soon as a sufficient number of settlers come in to locate and create a demand for such surplus water. In this manner every acre of mesa land of this and the neighboring valleys will soon be utilized and covered with trees, vines and happy homes. As we pass down toward the center and lower portion of the valley there is a change in the character of the soil, which becomes better suited to a more mixed character of farming. Here the soil is better calculated for the deciduous fruits, vegetables, and cereals, and for dairy farming. This portion of the valley is well watered by flowing streams and by artesian water which can be readily obtained in immense quantity and at small cost, as the wells seldom exceed 100 feet in depth. So abundant is this artesian water that at one locality a great number of artesian wells have been bored within a small area and the water collected into one large stream and conveyed some 20 miles away to that portion of Riverside which lies above the level at which water can be taken from the Santa Ana river. This enterprise is known as the Gage Ditch Company, and will soon bring into the highest state of cultivation some 10,000 acres of the finest land in San Bernardino county.

HON. JAS. M. WELSH, MAYOR OF STOCKTON. *Photo. by Spooner.*

THE FLOOD OF IMMIGRANTS.—According to reports received by the Immigration Bureau, 900 settlers came into this part of the State last week. Several colonies are preparing to make homes in California. A large organization, numbering nearly 100 persons, is expected from Iowa by the middle of next month. Smaller colonies, Swedish, German and of mixed nationalities, are seeking locations by correspondence. These people are from Kansas, Dakota and Minnesota.

RECENT advices from Mexico state that drouth in the southern portion of that country has caused the death of many cattle, and that cholera has destroyed thousands of swine, creating such a prejudice against pork that a number of shops devoted to pork and lard have been closed.

MARYSVILLE *Appeal:* The irrigating ditches brought down from Smartsville have doubled the price of land along their course in the foothills.

Jas. M. Welsh, Mayor of Stockton.

The genius of our Government and opportunities for securing wealth, honor and advancement are fitly illustrated in the life of the present Mayor of the city of Stockton. He was born in Dundee, Scotland, in the year 1845, and is now in the prime and vigor of manhood. At the age of five years his father and family emigrated to Canada, where he received a common-school education and afterward learned the trade of miller. In the year 1868, he came to California, and has followed milling continuously up to the present time.

In 1882, the Crown Milling Company was formed, consisting of Schwonbacker Bros., Balfour, Guthrie & Co., and Mr. Welsh, who has been the general manager of this immense plant. Although a quiet, unostentatious citizen, and what may be termed a strictly business man, the solid men of Stockton brought him out and urged him to accept the position of Mayor. He was elected by a good majority in a closely contested election. His administration was conservative and characterized by a strict adherence to law, constitutional enactments and individual rights, unmindful of spasmodic clamor or vituperative assaults. He was re-elected and succeeded himself by the largest majority ever given to a candidate for Mayor in the city of Stockton. At the present time he is president of the San Joaquin County Board of Trade and also of the Land Loan and Building Association of Stockton.

Mr. Welsh is not prominently connected with fraternal societies, although he is a member of F. and A. M. and has always taken a deep interest in humanitarian projects for the assistance and advancement of his fellow-men. He has followed one line of business from boyhood, and has the reputation of being one of the most skillful in this line on the Pacific Coast. His interesting family and the management of an immense business have occupied most of his time, until of late, being chosen executive head of the municipality of the city of Stockton, he has given much thought and study to political economy and the science of government. He is not a large man, but seems to have great endurance and has proved himself a wise counselor and astute leader.

Austin Bros.

This is one of the oldest hardware establishments in Stockton. It was originally established as a branch of the well-known firm of Thos. X. Selby & Co., of San Francisco, the present owners being successors to that firm. The individual members of the firm are H. S. Austin and W. B. Austin, the latter being the resident partner in Stockton, H. S. Austin residing in San Francisco. This house carries a very heavy general line of hardware, embracing all the heavier goods that are handled in connection with it. Their place of business, a very good view of which we present, was built by them, and is especially adapted to the requirements of their business. Two stores, each 150 feet deep by 50 feet front, a portion of the second story and the basement, are well filled with a desirable and well-selected assortment of heavy and shelf hardware, mechanics' tools of all kinds, builders' and carriage hardware, steel, bar and sheet iron, blacksmiths' tools and supplies, leather and rubber belting, packing, hose, cutlery, etc. This firm being importers direct from manufacturers, are enabled to offer superior inducements to their customers. The success of this establishment from its start is the best evidence of its general popularity, and it is to such houses that Stockton is indebted for its reputation as a mercantile center.

AUSTIN BROS'. BUILDING, STOCKTON.

CACTUS FODDER.—Texas stockmen who have tried feeding beeves on prickly pear say that fat is laid on fast, and the cattle appear to experience no difficulty in assimilating this new food. In view of such successes, *Hoof and Horn* urges the cattlemen of Arizona to experiment with the same plant, as it is one of the most prolific and widely distributed of the cactus family in the Territory.

HOLLISTER rejoices in the prospect of having a cannery, toward which $20,000 has been subscribed.

ESTABLISHED 1877.

HALE & CO.

The Largest Retail House on the Pacific Coast.

The Stockton house (one only of the many branches) has fully demonstrated by its unusual growth and prosperity what can be done by a concentration of capital and the condensing of several lines of business under one head.

Dry Goods, Clothing, Boots and Shoes,

Are shown in endless variety; and buying directly of the manufacturers for spot cash, and selling everything for cash only, they are enabled to take advantage of every turn of the market, and place their goods before the consumer at the smallest possible percentage over manufacturers cash. Hence their success.

HALE & CO.,

STOCKTON.

DR. C. GRATTAN'S

SPECIAL REMEDY

—FOR—

Diphtheria or Putrid Sore Throat.

DR. C. GRATTAN,

Stockton, Cal., Sole Proprietor.

DIRECTIONS:

The medicine to be given without any dilution in water. The dose to be given every three hours until the bowels are moved, then repeat the dose three times a day for two days, and twice a day for three days, and once a day for a week. In case the throat is very sore, take one teaspoonful of the Diphtheria Mixture to one-half a cupful of water, and gargle the throat six times a day. Those in the family who are not sick should take a few doses of this medicine, and it will prevent the spreading of this disease. For the blood, one-half a teaspoonful three times a day. For costiveness, indigestion, and foul stomach, or headache, take one tablespoonful on going to bed at night. It is a gentle purgative and moves the bowels without pain.

THIS REMEDY CURES

Diphtheria or Putrid Sore Throat, Bronchitis, Common Sore Throat, Hoarseness, Costiveness, Salt Rheum, Indigestion, Foul Stomach, Etc., Etc.,

—AND IS—

THE BEST BLOOD PURIFIER OF THE AGE!

It has been used with unequaled success in Scrofula, and all corrupt humors in the blood are quickly expelled by its use.

SOUTHWORTH & GRATTAN, Wholesale and Retail Agents,

STOCKTON, CAL.

For Sale by Druggists and Grocers Throughout the State.

PORT COSTA WAREHOUSE AND DOCK CO.

Located at Port Costa, California.

G. W. McNEAR, - - - - President.

STORAGE, 60,000 TONS CAPACITY.

Liberal advances made and insurance effected at lowest rates. The Port Costa Warehouses are regular for delivery of Wheat sold on Call Board. Frequently Wheat is in demand for Call Board delivery, and brings much higher prices than Wheat to arrive, as deliveries have to be made within five days after call, in lots of 100 tons, piled and inspected. Wheat at Port Costa, when on the market for sale, can be sold and cashed at once, with no fear of rejection or drawbacks of any kind, as the grain is on the spot for inspection. Grain received from car or barge, without extra expense of any kind to shippers, and prompt returns made. Attached are superior Cleaning and Smutting Mills for the handling of all grades of inferior grain.

For further information, apply to

Alameda.

Crops.—Haywards *Journal*, May 21: Robert Knudson, of the Half-way house, stated, on Wednesday, that the crop prospect in his section was exceedingly good. Johnny Alves, of the Spier ranch, also reports the crops coming out much better than at first expected, and claims to have the boss 50 acres of chevalier. The cool weather for two weeks past has been the saving of the grain in this section, and it is now filling out finely. All agree that it will be plump and of fine quality. Some of the late-sown grain is, of course, backward, but it is growing nicely. There are portions of the township where the crops will not turn out very well. The hay crop, though not heavy, is of much better quality than last year. A great deal has already been cut.

The Pear Slug has been depositing its eggs on the leaves of the pear and also the cherry trees, and will hatch out about June 1st. It would be well for orchardists to look out for them. State Inspector Klee's remedy for destroying the above pest is worth trying.

Butte.

An Oroville Farm.—*Register:* Four years ago M. L. King came here and bought 40 acres of rough, brush-covered land situated near Feather river and about three-quarters of a mile from Oroville. Doing all his work by himself and using only one horse to plow with, he has cleared about 25 acres, fenced it and planted most of it to trees and vines. He has on the place 100 large and very thrifty orange trees and 300 that are about six feet high; 100 fig trees; 350 apricot trees that are loaded with splendid fruit, and about the same number of peach trees that give promise of an abundant crop. He has almonds, walnuts, palm, prunes, plums, 50 cherry trees, 70 apple trees and 75 olive trees. There are 3000 bearing grapevines, mostly white Muscat and Zinfandel. His blackberries, strawberries and currants show that he will have an abundant crop. Last fall his Japanese persimmons were among the finest in the citrus fair at Sacramento. Mr. King has built a good dwelling—being a mechanic—fenced the land and done a large amount of work on the farm.

Contra Costa.

The Outlook.—Martinez *Item*, May 21: Mr. Simon Blum has recently visited the southern and western portions of the county, and reports that the cool weather has brought out the wheat and barley wonderfully. Barley that eight or ten days ago was scarcely a foot high has grown well, and is now heading out. The barley crop in San Ramon, Green, Taylor, Briones and Pinole valleys will be ⅔ more than it was last year. Late sown wheat looks badly in some sections, but early sown and summer-fallow looks better than it did last year. Wheat in the vicinity of Alamo looks splendidly, is level with the fences, and is filling finely. Taken together, the wheat and barley yield may reach ⅔ of the usual crop. Fruit is very promising everywhere in Contra Costa. Especially will there be large yields of apricots, plums, pears and grapes.

An Arbor Club.—Cor. *Bee*, May 22: The ladies of Antioch have formed an Arbor club, intending to plant and provide for trees beside the road from the depot to the town, a distance of about a mile and a half.

Humboldt.

Improved Ranches.—Garberville Cor. *Standard:* Two days ago we had a ramble over Joe Swithenbank's ranch, and a finer lot of sheep and cattle we have never seen. Mr. S. has, if not the largest, the best improved ranch on the South Fork, and is an extra good manager, and consequently successful. He is a man we like to see prosper, because he is one of those whole souled fellows whom money does not spoil. South of Mr. Swithenbank's is a little ranch worth looking at—only 160 acres—belonging to B. F. Stahl. Two years ago he pre-empted this quarter-section. People said he was crazy, but to-day he has it all under fence, a barn built, a neat dwelling-house nearly completed, 20 acres in grain and a fine garden with a great variety of vegetables. Mr. Stahl commenced to clear this land two years ago, and now look at the result. He has 11 in his family and had no resources, nothing to fall back on save work; and yet there are persons who have been living on the South Fork for 20 years and have made no improvements whatever save those necessary to swear by in proving up on their land.

Glanders.—The committee out looking for animals affected with glanders ordered two horses killed in White Thorn valley which were badly afflicted with the disease. Four animals had already died of the malady in the same section.

Encouraging. — L. Wheat, a prominent stock-raiser from Camp Grant, brings very encouraging reports from his section relative to a plentiful supply of feed for stock and a splendid outlook for fruits. Camp Grant has been the most successful and extensive fruit-raising section, up to this time, in the county.

Inyo.

Abundant Promise.—*Independent*, May 21: Never before was there such a prospect for a fine fruit crop around Independence as at present. Apricots and nectarines are already nearly as large as hen's eggs, apples, pears, peaches and plums are of good size, and all trees are heavily laden. Fruit-growers all make like reports.

Lake.

The Frost was Light.—Lakeport telegram, May 22: The late frost did little damage in Lake county; the vineyard men say they can detect scarcely any in the vineyards; a little of the very early fruit was injured slightly, but the rest is all right; some of the very early vegetables were also cut down, but that is all the damage done.

Los Angeles.

Editors Press:—Hundreds of tons of hay are lying in all stages, from the sickle to the large, well-cured shock. Very little is stacked yet. Weather is cool and cloudy, with frequent light showers to-day. The prospects are for little or no more rain. We are glad to see the showers so light, as much rain now would cause great loss of hay. Crops here are not the best, though there will be enough to keep prices reasonable.—D. J. O., *Spadra, May 19.*

A Good Gopher Trap.—Pasadena *Union:* Mr. Nelmes has an owl's nest in his barn at Glenrosa. On the 2d five young owls hatched out. On the morning of the 3d six dead gophers lay near the nest waiting to be devoured. The owls took possession of the pigeon-house five years ago and returned every season, when they have to retake their quarters by (generally) devouring a pair of young pigeons and driving the old ones off. Mr. Nelmes believes they have done no other harm, and will gladly sacrifice a pair of young pigeons once a year for such valuable friends.

Placer.

Fine Fruit Prospects.—*Bee*, May 19: J. F. Madden, of Newcastle, was in Sacramento to-day. He says that between Penryn and Auburn comparatively no damage has been done to fruit by the frost. The prospect for an enormous yield, and of the best quality, was never better. Apples, pears, peaches, apricots, plums, etc., are looking splendidly, and in the section mentioned the damage to grapes is so slight as to be almost inappreciable.

Superb Grain.—Auburn *Republican:* The banner wheatfield of the county is Peter Ahart's, just north of Lincoln. He has 800 acres of White Chili wheat, and there are 640 acres in one field which excites the admiration of all who see it. It stands nearly three feet high, while the tops are as even and level as a floor. It was sowed broadcast in October and November on summer-fallowed land, which has been in grain since 1854, except the four years preceding the present crop, when it was used to pasture sheep. This is the best crop it ever produced, and it seems to grow better with age. Mr. Ahart expects to begin heading by the middle of June, and thinks his wheatfield will yield between 20 and 25 bushels to the acre. He also has 400 acres of barley, or 1200 acres in grain all told. The latter is also in fine condition, and will probably be ready to cut by June 1st. It has been reported that one farmer near Sheridan has contracted to sell his crop for $1.80, but the highest that has been offered around Lincoln is $1.55, which found no takers. The farmers are sure of a good crop and expect high prices.

San Benito.

Artesian Water.—*Free Lance*, May 20: E. F. Fallon's artesian well is now down 255 feet. The drill has passed through several layers of clay, sand, etc., and is now working in rock. The water is already flowing over the top of the well, and indicates that with a little more work an exceedingly fine flow will be obtained. This well has been bored in a territory heretofore considered outside the artesian belt line, and will add greatly to the value of thousands of acres.

Good Grain.—B. F. Haun came over from his ranch on the other side of the Quien Sabe, Wednesday. He brought a sample of his wheat which measured four feet one inch in hight. His barley measures three feet and eight inches in hight.

Crops.—The outlook is generally more favorable than was at first thought. The summer-fallow and early sown grain is looking well, and will yield heavily. The late sown grain, except in most favored places, is very poor, and in some localities will hardly be worth cutting for hay.

San Bernardino.

The Finest of Oranges.—The San Bernardino *Index* reprints this compliment from the Pontiac (Mich.) *Gazette:* We have picked oranges from trees on the Mediterranean islands, on the West African coast, on the islands of the Antilles, and in the Southern States, but never tasted that fruit so luscious, finely flavored and juicy, as from a box received last Tuesday per express from San Bernardino, Cal.

San Diego.

Tia Juana Notes.—Cor. National City *Record*, May 17: Hay-making is now the order of the day. The crop is light, but of good quality. Mr. Clark cuts his fourth crop from one sowing of barley. It is the best piece in the valley. The fruit trees are well loaded. Peaches, apricots and apples will be plentiful, while grapevines are generally overloaded.

San Joaquin.

Irrigating Pump Tested.—Lodi *Cyclone*, May 19: The experimental starting of the Lawrence & Hutchins irrigation pump, Sunday, was a success. There was a large concourse of people from Lodi, Woodbridge and Lockeford, as well as a few Stocktonians, on hand to witness the first effort of what is expected to revolutionize farming in the Mokelumne valley. The pump was set to work under a light head of steam and threw a stream that filled the flume, which is 10 feet wide, to a depth of 10 or 12 inches with a current that ran like a young river. The ditches were not deemed strong enough when the levee had been elevated above the level of the land, to stand too great a pressure, and so the water was carried only a short distance in the canal and then left to submerge a wheat and alfalfa field near by. Everybody seems delighted with the successful trial.

San Luis Obispo.

Orchard Outlook.—San Luis Obispo, May 23: This is the first year of fruit culture on the Huer Huero and already it is necessary to pick large quantities to save the overloaded trees. Reports from different parts of the county show that the fruit yield will be enormous. Near town, lemons and oranges make a splendid showing. J. P. Andrews has in his orange grove several trees five years old, which will bear nearly 1000 oranges each.

Swarms of Blackbirds have appeared in this county, and are doing considerable damage in the grainfields. In some quarters their depredations are so severe that farmers employ gunners to guard the fields.

San Mateo.

Flax.—*Times and Gazette*, May 21: W. E Stanton's flax crop is a fine one, the flax standing from 22 to 28 inches above the ground. Mr. Stanton says that W. H. Hatfield, the promoter of the work, is well pleased with the appearance of the crop and is only sorry there is so little more like it.

Solano.

Editors Press:—The weather the past week has been quite cool for the time of year, and clouds hang around and threaten rain. We have not had any frost this month. L. W. Buck's cherry crop is very good. Bassfords will be through picking in a couple of days. H. Bassford has been sending from 50 to 80 boxes East daily the past week. Apricots are ripening pretty fast for cool weather, and will soon be plenty. The shipments East will make a large difference in the amount sent to the San Francisco market. The carload sent East from Winters last week would have been in the San Francisco market by this time. Fruit is picked much greener to ship East than to San Francisco, and, as a general thing, all the early fruit is picked too green even to be good eating. It is somewhat like the bananas we get here, that have to be put in a sweat-house and half cooked before we can eat them. Haying is pretty well through with. Grapevines are loaded with blossoms, and are already locking together. There is a prospect of a good crop, and the impression is that grapes, especially wine-grapes, will bring a good price. Lusk's agent was at Vacaville and Winters a few days ago and bought several lots of apricots at $1.60, delivered at the cars in 60-pound boxes; also, some to be delivered in Oakland at $1.75, which is about the same price. J. W. Gates sent some tomatoes to the city last week, the first of the season from Vacaville. The first tomatoes do not amount to much, as they come from the blossoms that are on the vines when they are transplanted from the hot-beds. It generally takes a Chinaman half a day to gather a box. After those few blossoms mature, it is from 10 days to two weeks before any more ripen. Mr. Gates has rented a young orchard to some Chinamen to raise vegetables on; they have already raised a crop of Irish potatoes, which were sold at from two to four cents per pound, and now are putting in sweet potatoes. Crops between young trees here do not seem to hurt them the first two years, and about pay the expense of cultivating, which is from $10 to $12 per acre.—G., *Vacaville, May 22, 1887.*

Carp Thriving.—Dixon *Tribune*, May 21: Carp in large numbers and weighing from five to ten pounds each are being captured in the shallow waters that are tributary to Cache, Haas and other sloughs. The usual method is to lie in wait and shoot them while they are in search of spawning grounds.

Sutter.

Good Prospects.—Marysville, May 21. Geo. Ohleyer says: In Sutter the grain crop promises to be of the full average, which means in that county about 25 bushels to the acre. Some fields of wheat seem good for 40 bushels an acre. Grain on summer-fallow is looking remarkably well. The amount in grain this season is 10 per cent above the average. The foregoing applies to Yuba also, with the exception that the average yield of that county does not equal Sutter's average of 25 bushels to the acre. The harvesting of barley begins in a few weeks. The grain in some places is fast turning yellow. The crop of Yuba and Sutter promises to be at least 25 per cent better than last year.

Sonoma.

Fruit Promising.—*Index-Tribune*, May 21: The peach and apple crop in Sonoma valley will be extraordinary this year. There will also be a heavy yield of plums, nectarines and all other fruits except cherries, which are reported very short.

Insect Foes.—Santa Rosa *Democrat*, May 21: One of our leading farmers stated Saturday that the greatest enemy which the fruit-growers are having to cope with this spring are caterpillars and pumpkin-bugs, which are more numerous than for some years past.

What Ails the Oats?—I. S. Cook has a 20-acre field of oats about four miles west of this city which has caused no little comment among the farmers in that neighborhood. Until attaining a hight of six inches the grain exhibited every sign of healthful vigor, but since that time, now two weeks ago, it has not grown an inch, although retaining its healthful appearance. Its roots seem to be dwarfed, and are coated with a substance resembling mildew.

Late Frosts.—*Index Tribune*, May 21: There was more damage done by the recent frosts than at first reported, but immediately around Sonoma and Glen Ellen the loss was merely nominal. Farther up the valley appeared rows of dull, dead, brown leaves, where a day or two before lines of green, flourishing, fruit-bearing vines had existed. Crabb's Black Burgundy fell at the first onslaught, wilted and withered away as if weary of life; the Zinfandel showed that its days were passed, the Berger followed its Hungarian friend, and the Malbec and Gutedel both acknowledged their inability to stand stress of weather.

Tulare.

The Latter Rain.—*Register*, May 20: Tulare was visited by a heavy shower Wednesday night, there being a fall at this place of about one inch. It will probably do more good than harm as it is, but the balance on either side of the ledger will not be great. Many thousand acres of grain and alfalfa hay are down and in the cock and winrow, and much of this will be damaged, anyway, and ruined if the rains continue for two or three days. On the other hand, some of the late sown grain will be made to fill out nicely that would have amounted to nothing but for the rain. Much good will also result to gardens and newly planted orchards and vineyards. The southern portion of the county did not get so much rain as Tulare and vicinity.

Peaches and 'Cots.—Visalia telegram, May 20: The first box of ripe peaches of the season arrived in town to-day from Boyd & Thomas' orchard, in Stokes valley. The first ripe apricots of the season were sent to S. F. from the same orchard May 10th, two days earlier than those from Phœnix, A. T.

Ventura.

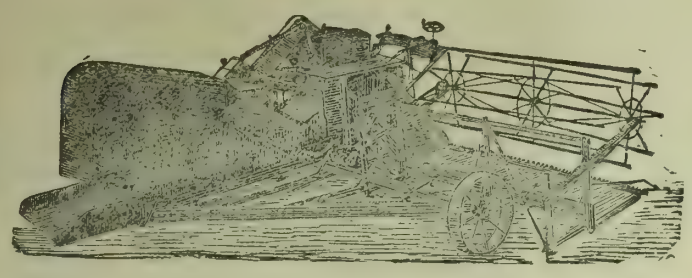
The Honey Interest.—*Free Press:* There are probably nearly 20,000 hives in the county. Two years ago the county produced about 3,000,000 lbs. of honey, but the present year was not so favorable and but about half that amount was produced. In many cases 400 lbs. to the hive have been produced. One apiary of 700 hives, and surrounded by bees amounting in all to 1800 hives within the radius of one or two miles, averaged 130 lbs. each. Another apiary containing 445 hives in the spring, increased to about 1200 and yielded 80 tons of honey two years ago. These are presented as fair examples of the products of the honey-bee in his section.

Yolo.

Petty Prodigies.—Woodland *Democrat*, May 19: We saw a strawberry at Brendel's fruit store yesterday that measured five and one-half inches in circumference. It looked as if about six berries had all grown together, as their outlines could be plainly seen. O. Collier brought into this office to-day the largest hen's egg we have ever seen—the product of a Brahma pullet. It measured eight inches in circumference and was three inches long.

The "Boss" Berries.—Yolo *Mail*, May 21: Jerome Baker brought to our office Tuesday six boxes of the largest and finest strawberries ever raised. Our box (an ordinary one-pound box) was full, and on actual count held just 18 berries, averaging five inches each in circumference. In the other five boxes the berries were nearly as large. Mr. Baker sent them to a friend in Sacramento, who, we hope, will show them to the *Bee* and *Record-Union*, as we know this story requires corroboration. These berries are the second crop and were raised three miles north from Woodland, where Mr. Baker has about five acres out to strawberries.

Mulberries.—The fruit of the mulberry tree has ripened in this vicinity.



OREGON.

Crop Prospects.—*Willamette Farmer*, May 19: The weather has finally conformed to the season, and warm sunny days succeed the wintry atmosphere that had so far invaded May. The way green things have grown the past week is a caution to unbelievers. We see that sprouts of fruit trees made six inches growth in a single week. Winter wheat has suffered badly from the cold storms of springtime. We went through a field of this grain that was badly "fired," or scalded, and old judges feel sure that the crop of Western Oregon will be inferior, and that the heads will not fill as well on fall sown as on the spring sowings. Grass is a good crop on meadows, and our hay harvest should be a large one. Pastures are fine and stock are thriving everywhere. The oat crop should be heavy unless the rains give way to permanent drouth. It is hardly possible that such should be the case with so many mountain ranges lifting great bodies of snow to condense the air that comes from the ocean. The fruit crop is seriously injured in some localities; cherries especially are a light crop. From all we learn the aggregate will be enough to show the world that Oregon can turn off enough fruit to meet all reasonable demands.

MATTESON & WILLIAMSON,

THE PIONEER HARVESTER BUILDERS OF THE WORLD.

Not One of These Harvesters Has Been Returned.

Not One of These Harvesters Has Been Returned.

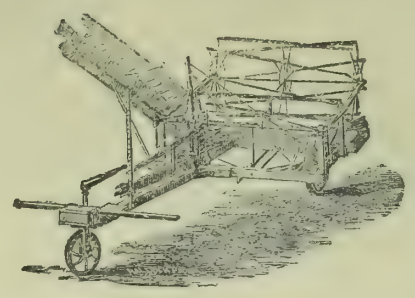
THE HARVEST QUEEN.

MATTESON & WILLIAMSON,

The only manufacturers in Stockton who make a specialty of making everything needed by the farmer in seeding and harvesting. Among their latest triumphs in harvesting machinery is the unrivaled

HARVEST QUEEN,

To Which They Invite the Attention of the Careful Farmer.



This machine was first placed in the field during the harvest of 1886. From the testimonials of those who have had it in use it is considered the peer of any now offered for public favor. For stanchness of build, lightness of draft, economy of manual labor and animal power, and in saving and cleaning the grain, its equal has yet to be produced. It is so furnished with efficient and ready operating brakes that the lives and limbs of operators are in no degree endangered. A limited number of the HARVEST QUEEN are being constructed for the harvest of 1887.

ORDERS AND CORRESPONDENCE SOLICITED.

☞ We refer you to the following-named persons who have had the Harvest Queen in use during the past harvest season: D. P. Edwards, Maxwell, Colusa Co.; H. Beckman, Woodbridge; H. W. Childs, Acampo; Ralston & Grigsby, Acampo; Yosemite Stage and Turnpike Co., Madeira; H. W. Patterson, Borden.

The Improved Link and V-Belt Combined Harvester.

Under the above caption we call attention to the advertisement of Messrs. Holt Bros., elsewhere in the RURAL. Their advertisement has been known as the Stockton Wheel Co., which was founded in Stockton about four years ago. The same enterprising firm has a much larger factory of the same kind in Concord, New Hampshire. Their Stockton premises comprise the main building, 45x100, three stories in hight, and constructed of brick; the storehouse 75x90 feet; the harvester building 35x150 feet, and the lumber shed 20x120 feet in dimensions. Their factory is equipped with all the latest improved machinery, and furnishes employment to from 25 to 30 hands. The products comprise Sarven patent and wood-hub wheels, bodies, headers, combined harvesters, etc., only the best material being used; and as only skilled workmen and superior machinery are utilized, the goods are sure to be perfect. The firm has a large establishment at 30 and 32 Main street, San Francisco, four stores and a basement being occupied, each 47½x137½ feet in dimensions. Here they carry a full stock of goods in their line, and all the business transactions of the house are conducted here. They carry here a full line of carriage hardware, such as springs, tires, axles, bolts, clips, etc., and a full line of trimmings.

They have also erected a spacious building for the construction of the Improved Link and V-Belt Combined Harvester, that, it is claimed, will cut, thrash, clean and sack more grain in a season, with less expense, than any other machine of the same capacity in the market. In all respects this house occupies a leading position in the trade, not only with regard to the superiority of its output, but it is equally conspicuous for the enterprise of its business policy and the liberality and promptness with which its dealings are conducted.

Diphtheria.

There is no modern disease that has proved so fatal to children as diphtheria or putrid sore throat. Of late it has been common among adults, with quite fatal results. Dr. C. Grattan, of Stockton, has made this disease a special study for 10 years, and devised a compound that has been highly successful as a remedial and curative agent. It has gained a State reputation as a blood purifier and family medicine for general debility and chronic diseases. It is known as Dr. C. Grattan's Special Remedy for Diphtheria.

Hale & Co.

In one of our cuts showing Main street, near the courthouse, is seen the name of Hale & Co., dry goods, etc. This firm has stores in the chief interior cities, among which are Sacramento, Petaluma, San Jose, Salinas City, and a purchasing house in San Francisco. By making large purchases they are enabled to sell goods at corresponding low rates. In each city where located they have taken and maintained a leading position. Their system, under enterprising managers, illustrates the benefit of combination of capital, and their liberality is shown in the low price at which they sell goods.

For Sale.

State and County Rights of a Fly Trap; warranted to keep your house free from flies. Send stamp for particulars to Z. Xevers, 208 Brannan St., San Francisco, Cal.

THE IMPROVED LINK AND V-BELT COMBINED HARVESTER!

The following are some of the advantages our Improved Harvester possesses over all others:

1. Our Improved Harvester runs FOUR horses lighter than any other machine made.
2. It is easily handled, and turns a square corner as readily as a mowing machine.
3. It is less liable to get out of order, and cheaper to keep in repair than any other machine.
4. It has no clumsy, expensive gearing to wear out or break.
5. It is run mostly by Link and V-Belts which, in case of breakage or accident, can be repaired in the field without loss of time.
6. Our Harvester makes no noise to frighten or irritate the horses, and makes less noise than ordinary headers.

7. Our Header is far the simplest and runs the lightest, and is the strongest and best. There are no Rickety Gears or Trembling Rods to break.
8. The Header may be raised and lowered instantly from any part of the Separator.
9. Our Harvester WEIGHS FIFTEEN HUNDRED POUNDS LESS than any other machine of the same capacity in the market.
10. It will cut, thrash, clean and sack more grain in a season, with less expense for labor and repairs, than any other Harvester ever turned out.

Remember, all our Improved Harvesters are warranted to work well or no pay. Examine them before purchasing elsewhere. We shall sell our Harvesters upon their merits alone.

Send for Testimonials and Price List.

MERY'S IMPROVED PIONEER **BARLEY CRUSHER**

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT!

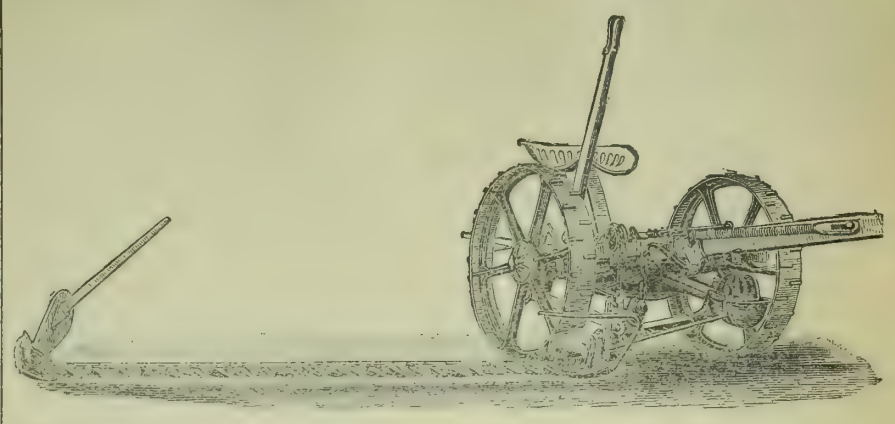
VALUABLE IMPROVEMENTS HAVE BEEN ADDED THIS YEAR.

This Mill has been in use on this Coast for 6 years,

TAKEN THE PREMIUM AT THE STATE FAIR

Four years in succession, and has met with general favor, there now being

Over 200 of them in use in California, Nevada & Oregon



It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

M. L. MERY,

CHICO IRON WORKS, CHICO, CAL.

THE STANDARD MOWERS.

The Only Successful and Practical

WIDE-CUT MOWERS.

The entire weight of the Cutter Bar being suspended on the Spring prevents the Bar from dragging on the ground, thus doing away with all side-draft and enabling us to use a 7-foot bar, thereby accomplishing a feat which cannot be done by other machines.

It has more cutting power, because nearly the whole weight of the cutter-bar and the inside and outside shoes is carried on the drive-wheels, thereby increasing the "*Traction*" more than enough to make up for the additional length of the knife.

The 7-foot Mower is as Light Draft and as easy to handle as any 4-foot Cut Mower made.

Remember with two horses and one man the 7-foot Mower will cut 20 acres of grass per day.

SIZE OF MACHINES:

4 Feet 3 Inches, 6 Feet, 7 Feet.

A. T. DEWEY. W. B. EWER. GEO. H. STRONG. } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED 1860

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S.F.

The Stockton Combined Harvester and Agricultural Works.

Stockton is leading all other centers in its manufactories of agricultural implements. The plant known as the Stockton Combined Harvester and Agricultural Works is the largest factory of the kind in the State, perhaps on the continent. The works are located in the suburbs of Stockton, near the railroad, and accessible from all points of the compass. It is difficult to give an adequate idea of these buildings, covering as they do about five acres of ground, and thoroughly equipped with the most approved modern machinery. The whole of this large establishment has been erected solely with the idea of permanency and convenience. A well 156 feet deep has been sunk, and the water, placed in three mammoth tanks, is conveyed to every floor of the different buildings, and every precaution has been taken to prevent conflagration. The legends on the various buildings, as seen in the accompanying cut, will give as complete an idea of the extent and variety of industries grouped in this plant as can be had without a visit and detailed study.

The company is made up of some of the most solid and reliable business men in the San Joaquin valley. Otis Perrin, president; F. M West, secretary; E. P. Palmer, manager; N. McEwen, superintendent. The superintendent and manager are practical men in this line of business. They use only the very best material and employ the most skilled labor.

It seems to have been the conception of the enterprising and sagacious men who control this institution to manufacture harvesters adapted to different localities and suited for large ranchers or small farmers. These several harvesters are named Minges, Houser, Shippee and Powell's combined harvesters. The Minges is a pull and belt machine, 30 inch cylinder, 46-inch separator, extra cleaner with 40-inch sieve, high, wide drive-wheels adapted for hard sandy soil, and has been successfully run for about five years. The Houser combined header thrasher is a pull and belt machine, in construction much like the Minges, and is more favorably known throughout the State than any other combined machine, as it was the first combined harvester which achieved success and solved the problem of a cheap method of harvesting. It is a powerful machine, capable of successfully harvesting the heaviest and worst-lodged grain without fear of breaking. The Shippee is a push machine, Nos. 1 and 2, with Shippee and Grattan improvements. They are the only combined machines that have an elevator to run straw into the header wagon, saving all the straw, if desired, also chaff, wild oats and weeds, and cleansing the land of all foul seeds. They enable the small farmer not only to do all his own harvesting, but to market his grain each day, greatly reducing harvest expenses. The Shippee and Houser Works have been consolidated under the above-entitled firm name.

In addition to the service which the combined harvester has done and is still to do in cheapening wheat production and thus benefiting our farmers directly, the machine is also spreading our fame abroad throughout the earth. We have achieved a number of important mechanical triumphs in the design and construction of industrial machinery, but there is none which is attracting so much attention as the combination of reaper and thrasher. Stockton is visited by inquiring travelers from all the agricultural regions of the world, many sent by governmental orders to see for themselves what this wonderful arrangement is which accomplishes so much work at such a little cost per acre. Thus general attention is being called to our industries and our resources which, in fact, but need to be known to be admired. The inventive skill and the investment of capital which has brought the combined harvesters to their present practical, working perfection, deserves well of the country and the prospect is that it will be fully recognized and rewarded.

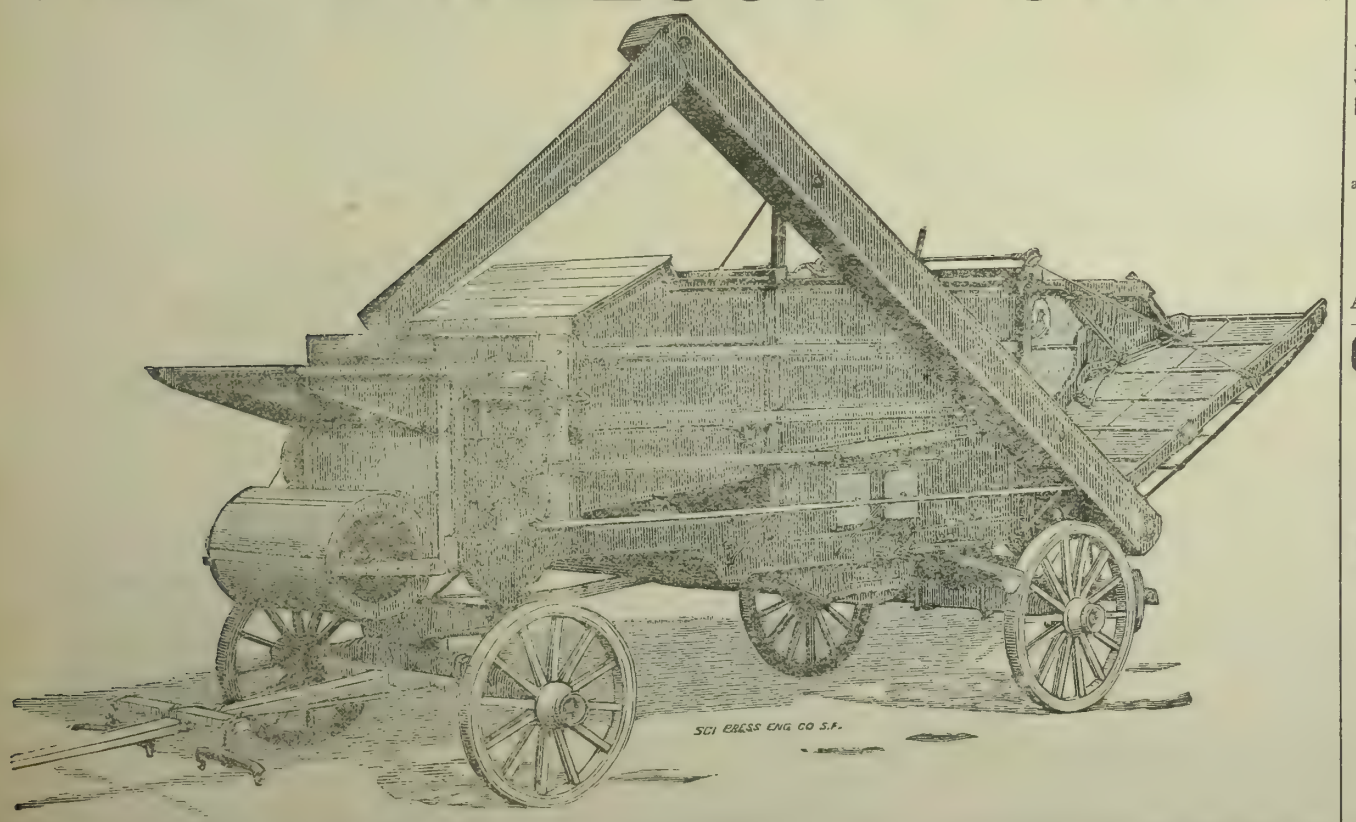
Rural Health Retreat, (Crystal Springs,) St. Helena, Cal.



Among the many delightful places for rest, recreation and restoration of mind and frame in California, is the "Crystal Springs Rural Health Retreat," shown in the above engraving on this page. The Retreat is situated on the slope of Howell mountain, 1200 feet above tide-level, 500 above and overlooking Napa valley, and two and a half miles from St. Helena, in Napa county. Among the natural advantages are stated: "Pure water, dry atmosphere, balmy sunshine, even temperature, mild breezes and the absence of high winds. Across the valley lies the Sonoma mountain range, breaking the sea breeze and shielding the Retreat from the chilling atmosphere of the coast, and presenting a safeguard against catarrh and lung diseases. The grandeur of its mountain ranges, with shrubby canyons lying in beauty at their feet, the famous Mt. St. Helena rearing its lofty head to the clouds, the grassy plain lying beneath, reflecting the sunbeams like a grand mirror before the Retreat, all perfumed with a variety of wild flowers, lend an enchantment to the scene. There are no stagnant pools or marshes within range; rainfall is plenteous, rendering irrigation unnecessary, and malaria is a stranger at the Retreat, and in all this beautiful valley. In fact the purity of the air on this hillside and in the upper valley is a specific for malaria, and all diseases affecting the head, throat and lungs, producing a healthy circulation through the mucous passages generally."

The Rural Health Retreat is twofold in its character. In the first place it undertakes to do direct work in the cure of diseases by hygienic and rational practice, by thoroughly competent physicians resident in the Retreat. While a radical table is furnished for invalids, and proper diet prescribed for each individual case, no one is confined to a starvation diet, and better and more ample variety is furnished at meals than is usually found upon invalid tables elsewhere. The managers have the services of two thoroughly competent physicians from Eastern cities of many years' experience in practice. They are assisted by two lady attendants, having a two-years' course at one of the largest hygienic and surgical sanitariums in the world, with five years' subsequent practice.

The Retreat is also a summer and winter resort to all who desire to spend a few weeks or months in recreation, and receive the benefit from rest and breathing this mountain air, whose healthfulness and purity is unsurpassed. For such, a liberal table is especially provided. While the chief object of this institution is to afford a sanitarium for those in need of hygienic and surgical treatment, ample means are afforded for recreation, and entertainment is provided for all boarders and pleasure-seekers who love decency and good order. Winding and picturesque roads, walls of blasted rock terracing the side-hills about the main building, cottages and driveways, a fine campus, spacious woods, shady groves, arbored seats, swings, swinging rings, swinging chairs, will be furnished; dumb-bell and Indian club exercises given to such as may desire them. Calisthenic exercises will also be led by a competent leader. To accommodate their increasing patronage the proprietors have been enlarging and building quite extensively, and in many ways improving their facilities for making the Retreat yet more comfortable for their guests.

It is certainly one of the best sanitariums, all things considered, in the United States. We feel an especial interest in the Rural Health Retreat, because one of the proprietors of this paper, with his family, has greatly enjoyed a recreation season there. They assure us that they are exceedingly well pleased with the Retreat for its natural and added beauties and comforts, and for the pure moral tone, the kindliness and cordiality, which prevail in the management. The accessibility of the Retreat should also contribute to its desirability, both to the invalid and the pleasure-seeker. We advise health and pleasure-seekers to send for printed reports and further information.

ORANGE CULTURE A practical treatise by T. A. GAREY, giving the results of long experience in Southern California. 196 pages, cloth bound. Sent post-paid at reduced price of 75 cts. per copy by DEWEY & CO., Publishers, S. F

From Tuolumne County.

EDITORS PRESS:—This season seems mixed in many ways. Some complain and others rejoice for their fullness. Among the foothills of Tuolumne county hay will be an average crop, and so will fruit. The frost has blighted some splendid gardens, while others are scarcely touched.

A few days ago I visited Sonoma and Columbia, and was surprised at the small damage in sight, when lower down the blight seemed as if a fire had swept the green from grapevines and even the shade trees. Around Jamestown this fact was apparent. Wherever the dew fell, notably in low places, and there was an opening for the north wind, the destruction seemed perfect. Big Oak Flat and Groveland suffered severely. It is really a pity to see such promising crops of fruit destroyed in one or two nights—all the labor of months and years, even, of planting and waiting for the crops which never come. If Californians were easily discouraged, such setbacks, from causes unavoidable, would cause despair and paralyze industry. But year after year it is try again, hoping that the conditions necessary for success will eventually crown the husbandman.

But even Jack Frost has not denuded our county of fruit. Peaches, apples, plums, cherries and other fruits are abundant. Grapes being yet tender, fell an easy prey to frost in places, but I cannot learn of other fruits being injured to any extent. In the higher latitudes the apple may have suffered; but after all the damage, we believe that this season's fruit will be largely in excess of the few former years, which suffered so much through grasshoppers and other causes.

Farmers are busy haying. The weather has been hazy and threatening rain for weeks. To-day is warm and sultry, a ring around the sun all day, which makes farmers timid about exposing much hay. Hay and grain will be higher in price than last year, which was the cheapest for hay on record. Mowers and sulky rakes are busy from morning till night, and it is housed as soon as it is cured sufficiently, so as not to heat and spoil.

We must record fewer chronic tramps scouring the country for a pick-up living. Now and again men able and willing to work come along for bed and board, but it is not a daily tax upon your generosity as formerly. It is to be regretted that the system of farming in California does not necessitate the employment of men by the year so as to create permanent homes for the employed as well as employer. Farmers complain of lack of proper help when harvest comes on all at once; but they have no one to blame; first, because farming on the great plains only requires help for a few months each year, and help must look elsewhere for employment for some eight or nine months. Many finding permanent occupation elsewhere return not to the short and laborious engagement of farming. From early dawn to late at night fatiguing labor has to be borne, requiring young and able men to stand the heat, dust and toil necessary to follow header and thrasher. It is surely money well earned and should be wisely spent, so as to rise above drudgery and dependence upon others for a living. Soon machinery will be so perfected that labor in the harvest field will be reduced to a minimum. The past few years have seen rapid progress toward that end. Electric motors will yet do away with fires and their dangerous action in a harvest-field. But then, how laborers are to be provided for is a problem of the future. JOHN TAYLOR.

Mt. Pleasant, May 22, 1887.

The Great Galloway Sale.

We have already alluded to the joint public sale of imported and native-bred Galloway cattle, to be held at Geo. L. Goulding & Co.'s City Stockyards, Denver, Col., on June 10th and 11th. Leonard Bros., of Mt. Leonard, Mo., and Bush & Morse, of the Windsor farm, Denver, Colorado, will offer 100 head of males and females of the choicest breeding and individuality, embracing selections from four different importations by the Leonards. Most of the cattle offered by Bush & Morse are direct descendants of the stock imported by the Leonards, who, in breeding the same, combined some of the best strains of blood in their celebrated herd. Those desiring Galloways would do well to be represented at the Denver sale.

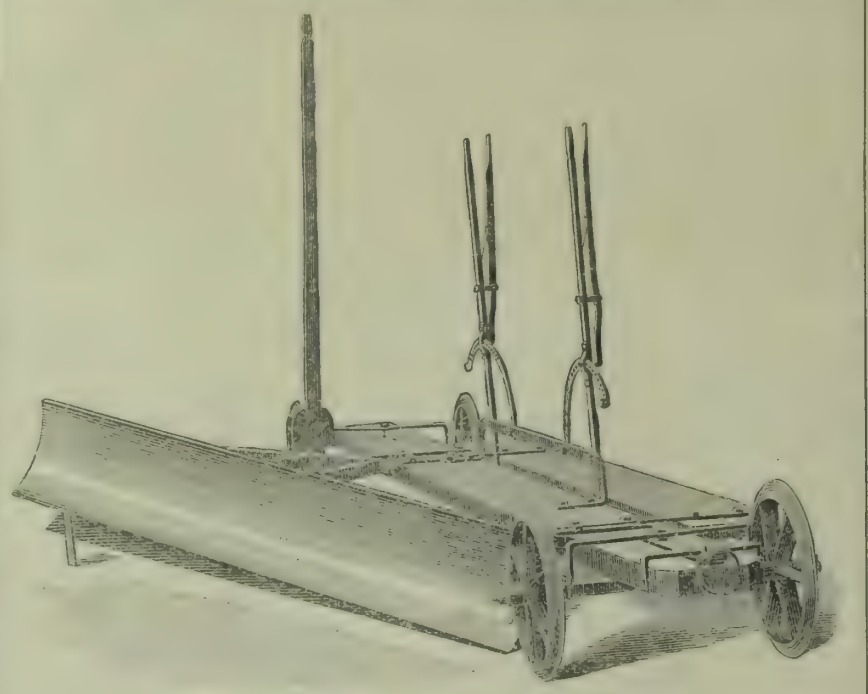
Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

MR. JAS. M. MCCARTY, real estate and loan broker, occupies a prominent position as general agent for local and Eastern capitalists. A photo-engraving cut of his residence enlivens our pages, and in a marked degree shows the refinement, picturesque and substantial homes that adorn the city of Stockton and environs. *

The So-Called Horse-Diphtheria.

EDITORS PRESS:—I should be much obliged if some of the readers of the PACIFIC RURAL PRESS would send particulars of that disease of the mouth and throat of horses, which many thought to be diphtheria.



There were quite a number of cases at Sacramento. I have written there for information also; whether they will write to me direct or through RURAL, I do not know, and it is not material, so long as we obtain the desired information.

I am much inclined to think that I am "on the track" of the *actual cause*, and if so, I need hardly say that it will be a benefit to owners and prevent much suffering to the horses.

ROBERT J. DAWSON,
Veterinary Surgeon,
225 Geary St., S. F.

A Popular Grader and Scraper.

We give on this page an engraving of a scraper and grader which commends itself to those who desire an effective implement at a moderate cost, and one which requires only the services of the driver for its working. It is the invention of L. E. Ashley, of Stockton, and is offered to the public by Clark & Ashley, of the same place. The engraving will enable any one acquainted with such machinery to understand its plan of operation. It has been largely used in San Joaquin county and has won good opinions for efficiency and general availability, for the great amount of leveling which needs to be done in fitting fields for irrigation, for road-making, and the like. Full particulars can be learned by addressing the manufacturers at Stockton.

CLARK & ASHLEY'S GRADER AND SCRAPER.

QUARANTINING CATTLE.—By advice of the New Mexico Cattle Sanitary Commission, Gov. Ross has issued a cattle quarantine proclamation to take effect June 1st. The reason given is that pleuro-pneumonia is epidemic in New York, New Jersey, Illinois, Canada, Scotland and England. The introduction of cattle from any of these places, or coming through the Chicago and Kansas City stockyards, is prohibited, unless the cattle have not been within the States, counties, or stockyards named during six months preceding their arrival in New Mexico, and have not shown symptoms of disease. Cattle coming from the quarters named, if allowed in the Territory after inspection, must come by the way of Raton. Inspectors can require importers to show all places where the cattle have been within the previous six months.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

A NOBLE DOG.—The death of the great St. Bernard dog, Merchant Prince, after two or three days' illness, is mentioned among the telegraphic items. Since he was imported last year by John N. Moore, of Melrose, Mass., he has taken over 20 first-class prizes, including the first in the Boston Kennel Show. Before he was brought to America his owner had been awarded 15 first-class prizes at various exhibitions in Europe. During the past year Mr. Moore is said to have been offered $10 000 for him, but refused to part with him. Merchant Prince was reckoned the largest and heaviest dog in the country, if not in the world, his weight being 220 pounds, and was a great favorite among the neighbors on account of his affectionate disposition and remarkable intelligence.

Enterprise Planing-Mill.

The advantage of location and development of this great valley has given the opportunity to establish extensive works of various industries in Stockton. Prominent among these is the firm of P. A. Buell & Co., manufacturers, builders and contractors. Their plant is a substantial brick building and covers nearly one block. They are supplied with all the latest improvements in machinery and facilities for kiln-drying. Their regular force of skilled mechanics and helpers ranges from 30 to 100 men. With ample capital, ripe experience and sagacious management, they have secured contracts and orders for millwork in every town from Stockton to San Diego. Mr. P. A. Buell, the active manager, has gained an enviable reputation as the leading builder and contractor in the San Joaquin valley. *

Lumber Merchants.

Messrs. Moore & Smith are the leading lumber merchants and manufacturers of the San Joaquin valley. Their immense mills are located on Puget sound, and their cargoes are shipped direct to Stockton. From this point their product is distributed the length and breadth of this great inland basin. *

THE first cherry plums of the season were received Monday from Briggs' orchard, Marysville. They were consigned to A. Lusk & Co., and sold for 25 cents per pound.

PACIFIC RURAL PRESS.

The Leading Agricultural Home Newspaper and standard authority on all branches of California Agriculture.

It is the chief medium for the dissemination of information concerning fruit-growing in Calfornia.

It has the fullest and most accurate REPORTS OF HORTICULTURAL MEETINGS, and is the best record of the EXPERIENCE OF INDIVIDUAL FRUIT-GROWERS in all parts of the State.

Its market reports are prepared with care and the greatest reliability possible for the benefit of the producer.

THE PACIFIC RURAL PRESS has more circulation and influence in the Pacific States and Territories than all the other agricultural weeklies in the United States combined. Advertisers can reach nearly all the leading reading farmers through its columns.

A well-known horticulturist who was in attendance upon the meetings of fruit-growers, writes; "The greatest praise that could be bestowed on the RURAL PRESS at the late Fruit-Growers' Convention, and which shows, undoubtedly, the well deserved popularity of that paper, is the fact that almost all the members of that Convention were subscribers to the Press."

It is a Farm and Home Journal of the highest class, pure in tone and well informed on all matters of industrial interest. It is handsomely printed and illustrated. It is a 20-page weekly, and is furnished, postage paid, for $3 per year in advance. Single copies, 10 cents, prepaid.

What Others Say of the "Rural Press."

PROUD OF THE RURAL.—We feel proud of the RURAL PRESS. It is a paper that we are not ashamed to send to our friends in the East. Every farmer on the Pacific Coast should take it, and it is a valuable paper for anyone to read. We appreciate your efforts. Long may you live to bless our cause. *James Blood, Santa Barbara Co.*

THE RURAL BEST OF ALL.—I take from four to six papers but *if I could take but one*, I should unhesitatingly choose the PACIFIC RURAL PRESS.—*J. M. Asher, San Diego Co.*

INVALUABLE.—I congratulate you on the *general excellence* of the RURAL PRESS, and consider it simply invaluable to all residents of the Pacific Coast.—*Frederick C. Sheldon, M. D., Los Angeles Co.*

Established 1870. Yearly subscription $3. [Thirteen and one-half months are allowed new subscribers and old subscribers paying $3, strictly in advance.]

Consumption Cured.

An old physician, retired from practice, having had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung Affections, also a positive and radical cure for Nervous Debility and all Nervous Complaints, after having tested its wonderful curative powers in thousands of cases, has felt it his duty to make it known to his suffering fellows. Actuated by this motive and a desire to relieve human suffering, I will send free of charge, to all who desire it, this recipe, in German, French, or English, with full directions for preparing and using. Sent by mail by addressing with samp, naming this paper, W. A. NOYES, 149 Powers' Block, Rochester, N. Y.

BRONSON PITTS THRASHING MACHINES

The Bronson Improvement on the Buffalo Pitts Thrashers consists of a set of long, agitating fingers extending from beneath the cylinder to the grain belt. These fingers have a longitudinal, as well as rising and falling motion. As the grain and straw are discharged from the cylinder, the straw is caught on the fingers and shaken out loose, and at the same time carried forward (by the longitudinal motion, assisted by the first Beater) on to the top of grain belt. At the same time the grain is shot through the loose straw to a sheet-iron pan (below the fingers), which, having the same longitudinal motion as the fingers, discharges the grain into the grain-belt cells before they have been covered by the straw.

The longitudinal motions of the Fingers and the End-Shake Shoe, operate to counteract each other, both being driven from the same crank shaft, but in opposite directions.

SPECIAL IMPROVEMENTS.—Although for the past two or three years we have felt each year that our Thrashers had arrived at a degree of perfection that left no room for improvement, yet each succeeding year we have been able to do "a little BETTER," and for this year we have an unusually brilliant list.

The Bronson Separator, with Recleaner incorporated in the Machine and Fan in Straw Rake. (Fan in Straw Rake is not shown in above cut The Self-Feeder shown is not included in prices named below.)

32-inch Cylinder with Sieves 44 inches wide, having extra enlarged separating capacity, with Recleaner, and Fan in Straw Rake.....$1100 00

36-inch Cylinder, with Sieves 52 inches wide, having extra enlarged separating capacity, with Recleaner, and Fan in Straw Rake..... 1250 00

40-inch Cylinder with Sieves 56 inches wide, having extra enlarged separating capacity, with Recleaner, and Fan in Straw Rake..... 1300 00

The above Separators have Iron Axle Wagons, 5-inch Tires, Chaff Carriers, 12 Double Bar Cylinder, Cast Steel Cylinder Shafts, Steel-Laid Teeth, Extra Large Cleaning Capacity, entire Machinery highly finished.

Large Band Jacks.....$40 00

EDITORS PRESS:—Many of your readers know not what an agent's life is like. In winter, traveling over mountain-roads, chilled to the marrow, we drive up to a house or shake-down or some dilapidated structure to find either no accommodations or no one living there. So, after feeding our horses and ourselves—if lucky enough to have anything to do so with—we crawl rather than walk to some sheltered corner to shiver through the night. We probably go through more hardships than any one in any other class, craft or trade, call it what you will. We are liable any day to get rained on during the winter.

But in summer, what a contrast! Who gets the fine views? Who sees more rugged nature than we who are traveling all the time—over mountains, through glens, across primitive bridges, fording small streams through heavy woods which at the present season look splendidly—full of wild flowers, ferns and mosses, the leaves all colors, from the laurels very dark to the maples very light green; while the creeping vines of ivy, blackberry and poison oak, from all shades of green to crimson, show in pretty contrast to the dark-brown, seared trunk of the gigantic redwood, which impresses and awes the beholder. Every breeze which blows through the tree-tops makes a peculiar sighing, stirs the heavy underbrush, wafts the dry leaves to and fro, and is laden with the aroma of the laurel, myrtle, honeysuckle and kindred flowers. Springs, gurgling through the mosses which line their banks, surging over rocks, around roots and stumps, cold as ice and clear as crystal. Every little while, lying peacefully in a hollow, or on a gentle slope, nestles a farmhouse, surrounded by fruit trees and flowers, and dotting the grass, the heads of the mustard, pansy, buttercups and others too numerous to mention; while in the distance are seen cows and horses which give life and charm to the view and make us think how puny are the attempts of painters to depict anything as we see it ourselves. It all needs to be seen to be appreciated.

E. P. S.

Eureka.

DR. C. GRATTAN has planted this season 70 acres in fruit trees and vines. In the center of this tract of land, at the highest point, is situated his noted artesian well. There is a great volume of water flowing into an artificial lake that is large enough to take a boat-ride on. This water has gained a local celebrity as a pure medicinal water that has proved a curative agent in kidney complaints. From an analysis its component parts are nearly the same as the celebrated Bethesda water.

M. P. Henderson.

M. P. Henderson & Son are the proprietors of an extensive carriage manufactory, which was established in 1869 with a working force of three men, in a small shop on Weber avenue, which they soon outgrew and removed to the corner of Main and American streets, where they erected their present substantial factories, in which is to be found all the latest improved machinery which can be used in the manufacture of carriages and wagons, to reduce cost and yet improve quality, which is necessary in this country to the consumer.

All kinds of vehicles are made by them, from the heaviest lumber or freight wagons and stage coaches to the lightest trotting sulkies and buggies, or from the improved farm wagons to the elegant carriages and phaetons; for all of which they have taken premiums at all exhibitions where shown, over all competitors.

The lumber, wheels, and all materials and stock used in this establishment are carried for two years ahead to insure everything being thoroughly seasoned and able to stand any climate.

They also supply the trade or any person with wheels and all stock and materials necessary to complete a vehicle. Being their own importers in all lines and buying from first hands, they offer an advantage over others in furnishing any part or the whole of the woodwork all ready for ironing.

All work turned out by the firm is manufactured under the personal supervision of the members of the firm, being models of taste and elegance, noted for thorough construction and durability. Their genius is employed constantly on improvements, among other items having produced several years ago a patented buckboard, known as Henderson's, which has proved a wonderful success and filled a long-felt want of the farmers, miners, liverymen and travelers of all kinds.

Their work finds its way to all parts of the Pacific Coast and islands, and is much recommended by its staying and lasting qualities.

The Stockton Milling Co.

The Stockton Milling Co., proprietors of the Crown Flouring Mills, located at Stockton, Cal., is an association of capitalists, who, in 1882, realizing the advantages possessed by Stockton for manufacturing flour, organized a company with a capital of $300,000 and commenced the erection of what is known as the Crown Mills. This is an expensive and substantial structure of brick, located immediately on the water front, and has been in operation seven years. Its capacity is 1400 barrels of flour daily, and runs night and day, and furnishes employment to more than 65 men. The mill is equipped with the latest improved roller machinery for the manufacture of flour, and its product stands at the head and is in good demand both with home and foreign trade.

As the wheat produced in the San Joaquin valley is as good as is produced in any other grain district in the world, and as Stockton is the grain market for an extensive region of country, this mill has superior facilities for the selection of choice wheat. The general manager of this firm is Mr. J. M. Welsh, who is acknowledged authority on milling business generally.

The office of the company in San Francisco is located at No. 319 California street.

Pacific Asylum.

The Pacific Asylum is pleasantly situated in the suburbs of Stockton about half a mile from the courthouse. It is a substantial brick structure in the center of a tract of 40 acres set with vines and fruit trees, and laid out with graveled walks and beautiful shade trees. Dr. Asa Clark, the proprietor, kept the insane of the State of Nevada for several years under contract until they were removed to the new State Asylum at Reno. On the 10th of August, 1882, the Pacific Asylum was opened as a private institution for the care and treatment of mental and nervous diseases. It must be apparent to any one familiar with the crowded condition of our State Asylums, that delicate and refined people would be better cared for and have a better prospect of recovery in a well-regulated private establishment. Dr. Clark has had large experience in the treatment of the insane, and has a corps of able assistants who give personal attention to his patients, and as far as possible make it a home.

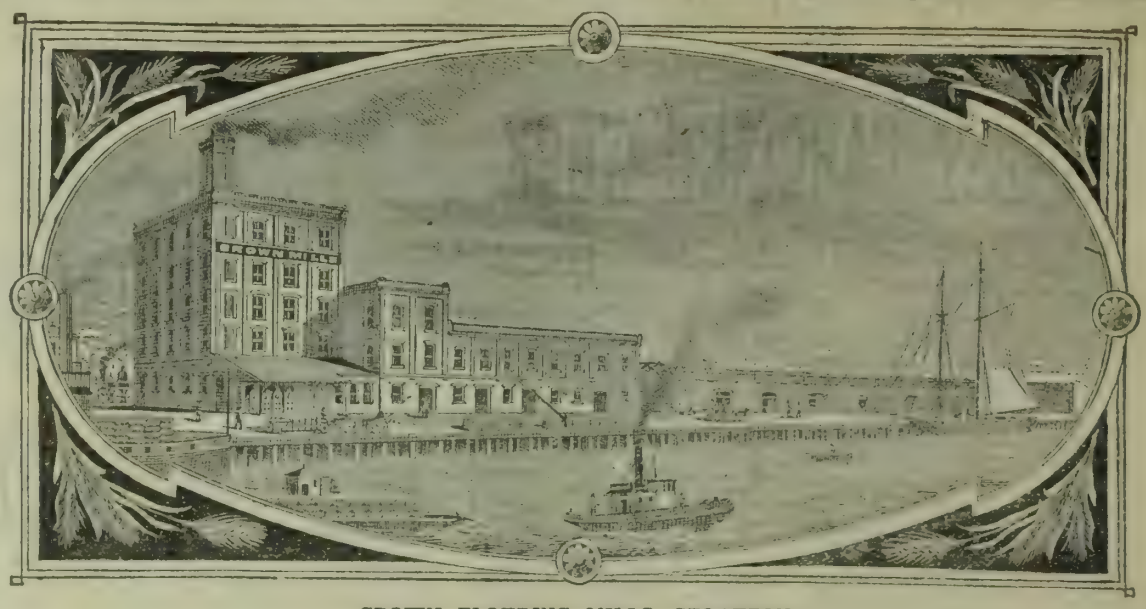
It is a matter of professional pride rather than of money-making with the proprietor, and the leading physicians of California have given a very flattering indorsement of this management and treatment of the afflicted and demented.

Irrigating Pumps.

The tradewinds that prevail in the summer season have caused the windmill to come into general use as a means of pumping water for stock and for garden irrigation. During the last ten years Mr. Fred. A. Ruhl, of Stockton, has been experimenting and inventing valves for deep-well and shallow-well pumps. He has been granted letters patent on several that have been introduced and become very popular. There is a large demand for the Ruhl valves from Oregon to Mexico, and it has become one of the manufacturing industries of Stockton. We will give an illustration and description of these valves in the RURAL PRESS in the near future, as a subject of much interest to our readers. *

MESSRS. L. M. CUTTING & SON, real estate and business agents of Stockton, have in charge a number of large landed estates, among which is that of the late Captain Webber, who laid out the city of Stockton. During the last year several tracts have been divided into small parcels and put on the market by this firm. Parties seeking investments in this locality will find them in position to give reliable information in their line of business. *

Commission Merchant.



Mr. C. V. Thompson has for several years been the leading commission merchant and dealer in fruit and vegetables. He is located near the levee, and has the advantage of water and railroad communication. It is no uncommon practice for his house to receive cargo consignments and receive and distribute to his numerous patrons in carload lots. He has unusual facilities to handle consignments advantageously to the producer and consumer. *

The Stockton Iron Works.

Messrs. Farmington, Hyatt & Co., the proprietors of this establishment, have a State reputation as skilled workmen in all classes of machinery. A recent number of the PACIFIC RURAL PRESS contained a descriptive article of a dredger built by them, which is now in use on Roberts' island. This firm occupies a leading position as manufacturers of brass goods, builders of heavy machinery for steamboats and agricultural machines. *

Stockton & S. F. River Express Co.

During the last nine years the Stockton & San Francisco River Express Co. have held a prominent position as common carriers and commission merchants. At their inception they confined themselves to the river trade, but now they ship to all parts of the world. They have wagons running to all parts of the city, and ship goods at less than one-half the rates charged by railroad. The proprietors are reliable and trustworthy gentlemen. *

To January 15, 1886, total contract pumping capacity, over one billion of gallons in 24 hours. A pamphlet fully descriptive of this department of the business furnished on application

A. L. FISH, Sales Agent for the Pacific Coast,

Nos. 30 and 32 FIRST STREET, SAN FRANCISCO, CAL.

The H. C. Shaw Plow Works.

One of the old landmarks of the city of Stockton is shown in the above cut. The history of this house is one closely connected with furnishing improved agricultural implements and machinery in all portions of the Pacific Coast, Arizona, and a part of Mexico. We herewith give an extract from the PACIFIC RURAL PRESS published Oct. 20, 1883:

The pioneers who were first impressed with the immense resources of California as a grain-growing State fully realized that, with high-priced labor and a long dry season, agricultural implements must be made that would meet the necessities of the time and that were adapted to a new system of farming. The city of Stockton, situated at the head of navigation and in the heart of the great San Joaquin valley, naturally became a distributing point for agricultural supplies and implements. The enterprising merchants and mechanics anticipated the wants of the farmer, and by their advice and suggestions undertook the task of making a plow that would cultivate the virgin soil thoroughly, expeditiously and economically. Experiments, trials and disappointments followed in turn only to be repeated each year. In 1861 and 1862 the old walking cast plow, fastened in two or three gangs, was followed by the Knox patent sulky cultivator, or, as it was then termed, "Yankee Fiddle," which did a good deal of "scratching" and but little plowing. In 1864, Mr. Robert Baxter, of Stockton, was the first, we believe, to use the reversible mold-board in gang plows, which had been used in Virginia 35 years ago in single plows. Mr. H. C. Shaw, one of the oldest dealers in agricultural implements of Stockton, seeing the necessities of the farmer in cultivating the vast fields of the San Joaquin valley having various kinds of soil, undertook to invent a gang plow that would suit the wants of this new system of cultivation. His policy from the first was to follow the suggestions and advice of practical and intelligent farmers in making and improving his Stockton gang plow. This system has been followed for 20 years, and during that time some new and distinct improvement has been made each year, and the most of them by the advice and suggestions of large grain-raisers, who personally supervise the plowing and seeding of their own lands. The "H. C. Shaw" Stockton gang plow is made with three, four or five 10-inch plows, or six 8-inch plows, to which a seeder can be attached in front as a drill or behind as a seeder, with the harrow following. Thus equipped, one man with eight horses can plow, seed and harrow eight acres a day. In 1872, in a field test, the H. C. Shaw Stockton gang plow took the first premium, and since that time in this class has repeated its victory in every trial down to 1883. At the late San Joaquin District Fair it received a special premium. Their long use and the growing demand has made them a noted and familiar gang plow all over the Pacific Coast. Mr. J. W. Jones, one of the largest grain-raisers in this State, has experimented with all kinds, and the result of his experience is that in adaptability to the different soils, whether adobe, loam or sandy soil, economy and thorough cultivation, the four-gang 10-inch Stockton plow, with seeders attached, is the best, and of which he has 100 in use on his different ranches.

THE H. C. SHAW PLOW WORKS, STOCKTON, CAL.

MESSRS. REID & NOBLE, leading real-estate agents of Stockton, have on sale a number of large tracts of land in San Joaquin valley and in the vicinity of the city of Stockton that have been subdivided into 10 and 20-acre lots. As searchers of records and reliable agents, they occupy a leading position.

What is Buhach?

Buhach is a word adopted as the trademark and name of the California insect powder, which is made from the blossoms of the plant *Pyrethrum Cinerariæ Folium* by the Buhach Producing and Manufacturing Company, of Stockton, California. This remarkable plant is a native of Persia, Asia, but was introduced into California by the above-named company from Dalmatia, Europe, where it has been profitably cultivated for many years. It is now extensively cultivated upon the plantations of the company, located near Atwater, Merced county, California, where the conditions of soil and climate have been found particularly favorable for the production of a plant rich in the essential oil, which makes it valuable for the destruction of insect life. Several experiments have been made to test the adaptability of the plant to the soil and climate of different localities in the State, and by this means it has been ascertained that a dry and warm climate and a light and porous soil are necessary for the production of the plant, and that the powder manufactured from it, when thus grown, is far more effectual as an insect destroyer than that made from the plant raised in a moist climate or upon a different kind of soil.

The plant is a perennial and will put forth stalks and flowers from the root for five or six years, when it begins to decay, and is removed and younger plants put in its place. It requires especial attention and the ground must be thoroughly cultivated in order to make the plant grow its full crop of blossoms, which is the only portion of the plant that is now used. When the blossoms mature they are carefully picked by hand, which is a slow and expensive process, and during the harvest season as high as 250 hands are sometimes employed upon the plantation of the company. After the flowers are gathered they have to be thoroughly dried, and are then ground to powder by the use of burr stones, the process being similar to that once so generally employed in the manufacture of flour from wheat. The powder thus manufactured is the product to which the name of Buhach is given, and which, wherever it has been introduced and its qualities made known, is regarded as a necessity in every house. Notwithstanding that it is remarkably destructive to insect life, it is absolutely harmless to man or beast, which makes its use possible where other preparations cannot be introduced. By its intelligent use every house can be protected from the many annoyances that are otherwise suffered from the prevalence of insect life, and the general comfort of the residents is correspondingly increased. The introduction of the valuable plant from which Buhach is manufactured has been an important addition to the products of California, and, aside from the fact that an important industry has been established, and the field of labor enlarged, an article is produced which is particularly demanded by the people of the State. The business of the Buhach Producing and Manufacturing Company is constantly increasing, and their facilities for supplying the growing demand for their product are being constantly enlarged.

H. H. H. Horse Medicine.

One of the chief manufacturing industries of Stockton is carried on by the well-known and enterprising firm of H. H. Moore & Son. The proprietary compound known as H. H. H. Horse Medicine is a familiar remedial agent in all portions of the Pacific Coast. It has gained such popularity and is in such demand that country merchants and druggists find it a necessary article to keep in stock.

A NEW COLONY

On the new extension of Southern Pacific Railroads, on the lands belonging to R. T. BUELL, Esq., near Los Alamos, Santa Barbara county, Cal. Parties desiring to visit the property now, can go via San Luis Obispo and take the cars from thence to Los Alamos, thence by stage to the Colony. **20,000** acres of the best lands in California, subdivided into 20, 40 and 80-acre farms; $20 to $30 per acre. INTERNATIONAL IMMIGRANT UNION, 401 California St., San Francisco.

20-ACRE TRACTS.

Fine, rolling, cleared, reddish-brown land, under cultivation in the Shasta Fruit and Raisin Colony. Twenty acres for $500. Terms: $200 cash, and balance in installments to suit purchaser, at 8 per cent per annum. Any tract will be set in raisins or fruit and brought to bearing by proprietor of colony, if desired. Send stamp for circular, and state how you wish the installments. GRIFFIN BROS., Cottonwood, Shasta Co., Cal.

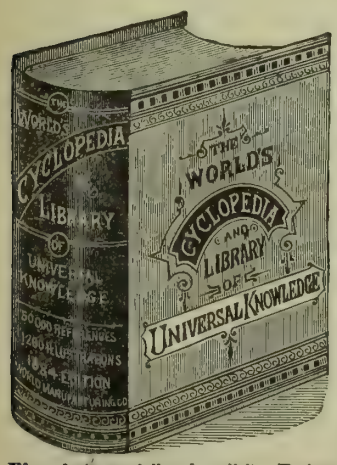
Beautiful Poetic Review, entertaining and instructive; 35 pages (a handsome and pleasing present)..25

NOTE.—The cash must accompany all orders. Addres this office, No. 252 Market St., S. F.

Inform your neighbors about our offers and paper.



Sample copies of this paper mailed free to persons thought likely to subscribe.

Send for free circular describing most of these premiums, and any further information desired.

In writing correspondence, items of information, or on other business, please use a separate sheet.

EXTRAORDINARY OFFER!

This Valuable Book for 50 Cents!

To every one who subscribes to this paper. It contains **50,000** Separate and Distinct References; **1200** Engravings illustrating various topics. Accurate and concise information on Art, Science, Philosophy and Religion, including learned essays by the compiler, Prof. H. L. Williams and several hundred other authors. The articles on **Anatomy, Architecture, Agriculture, Astronomy** and the **Fine Arts**, are full and explicit. **Botany, Chemistry, Engineering, Geography, Geology and History**, are each treated ably and explicitly. The article on Engineering is still further amplified by a full description, illustrated with plates and diagrams of the **Great Brooklyn Bridge; Mechanics** with plates illustrating Mechanical Motions. **Mineralogy, Medicine, Law, Languages and Governments**, are so clearly treated of, that every one who reads can understand. In addition to the full and complete Cyclopedia, arranged in alphabetical form, we have, bound up in the volume, a **Complete Library of Knowledge**, including a Guide to Correct Speaking and Writing; Bookkeeping, a complete guide to business; Chronological History; Mythology; AN INDEX TO THE HOLY BIBLE a complete brief Biographical Dictionary; full and complete statistical history of the United States, corrected down to 1884. The Interest, Banking, Usury, Insolvent and Homestead Laws of the United States, are for the first time gathered together in one volume. **A LIST OF COUNTERFEIT NOTES WITH RULES FOR DETECTION OF COUNTERFEITS.** Separate Dictionaries of Musical, Nautical, and Geographical terms; a carefully prepared treatise on Pronunciation, giving rules and examples whereby every one can become his own teacher. **AN APPENDIX OF THE ENGLISH DICTIONARY**, giving hundreds of words not contained in the ordinary dictionaries. **FLAGS OF ALL NATIONS** beautifully illustrated by colored plates. In fact the book is a library in itself. It has **800** pages, and is more profusely illustrated than any other Encyclopedia at the price, and contains a mine of information on almost every subject known to man. Every one of the many departments is worth more than the cost of the book. As "knowledge is power," this Cyclopedia will be a source of wealth to thousands in all ages and conditions in life. This handsome octavo volume is printed on good paper, and handsomely bound in cloth embellished with gold.

Without guaranteeing all that is said above by the Eastern publishers of the work, the proprietors of this paper consider the book a valuable one, and (in the absence of a more costly publication) very desirable in most households, and worth several times the cost mentioned above. In fact, we will refund the cost, with postage added, if any subscriber chooses to return the Cyclopedia to us within thirty days after receiving it. Address the publishers of this paper.

While this notice appears, the WORLD'S CYCLOPEDIA will be sent to any subscriber (old or new) who orders it, and pays his subscription one year in advance and 50 cents additional.

Anderson Springs.

We have seen hundreds of guests at this well-reputed resort who have been benefited by its health-giving springs and baths, and delighted with the cheerful home comforts, good and abundantly supplied tables. Do not fail to visit Anderson springs when in search of health and recreation. New cottages and improvements have been added to the place during the last few seasons. See announcement in our advertising columns.

AGRICULTURAL BOOKS.

Sold by Dewey & Co., Publishers "Pacific Rural Press."

CALIFORNIA FRUIT GROWER.—A practical Handbook for the orchardist (in preparation).

CATALOGUE OF EUROPEAN VINES—With synonyms and brief descriptions, by I. Bleasdale, D. D. Invaluable to those growing the vinifera. Price, in pamphlet, 50 cents.

ORANGE GROWING IN CALIFORNIA—By T. A. Garey, of Los Angeles. The most comprehensive treatise on the growth of this fruit. It contains full instructions for growing the trees, planting and care of orchards, etc.; 227 pages. Price, 75 cents.

SILK GROWERS' MANUAL—By W. B. Ewer, A. M. A practical treatise full of useful hints for beginners in this State; 20 pages. Pamphlet, price 25 cents.

FRUIT GROWERS' CONVENTION REPORTS.—These annual conventions have resulted in bringing out the best and most useful information concerning the growth of different fruits in this State. The subjects discussed are of the most direct practical value and the facts laid down will prove helpful and suggestive to all in the fruit business. We have the reports of 1881, 1882, 1884, and 1885—the first for 10 cents, the others at 25 cents each.

THE AGRICULTURAL FEATURES OF CALIFORNIA—By Prof. Hilgard, 138 large pages, bound in stiff cloth, with colored maps, $1. This book is the best general review of California soils, climate and productions in existence.

NILES' STOCK AND POULTRY BOOK—Pamphlet, giving directions applicable to poultry growing in this State; 120 pages, post-paid for 50 cents.

KENDALL'S TREATISE ON THE HORSE AND DISEASES—Post-paid for 25 cents.

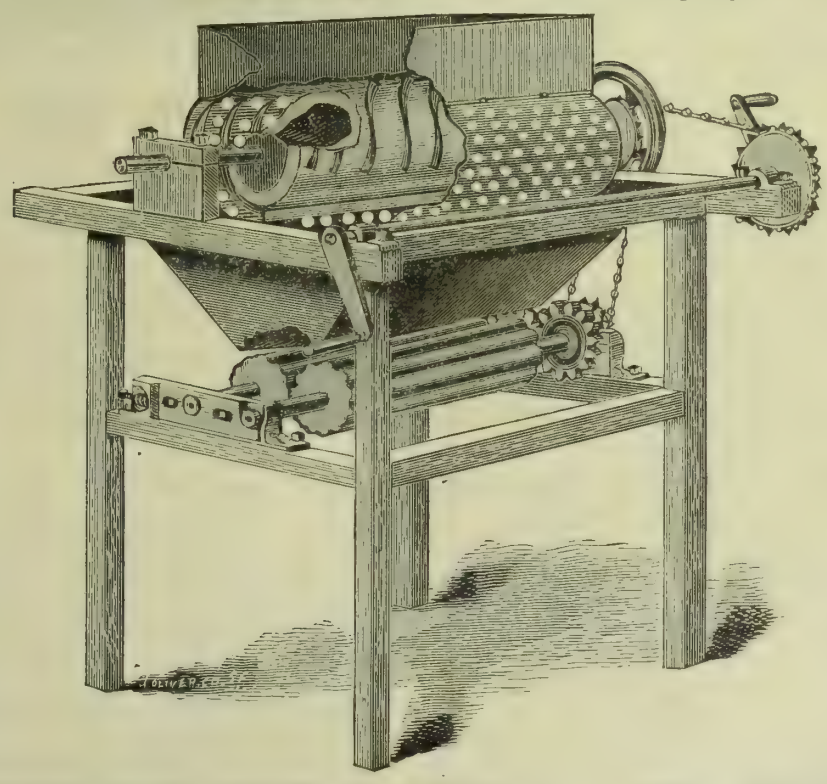
ARCHITECTURE SIMPLIFIED OR HOW TO BUILD A HOUSE.—Contains plans and amounts of materials for a number of buildings from a little cottage to a large dwelling. Price, five cents.

ACME STEAM EVAPORATORS.—We are informed that two carloads of these evaporators have arrived and two more are on the way. The Acme seems to be gaining wide introduction in this State. It is said there are nine of them in Vaca valley alone. The demand for the machines has induced the Eastern manufacturers to double their force of men, and they assure Batchelor & Wylie, the Pacific Coast agents, that they will be able to supply the active demand springing up, especially in California.

THE GOOD OF MOSQUITOES.—A writer in the Springfield *Republican* says: "I found out the real mission of the pest by putting a lot of the wigglers into a hogshead of water and filling another hogshead, into which no wigglers were put. The second body of water soon became foul, while the first remained sweet, showing that our swamps would more often become sources of disease if they were not infested with mosquitoes."

If you are bilious, take Dr. Pierce's "Pleasant Purgative Pellets," the original "Little Liver Pills." Of all druggists.

The Brand on Cain



Was not more fearful than are the marks of skin diseases, and yet Dr. Pierce's "Golden Medical Discovery" is a certain cure for all of them. Blotches, pimples, eruptions, pustules, scaly incrustations, lumps, inflamed patches, salt-rheum, tetter, boils, carbuncles, ulcers, old sores, are by its use healed quickly and permanently.

Young and middle-aged men, suffering from nervous debility and kindred affections, as loss of memory and hypochondria, should inclose 10 cents in stamps for large illustrated treatise suggesting sure means of cure. Address, World's Dispensary Medical Association, Buffalo, N. Y.

An Improved Grape Stemmer and Crusher.

W. H. Worth, of Petaluma, is doing a very useful service to the grape interest by his invention and manufacture of appliances for wine-makers. We have previously noticed his press, which has come into wide use. At this time we desire to call attention to Mr. Worth's improved grape stemmer and crusher, shown in the engraving on this page, and recently patented through Dewey & Co.'s agency. It is a device especially adapted for stripping grapes from their stems and discharging the grapes at the instant of separation without crushing. It consists of a horizontal revolving drum, having spirally arranged flanges projecting from its circumference, and an outer inclosing case of the same shape, having similar spiral flanges fixed within it, but at the reverse angle from those upon the drum, the flanges in both cases occupying upward of two-thirds of the circumference of the drum and case; and, in connection with these, of a longitudinal flange projecting from the side of the drum, extending its whole length in the space not occupied by the flanges. In connection with this stemming device, which has a discharge opening at one end for the stems, there is a hopper or chute to receive the separated grapes, and crushing rollers which are operated therewith. The engraving shows clearly the features of the device which we have mentioned. The main aim of the invention is to overcome the objection to those stemmers which crush the grapes in connection with the stems, and thus transmit undesirable matters to the juice.

In the operation of Mr. Worth's stemmer, the bunches, fed into the opening, are carried

IMPROVED GRAPE STEMMER AND CRUSHER—W. H. WORTH, PETALUMA.

around by the drum, the straight flange serving to turn them over and sweep them down along the sides of the drum and between it and the outer casing. The holes made through the sides of the outer casing are large enough to allow the grapes to project and pass through, and they are held by this means while the double spiral flanges act to strip the stems from the grapes, the latter falling immediately outside of the cylinders, through the holes, and without further contact with the stems. The bunches are carried around by the spiral blades and the longitudinal flange, so as to be passed around within the casing, being gradually moved toward the discharge or open end of the casing at the same time, and as they are rolled or turned over by the action of the longitudinal flange upon the drum, all the grapes upon the stems will be forced through the holes in the outer casing and discharged, so that when the stems reach the end of the casing they will be thrown out entirely clear of grapes, and will not carry any amount of skins or pulp with them, as would be the case if the grapes were partially crushed within the stemming apparatus.

We trust these descriptive notes will render the main features of Mr. Worth's improvement intelligible. Any other information concerning the machine may be had by addressing the inventor, W. H. Worth, Petaluma, Cal.

IODINE, hitherto known in nature only in combination with other elements, is now found in a free state in the water of Woodhall Spa, near Lincoln, in England. The water is colored a decided brown by the iodine.

California Inventors Should consult DEWEY & CO. AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 252 Market St., San Francisco Elevator, 12 Front St.

SCALDS and BURNS should have prompt and proper care or they may prove very dangerous and perhaps FATAL.

ACCIDENTS are constantly happening. A kick of a horse or cow may cause a bad bruise; the slip of an axe or knife may result in a serious Cut.

Any of these things may happen to one of YOUR family at any moment. Have you a bottle of PERRY DAVIS' PAIN KILLER ready for use in such cases? It has no equal for the cure of Scalds, burns, cuts, swellings, bruises, sprains, sores, insect bites &c.—All Druggists sell it.

PERRY DAVIS & SON. PROVIDENCE R. I.

THE GRAND SALE OF THE SEASON!

OF IMPORTED AND NATIVE-BRED

GALLOWAY CATTLE

ON JUNE 10th and 11th,

At GEO. L. GOULDING & CO.'S City Stock Yards, Denver, Colorado.

LEONARD BROS., of Mt. Leonard, Mo.,

—AND—

BUSH & MORSE, OF WINDSOR FARM, DENVER, COL.

Will hold a joint public sale of **Imported and Native Bred Galloway Cattle.** The lot consists of 100 head of males and females of the choicest breeding and individuality, embracing selections from four different importations by the Leonards, who (it is a well-known fact) brought over only the best that money could buy and careful judgment select. Most of the cattle offered by Bush & Morse, of the Windsor Farm, are direct descendants of the stock imported by the Leonards, who, in breeding the same, combined some of the best strains of blood in their herd. It is once in a lifetime that such an opportunity is offered to the public of purchasing such a splendid lot of cattle, and the undersigned feel no hesitancy in endorsing what is claimed for them—"that they are the finest lot ever offered at public sale in the world." The fact that they were all imported or bred by the Leonards is sufficient guarantee that the stock is as represented—"the very best that can be found." Nearly all the young stock are by the famous sire, "British Nero," 1377, and the females are bred to that grand bull, "Borderer of Drumlanrig," 2628, whose cut appears above.

In the breeding are found such popular strains of blood as represented in the tribes of Drumlanrig Semiramis, Lady Satnley, Forest Queen, etc., embracing such famous sires as Black Prince of Drumlanrig Hardeu, Moss Trooper, Montague, Scottish Borderer, Pretender, Guardsman and others equally noted for their show-yard careers and the grand quality of their get

All necessary assistance will be furnished to buyers from a distance in loading and shipping their stock. Terms of sale, cash, or four months approved paper bearing 8 per cent interest. Catalogues furnished on application.

GEO. L. GOULDING & CO.

COL. S. A. SAWYER, Auctioneer.

NOTE.—During the sale there will be on exhibition some steers and bulls bred from Thoroughbred Galloway Bulls out of Shorthorn Cows. Cattlemen will be able to judge for themselves as to the result of the cross.

IMPORTANT!

Grangeville, Tulare Co., Cal.

The most Successful Remedy ever discovered and it is certain in its effects and does not blister. Read proof below.

KENDALL'S SPAVIN CURE.

PHILADELPHIA, PA., March 18, 1885.

DR. B. J. KENDALL CO.—Gents: I had occasion to test your Kendall's Spavin Cure about a year since in the following manner. We had a horse which had been used by the Frankford and Southwark Fifth and Sixth Streets Philadelphia City Passenger R. R. Co., that developed a Ringbone, and after some months became so lame that we were compelled to put him away by selling, which we did to a party who took him to the country, and said party commenced a treatment of the horse with your Kendall's Spavin Cure which he followed up for the space of about three months with such results that at that time they put him to work, and a little later succeeded in entirely curing him, leaving the part perfectly smooth, which circumstance warrants me in saying that I have a great amount of confidence in your Kendall's Spavin Cure. Yours truly, GEORGE F. RICHER, Assistant Stable Foreman of Frankford and Southwark Fifth and Sixth Sts., Philadelphia City Passenger R. R.

Price $1 per bottle, or six bottles for $5. All Druggists have it or can get it for you, or it will be sent to any address on receipt of price by the proprietors, Dr. B. J. KENDALL Co., Enosburgh Falls, Vt.

SOLD BY ALL DRUGGISTS.

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources of their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.

THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitor anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. **A NEW FEATURE** has been added to the Premium List this year, in the shape of awards for a **Sheaf Display of Cereals.** Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor. Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

EDWIN F. SMITH, Secretary. L. U. SHIPPEE, President.

Jackson's "ACME" Stacker, Loader and Rakes.

The "Acme" stacks hay, grain or straw, or loads it on wagons, at about one-third usual cost. It takes the hay from the swath (or from the cock or windrow) and puts it on the stack without manual labor. It builds high and compact stacks, which turn the rain, and the rapidity with which a crop can be harvested insures its safety. Six men and ten horses put up 100 tons a day. They have been tried in every kind of hay and grain; are a success in reaped grain. They are the best for unloading header wagons with nets, for which purpose a net attachment is used. Improved and adapted to this Coast. Every improvement tested and every machine guaranteed.

The Rakes are the best in the world! they carry from 300 to 1300 pounds, and dump the load automatically. The driver's weight balances the load so it can be carried easily. The Stacker weighs 1700 lbs., costs $150; the Rakes weigh 650 lbs., costs $50 each. Net attachment to unload header bed weighs 640 lbs., costs $50; Nets, $6 each. Satisfaction guaranteed. Write me for circulars, free. I own for this Coast the original patents covering this plan of stacking. Beware of infringements. Address

S. F. Market Report

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, May 25, 1887.

Continued fine crop weather has brought all kinds of vegetation to greater perfection, particularly cereals. Movements in fruits are of larger proportion, with each day adding to the volume received and also sent to the East. Wheat abroad and at the East has ruled strong throughout the week. The following is to-day's cable:

LONDON, May 25.—Cargoes off coast, firmly held; cargoes on passage and for shipment, firm, but not active; Cal. wheat of coast, 39s 6d; Cal. wheat just shipped, 40s; Cal. wheat nearly due, 39s 6d; French country market, very firm; Liverpool wheat, spot, slow; Liverpool wheat, Cal. 7s 10½d to 8s 1½d.

Foreign Review.

LONDON, May 23.—The *Mark Lane Express*, in its review of the past week, says: English wheat has been slow. Prices advanced 6d in provincial markets. The sales of English wheat during the week were 53,573 quarters at 34s 1d, against 66,596 quarters at 32s 4d during the corresponding period of last year. Flour is steady. The supply of foreign wheat is small, but buyers are apathetic. Corn is dull; dealings have been in favor of buyers. Nineteen cargoes of wheat arrived; four were sold, nine were withdrawn and six remained. At to-day's market English wheat was scarce, and held for 1s advance. Foreign wheat was firm. Flour was against buyers. Corn was scarce and steady. Barleys were dull and lower. Oats were in favor of buyers. Pease and Linseed were unchanged.

Eastern Wheat Markets.

NEW YORK, May 21.—The closing was firm on a rally from lowest points, with losses of ½c for May and June at 96½c, and gains of ⅛ for July, at 96¼c, and ¼ for the later months as follows: Aug., 94c; Sept., 93¾c; Oct., 94½c; Nov., 95¼c; Dec., 96c.

NEW YORK, May 25—12 M.—97¾c for cash, 96⅜@96¾c for May, 96½@96¾c for June, 96⅜@96½c for July and 94@94¼c for August.

CHICAGO, May 25—1 P. M.—Wheat stronger; cash, 87⅜c; June, 88⅛c; July, 86⅝c. Corn steady; cash, 37⅛c; June, 38⅜c; July, 40 1-16c.

Eastern Wool Markets.

NEW YORK, May 23.—Wool dealers do not find much custom to encourage them, the demand proving of such erratic character as to keep the market in a very uncertain condition as to the movement and prevent a regular line of valuation on any grade. But buyers obtain no advantage on any of the desirable grades. Prices have undergone no material change. Some of the poorer wools are selling at 13c to 15c, and very choice up to 22c. The assortments are improving in quality, considerable of the arrivals being choice. Territory wools are dull. Sales have been 173,800 lbs. Texas wool is in moderate demand. Oregon wool quiet. California wool continues dull; large stocks of fall wool are on hand; sales of 113,000 lbs. are reported, and of new spring wool there has been sold 10,000 lbs.—all on private terms.

The Boston market is in an unsettled condition. Among the sales were 173,800 lbs. Territory at 17 to 24c; 47,500 lbs. Oregon at 20@22c.

In Philadelphia the situation is unchanged. Among the sales were 15,000 lbs. California at 18c; 10,000 lbs. fine Montana at 21c; 10,000 fine Territory at 18c; 8000 lbs. one-quarter Territory at 23c; 22,000 lbs. Montana at 25c.

California Fruit in Chicago.

CHICAGO, May 21.—Only fancy fruit dealers are using cherries, and they take only California, which are very fine. California, large, white, sweet in 10-lb boxes, sold at $2.50@3, and Black Tartarian at $2.25@2.50. Lemons are more in demand at $3@4 per box. Oranges unchanged, and in good supply. The demand fair, and only for choice. Common qualities rule dull. Bright Riverside, good to fancy, $3@4; San Bernardino, $3@4; Santa Ana, $2.75@3.25; St. Michael, paper rind, $3@3.50; Orange, $2.50@2.75; Los Angeles, $2.50@2.75; Navel, according to quality, $3@4; San Gabriel, $2.50@3; Blood, fancy, $4@6; culls, $2.

Dried fruits exhibit no essential change. Stocks are, as a rule, only moderate to light, and a steady feeling prevails. Peaches are the only thing in which nothing of consequence is doing: the supply, consisting mainly of old peaches, which are not cared for, and the few which would sell are very scarce. Of California dried fruits there are no stocks except of raisins and plums, and the plums are about all held by one house. Prices rule firm, and there is a good demand at the following prices: Plums, pitted, ℔ lb, 11@12c; raisins, London layers, 20-lb boxes, ℔ box, $1.50@1.75; loose Muscatel, ℔ box, $1.25@1.35; California layers, ℔ box, $1.25@1.35.

Apricots and Cherries in Chicago.

[Telegram to California Fruit Union.]

CHICAGO, May 24.—Car apricots arrived. Your men are putting in too much small scrubby fruit. Selling from $2.00 to $2.75. Cherries arrive principally in good condition, and are selling per box at from $1.75 to $2.25, while crates all sold quick at good prices—from $5.00 to $5.50.

PORTER BROS. CO., agents.

Dried Fruit and Canned Goods East.

NEW YORK, May 21.—Canned Goods—The jobbing demand is fair and the market firm for most descriptions. California pears, $2.50@3 25.

Dried Fruits—Raisins are attracting increased attention. California goods are moving out quite liberally at well-sustained quotations. Loose Muscatels, $1.25@1.35 for crown and $1.50@1.70 for three crown; London layers, $1.50 @1.75.

New York Hop Market.

NEW YORK, May 21.—An increased demand has been reported for choice German hops at 21@22 cents to cover short sales to brewers. Choice Pacifics are also in more demand and prime, with on holder reported to have withdrawn on negotiation at 18@20 cents that were pending. A 100-bale lot brought 19 cents. Medium grade 1886 hops are receiving little attention, but the scarcity of choice goods imparts a better tone all through. Reports as to the crop outlook are very conflicting. The statement is secured from a reliable source that fully 15 per cent of the acreage in hops is or will be plowed up. Pacific Coast crop of 1886, best, 19@20 cents; same, common to good, 13@16 cents; 1885, good to prime, 7@9 cents.

California Products at New York.

NEW YORK, May 21.—Beans—California Lima firm at $1.80.

Green Fruit—California tangerines are scarce at 75 cents a dozen; sweet California cherries are more plentiful at 75 cents a quart.

Local Markets.

BAGS—Trade is reported to be steadier, but as yet in a small way, owing to continued uncertainty about crops. Calcuttas are selling at 5⅝@5¾c.

BARLEY—A fairly steady market has characterized the week. Considerable has been bought by operators on Call to cover their buyer options, which are higher than the sample market. Many large farmers intend to hold barley and sell wheat. On Call, trading has continued active. To-day's sales were as follows:

Morning Session: Buyer season—100 tons, $1.05; 100, $1.04¾. Buyer 1887—200 tons, $1.18⅝; 100, $1.18⅞; 100, $1.18¾. Seller 1887—100 tons, $1.05¾; 300, $1.05. No. 1 Brewing, buyer season—100 tons, $1.17½. No. 1 Brewing, buyer 1887—100 tons, $1.27 ½ ctl. Afternoon Session: August—300 tons, $1.81. Buyer, August and September—900 tons, $1.84. Seller 1887—200 tons, $1.79½; 4000, $1.79⅝ ½ ctl.

BUTTER—The tone of the market is easier, owing to Washington Territory, Oregon and other distant points being supplied chiefly by local dairies or else by the East. Many dealers are not packing, believing that prices will recede some.

CHEESE—The market is well supplied, with a lighter trade call reported. The general tone is easy, as distant points are drawing chiefly from the East.

EGGS—Strictly choice ranch eggs are firmer, but poor are slow.

FLOUR—The market is firm at full quotations for choice brands.

WHEAT—Millers continue to pick up all the straggling parcels of choice to be had at from $1.82½ to $1.85. The stock in sight is being reduced rapidly by shipments to Europe. On Call transactions, the past week, were free, with seller '87 the favorite option. The following are to-day's sales:

Morning Session: Buyer 1887—200 tons, $2 02½. Seller 1887—400 tons, $1.79⅝ ½ ctl. Afternoon Session: Buyer season—500 tons, $1.05; 200, $1.04¾. Buyer 1887—100 tons, $1.18⅜; 800, $1.18¾; 500, $1.18½. Seller 1887—200 tons, $1.04¾; 200, $1.04½; 300, $1.04⅝ ½ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

Eastern advices report that the wheat syndicate has control of about 5,000,000 centals of the visible supply east of the Rocky mountains. If this be correct then they are, for the next 30 odd days, masters of the situation. This season of the year is generally favorable to an active manipulation on the up-grade, owing to foreign crops being subject to the vicissitude of climatic changes, particularly in Great Britain. Every decided unfavorable turn in the weather will be a pretext to turn the price of wheat up a peg or two. That the syndicate expects to operate in this way is reasonably certain, from the fact that they are getting all the wheat they can to the seaboard so as to ship at a moment's notice. In this State the same tactics is being pursued, for vessels have been taken for quick loading so as to dispose of cargoes, if necessary, on passage. The quantity that will be cleared from this port before July next will aggregate fully 50,000 tons; some place it at about 100,000 tons.

Crop advices received from Europe are generally of a favorable character, yet it is some time before harvest and the most trying time is to come.

All information to hand reports that the consumption of wheat-flour abroad has been quite large, owing to the small rye and root crops. This year these crops promise to be fully if not above an average.

Eastern advices, taken as a whole, are not favorable to an average wheat outturn this season. Taking this coast and the East together it is hardly safe to place the entire crop of the country at over 425,000,000 bushels, a shortage compared with last year of fully 35,000,000 bushels.

In this State crop prospects continue favorable, but fears are freely expressed that hot north winds may do considerable damage next month.

The local wheat market has ruled strong throughout the week notwithstanding the light trading. Heavy exporting is going on, which will cut down the visible supply by the end of June to a very small quantity.

The low freights to the East have caused a slight increase in the call of choice grades of barley, but owing to holders' advanced views trading is light. The demand from local brewers is reported to be fair for the season, with the supply light. The demand for feed barley continues active, but buyers confine their purchases to actual requirements. The estimates of the yield this year have been reduced, owing to many fields being cut for hay—the latter bringing more money proportionately than barley. It now looks as if the incoming crop of barley will hardly meet the consumption of the State, even with the carryover from this season added to it, which will cause high prices later on.

The local barley market ruled fairly firm throughout the week, with free sales by the bears, owing to more favorable crop weather, but with the first blast of hot winds then they will run to cover and advance prices quite rapidly.

Rye is scarce and high. Buckwheat is barely steady.

Corn is in fair demand at full prices, with white quite scarce.

Choice oats are in moderate supply, but fair grades are in good supply. Crop advices from Oregon and Puget Sound are favorable to more than an average yield to the acre.

Feedstuff.

Bran and middlings are in good inquiry, with values well maintained. Cracked and feedmeal are steady, as is oilcake meal.

Choice old hay is in better demand, with buyers paying well up, so as to have their wants met. New is coming in more freely, but meets with a slow market.

Fruits.

Cherries are coming in very freely, but are absorbed by canners and the trade. Sales made to canners ranged from 6 to 7 cts for Royal Ann, and 4 to 5 cts for Gov. Wood and Oxheart. Some cherry plums came in, but did not sell readily at fancy figures.

Under the lower freight tariff overland, heavy shipments are being made of all kinds of seasonable fruits.

Apricots are coming in, but as yet they are not any too ripe for the table.

Some green apples were received the past week, which were hard to sell. Canners are buying gooseberries at from 1½ to 2 cts ℔ lb. The crop this year is large.

Strawberries fluctuated considerably the past week. Owing to the high prices ruling, canners do not buy except to clean up a consignment at low values.

Currants are coming in more freely, but as yet command high prices. Canners expect to be able to run on them within the next two or three weeks.

Raspberries continue scarce, and owing to high prices the demand is slow.

Choice dried fruits are very scarce and command full prices. Eastern advices report a good demand for apples and peaches, with a slight advance paid for something extra.

Eastern advices report a growing scarcity of choice California raisins, with an advance obtainable. In our market there is nothing new to report. The stock is light, with dealers firm in their views.

Live-Stock.

Continued free receipts of seasonable fruits and vegetables operate against the meat market, as does the weather, owing to the latter not allowing butchers to carry much of a supply. The market for bullocks and mutton sheep favors buyers, but veal and lambs are firm. In milch cows there is very little doing. In horses there was more trading the past week, chiefly for medium sized general utility animals to be used principally by campers out. The railroads are about supplied with all the work animals required for some time.

The following are the wholesale rates of slaughterers to butchers:

BEEF — Extra, 8c; first grade, grass fed, 7@7½c per lb.; second grade, 6¾@—c; third grade, 6c.

MUTTON—Ewes, 6c; wethers, 7c.

LAMB—Spring, 9@10c.

VEAL—Large, 6@8¼c; small, 6@8c.

PORK—Live hogs, 4¾@5c for heavy and medium; hard dressed, 7½@8¼c per lb; light, 4½@5c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

All quotations for old potatoes are withdrawn, owing to the trade call running chiefly on new. As yet there are few varieties of new in the market. Prices are lower under freer receipts. Old potatoes are in fair supply, but the demand is light.

New onions are coming in in better condition, with the more matured fetching top quotations.

Canners continue to clean up the market on green peas. Asparagus continues firm, with slight daily fluctuations. Under heavy receipts of tomatoes from Los Angeles, prices broke. It now looks as if prices will go still lower. String beans are in liberal supply, as are all other seasonable vegetables.

Miscellaneous.

Choice beans are scarce and higher, owing to a good demand from the East, where the stock is light and higher prices rule. It is thought that the East will have to import foreign, so as to have the trade wants met. The crop in this State will be below an average.

Active trading continues to be reported in wools, chiefly for shipping to the East. Both buyers and growers appear anxious to take advantage of the present low tariff overland. The freight is $1 per hundred in grease, and $1.50 per hundred scoured.

Owing to continued unfavorable crop information from New York, hops are more firmly held. The crop in this State promises to be large.

Honey and beeswax continue in buyers' favor, with a slight advance obtainable for choice.

In nuts there is nothing new to report. The stock here is light, as is the demand.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	247,101	251,963
In port, disengaged	120,803	30,170
In port, engaged	17,038	27,363
Totals	385,042	309,396

The above gives a carrying capacity as follows: 1887, 616,067 short tons; 1886, 495,033 short tons; increase over last year, 121,034.

In poultry, geese are weaker, but choice roosters, broilers, and hens are firm and wanted.

San Francisco, May 25, 1887.

Fruits and Vegetables.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

Sales Dates Changed.

After the page of this week's RURAL containing notices of cattle sales had been printed we received notice from Killip & Co. that two sales dates had been changed so that the sale of Holsteins from the famous Ontare herd will take place at Oakland Park on Thursday, June 16th, and the combination sale of thoroughbreds from the farms of Messrs. Winters, Pritchard, McShafter and Todhunter will be held at Agricultural Park, Sacramento, on Thursday, June 23d. Readers will notice that the change makes the date of each sale *one day later* than stated in the advertisement in this week's RURAL. Both of these sales should attract wide attention, as the breeders offering animals are among the best stockmen in the State.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

BATCHELOR & WYLIE,

SOLE AGENTS FOR THE

ACME STEAM HEAT EVAPORATOR CO.

OF CHARLOTTE, MICH.

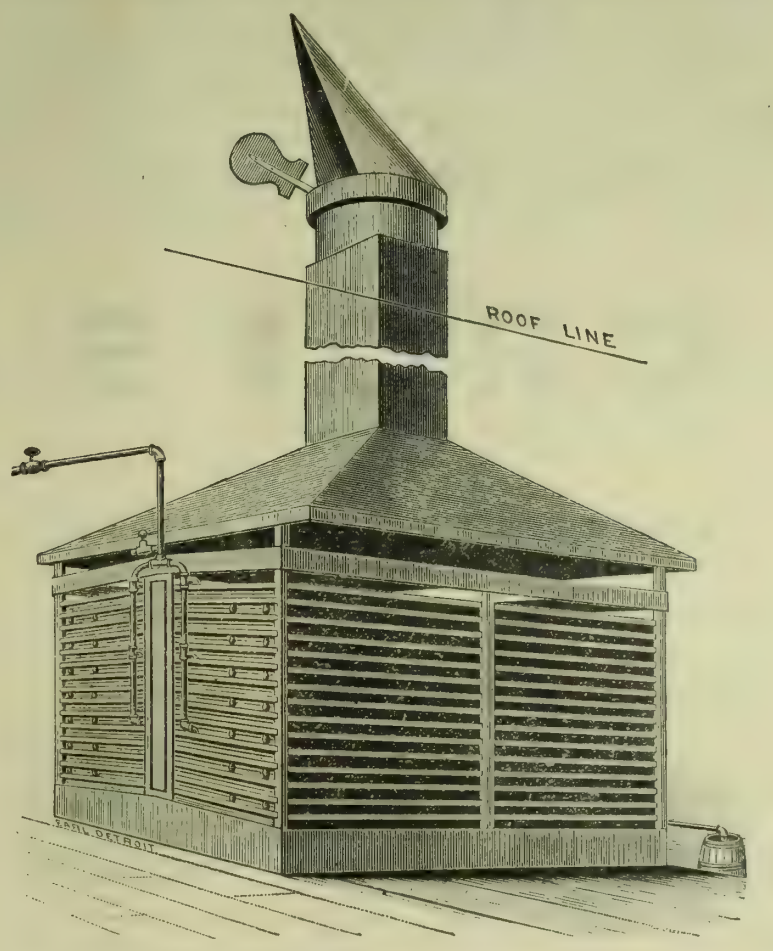
When any person investigates the different processes by which fruit is evaporated, with a view of making it a profitable business, he ought to look to the following vital points, to wit:

Absolute Safety from Fire.

Greatest Capacity with Least Labor and Fuel.

Quality that Brings the Highest Price, Produced with the Least Skill.

A Machine that is Durable, the Capacity of which can be increased at will, with a Proportionately Decreased Cost.



We KNOW that all these qualities are embraced in our Acme process.

The subjecting of fruit to a high degree of heat, and carrying the moisture over fruit partially dried, is wrong. On the contrary, the true theory is a direct, low degree of heat that will not burn or scorch, and good ventilation. Sufficient heat to force the moisture out of the article dried is all that is necessary, if the moisture is carried away immediately. Our machine does this in such a manner that the moisture from one drying chamber does not go through or interfere with the contents of the other chambers, and this is accomplished without cooling the steam chambers.

THE MACHINE

By which the foregoing results are attained, consists of a succession of flat steam chambers, placed one above the other, in close proximity, leaving room between them for the introduction of trays of fruit.

These chambers are filled with steam, or heated water, by a continuous current of even pressure, which imparts a uniform heat to the machine, thus securing even drying.

As the moisture is expelled from the fruit it is carried away from the machine, without coming in contact with any other fruit, thus preventing cooking or steaming, and also hastening the process.

Moisture thus removed does not need to be disposed of by evaporation, thereby avoiding the necessity for intense heat; while, by applying heat of the same temperature from both above and below, we dry the fruit on both sides (which no other machine does), thus inclosing, in a measure, the juice, which a further subjection to heat so cooks as to render fixed and safe, so far as keeping is concerned, as jelly.

Thus we retain the flavor, so essential to good fruit, but impossible by any other process.

In these machines two tiers of steam chambers are placed side by side with a space between them.

The steam chambers are inclined toward the outside, which causes all water from condensation to flow to the outer edge, whence it finds its way out, through the lower connections. This arrangement enables us to have the spaces of uniform width, and leaves the second connection free at all times for the passage of steam.

Through the devices attached to the machine, the degree of heat is under the control of the operator; but it is also true that the immediate removal of moisture is as important as a high degree of heat.

The hood gathers the heated vapor, which rises through the center of the machine, conducting it to the flue from whence it passes out of the building.

In use there is a constant flow of vapor through the drying-chamber into the space between the tiers of chambers, thence up through the hood and flue above it. So perfect is the operation that no moisture escapes into the room where it is operated.

BATCHELOR & WYLIE, 37 Market Street, San Francisco.

A FEW REASONS WHY YOU SHOULD INSURE YOUR PROPERTY

—IN THE—

COMMERCIAL UNION ASSURANCE CO.

(LIMITED)

OF LONDON:

1. It has been doing business on the Pacific Coast for over twenty years.
2. It avoids litigation and technicalities, and has no unpaid or disputed claims on the Coast.
3. It has cash assets of $12,476,165, of which $4,222,348 is surplus to policy-holders.
4. Being possessed of such large resources at home, the Company has created a Board of Trustees in New York, composed of representative American gentlemen, who now hold, in connection with various State Officers of Insurance Departments, the sum of $2,596,314 in trust as special security for United States policy-holders in addition to funds at the Head Office.
5. Its cash income in 1886 of $5,873,365.50, gives the strongest evidence of its popularity, and the confidence of the public.
6. It pays its losses in cash, without discount, not taking the usual 60 days.
7. It has paid for losses over fifty-one million dollars, equal to ninety-four tons weight in United States gold coin.

COME LOOK AT THIS!
The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Park Association, Santa Clara Valley Agricultural Society and Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. The follower has a movement of 26½ inches, the first revolution of the screw moves the follower 1½ ins., the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track. Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.

Printed Testimonials can be had on application of the following parties, who have bought my press: J. B. J. Portal, San Jose; Wm. Pfeffer, Gubserville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. Stiller, Gubserville; Lay Clark & Co., Santa Rosa; Vache Freres, Old San Bernardino; J. F. Crank, San Gabriel; James Finlayson, Healdsburg; P. & J. J. Gobbi, Healdsburg; Wm. Allen, San Gabriel; Wm. DEATH TO MILDEW!

And Insects that prey upon Grapevines and Plants of all kinds.

In Hamilton's Pest Exterminator we are enabled to offer to the public the most valuable and useful article ever discovered for the effectual annihilation of mildew and pests of every kind, that infest our vines and plants. This valuable compound, whose merit has been fully established, is used in a Fumigator as represented in the cut, and is therefore easy of application, and does its work thoroughly.

It Leaves No Noxious Vapors.
It Cleans the Vines or Plants.
It Destroys all Pests and Parasites.

It leaves the plant in perfect health, thus largely increasing the yield of fruit. One trial will convince the most skeptical of its merits. Orders promptly attended to.

Price $5. Patent applied for.

Manufactured and for sale by

A. O. HAMILTON,

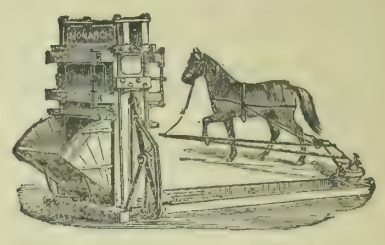
36 Steuart Street, San Francisco.

HAMILTON'S PEST EXTERMINATOR.

HAY PRESSES.

THE HURRICANE,

A Mounted Double-Ender Baling Machine, capable of baling 40 tons per day.



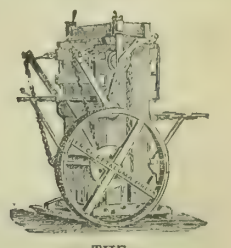
ITS RECORD

For the first year of its existence is as follows: **Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.**

Two sizes: Compressed bales and common bales. **Improved this year so that it is nearly one-quarter faster than before, and the back-and-forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.**

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., **$1000.**



THE JUNIOR MONARCH

Does its own Tramping. Feeds at Side, near the Bottom.

HAS THE FOLLOWING RECORD:

33 tons in one day; 105 tons in 3½ days; 20 tons, and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., **$500.**

—THE—

Genuine Price Petaluma,

With Latest Improvements.

Made under the supervision of the inventor, JACOB PRICE. Too well known to need further description. First-class material and workmanship. Capacity, from 10 to 18 tons per day. Hay must be tramped in press.

Price, at factory, San Leandro, Cal., **$350.**

San Francisco Agency—JAMES LINFORTH 120 Front St., San Francisco.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOEBIG—Dear Sir: I have analyzed your sample of **"Nitrogenous Superphosphate,"** with the following result:

Soluble Phosphoric Acid	12.90 per cent
Reverted Phosphoric Acid	.95 "
Insoluble Phosphoric Acid	2.83 "
Potash	2.23 "
Ammonia	1.87 "
Nitric Acid	2.95 "

The above amount of **Nitric Acid** is equal to 0.85 per cent **Ammonia,** therefore, total of Nitrogen calculated as **Ammonia,** 2.72 per cent.

This **Fertilizer** is a **Valuable Manure** for vineyards, orchards, gardens, farms, and I **recommend** its use by the cultivators of the soil **generally,** in **California.** Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the **"Nitrogenous Superphosphate"** Fertilizer, analyzed by him at your request. It is a **high-grade article,** and as such returns the user a better money value than a low-grade fertilizer. It is **especially well** adapted to use in **California,** on account of the **predominance** in it of **Phosphoric Acid,** which is generally in small supply in our soils. Yet it is desirable that **"complete"** fertilizers be used in our orchards and vineyards, and **yours is of that character** in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of **Phosphoric Acid**—the chief element of all plant food—in combination with the necessary quantities of **Potash** and **Ammonia,** and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from ½ pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

The Milburn Hollow Iron Axle Wagon.

SEND FOR CATALOGUE.

WRITE FOR PRICES.

PACIFIC COAST GEAR, with STAKE RACK BED

And California Roller Brake.

THIS WAGON IS MADE ESPECIALLY TO OUR ORDER FOR THE PACIFIC COAST TRADE. More of these wagons sold than all other wagons on the Coast combined. This is the ONLY WAGON that the farmer can RELY UPON. Over 40,000 now in use and only six have been in any way disabled; axles slightly bent, not one broken. Of what other wagon can you speak of in such praise? True merit leads. These axles are Wrought Hollow Iron case hardened, and as for strength, durability and lightness of draft, it cannot be excelled by any other wagon in existence. The wheels run through boiling oil.

It is the Strongest and Lightest Wagon in the world. The only wagon that IS GUARANTEED is the Milburn Hollow Iron Axle Wagon.

☞NOTICE THIS GUARANTEE. We will replace, FREE of charge, every BROKEN Axle sold by us, no matter under what condition it broke or what the load weighed. **THE MILBURN HOLLOW IRON AXLE IS GUARANTEED** to be well made and of good material; and, if with fair usage, any breakages occur within one year, from **defects in material or workmanship**, we will, on application, and the RETURN of the broken or defective parts, stating DATE OF PURCHASE, size of wagon and cause of breakage, furnish new parts, or order them replaced without cost to the purchaser Unless these conditions are complied with, claims for breakages, etc., will not be allowed. We furnish new Axles FREE for any broken hollow Axles. Buy the **Milburn Hollow Iron Axle Wagon,** because it pays to buy the BEST.

TESTIMONIALS.

MADERA, CAL., May 18, 1887.

MESSRS. TRUMAN, ISHAM & HOOKER, San Francisco—Gentlemen: We have 4 of your MILBURN HOLLOW IRON AXLE WAGONS, and our verdict is they are the best wagon ever run. We have never had a breakage, and in carrying capacity and lightness in running they surpass any farm wagon we have ever used, and we have used many different kinds.

DAVIS & EDWARDS.

STOCKTON, CAL.

MR. H. T. HUDSON, Stockton, Cal.—Dear Sir: We take pleasure in being able to testify to the many good qualities of the MILBURN HOLLOW IRON AXLE WAGON. We have severely tested it in hauling enormous loads of green lumber from the Water Front to the Lumber Yard on East Street, in this city, and many loads weighing five tons, and it has never failed us. Its timber seems well seasoned, and for light draft it surpasses any other wagon ever used by us, and almost runs itself. We shall probably need another and a larger one before long. We can cheerfully recommend them to the public. Yours very truly,

E. B. DEAN & CO., Lumber Dealers.

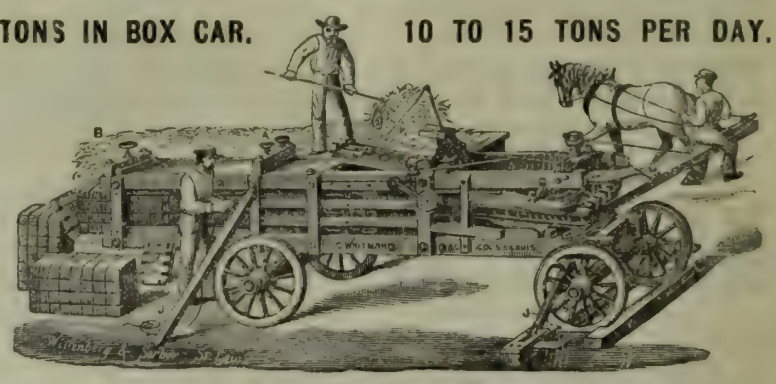
KINGSBURG, CAL., May 3, 1887.

MESSRS. TRUMAN, ISHAM & HOOKER, San Francisco—Gentlemen: I bought a 3½ Hollow Axle Wagon of your agents, Harp & Ball, last August, and rigged it for hauling lumber from the mountains, and must say that though I had heard a great deal in its favor, I was not ready to pronounce it as near perfection as it is. I can haul more lumber on my wagon with 6 animals than can be drawn by 8 on any other make I ever used, and although I loaded heavy and hauled over very rough roads, I was not put to one dollar extra expense. I have not seen a man yet who has a Hollow Axle Wagon who would trade even for any other wagon and take the box and brake for boot.

Yours very truly, SAMUEL OLDHAM.

HAY PRESSES

OF EVERY DESCRIPTION.



We are Headquarters for all kinds of Baling Presses on the Pacific Coast.

WHITMAN'S NEW REBOUND PLUNGER,

HAY, STRAW and WOOL PRESS

IMPROVED FOR 1887.

10 TONS IN BOX CAR. 10 TO 15 TONS PER DAY.

☞Do not confound our NEW press with that made two years since. Every Press Fully Warranted.

For one or two horses The most powerful in use The most rapid and durable, and the most perfect. Makes the most perfect bale. The most simple to operate. Least expense for repairs. NO STOPS FOR TYING BALE.

THE GREATEST SUCCESS OF THE AGE!

Victorious in every contest. Double-acting with new concentrating power. Do not buy a Press until you have seen the IMPROVED New Whitman with concentrating power. Puts from 10 to 15 Tons in a Car.

16x18	Mounted, weight, 3600 lbs	$400 00
18x22	Mounted, weight, 3800 lbs	450 00

All make bales of variable size.

IN BALING YOUR HAY USE

STEEL BALE TIES,

Cheaper than Wire, Better than Rope. Write to us for Prices.

VEHICLES and AGRICULTURAL IMPLEMENTS in Great Variety.

TRUMAN, ISHAM & HOOKER, 421-427 Market St., S. F.

PACIFIC RURAL PRESS

TWENTY-PAGE EDITION.

Vol. XXXIII.—No. 23. SAN FRANCISCO, SATURDAY, JUNE 4, 1887. $3 a Year, in Advance; Single Copies, 10 Cts.

A School for Nurses.

Mr. D. O. Mills' donation of a handsome sum for the erection in New York of a training school for male nurses is more significant than the bare announcement of the news would indicate. The idea is unique, as hitherto the benefit of this sort of instruction has been almost exclusively confined to females, though it is obvious that the services of men in the sickroom are often imperative. The course of instruction includes everything needed to make one skillful in the art of nursing, such as bed-making, change of patient's position, the application of various remedies, the use of the bath, friction, electric battery, etc., dressing of wounds, bandaging, and padding of splints, the effect of medicines and diet, methods of recording temperature, respiration and pulse, with elementary instruction in anatomy and physiology.

It was only a few days ago that we heard an Oakland physician express a wish that he could find a skillful nurse. He said good nurses were hard to obtain, as many assumed the duty as a makeshift till some more agreeable vocation could be found. He thought it would be a beneficent thing to encourage training schools for nurses, in connection with our medical institutions, and expressed the opinion that in a pecuniary point of view educated skill in this direction offered to women the best inducements.

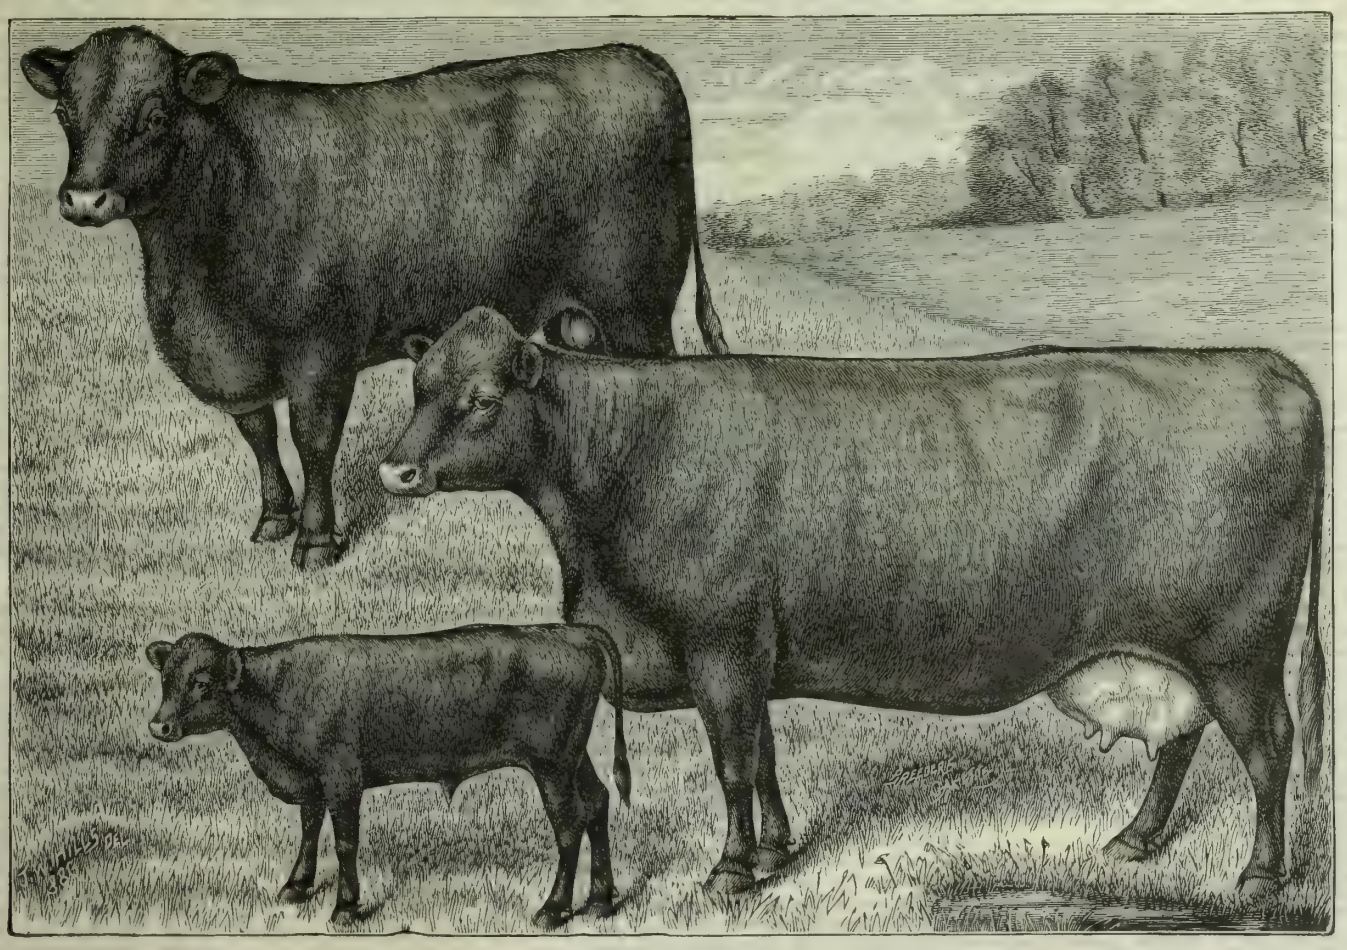
Be this as it may, a special fitness is required to enable one to become a successful nurse, just as a special fitness is needed to excel in music or the practice of medicine. Doctors cannot be made to order, neither can nurses. Automatons with diplomas are turned out every year by the hundreds, but where the inborn, God-given aptitude is lacking no amount of instruction can supply it. A good nurse must be in perfect health, able to endure loss of sleep, irregularity of meals and lack of open-air exercise; possess a cheery, sunny disposition, inspiring magnetism, great presence of mind under sudden and trying circumstances, courage to face the pestilence and most violent contagious disease; and, above all, that kind of love for humanity, sympathy and tenderness of heart that merges self in the presence of the sick and afflicted.

There is some talk of arranging a competitive display of Florida and California Navel oranges at Riverside next winter.

W. I. Bananas in California.—A novelty in the fruit-trade was the receipt at Sacramento by W. R. Strong & Co., May 26th, of a cargo of bananas from the West Indies via N. O. The *Record-Union* thinks it is the first time that this fruit has reached this part of the world. It shows what can be done in this day of quick railroad communication and facilities for safe handling over long distances. The fruit came in one of the S. P. fruit cars, by passenger train, and arrived in excellent condition. It differs from the banana with which we are familiar on this coast, in that many of the bunches are of much greater size, while the fruit is of different shape. Arrangements have been made to distribute this tropical cargo as far east as Utah and Montana, and, by the quick time now made by the California & Oregon route, to the "Webfoots" and other inhabitants northward.

The June flood in the Columbia and Snake rivers, caused by snow melting in the mountains, is on a fortnight earlier, and somewhat higher than usual. Lewiston, Idaho, is partly inundated, and the old warehouse of the O. R. & N. Co., at Almota, has been swept away.

Assignment of J. M. Hixson & Co.—It is telegraphed from Chicago that J. M. and W. D. Hixson, lately of this city and recently of Chicago, have made an assignment with liabilities placed at $10,000. The creditors are said to be mainly in California.



Hog Cholera is said to be epizootic in San Diego county to a disastrous extent.

Irrigation Efforts.—There is cropping out quite a difference of opinion, in certain districts where irrigation enterprises are mooted, about organizing districts under the Wright law. It is natural that there should be contest on this point. There are certain areas of the State where a good part of the people are opposed to the introduction of irrigation water for various reasons. They are certainly entitled to be heard, and to put forth efforts to make their opinions prevail. It is not intended to force irrigation upon people who do not want it, and wherever possible districts should be laid out to exclude such areas. This will not always be possible, and in this, as in other commendable public improvements, the good of the greatest number must be consulted. We trust full discussion and consideration will be given to the subject before action is taken in any district, and the bearings of all mooted propositions be understood. There is often much gained by throwing full light upon vexed questions.

Wool Over the Canadian Pacific.—One hundred and eighty tons of wool from the Miller & Lux ranges in Fresno were shipped on the steamer City of Stockton, on the 19th inst., to San Francisco, on the way to Boston over the Canadian Pacific railroad.

The first new honey of the season was received in S. F. May 27th, from L. W. Burr, Bakersfield, Kern Co., and said to be first-class.

The High-License Bill, passed by the late N. Y. Legislature, has been vetoed by Gov. Hill.

RED POLLED COW DUCHESS OF IOWA 2772, AND HER CALVES, SLASHER 2ND AND HAWKEYE.

Red Polled Cattle.

Whether it is better to dehorn cattle or to breed hornless animals is now quite a popular question. We have had articles stating the advantages of each method of procedure. It must be acknowledged that much progress has been gained during the last few years, in making a case against horns as useless, if not objectionable, appendages, and in bringing the people to the idea that even a hornless head is beautiful. It is not likely, however, that any sweeping changes in the head-gear of our live-stock will be made. One cannot mold animal anatomy as quickly as fashion shapes a lady's bonnet, even if one uses a chisel or hand-saw. There will probably be "horned stock" for those who like them for many generations to come.

Our readers have been shown during the last few years portraits of all the famous hornless breeds, the Galloways, the Aberdeen and Angus, the Red Polled, etc. Upon this page we have a group of the last-named breed which will, we are sure, have an influence in winning admiration for the hornless cattle on the ground of shapeliness and beauty. They are already recognized as valuable dairy stock. The animals in the engraving are the property of Hon. L. F. Ross, of Mount Prospect Farm, Iowa City, Iowa. Gen. Ross is doing much for the Red Polled interest in this country by his intelligent and enthusiastic advocacy of the breed. The central figure in the engraving is the Red Polled cow Duchess of Iowa, 2772, A. P. R. 40, and the other animals are her two calves, Slasher 20, as a yearling, and little chap Hawkeye, taken before he was 24 hours old. The Duchess of Iowa was the first pure-blooded Red Polled heifer born in Iowa, her dam Jilt 2274 was bred by the Duchess of Hamilton and Brandon, one of the most noted breeders of Red Polled cattle in England. The cow is a grand-daughter of a superb bull, Slasher 577, whose weight was over 3000 pounds. At 26 months old she gave 38 pounds of milk per day. At three years old she weighed 1110 pounds. Her first calf, Slasher 2d, weighed, at one year old, 720 pounds. Her second calf, Hawkeye, at 14 hours old (when the sketch was made), weighed an even 100 pounds. The entire family, mother and two sons, are all natives of Iowa, are all "Hawkeyes," and are fair specimens of the breed, as reared there. The Red Polled cattle are constantly growing in favor at the East.

HORTICULTURE.

The Fruit Prospects.

The following interesting paper was read by B. M. Lelong, Secretary of the State Board of Horticulture, at the meeting of the State Horticultural Society on May 28:

Mr. President: It was suggested to me by a member of the board of which I have the honor to represent, to ascertain from the fruit-growers of California the actual condition of their crops and the general fruit prospect of their sections for this year. In reply to my letters of inquiry, I received the following, which I lay before you, the contents of which are for your kind consideration:

Placer County.

N. R. Peck, Penryn, May 17th, reports: "I have interviewed the Assessor, the shippers, and also many fruit-growers in the county. Apricot crop good; plum, fair; pears, very good; cherry, good. The prospect for the fruit-growers is considered good. The peach crop is very large."

F. W. Butler, Penryn, May 22d, reports plums light. The trees blossomed free, but the young fruit is falling off. Bartlett pears promise a full crop. Cherries are largely marketed; the crop has been quite light; the trees blossomed profusely, but the fruit failed without apparent cause. Peaches, more than the average crop; the trees are very heavily laden. Crops on low ground are damaged by late rains, but not injured on high ground. The prospect for fruit-growers this season is a good average. Peaches is our leading crop.

Nevada County.

Felix Gillet, May 24th, reports Nevada county as follows: "There are but few apricots in the mountains of Nevada county. What fruit there was was killed by the gum and frosts. No apricots up here this year. The plum crop is quite short; the gum and frost injured it badly. There will be but few plums in this county this summer. Pears in our neighborhood were not hurt by frost, though they were in some places around Grass Valley. Bartletts are all right, but a great many pears are damaged, having been badly hit by hailstones on the 29th of April. The average crop is very short, caused mostly by the gum and by the frost on the 11th of May. The apple crop, as it is an odd year, will also be short. The general fruit prospects for the fruit-growers are bad this season. The pear and even apple crops would yield well, though, if they were not at the mercy of the codlin moth."

Butte County.

George M. Gray reports Chico, under date of May 20th, as follows: "The apricot crop is very large in some parts of the orchard, and quite badly covered with shothole fungus. Plum crop and prune crop good. Never had a better show for Bartlett pears, not crowded as sometimes, but enough for a good crop. Cherry crop, which is three-quarters gathered, is not quite an average, but No. 1 in quality. Napoleons very heavy; Tartarians set very full but nine-tenths blasted. Had one-tenth more staid on the trees there would have been a large crop. Peach trees never had a more even set. We usually had to thin out a good deal, but this year there are just enough on the trees."

Sacramento County.

C. W. Reed, of Sacramento, under date of May 13th, reports as follows: "The prospects for a good crop in the Sacramento valley generally were never better, especially for apples, apricots, cherries and peaches. The plum crop is light. The cold nights and north winds for the past week have caused the pears to drop considerably, but yet I think it may be considered a full crop, judging from my own orchard."

Sol Runyon, Courtland, May 25th, reports Sacramento river as follows: "The prospect for the fruit-growers this season is good. Plums are somewhat short. Cherry crop also short on account of cold weather and rain on bloom, which caused them to drop. Apricots, large crop, also peaches. Pears are short, Bartletts in particular. Seckles have a very large crop this year."

Ventura County.

N. W. Blanchard, Ventura county, May 23d, reports apricot good crop. The plum cuts no figure in this county. The pear crop is good, also apples and peaches. Cherries only in exceptional localities do well. Prospect for fruit-growers good.

Yolo and Solano.

Webster Treat, Davisville, May 13th, reports that the plum crop is rather short; pear crop, medium; peach and apricot, large; almonds, fair; cherries, light.

A. T. Hatch, Suisun, May 18th, says of the Solano county crop prospects: "Apricots, extra fine; plums very short; never saw as fine a prospect for Bartlett and Winter Nelis pears; cherries short, attributable to the rain on the bloom. The general prospect for fruit-growers in this section is good."

Napa and Sonoma.

Drury Melone, Napa, May 18th, writes that the apricot crop in that county is very good, plums are short, pear crop short, Bartletts in particular; the cherry crop is short; fruit in Napa county will be of fair quality.

Robert Hall, Sonoma, May 20th, reports apricot crop best in five years. Plum crop large, trees overloaded. Bartlett pears in our neighborhood will be a fair crop if later they do not drop; but 50 per cent are blighted, therefore not over one half can be marketed. I do not understand why our cherries should not have set better, and would like to have this subject brought up for discussion. The trees blossomed beautifully; birds were not destructive, and cherries set well. All at once they commenced falling—indications of blight. To illustrate, I have a block of 600 trees. On the east side white varieties, on the west all are black; the easterly half is an abundant crop, while the westerly will hardly pay the cost of cultivation. On the easterly side of this block a black Tartarian occasionally may be found, surrounded by Eltons or Royal Ann. In that case the trees are loaded. Yet with the same method of pruning, the same age, same cultivation, same soil, same drainage, others in this valley have an abundant crop, and in some cases (and the latter include the majority) the cherry crop is light. The general prospect for fruit-growers in our section this season is, provided prices do not drop out of sight, the best in 10 years.

Alameda County.

H. W. Meek, San Lorenzo, Alameda county, writes: "The apricot crop is very large, plums short; Bartlett pears are full and Winter Nelis about half a crop; the cherries are short; general prospects for fruit-growers this season very good." He thinks the shortage in the cherry crop is due to heavy rains while the trees were in bloom.

Santa Clara County.

A. Block, Santa Clara, May 18th, reports as follows: "Apricots in Santa Clara county, full crop, though they are now thinning very much; yet I expect that a full crop will be left. My estimate of apricots in this county is 5000 tons—not 15,000, as my friend Judge Blackwood makes it. (Judge Blackwood at the last meeting of the society, while discussing the dangers of overproduction, made this among several other estimates.) The most this county ever raised in the best year was 1700 tons, probably not that; if you multiply by three it is a proper estimate of this year's crop. The plum crop will be light, prunes the same. My pear crop is fair, also Bartletts, though I am informed that others have light crops of Bartletts. Winter Nelis are almost a failure, generally so, except possibly in a few localities. The cherry crop is short, due to cold weather in the early part of April, which destroyed the bloom. Have been informed that peaches have been frost-bitten at the Willows, near San Jose, by the cold spell of last week; that many are injured, the pit becoming black, though they are holding to the tree yet. Some parties say that all of theirs were frosted; this, however, was only in this locality."

Tulare and Fresno.

Isaac H. Thomas, Visalia, May 18th, reports that in Tulare and Fresno counties the apricot crop is heavy and the peach and nectarine crop fair. Cherries do not do well; there is too little humidity in the atmosphere for cherries. Bartlett pears are a fair crop, apples light and plums and prunes very light. The cause of failure of plums, prunes and apples I don't know. Apples had light bloom; plums and prunes bloomed full, but did not set their fruit. The general prospect for these two counties is good.

Santa Barbara County.

Joseph Sexton, Goleta, Santa Barbara county, reports that fruit prospects are generally good, apricots in particular of all kinds full; but plums do well in that county; the cherry plum, red egg and green gage are all full; pears full crop, except Winter Nelis; walnuts and prunes, prime; cherries do not do well in that county. There will be great wastage of fruit this year, no preparations having been made to save it. It is too late to do much now.

Summary.

Many other letters were also received, giving similar statements. While the amount of letters received do not comprise all the counties in the State, yet enough information has been received to show that the cherry crop, the plum, the Bartlett, and the Winter Nelis pear crops will not be as large as was anticipated at the early part of the season. In some sections the cherry crops have almost been a failure, caused by the late rains on the bloom. The cold spell also did considerable damage, causing the cherries to drop after having attained a fair size. In some orchards the damage was not felt. As the trees were overloaded, the fruit which remained became of better quality. The same may be said of the plum crop and of the Bartlett and Winter Nelis. Of course there are exceptional places; for instance, Mr. Pepper, of Petaluma, reports his crop of plums to be very large, while his apples and pears are almost a failure. Notwithstanding the many things the fruit growers of California have to contend with, the general fruit prospect is the best for several years.

The Gooseberry.

EDITORS PRESS:—Seeing an account of the success of a party near Linden with the gooseberry, I thought I would ask some one to explain the cause of there being so few in this market. Are they subject to mildew? I have rich, dark mellow loam, very deep; can irrigate if necessary. Will some one give his experience in the southern counties, or anywhere else? A TRUTHSEEKER.

Spadra, Los Angeles Co.

FLORICULTURE.

How to Have Flowers Without Care.

EDITORS PRESS:—It often happens that those who really love flowers and long to have pretty gardens, go without them for lack of time to care for them properly. How often I have heard a tired, overworked woman say, "Well, I love flowers as well as any one, but I have put in plants time and again and they all die because I have no time to see to them. I've just given up trying to have a garden."

Often too it is the father, who, dearly loving them, tries fitfully before and after his hard day's work to get time to beautify his little garden plot. The work of digging, planting, and watering is hard on one coming home tired out, and, after a few trials, seeing all his work going for nothing and his plants dying for need of more care, he gets discouraged, loses interest, and says 'tis of no use to try to have a garden till he can get more time. As a usual thing that "time" never comes and he gets along year after year without.

Now as a usual thing the fault lies not so much in the lack of care, nor in any fault of the soil, as in the varieties of plants selected. Fuchsias, heliotropes, delicate roses, carnations, lilies, and all such flowers, will not grow and blossom well unless given a certain amount of care in the shape of cultivation, trimming, and careful watering; but there are many varieties of beautiful plants which will bloom the year round and give a lovely effect without water or care of any sort, after they are once well started. These are the sort to plant where one has little time to give to their cultivation, and if a careful selection is made, and taste used in arranging them, after the first few days' trouble of planting and starting them, little else is needed.

Weeds, of course, have a faculty of growing, and have to be rooted out, but even they are not much to be dreaded, in a small garden, if taken after a rain and while the ground is soft. Those who will afford the trifling cost of one of the convenient weeders to be bought at any hardware store, can reduce this task still further and do an astonishing amount of execution in an hour, so that a little time spent at this task once a month will keep a small garden plot in comparative good order.

Selection of Plants.

In the first place, don't try to have too many kinds; where you may succeed with two or three you may fail with a dozen, and a few well kept and constantly blooming plants are far better than a lot of straggling, poor ones.

Supposing, then, you have a small city lot or small country dooryard, and want to make it pretty. If your house completely fills it, you will have but a tiny garden in front, but even that, if planted rightly, may be very attractive. Fill the little place with various colored verbenas, petunias, or some such bedding plants, and, if you are inclined, tack some strong wires under the front windows, twist the other end firmly around pegs stuck in the ground, and plant sweet peas and nasturtiums, and let them run. Do not try in so small a space to have anything large or bushy, for it neither looks well itself nor allows anything else to do so. If you can have but a window-box and wish one which will take care of itself, use these same plants, putting, say, a purple verbena at one end, a pink at the other, and a white in the center. At either end fasten a wire or run it up on the side of your window for sweet peas and nasturtiums to climb upon. In this way and with scarcely any trouble but that of a little watering, you may have a window-box lovely with bloom and gorgeous in color 10 months out of 12.

If, however, you are more favored and have a lot which is not entirely filled by your house, you may have it beautiful with small expense and scarcely any work. Let us suppose, then, that you have a small yard and wish to make it pretty.

Don't attempt to put in a lawn of grass, for this at once demands tools for clipping it, and is enough to keep one person busy all the time trimming and weeding. If you must have it green around the house, put in white clover, which grows to a moderate hight, is always green and requires little care, except once in awhile to have the hose left to run on it. When in bloom it is a pretty sight, and it blooms most of the time. Then buy a paper of seeds of the double marigold and plant them as a border to your clover. These are brilliant rich orange, never fail to come up if the seed is good, no matter how hard the ground, and once up will luxuriate where other plants fail entirely. They bloom before they are fairly started and never stop till something happens along and kills them, for I never saw one die of its own accord. Nothing can be prettier as a border than these low bushy plants fairly loaded with yellow flowers.

If you wish still further to beautify your little plot of green, plant in it a shrub or two in the shape of a laurestinus, or something of that sort. These, when well started, grow rapidly, are tough and not easily broken, and are in bloom nearly the whole year round.

We will suppose, then, that you have a narrow flower-bed, running around the house, in which you desire to put some flowers. If you think you will have a little time and patience to train a couple of climbing roses over your front porch, put in the lovely white La Marque and pink Hermosa, both hardy and constant bloomers and of good substance in bud and flower.

If, however, you have any doubts as to their tacking up, leave them out, for roses trailing in the dirt, trampled and unsightly, are no particular ornament. Plant on either side of your porch a rosebush, say the Cels Multiflora and Jules Margotten. These are not the newest or rarest, but they are easily grown and a vigorous bush of either, constantly full of big blush or crimson sweet-scented buds, is a pretty sight.

For the balance of your bed and clear around your house, put in verbenas of different colors. You have no idea of their capabilities. A small verbena plant, such as you can buy at most florists' for 10 cents, will, in the course of six months, if it isn't used as a playground for the children, or a scratching-place for hens, cover four or five feet square with a solid mass of bloom. Not only this, but it continues blooming the year round, unless you have time enough to take the shears and cut it back to bare stalks to rest it once in awhile (a most beneficial performance); but if you don't it will give a profusion of lovely blossoms for months, and without water. A dozen varieties of verbenas ranging from white through all shades of pink, purple and red, make a mass of inconceivable brilliancy, and one who has never seen them growing finely cannot imagine how beautiful they are.

Geraniums.

These alone will be sufficient to make your little yard the envy of your neighbors; but if you still further wish to ornament it, or have a little more ground than what I have described, then put in geraniums, not the pelargoniums or "Lady Washingtons," as they are tender, but the common geraniums, single and double, which grow and bloom where nearly everything else refuses, and root in any soil. Few know how many shades may be gotten in these, or, in these shades, how much superior some varieties are to others in size, freedom of flowering and richness of color. If you are going to take up a collection from your neighbors' gardens, you will probably get a common variety of single and double scarlet, single pink salmon, and perhaps white. These are all very effective if arranged up against a fence where their brittle branches are not easily broken, and where their masses of color show well at a distance. If, however, you spend 10 or 15 cents apiece for a few kinds, you may select from all shades of pink, ranging from the palest blush to the deepest rose, a half-dozen shades of double and single salmon, double and single whites and every possible shade of red from scarlets of various softness or intensity to wine colors and crimsons, some of them most lovely. Beside these there are new tints constantly appearing, giving boundless variety to a garden. Plant some of these such as your taste selects, and intersperse with white marguerites. These never need care or trimming (except you wish to force blossoms out of season) and bloom a good part of the year without the least urging.

Vines.

If you desire vines, put in strong roots of honeysuckle, the scarlet trumpet creeper, the common blue clematis, or the scarlet passion vine. When first planted, run a strong wire from the ground (firmly twisted to a stake) to the top of whatever you wish to cover and leave it. Trust me, any of the vines I have named will, if given the least chance, soon find their spiral way up the wire and do their own training.

Laying Out Beds.

Perhaps, however, you wish, instead of grass, to bed your little yard down entirely in flower-plots and walks. If so, arrange the yard in the shape you desire (avoiding too large beds, which necessitate tramping on them to gather flowers), and fill your different plots not with standing bushes, and separate, distinct plants, but bedding plants which will cover the entire bed, give a mass of bloom, and most of which will grow so strongly as to aid in excluding the weeds, which would otherwise fill the bare spaces. For this purpose use the ever-useful verbena, white sweet allysium, nasturtium and petunias. These last are a source of constant satisfaction if grown in a mass, whether single or double. They are constant bloomers, very sweet-scented, and rapid and persistent growers. I have had people pass all my fine plants by to admire a common white single petunia, which was doing its best, and bloomed like a great bouquet.

In naming the plants suitable for such a garden, I have left entirely out of the question all varieties which are tender and need care to a certain extent.

These last are not suitable for a garden which cannot be well cultivated and carefully tended, and the care necessary to grow one of them would keep a dozen of the hardy plants I have recommended in fine bloom. These are sure to do well under any circumstances, give plenty of variety in color and shape, and are seldom or never out of bloom. From them one may at any season gather lovely bouquets or decorate most effectively, if desired, and they may be grown with so little labor that a garden of these flowers may, with truth, be said to be literally one in which flowers are grown without care.

GARDENER.

North Temescal, Alameda Co.

TO REMOVE VARNISH FROM PAINT.—To remove varnish without injuring paint, brush on spirits of ammonia or hartshorn, which softens the oil, allowing of its being rubbed off easily.

THE APIARY.

A Ventura County Bee-Ranch.

EDITORS PRESS:—On the western banks of the Sespe river, near the mouth of the mountain canyon of that stream, about three miles northeast of the Sespe depot of the coast extension of the S. P. R. R., is located the very fine apiary of R. Wilkin. We refer to the accompanying illustration as an accurate representation of the same. Mr. W. is an old Californian and apiarist, well informed in the science of bee-keeping, and considered first class authority. We write these notes partly from personal inspection of the premises, and partly from information kindly furnished us by Mr. W. while at his apiary a few days ago.

Mr. Wilkin located here to be out of the way of other bee men, if that were possible. He has at this place 450 colonies. His hives are the simplest form of the Langstroth. The brood-chamber contains about 1900 inches. The upper story is the same as the lower, and the two are interchangeable. The covers and the bottoms are the same, two inches longer than the hive, so that when at the bottom, the extra in length projecting furnishes a good lighting place for bees. The ends of these boards are furnished with cleats, rabbeted down so as to nail from top and end. When the covers become old, or in the least leaky, they may be changed to the bottom.

Foundation comb is used so as to exclude drone comb as much as possible. It is thought drones will, in any event, be numerous enough for all practical purposes. Mr. W. makes his own foundation comb, by means of well-perfected machinery.

The extracting house stands in the center of the apiary. This is for convenience of access, the rows of hives diverging from it in every direction. The house is a small frame, say 10 by 12 feet. In order to exclude bees, the door is so arranged that, upon passing, it always shuts to of itself, by assistance of a clock-spring. The frame of upper half of the walls, all around, is covered with wire cloth, which furnishes ample ventilation, making a very pleasant place for work, and a comfortably cool retreat during warmest weather. Grapevines, hanging in festoons around the eaves, during the fruiting season, present a most delightful picture.

The capping-box is 6 feet long, 2 feet deep, lined with tin. It has a false bottom of galvanized iron perforated, to drain the honey from the cappings.

The extracting tank is one of Mr. W.'s own getting up, is square, comes up against the end of capping-box so that the honey is easily drained from the capping-box through an opening leading into the tank. In capping, the honey-frame is rested upon an iron pivot, which makes it very easy turning from side to side.

An eight-framed comb revolving extractor is used. The honey flows from the extractor through a pipe to a

System of Evaporators.

These are four in number. Each is 12 feet long, 5 feet wide and 1 foot deep, holding about 5000 pounds honey; made of tin, and painted on the outside to prevent rust. A light wooden frame around the top of each evaporator helps to stiffen the sides and hold in place. Upon this rests a covering of muslin arched, which admits the heat of the sun, and yet serves to keep out insects, dust, etc. The muslin is supported by six cross-sticks elevated in the center and fastened at ends on to the wooden frame above sides of the evaporator.

It is necessary that the system occupy slanting ground, so that the honey may flow from the bottom of the evaporator next the extracting tank and in at the top of the next in order, and so on down through the series. From the lowest evaporator the honey flows into a 14,000-pound tank of galvanized iron. This may be of other material, such as wood lined with tin, etc. From this the honey is drawn into tin cans for shipment.

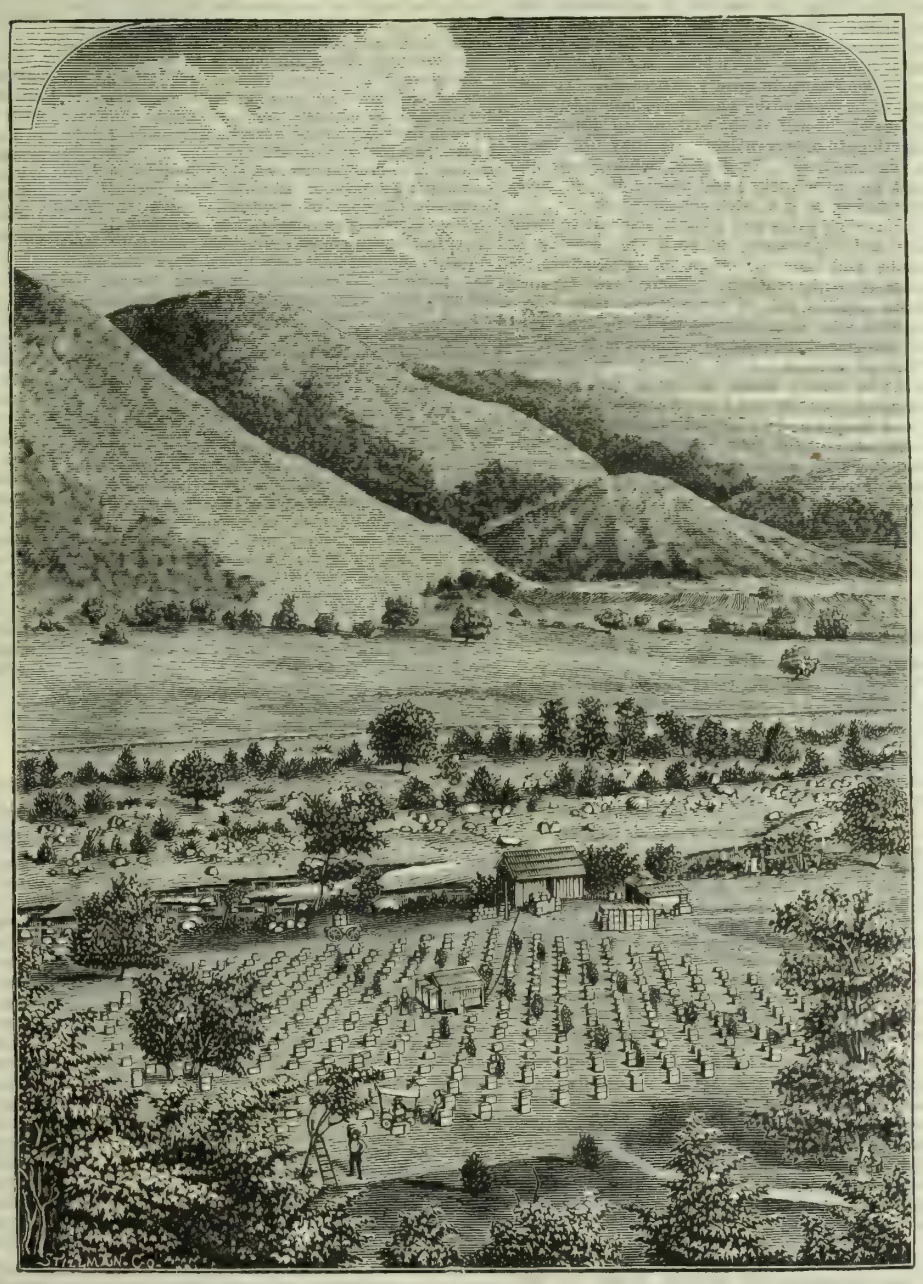
In the process of evaporation, any watery substance that may be mixed with the honey is removed, and the honey becomes thick and ropy. This seems to prevent, to a considerable extent, the tendency to granulation. Mr. W. has about five tons stored away in tin cans which was thus treated before canning, and which is now apparently as liquid as when first evaporated a year ago.

When first-class honey begins to flow, it is important to throw out all dark or second-rate honey so as to have the qualities distinct. This work should be done early in the season, so as to be ready for the new flow, as it is important to get the best honey on to the market early.

In case of an emergency in any season, these evaporators may be used for storing honey. They with the large tank have a combined capacity of about 34,000 pounds. One of these evaporators turned over for a roof, temporarily boarded up at sides, furnishes a good winter store for the cans of honey remaining on hand.

Mr. W. has been shipping to England. He has, within the past four or five years, shipped to one firm there, in one and two-pound cans, sufficient to realize from the sale about $40,000.

Heretofore, perhaps, at least nine-tenths of the honey of this county has been extracted, but there is now a tendency to give more attention to comb honey.



According to the assessors' books there are about 18,000 colonies of bees in this comparatively small county. These yielded last year, on the average, about 200 pounds of honey to the hive, making, say, about 1800 tons.

Until within the three years last past, foul brood existed in the county to a considerable extent, but since that time a County Foul Brood Inspector, appointed under a recent law, has condemned, and destroyed by burning, about 300 hives of bees. By this means the disease is now being kept in check, while it is reported that in some of the neighboring counties its ravages are considerable.

It is thought that within a radius of two miles from this apiary, there are now about 1800 colonies of bees belonging to various persons, and generally doing well. This shows the great abundance of bee forage in the county. This apiary last year produced 180 pounds of honey per hive, average. They would, of course, still do better if there were fewer in apiary or neighborhood. This year it is not expected they will do so well, as the flowers, although blooming profusely everywhere, yet seem to be wanting in abundance of honey-yielding properties.

The leading honey-producing plants in this neighborhood are alfileria, phacelia and wild mustard, which bloom early and give a start in the spring and during the breeding season. Then comes purple sage, then white sage and "wild alfalfa"—this last a plant of the broom family. These yield the main portion of the choice marketable honey sent away from here every season. The Tijon or bearberry and Sumac produce a fair honey. These are both shrubs of rather ornamental growth, the first well known in most timbered or mountainous parts of California for its dark serrated leaves and brightly scarlet berries, extensively used in many places in ornamentation at Christmas festivals, etc. Nightshade furnishes a poorer forage all the year round, and bees work on it in winter. There are, in the neighborhood, many other honey-yielding plants generally considered of minor importance. There is, at times, in certain seasons, an abundant supply of the famous white sage, which has been the means of making the attractive and delicious white honey of Southern California so well known in Eastern markets.

BEE RANCH OF R. WILKIN, VENTURA COUNTY, CAL.

THE BOTANIST.

The Great Brome Grass.

[Written for the RURAL PRESS by C. L. ANDERSON, M. D.]

In the early days of California one of the chief grasses of our county (Santa Cruz) was the wild oats, *Avena fatua*. It was an excellent forage grass. Now it has almost disappeared from our lands, and its place is chiefly taken by two other grasses, the Great Brome (*Bromus maximus*) and a small Fescue (*Festuca myurus*). The Brome, however, seems to monopolize everything. It is nearly everywhere, from the bottom-lands to the mountain summits. Have we been benefited by the exchange?

The Great Brome comes from the plains of Morocco—the land of that famous leather morocco. In all probability it traveled through Spain and thus reached California. It found a soil and climate eminently well suited to the rapid and abundant growth. About 100 years ago Desfontaines, a French botanist, described this Brome. Twenty years ago it was almost a stranger on this shore. Its reputation is not good, but, I trust, without good reason. It has been traduced and badly used. Even one of our recent botanists, E. L. Greene, says that "not even the goats are fond of it." Now what a goat would refuse in the way of food must be poor indeed!

I have better testimony to offer. I know that cattle and horses do eat it with a relish, and grow fat on it. While they leave the coarse stem of the wild oats merely eating the top, they will eat this Brome to the ground, and either green or dried, will consume the whole plant. It may be that everybody's cattle and horses will not do this. That is because they do not know what is good for them. Like most other grasses, when this Brome becomes old and dry, is not so good; and the long beard, or awn, is unpleasant. But there is a large, nutritious grain, perhaps larger than a grain of oats or rye, and late in the season, when all the grasses are dry, stock will gather this grain from the ground where it has fallen, and eat it.

When cut in the flower the Great Brome answers well for hay, and is worth more per ton than half the hay that comes into the market—not excepting the wild oats hay that we ship from San Benito county to Santa Cruz, in such large quantities. And when we consider the troublesome beards that surround the grain, I may truly say that they are *no worse* than bearded barley or wild oats.

Now while I am not quite in favor of turning out our wheat, barley, oats, etc., and sowing our fields with the Great Brome, I think it well to do justice to this stranger which has come to our shore evidently to stay, and which so easily and persistently makes itself at home in all the waste places.

The Brome is with us without our invitation. It is in the roadsides and fencesides, plains, hillsides, woodlands and mountain summits. It is far superior to the wild barleys, which, alas! are too common, and the hundred other weeds introduced, and it is really deserving of a good work. It is self-invited, a stowaway in some of the later ships from Spain. Nevertheless, may we not hope that it will prove an angel unawares?

In order that your readers may recognize this grass by name, I append a description: It is an annual, and one of the first grasses to start with the early rains. The stems are from 12 to 40 inches in length, not erect, but spreading. The leaves are coarse compared with other grasses; soft, hairy, about one-fourth of an inch in width. The head is about 4 to 10 inches in length, with wide-spreading branches, like the wild oats, only more so. The beards (awns) are about two inches in length, with short, upward barbs, in about four rows. It is rather dark-green in color, and each head (panicle) carries about 20 to 100 grains; so that when ripe the grass droops and as it matures becomes of a dark, purple-brown color, giving the field or patch where it grows a peculiar rusty look.

Santa Cruz, Cal.

THE STOCK YARD.

Our Future in Beef.

A writer for the *Sagebrush Stockman* signing himself G. M. D., of Sacramento, gives the following interesting sketch: I wonder if men now engaged in the business of raising beef cattle, or those contemplating engaging in that enterprise on the Pacific Coast, ever dream of the real possibilities in the direction of success and profit in the immediate future. I am engaged in the cattle business, and have naturally given the subject of future developments much study; with the result that I am inclined to take a hopeful view of the prospect.

As it appears to me, three prominent elements are at work to bring good, remunerative prices for beef here. They are: First—The fact that while during the past 10 years or so on this coast the home consumption, and consequent demand, has been about equal to the supply, the condition is now rapidly changing, for we are now receiving, and will continue for a number of years to receive, an enormous immigration of beef-eaters from the East, who know what good beef is, and will have it at any reasonable cost. Second—Our supply is not making a corresponding increase, and I very much doubt if it can be brought up to the standard, for with rare exceptions our ranges are already overstocked, and the area of the ranges being steadily lessened by the encroachments of those agriculturally inclined, consequently our annual beef product can only be increased by increasing the general feed supply of alfalfa, beets, other root crops, etc., on our fertile and water-blessed lands, and an approach, in a measure, toward Eastern methods of cattle-raising and feeding; for let it be remembered that vast as are the annual range products of the United States, they constitute but a small proportion of the beef product of the country. Third—We can expect to draw no beef supply from the country east of the western slope of the Rocky mountains, for they have now got to the point where their demand is slowly but surely exceeding their supply, a state of affairs hastened by the enormous loss of cattle from cold and drouth on the Western and Southern ranges during the last three years, supplemented by the great and steadily increasing immigration from Europe of people who soon learn to eat beef, although, for pecuniary reasons, largely denied the luxury abroad; and these people are rapidly settling upon and cultivating the broad cattle ranges, to the detriment of that interest, for the present at least.

Are not these three vital reasons for the belief that the production of good beef will prove in the near future a business yielding good returns? Few know the extent of the recent ravages wrought on Western and Southern ranges by extremes of weather and drouth. The writer of this article saw many, many thousand head of cows, heifers and young immature steers rushed upon the market and sold at the Chicago stock yards last fall, from the ranges, chiefly from Montana and Texas. And why sold, you ask, when they were just the class of cattle needed on the ranges? They were sold to save them from certain death by starvation, and when the thousand or more per day were run in, of course the price received was ruinous, but better than nothing, and death to cattle means nothing to the owner.

Now, how can the coming demand for beef on this coast be met? How can the quality be improved?

[This branch of the subject will be considered at another time.—EDS. PRESS.]

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Col. Irish to the Grangers.

The telegraph spoke of Col. Irish's address at the Hock Farm picnic, week before last, as interesting and eloquent. Later and lengthier reports, by mail, confirm the earlier account. The *Sutter Farmer* says: "It was one of the most practical, homespun and eloquent speeches we have ever listened to on this or any other occasion. To give even a faint idea of the depth and breadth of this speech, clothed in the eloquent, forcible and every-day talk, is beyond our power." When asked for his manuscript, for publication, he replied that he had not written anything.

He said at the outset that he had been invited there to teach, but found he should take lessons instead. He was charmed with what he had seen during the morning hours, the magnificent wheatfields, the elegant, solid and imposing rural dwellings, the evidence of horticultural possibilities as presented in the numerous orchards and vineyards, and last, but not least, this magnificent grove of stately fig trees, so extensive as to enable Adam and Eve, were they here, to set up a wholesale clothing establishment. He pronounced it the garden spot of the State—a fact not dreamed of by one in fifty of the people. He dwelt at length on the subject of individual ownership of the soil, saying that all should strive to own the land they till, and that the highest type of manhood is produced and springs from the ownership and occupancy of the soil.

It was the tiller of the soil that made this country so valuable. The calling of the farmer is vastly different from that of all others; without him there would not be any life. The mind of man can conceive of a time when the physician will no longer be needed, because the health of the people will be good; when the services of the lawyer and judge may be dispensed with, because the moral standing of communities may be improved to such an extent that the minions of the law will be a thing of the past. But no mind can conceive of the retirement of the farmer, who is a physical necessity, and will stand by his plow until the judgment day. The farmer supplies the means of existence, and statesmen must recognize his rights—they are transcendently above the rights of all other interests, therefore public regulations must care for them, without the prayers that are now generally needed in the halls of legislation.

He referred to a question said to be local, but in reality as broad as the State. Owing to lack of information as to the extent of the country destroyed and imperiled, the people of this region have gained the reputation of being unreasonable, vindictive, and exorbitant; their country and cause are belittled, and the destroyer's golden era magnified. "Why, in the barrooms of San Francisco, the diamond-decked lemon-squeezer mournfully tells of the times when mining was in full blast, before the stoppage of one particular branch, and argues that the farming industry ought to be done away with, because farmers are not in the habit of throwing up $20 pieces for a drink and demanding no change. It is such talk that does us most injury, and should be counteracted by a greater effort at publicity, by publishing to the world the extent of our country and resources, by bringing the merchants, business men and representative public men to view the situation as he had seen it." The speaker said we had won a great battle, and must in the near future triumph over every obstacle, and when the dark clouds of adversity shall have passed away and it be known that we are absolutely safe, and that the levees that stand to-day between us and ruin shall of their own accord rise above the deepening channels, the most active imagination must fail to foresee the brilliancy of the future.

Diversified farming is the thing that every intelligent owner should study, for the days of special farming are a thing of the past. If every farmer raised wheat there would be nothing but wheat for sale, and wheat is not all that is conducive to good health. Stock-growing should receive more attention here. The soil must be tilled by the owners, or in time a question like that existing in the British domain would arise. The greatest farmers' organization—the Grange—pre-eminently represents individual home ownership, and for that reason its councils are the best. There is forming in this country a political organization, which, though in an embryotic state, is teaching its tenets in such a way that many are being led to believe they will in course of time have the right to confiscate the lands of large owners. He looked to the farmers and Grangers to forestall and turn away this growing menace, for theirs is a class of law, order and stability without which governments cannot exist.

The *Farmer* and the Marysville *Appeal* unite in testifying that he held his large audience spellbound and was liberally applauded, and the latter witness adds that the speech was considered the best that has been delivered at any of the Grangers' annual picnics.

SACRAMENTO COUNTY POMONA GRANGE is to hold a special meeting at Galt, by invitation of the local Grange, Saturday, June 4th, at 10 A. M.

Conservative Farmers — By a Farmer.

Farmers, as a class, are rated somewhat conservative.

The ownership of soil in fee simple, with the privilege of holding more than he needs, promotes conservatism. He looks upon high prices for produce and low wages as in his interest. His radicalism usually crops out in resolutions against monopolistic transportation extortion, and high rates of interest on mortgages. The railroad kings and bankers tread upon his immediate corns. His conservatism on the one hand and his radicalism on the other are owing to closely surrounding conditions. Touch a man where he lives and we wake him up. He opens out or closes in in accordance with the pressure or resistance.

But there are classes of conservatism among farmers.

To acquire and hold against the use of others more land than one can use is aggressive conservatism. To hold the land for a rise in price is a dogged conservatism. To hold it to collect rental from other men's labor and enterprise is iordly conservatism mildly expressed. To hold land to be worked by cheapened labor, to build up wealth for self at the expense of others, is extortionate conservatism. To pay big usury on big mortgages to drones, while man and beast are overworked and poorly fed to meet their demands, is slavish conservatism.

To use big gains and a bank account to swell one's self-importance, to seek the society of nabobs and ape the ways of aristocrats, is pompous conservatism. There are farmers whose incomes are of more value than home comforts who count success in life by the cent per cent standard; miserable conservatives!

But all farmers are not members of any conservative class. Many of them are nature's noblemen, men of broad mind, open heart and honest purpose—radical from principle, just by virtue of inherent good—cultivated gentlemen, home-builders, supporters of wholesome laws, active in reforms, and ever ready to oppose the wrong and aid the right.—*S. Harris Herring, in Swinton's Paper.*

San Joaquin Pomona Grange.

The Pomona Grange in session at Lodi, May 25th, passed the following without a dissenting voice:

WHEREAS, The Boards of Trade of this county have encouraged Pomona Grange to make an exhibit this year,

Resolved, That this Grange ascertain what can be done in this direction, and report the same to a meeting of the Grange to be held in Lodi, Wednesday, June 15, 1887.

Resolved, That all persons disposed to foster this movement by giving cereals, fruits or money, make it known as soon as possible to any one of the following committee: J. D. Huffman, Lodi; G. H. Ashley, E. Fiske and D. Sheen, Woodbridge; S. C. Waters, Clements; J. L. Beecher, Jr., Stockton. Be it further

Resolved, That it is the sense and request of this body that the Hon. Marion Biggs, Congressman-elect of this Congressional district, use all honorable means to oppose the repeal of, or an amendment to, the fourth section of the Interstate Commerce Bill, passed at the last session of the National Congress.

The Lodi *Sentinel* adds that the above resolutions were adopted at an unusually large meeting, and consequently convey the sentiments of the Grangers. They are doing a good thing in thus endeavoring to obtain a suitable exhibit of the products of this county at the Mechanics' Fair this fall, in S. F., and should receive the support of every property-holder in the county.

WILL CONSULT THE GRANGERS.—A meeting of the committee of citizens chosen to take measures to assist in making the Mechanics' Institute Fair of 1887 a grand success, and in there displaying the great resources of this State for the enlightenment of visitors, was held on Tuesday last. The following gentlemen were present: W. T. Garratt, A. S. Halidie, J. Mervyn Donahue, P. B. Cornwall, B. F. Flint and William P. Stout. The committee organized by electing A. J. Bryant, president; W. T. Garratt, vice-president, and W. P. Stout, secretary *pro tem.* Mr. Flint thought that the Grangers' Business Association of California should have a representation upon the committee, and the secretary was instructed to communicate with that body, and ask it to select one of their members to act with the committee. Capt. J. H. Drummond, of Glen Ellen, was added to the committee, after which the meeting adjourned.

SOCIAL AT MARTINEZ.—The *Gazette* says that after an interval of more than ordinary length, another of those attractive socials for which the Grangers are noted came off on Saturday evening, May 21st. The hall was well filled, and the young people entered into the enjoyment with zest and spirit. During the evening Misses Lulu Frazer and Evelyn Williams sang a duet, Mrs. W. B. Thomas gave a humorous recitation, and Miss Maggie Williams favored the company with a solo. At the midnight hour, as usual, the party was at an end, and all left with renewed conviction that Grangers' socials are hard to surpass.

ST. HELENA GRANGE has passed resolutions of condolence, in view of the recent death of Willis P. Pinkham, a brother every way worthy of confidence and esteem.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

THE strongest efforts are being made through the press and by taking advantage of technicalities in the Act to bring the Interstate Commerce law into disrepute, and so influence public sentiment against it that the attempts evidently to be made in the next Congress to have it repealed may be entirely successful. Farmers who more than all others helped to bring about this law, and who above all others are interested in its enforcement, should not be misled by false statements or let evil overcome good because of their apathy or want of knowledge in this matter. The very essence of the Interstate Commerce law is *equality*, anti-discrimination, "a fair field and no favor," equal charges for equal services, equality in *persons* and in *places*. No higher charges for a *short* than for a *long* haul; no pooling of earnings, no free passes. We hear of petitions from railroads and those who have been enjoying *unequal* advantages against portions of the law; but so far there are more petitions representing more persons and interests *against* any repeal of parts or all of the law. To-day we read the telegrams that tell of the failure of two large barbed-wire manufacturing establishments in Chicago, to the amount of $755 000, and "the failure is chiefly attributable to the Interstate Commerce Act." If special rates of freight and undue advantages have been given firms, by which they became monopolies, and could crush out other firms in the same line of business who had *not* these favors, as with the Standard Oil Co., whose freight rebates have been announced in 18 months' time to amount to $10,000,000, and who have crushed out hundreds of other oil refineries *because* of these *special* favors—and they cannot compete on an *equal* footing with other firms—they must fail. And it was to suit just such cases that this law was made and passed. "Let *justice* be done though the heavens fall." Our forefathers said in the Declaration of Independence, "all men should have an *equal* chance in life, liberty, and the pursuit of happiness." That principle is the foundation of all our Government, and it is the chief corner-stone of the Interstate Commerce law.

"WE have a great work before us, and it is a calling that any true American should be proud of, for this country must be saved for the people, and the people must do it. Let us put on our whole armor and raise our own statesmen, who will formulate our laws in the interest of the whole people, and see that the land is restored to actual settlers, to be the homes of our people, not aliens; elect our officers, not appoint them; keep our water-courses free, and control public carriers, and tax the people only for public purposes, and no more than is necessary. Then we will begin to financier our business, and can discharge at least some of the volunteered service of corporations."—*H. E. Hayes, Lecturer Oregon State Grange.*

"SPECULATION in futures is of such a degrading and dangerous character that laws which apply to gambling should with equal force be made to apply to these nefarious trades." True enough, and farmers are coming to understand that the prices of the great staple crops of this country are regulated more by these gamblers than by the laws of supply and demand. The Grange has already taken hold of this subject and it will be followed up.

"'LET your light so shine that others may see your good works.'" Attend strictly to your Grange meetings. Study how you may benefit the Grange, and not how the Grange will benefit you. Work for a purpose. Be zealous in the establishment of Grange schools. Keep away from the courthouse. As long as men have errors they will have difficulties. Adjust them in the Grange—men have to decide them some way—then why not take the easiest, cheapest and justest plan? There never was a better time to advance the work of the Grange. All over the State there is an unrest among the farmers and laboring classes. All other classes and professions, except the farmer, are organizing with wonderful rapidity. He needs it more and feels it most, yet stands apart. This thing can't remain long. With the great moneyed powers and laboring classes antagonizing each other like an upper and nether millstone, the farmer will be doomed to abject ruin."—*W. R. Williams, Master North Carolina State Grange.*

"NEIGHBORHOODS where Grangers and farmers' clubs flourish are characterized by better farming, as well as a more friendly and social spirit among the people. No one man does or can know everything about farming, any more than about other things. Each member contributes his ideas, and the stock of information about the best farm methods is largely increased. Even those who hold aloof are brought in, however unwillingly. Keen observers note the improvement they are secretly making, or if their farming shows none of these, they point to it as a horrible example, and as a warning of the bad effects of neither learning themselves nor imparting their information to others. Some farmers who have enjoyed the benefits of the Grange for many years say they would not live in a neighborhood or town where no Grange exists."—*American Cultivator.*

THE Master of the Indiana State Grange has appointed Saturday, June 4th, as "Children's Day" among the Patrons of that State. In the young folks are centered the hopes of the family, the Grange and the nation; none too soon can they now receive lessons that tend to develop a higher and better manhood and womanhood that will "help them in loving the good, the beautiful, the true, the home, the farm, the Grange and their native land." Yes, we open the doors and bid them welcome; welcome to our Grange halls, welcome to our social gatherings, welcome to all our hopes and efforts for the better life, welcome "for the good of our Order, our country and mankind."

PROGRESS.—Three more new Granges, two in Mass. and one in Penn.

DEPUTY National Lecturer, J. H. Brigham, is lecturing in Kentucky, and D. H. Thing is in Maryland. The Lecturer of the National Grange is in West Virginia. X. X. Chartters, Master of the Virginia State Grange, is lecturing among the Granges of his State and with good effect.

DANVILLE GRANGE gives a Harvest Feast today. It is one of the best Granges in the State, and will, no doubt, report a good meeting.

EDEN GRANGE had a good Harvest Feast, as usual, on Saturday last, when five applicants received the fifth degree. Judge Russell, who has steadily gained health, was there, and addressed the Grange to the pleasure of a good number present. The Judge speaks well of the manner in which the work is being done by the officers of Eden. Judge Blackwood and Brother Dennis both spoke in favor of the cause of temperance in their earnest, emphatic way. Brother Kelsey and Sisters Brooks and Kinney were present from Temescal Grange.

THE LATE D. WYATT AIKEN.—The National Lecturer's column in the RURAL of April 30th held a brief but feeling eulogy on Hon. D. Wyatt Aiken, who died at his home in Cokesbury, S. C., April 6, 1887. By request, and with the approval of Hon. Put Darden, M. N. G., Secretary Trimble has prepared a somewhat extended tribute to his memory as an early, able and constant advocate of Grange principles, a man of exalted moral worth and a devout and consistent Christian.

NORTH BUTTE GRANGE digressed from the current methods of celebrating the vernal season by decorating the graves of the departed with floral offerings. This is a movement that will gain strength in practice. No more appropriate tribute could be thought of to the memory of departed friends, and to keep green the old love and esteem. This movement was inaugurated yesterday near Pennington.—*Sutter Farmer, May 20th.*

TULARE GRANGE, thanks to the enthusiasm and persuasive industry of Bro. Maples and other local officers, aided by Bro. Overhiser, has 25 fresh applications for membership. We commend their judgment in concentrating their force in one strong Grange, instead of dividing it between two organizations.

NORTH BUTTE GRANGE held memorial services, May 19th, and strewed flowers on the graves, not of Patrons only, but of all in the cemetery — even the poorest and lowliest—and the members separated with sympathies deepened and strengthened by the tender observance.

A GRANGE HALL FOR SAN JOSE.—At a meeting of the Horticultural Hall Association last Saturday, it was voted to construct an additional hall for the use of the San Jose Grange, the latter agreeing to lease it for 20 years.

Beware of Sparks!

A wide-spread mountain fire was reported last week as raging on the east side of Napa valley, between St. Helena and Calistoga.

Also, the fence inclosing H. Barnhart's land, along the line of the railroad south of Lodi, took fire—it is supposed from the sparks dropped by an engine—and was partially destroyed, though the grain was still too green to be much injured.

Saturday night, at Kentucky Ranch, 15 miles from Marysville, several hundred acres of hay, some standing grain, barns and much fence, were consumed, to the value of thousands of dollars.

Sunday afternoon fire was discovered on the grazing fields at J. Traynor's sheep-ranch, nine miles north of the same city. Before it could be stopped it reached the grain field and destroyed 17 acres. Only the combined efforts of several large crews of farm hands from different ranches saved many thousand acres of growing grain. Several of the men were nearly stifled, and required the services of a physician.

These occurrences remind us that the season is again at hand when field and forest blazes are wont to destroy great values. It behooves every one, young and old, to beware of kindling wayside fires, or dropping matches or cigars about the ranch or along the road. Probably nine-tenths of all the disastrous conflagrations of harvest-time result from the little carelessnesses named above. "Behold how great a fire a little matter kindleth," and take care of that same little matter.

THE NEWCASTLE APRICOT.—We received June 1st from C. M. Silva & Son, of Newcastle, Placer county, a box of a new seedling early apricot which they have been testing since 1881, and have secured a stock of trees which they will offer this fall. In their growing, the new apricot, which they name the "Newcastle," has proved quite as early as the Pringle, and we can pronounce from the fruit submitted to us that it is much better than the Pringle in size, color and flavor. The richness of flavor is especially noticeable. It has a deliciousness which has generally to be looked for in the luscious varieties which ripen much later. It seems to us that the variety has a great future before it. Messrs. Silva & Son write us that the tree has borne regularly since 1881.

A LONELY FLOWER.—On Mount Whitney, the highest mountain in California, at a level of 14,000 feet above the sea and 1500 feet above the timber line, where there is no soil and no moisture save snow, and hail, and ice, there grows a little flower shaped like a bell-flower, gaudy in colors of red, purple, and blue. It is called Jacob's ladder, and its fragrance partakes of the white jasmine. It blooms alone, for it not only has no floral associates, but there is no creature, not even bird or insect, to keep it company.

AGRICULTURAL NOTES.

CALIFORNIA.

Butte.

OLIVE CULTURE.—Oroville *Register:* Olive-growing is yet in its infancy in Butte, though large and thrifty trees have been in bearing here for 10 years. The natural home of the olive is in the foothills, and splendid trees may be seen in full bearing at Mrs. Z. M. Sexton's, Joe Gardella's and at George Wallet's. The oil made from these trees is of a fine quality, and it shows what may be expected from the olive here in the future. The attention of fruit-growers has only recently been called to the olive, but during the past year a large number of trees have been planted, John C. Gray alone putting out 4500 trees a few miles east of Oroville. The olive flourishes best in a dry soil, the hill-land oil selling for a higher price than low-land oil.

THE BEE BUSINESS.—L. N. Eyler, who has had a good deal of experience with bees, tells us that since the orange began to be planted so extensively in this vicinity the honey made is very fine, and appears to be flavored with the orange blossoms. The bees begin to work here about the 1st of March and continue till the 1st of January. Each hive will produce about 80 pounds of honey, worth from 15 to 20 cents a pound. The patent hive he thinks too warm for this region, and makes his own, which he believes better suited to the climate. He is confident there is no better region in the world for honey. Along Feather river the wild coffee is very abundant, and this is a favorite plant with the bees; but they prefer the orange to all other blossoms. Mr. Eyler says that all depends on taking care of the bees, but if they are properly treated they will be a success here beyond all doubt.

Contra Costa.

THRIFTY VINES.—*Gazette*, May 28: There is no part of the State where vines are more exempt from injury by frost, or suffer less from disease or insect enemies, than in Contra Costa. Among the many vineyards notable for thriftiness is that of Mr. Thomas Griffin, near Martinez, which is deserving of mention. He has 20 acres of Black Ferrera, three years old, of luxuriant growth, literally loaded with large clusters of grapes—more than the canes can sustain. The prolific appearance of this young vineyard is noticeable, even in this favored clime.

Inyo.

OWEN'S VALLEY ITEMS.—*Independent*, May 28: A large force of men and horses, with suitable machinery, are now at work on the upper end of the big canal for the irrigation district. The citizens of Lone Pine are building a flume to carry water into the town for irrigating purposes. A large quantity of water has been allowed to go to waste above the town which will be utilized by means of this flume....The usual visitation of sheep has set in. About half a million come to the valley each year....The first cutting of alfalfa is nearly ready around Independence; the crop will be a heavy one.... There will be ripe peaches at Independence about the middle of June. Prune trees are very heavily loaded; so are apricots and nectarines.

Kern.

MATERIAL FOR FENCING.—*Kern Co. Echo:* Our readers will remember an article some time ago on the growth of bamboo for fencing. C. A. Maul has planted out 200 roots of this plant, and expects to raise his own fencing. The growth of this bamboo reaches a hight of from 30 to 40 feet each year, is very straight, and when dry, hard and strong. The stock will be cut into suitable lengths for pickets and woven with wires into a neat, strong, durable, rabbit-proof and stock-proof fence. Parties who have been raising it for some time assert that an acre, well set to roots, will produce pickets enough each year to make six miles of fence. Allowing one-half for enthusiasm, and there is still something in it.

Los Angeles.

GUM TREES FOR FIREWOOD.—Anaheim *Gazette:* Postmaster Gardiner believes in growing trees for fuel, and is now planting five acres as an addition to his present grove. The fuel problem is going to be a serious one in the not distant future, and more attention should be paid to planting such rapid-growing trees as the eucalyptus.

POMOLOGICAL MEETING.—Orange *Tribune:* The next meeting (July 1st) of the Pomological Society, at Orange, promises a larger attendance than usual. We are authorized to announce that papers will be read by Geo. Rice, Sec. of the Orange-Growers' Protective Union, on "Oranges for Profit," and by Milton Thomas, the veteran nurseryman, on "The Past, Present, and Future of Fruit-growing in Southern California." E. Edson Smith will tell how to make a 10-acre fruit ranch support a family. A. F. Kercheval will sing "Apples of Gold in Pictures of Silver." The reading of each paper will be followed by five-minute speeches by the members. Good music will diversify the exercises, and Orange will entertain her guests with the best the season affords.

San Bernardino.

CITRUS FRUIT IN COLD STORAGE.—*Press and Horticulturist*, May 28: Mr. Stowe reports 15,000 boxes of oranges and about 2000 boxes of lemons in good condition at the Cold Storage Works in this city. This fruit was placed in cold storage from one to three months ago, and is to-day as perfect as when taken from the orchard. It has decreased in bulk somewhat, but is still of perfect flavor and condition. This is all Riverside fruit. The lemons will be placed on the market during June and July, at good figures, and the time is now at hand when a lemon orchard will be one of the best properties in Southern California. There are about 200 boxes of the Riverside Washington Navels now on hand, which are being sold for $8 per box. There is more of this fruit in the Chicago market, and the market reports from that city quoting Navel oranges at $4 per box refer to the Australian Navels from the coast valleys.

ORANGE SHIPMENTS.—Following is a review of the orange shipments from Riverside for the current season:

	Cars.	Boxes.
December shipments	11	3,204
January shipments	31	8,907
February shipments	49	13,996
March shipments	84	23,918
April shipments	71	20,214
May shipments	72	20,559
Total to date	318	90,798

SHIPMENTS IN FORMER YEARS.

	Carloads.

Crop of 1881-82	42
Crop of 1882-83	45
Crop of 1883-84	50
Crop of 1884-85	456
Crop of 1885-86	506

San Luis Obispo.

RESULT OF GOOD FARMING.—Estrella Cor. *Tribune:* Now this is a pretty dry year. Rains have been light and not very well placed. It's a sort of a test year with a good many of us, comparatively new-comers. Probably there's a larger acreage of grain sowed in the eastern part of the county than ever before—I heard it estimated as double—and the chances are that most of it won't yield more than half a crop. As far as I can see, there ought not to have been a failure anywhere. I don't think I am any better situated than the majority, but my grain stands waist high and promises a full crop. But then I put in on summer-fallowed land, plowed deep and cross-plowed. I am encouraged to think that, take an average year, or take a year like the present one that is below the average for rain, I can count on a crop every time if the ground is properly worked. Fruits and vines do finely, too, but they want to be well cared for. You can't stick a young tree in the ground and leave it to work its own way. My little orchard of five acres is two years old and is doing first-rate, except where I failed to attend to it. I think anything can be raised here 'most any year, if we know how and do our share.

Santa Barbara.

A GIANT VINE.—*Independent*, May 21: There is a grapevine in Carpinteria, the property of Jacob Wilson, that excels the famous Montecito vine that was forwarded in 1876 to the Centennial. At the butt it measures 5 feet 10 inches, and five feet from the ground 5 feet 2 inches. It is of the Mission variety, and is reputed to be the largest grapevine in the world. It is supported by a trellis, covering an area of ground almost 100 feet square. Mr. Wilson informed us that the vine, two years ago, produced four tons of grapes.

UP THE SANTA MARIA VALLEY.—*Times*, May 28: The Santa Maria mesa, on the north side of the Sisquoc river, is entirely covered with wheat and barley, and the quality will certainly be as good as usual; thousands of acres can be seen which will produce from 15 to 30 sacks of grain to the acre. The mesa is principally sown to wheat, with here and there a small tract of barley, which is fast ripening. The grain on the mesa joining the valley on the south will produce a good crop of an excellent quality. The extensive Sisquoc orchard is heavily laden with many kinds of choice fruits, and all the orchards we had an opportunity of visiting indicate the heaviest crops they have ever produced. The 40 acres of English walnuts just set out by Joseph Kaiser seem to be growing nicely. The trees are choice and set out regularly and perfectly; the ground is well cultivated, and everything connected therewith attests the enterprise and business method of our pioneer in this industry. How rapid the change, that has transformed this valley from an open plain, with only an adobe ranch-house here and there, grazed over by thousands of half-tamed cattle and horses, to one of the richest agricultural and fruit belts in California, the home of hundreds of enterprising farmers.

Santa Clara.

SUCCESSFUL DAIRYING.—*Free Lance*, May 20: The ranch of G. J. Jarvis, at San Felipe, contains 80 acres in the heart of the artesian belt. The land is no better or worse than that surrounding it, which is also used mainly for dairying purposes. The main advantage it possesses over the average California ranch is having plenty of artesian water. About 70 acres are used for dairying, the remainder being used for orchard and garden purposes. The 70 acres are divided into fields of various sizes, and sown in alfalfa. When one field is fed down, the cattle are turned into the next, and water is run on to the field they have left. Thus a regular succession is kept up, the stock averaging two or three weeks' stay in each field. On this alfalfa, Mr. Jarvis supports 40 head of cattle and horses, and cuts several thousand tons of hay. Last month, from 25 milch cows, he got 26,000 pounds of milk, which, taken to the cheese factory, yielded about 2700 pounds of first quality cheese, netting him about $250. There are several other dairy ranches in San Felipe as productive as that of Mr. Jarvis, but the number of such ought to be largely increased. There is plenty of land in this district at present almost going to waste, which ought to be yielding good returns to enterprising owners.

A HUGE CATAMOUNT.—Gilroy *Advocate:* A lion measuring nine feet two inches from head to tail was killed recently by Ed. Wilson on his father's ranch in the eastern range near the Gilroy Hot Springs. This is the largest lion ever brought low by the rifle in these parts. Its weight without hide or entrails was 150 pounds.

Santa Cruz.

MOVING A MAGNOLIA.—*Courier-Item:* The fine magnolia tree, growing on the lot on Pacific avenue lately purchased by Mr. Degener, was being taken up Tuesday with four feet square of the soil and root, which were boxed in on all sides and bottom. The tree, which is eight inches in diameter at the ground and nearly 20 feet in hight, will be raised with jack-screws, placed on trucks, and reset in the courthouse square. Sheriff Dakan is taking great interest in saving his handsome tree and placing it where it will be an ornament. The tree is at least 15 years old, is the largest of its kind in the city, and bears, at the time of its removal, more than a hundred buds and blossoms.

Shasta.

WISE INDUSTRY WINS.—*Index:* Three years ago Mr. and Mrs. Tarlton bought 160 acres of redland two miles north of Cottonwood. They examined the natural vegetation and general features of this locality and decided to put out an orchard and vineyard. Some of their neighbors urgently advised them not to try the experiment, for they would surely fail; but Mr. T. went on with his suicidal work. The result is, he has one of the nicest places north of Sacramento. Every tree, vine, shrub or flower they put into the soil has grown better than they expected. The front yard is filled with flowering plants and shrubs. In the orchard are all kinds of trees, from the hardy apple to the tender apricot, loaded with fruit. Mr. T. has been through the orchard and pulled off more than half the fruit. (The trees are but three years old, and it is best not to allow them to bear heavily at first.) We measured some of the sprouts grown this season and found a number of them six feet long. In the three-year-old vineyard we saw half a dozen varieties, all loaded with grapes except the Seedless Sultana. There is not the slightest indication that frost has ever visited this vineyard. All this has been done by thorough cultivation, no irrigation whatever having been resorted to.

LOTS OF MAST.—One of the hog-men from the oak-covered foothills says there will be acorns and acorns of hog-feed this year; hence he is happy and smileth and goes down into his overalls and digs up two dollars and four bits. As he counts the coin the editor gets happy and smiles, too.

Solano.

PAYING POULTRY.—Dixon *Tribune:* R. H. Barkway, of Rio Vista, sold a dozen year-old chickens in San Francisco a week or two since for $14. They were of the Light Brahma breed. This seems a fabulous price, but it must be remembered that the dozen weighed 100 pounds.

A SMALL BLACK BEETLE, unnamed in the catalogue of fruit pests, is committing fearful ravages among the grapevines about Davisville. Thousands of vines in the Briggs vineyard are almost completely denuded of foliage, and the crop ruined. No remedy has yet been found. Sulphur and Paris green only sharpen his appetite.

Sonoma.

WOOL-SALES DAY.—Cloverdale *Reveille:* Wednesday, June 15th, is set for general wool-sale. It is very important to wool-growers that they take advantage of this opportunity and bring their wool before more than one judge for inspection. A good quality will be eagerly sought for and buyers will come into competition and the highest prices will be offered. Let there not be a wool-grower in the whole vicinity remain away. It is going to be a lively day for Cloverdale. The ladies of M. E. Church South propose giving a dinner on the occasion.

Sutter.

EGYPTIAN CORN.—*Farmer:* The Egyptian corn pastures are growing nicely, and are about ready to be turned on. No more profitable discovery was ever made in California for summer pastures on our uplands.

Yolo.

PEAS IN PLENTY.—*Mail:* Mr. Lusk, who has an extensive garden on Cache creek, states his crop of green peas this year will amount to about 2000 sacks. He will probably ship them all.

PROLIFIC BARLEY.—C. Hevel paid us a visit Wednesday, having with him a bunch of 52 stalks of barley, which had sprung from one grain. He took it from a 50-acre field, near Merritts, and says that the whole field is of as heavy growth.

Tulare.

BERMUDA GRASS.—Tulare *Register:* Three years ago J. A. Cary, of Tipton, began an experiment with Bermuda grass on alkali. He had a small patch of ground near his reservoir that was clad in white alkali as with a shroud. Nothing, not even alkali weeds, would grow upon it. But the Bermuda grass took root, spread its tendrils out and took root again and again, and now, in three years time, it forms a perfect mat over so much of the alkali spot as it was planted on, covers it as with a Smyrna rug. Nor is that all. Bermuda grass does make very valuable pasturage. In the same inclosure with this grass plot is a little patch of alfalfa, and Mr. Cary tells us that if he turns any of his animals upon that alfalfa patch they will feed a little while and then deliberately walk over upon the Bermuda grass and feed there the rest of the time, decidedly preferring it to alfalfa.

Yuba.

WILD BLACKBERRIES.—*Appeal*, May 27: The banks of the Feather river for several miles north of the railroad bridge were alive Sunday with boys and Chinamen, gathering wild blackberries, which they found plentiful, and in most places easy of access.

OREGON.

THE FRUIT CROP.—Willamette *Farmer*, May 27: The fruit crop could hardly pass through the 10 days of rain and hail and storm of early May unscathed, and in most of this valley, and probably through the whole region west of the Cascades, the damage has been considerable. We hear from all directions of serious injury and loss, though in exceptional localities orchards stood the severe ordeal and will produce fairly; and we happen to be among those so favored. Cherries were damaged by the frosts that followed the storms, and around Portland will be light. Peaches were almost totally destroyed by the hard frosts that followed the warm spell in January, and there will be a very small yield of peaches anywhere north of California. Plums and prunes are damaged more or less; so are pears, and some assert that they will have no apples. It is common to hear such complaints, and to find fruit in abundance when the crop ripens. It is probable that the damage is overstated, yet there must be some ground for such universal complaints. Our fruit-growers have a good market opening to them that increases every year. The Canadian Pacific region will demand a large supply; the Northern and Union Pacific are developing new mining regions, and these form the most reliable and profitable customers for our fruits.

In Butte County.

From many who have visited the enterprising vicinity of Oroville, Butte county, we hear words of praise for the natural features of the country and its adaptation for the most desirable growths. The exhibits made at the recent citrus fairs in Sacramento have brought the region into much prominence, and its progress in development bids fair to be rapid and great. In our notices of the fairs, and extracts from time to time from the local press, our readers have heard of many who are leading in citrus and other cultures and thus have become acquainted with their work. A correspondent who drops us a brief note mentions the place of T. B. Hutchins, at Central house, where he found a flourishing orange grove, in front of his residence, which bears finely. Mr. Hutchins has also a 40-acre orchard of peaches and apricots, which is doing well. Loquats bear well with him.

There seems to be a general disposition to add fruit to other farming enterprises. Daniel Hilton, one mile east of Oroville, who has a fine dairy herd of 80 head of Jerseys and Shorthorns, has 15 orange trees which are now 12 years old and bearing well; also lemon trees in bearing, and 16 acres of mixed fruits. At the ranch of C. B. Shear, four miles north of Chico, our correspondent saw a large orchard of apricots, peaches and plums, which hold a good crop this year; and a small vineyard thrifty and promising. Mr. Shear also grows grain, and his crop looks well.

There is much inquiry in Butte county for homes. The enterprise put forth recently in dividing upland and making it available to settlers in small parcels is bringing in many desirable settlers. We are glad to hear of such advancement, and shall be glad to have short notes of news from those who have not the time or inclination for more elaborate letters.

MONARCH FENCE MACHINE.—The progress in public esteem made by what is sometimes called "combination fence," that is, pickets interwoven with wire, is quite remarkable, though not wonderful, for certainly this style of fence has very much to commend it. There are various styles of the fence, as our readers know—that which is made at the factory and sold by the bale, and that which is put up on the line with a special machine. Of the latter sort, one which has won prominence is the Henley Monarch fence machine, which has been advertised in our columns. Hawley Brothers Hardware Co. have now the agency for this machine. A handsome illustrated catalogue can be had on application to them.

NEW GOPHER TRAP.—All the boys will be interested in the advertisement in this paper of a new gopher trap which was invented and patented by Bertie Jolly, of Soledad, Monterey county—a youth of 15 years. It is claimed that a boy can catch more gophers with it in a given time than a man can with any "grown-up" trap. No doubt all the boys will want to try it. They say if you don't think it worth what it costs you can get your money back.

The Crimson Snow Plant of the Sierras.

[Written for the RURAL PRESS by E. T. Y. SWETT.]

High in the great dome of Heaven
Rises a white mountain peak;
Calm, pure, lofty, and steadfast,
What if it seem a bit bleak?

Search in its frozen white bosom,
Tenderest plant-life is there;
Caressed and nurtured and sheltered,
Under the crags black and bare.

Look not for warmth on the surface,
For surface must character show;
But search in life's hidden recesses,
There snow-plants of love ever grow.

1419 Taylor St., S. F.

A Scare.

"Well, I will try once more, Milly; but you mustn't be too particular."

Tom frowned a little as he reminded his young wife that this was the fourth time she had been left without a servant during the year they had lived at Cloverbanks.

It was such a bother to be bringing them constantly from the intelligence office!

And Milly colored a little, knowing that she was very particular and a little set in her way, and might be more patient. She would try hard to succeed with the next one; it was so dreadful to get along in the hot weather with no help, and the baby teething.

Tom drove in town, and about 11 o'clock a neat little woman came out on the train.

"I am glad you are not a young girl," said Milly. "I suppose you have had experience in housework?"

"Oh, yes, indeed!" was the reply, with suavity. "I have kept house for myself; I am a widow."

"Have you been a widow long?" asked Milly.

"Two years. I understand all kinds of cooking—fine laundry work—everything."

So it proved. Milly was so pleased she felt absolutely grateful, and looked on admiringly as the rather disordered household was brought up to a state of perfect order.

Meanwhile, Mrs. Maria, as the new-comer styled herself, was very loquacious.

"Perhaps I say it, who shouldn't, Mrs. Westerly, but I'm good help. I can take right hold anywhere, and I don't overcharge. I've lived in a number of places and they'll all recommend me."

"I should think likely," replied Milly, who was rocking the baby, while Mrs. Maria put the sitting-room to rights.

"I'm a good hand in sickness, too. Hope none of you won't get sick while I am here, but it's unhealthy this hot weather," dusting the mantel deftly. "Don't you think Mr. Westerley looks a little peaked?"

"The heat wears on him some," said Milly.

"It's bad to get out of health—affects the nerves."

She had a small round face, with apple cheeks and sharp, black eyes. She paused in her work and looked intently at Milly.

"Affects the mind?"

"Yes."

"It's bad to get the mind disordered."

"It is, indeed," said Milly, carelessly.

"I don't suppose you notice it, Mrs. Westerley, but I think Mr. Westerley is very irritable."

"He gets tired," replied Milly; "and, as you say, I think he is not very well."

She blushed a little for Tom, remembering how he had scolded because the baby had thrown the hair-brush in the bath-tub that morning. But she had really excused it, because she knew he was overworked, and had not rested well through the hot night.

She was not well herself; the dog-days had commenced, and she felt dull, weak and unsociable. The baby cried nights, and Tom was certainly impatient and testy.

Mrs. Maria seemed insensible to the heat. She flew about the house like a parched pea. Milly literally had no care of the housekeeping. Everything was done in an exquisite order. It was a great relief.

Most a fortnight after Mrs. Maria's arrival, Milly received a letter from her Aunt Helen, asking her to come down to the shore for a week.

"I can go, can't I, Tom?" she cried.

And Tom said yes.

So Milly and baby went down to Havenside, and told Aunt Helen what a nice housekeeper had been left with Tom at Cloverbanks, and how delightful it was to be free for a week to enjoy the salt air and surf bathing.

When she came back Tom met her at the station; there was an anxious cloud on his brow.

"Feeling well, Milly?" he asked.

"Oh, yes, indeed!" she replied, brightly.

He looked at her sharply, and she looked at him.

"Why, don't I look well, Tom?"

"I don't see but what you do," he answered.

"How has Mrs. Maria got along?"

"First-class."

"She is a treasure, isn't she?"

"Yes."

But Milly thought Tom looked queer; he was always watching her. When she woke up in the morning she found him looking at her sleeping face.

How strange of Tom! He wasn't irritable now, he was odd. It made her nervous, as if some trouble were impending which she did not know. It seemed to her that Tom looked pale and harassed.

"Is anything the matter, Tom? What makes you seem so queer?"

"What makes you act as if you were afraid of me?" he responded.

"You look so strange!"

"I am worried a little—but never mind."

Soon Milly began to notice that Mrs. Maria was watching her, too. A dozen times a day she found the little woman's eyes fixed sharply on her face.

It was annoying. She was quick-tempered and could not help showing that she was annoyed.

"What do you want of me?" she asked one day, haughtily, when Tom was present.

"Nothing — nothing," replied the little woman, soothingly.

Tom, who was reading, looked around sharply.

She thought Mrs. Maria said something to him as she passed his chair. It sounded like: "They never like to be watched!"

Who? Did people think she had joined a gang of conspirators?

She went up to her room with a swelling heart, but it was a very hot night, she was very tired, and soon forgot her troubles in a heavy sleep.

She was awakened by Tom crossing the room and found that he had the baby in his arms.

"She will sleep better in the next room with me," he said.

"She's very well in her crib, Tom," said his wife, in wonder.

Milly could not sleep after that. Tom had looked so pale and strange. Every night, now, Tom slept in the next room with Lilly, and gave her to Mrs. Maria to be dressed in the morning. She said something rather fretfully to Mrs. Maria about "Mr. Westerley's notion."

"Poor dear! can't you see?" said Mrs. Maria, pitifully.

"See what?" asked Milly, feeling as if she were going crazy.

"I've noticed it ever since I've been here. I don't know whether it's heat or overwork, or whether it's hereditary. The poor man is a little wrong in his mind."

The truth seemed to flash over Milly. Tom's uncle had died insane. His strange behavior was explained all at once. Her blood froze with horror.

"Oh, what shall I do?" she cried.

"You must humor him. There is nothing like humoring them. I've had a mother, a grandmother and two sisters insane."

"Oh, how dreadful!" shrieked Milly.

She sobbed and cried in the face of the calamity.

Then she tried to think. She dared trust him no longer with Lilly. He was mad and unsafe. Oh, it seemed as if the terrible thing could not be borne!

She was trembling like a leaf, when she saw Tom's buggy drive into the yard. He saw her agitation as soon as he entered the house.

"What is the matter, Milly?" he said.

"She's been very bad this afternoon, poor dear!" Mrs. Maria said, softly.

"Milly, perhaps I—I had better have a doctor for you."

"A doctor for me, Tom?" she said, amazedly. "Oh, don't—don't touch the baby."

For he had turned anxiously toward the cradle and taken the little one in his arms.

"Don't—don't take the baby!" cried Milly, in agony.

She reached to take it from his arms, but with a frown he resisted her. How strong he was! A panic seized her. She began to scream and cry aloud.

"Tom—oh, Tom! try to think what you are doing. Don't take the baby from me. You will hurt her. I want my baby. Oh, I must have her!"

"Oh," groaned Tom, "I must have help! Mrs. Maria, run for the doctor."

She had hardly gone, and Milly had sunk weakly into a chair, crying, when two men entered the open door.

"Is there a woman here named Maria Hewins?" they asked.

Tom shook his head.

"She is about here somewhere," the elder said. "Or else she has just left. You have employed her all summer."

"Do you mean my domestic?" asked Tom.

The men nodded.

"We have called her Mrs. Maria."

"It's all one. Her name is Maria Hewins. This man with me is her husband. She's got a family of seven children down in Maine. She's temporarily insane. The doctor says she'll get over it. She has escaped from the care of her friends."

"Then she isn't a widow?"

"No."

"Never lived out before?"

"Never."

"Is crazy?"

"Yes. And thinks everybody else is so. You'd never mistrust it, perhaps—she's mighty smart—but you see she's always thinking everybody else is insane."

A little information sufficed to put the men on the right track, and they went away.

"Milly!" said Tom.

"Tom!" cried Milly.

"She's made all this trouble."

"Yes. You ain't insane, are you, Tom?"

"No more than you are. But she filled my head with stories of your strange behavior while you were gone down to the shore. It seemed as if you did act strangely, Milly."

"It seemed as if you did, Tom."

"I was afraid to trust the baby with you. She warned me that insane mothers frequently injured their children."

"And I was afraid to trust Lilly with you, Tom. I thought you took her into the other room to sleep because you were crazy. Oh, I have suffered so!"

"I guess I have. Thank God," concluded Tom, "it was only a scare!"

They learned, the next day, that the author of their misfortune was safely recovered by her friends.

But Milly received such a shock that she never took into the house another domestic without thoroughly investigating her character.

May in Plumas.

[Written for the RURAL PRESS by MARY P. ARMS.]

We are indeed in the midst of the spring—not the uncertain April days with the breath of March still lingering over them—but the warm, self-assured May time, entering into the very heart of things. The swollen buds on the trees are bursting into abundant leafage. We are rejoicing over the "splendor of the grass." Our dumb friends come home sleek and satisfied with their abundant pasturage. The grain is coming up, and we are lost in admiration of its delicate green tint and the old miracle of growth, ever new.

The farmers begin to pray instinctively for rain, some almost unconsciously, others with the well-assured faith of those who believe in the great Fatherhood of Him who is Lord of the harvest. And the gathering clouds and afternoon winds are suggestive of spring showers. The apple trees, which are few in number in this high valley given over to summer frosts, are wonderfully beautiful in their dress of pink and white. The plum trees have failed to give us of their bridal veil of bloom, because of some cold weather which came earlier in the season. But when we look at the delicate emerald dress in which Dame Nature has clothed them, we think with Ruskin; "What a beautiful thought it was, when God first thought of making a tree."

The budded lilacs are swaying in the breeze, but we fear those cold days have robbed us of the beauty and fragrance of their purple plumes. The green tufts of the poppy have sprung up everywhere, and just now they are beginning to give us their gifts of gold. Indeed Flora has spread a rich repast for those who love her, all over the pasture and meadowlands.

The insect world seems all astir. How little thought we give to the myriad of wee creatures God has made! The cocoons, so wonderfully woven by the great green caterpillars last summer, are opening, and the butterfly with painted wing flits leisurely from flower to flower. The bees hang heavily about the doors of their hives, awaiting the royal mandate for swarming. The little chickens run about the yard, chirruping their utter helplessness, and are answered by the reassuring call of the brooding hen-mother in the coop. Watching her, we recall the beautiful simile of holy writ, so expressive of divine tenderness: "O Jerusalem, Jerusalem! how often would I have gathered thee as a hen gathereth her chickens under her wings."

The birds are busy with their nest-building. The June roses are coming into bud. All things are suggestive of the summer. Bloom and beauty are everywhere. Our souls are not large enough to contain it all.

Beckwourth, Cal., May 25, 1887.

THE BOTANIC GARDENS OF THE WORLD.—According to a report of the Montreal Horticultural Society, there are 197 botanical gardens in the entire world, and they are thus distributed: France and her colonies, 25; England and Ireland, 12; the English colonies, 27; Germany, 34; Italy, 23; Russia and Siberia, 17; Austria and Hungary, 13; Scandinavia, 7; Belgium and Holland and colonies, Spain and colonies, and the United States, 5 each; Portugal and Switzerland, 3 each; Denmark and Roumania, 2 each; Brazil, Chili, Ecuador, Egypt, Greece, Guatemala, Japan, Peru and Servia, 1 each. The list may be completed by mentioning the gardens of Geneva and Louvain, and a few that have recently been organized in English India. At least half of the gardens mentioned above are kept up by the Government, 18 per cent by universities, sometimes in conjunction with the general or city Government, 11 per cent by cities alone, and 5 per cent by private donations. Out of the same number 94 per cent are always open to the public, 70 per cent are open to visitors on Sunday only, and 73 per cent publish reports or contribute in some such way to scientific research.

My Lady-Love.

[Written for the RURAL PRESS by DAGMAR MARIAGER.]

What matters it about her hat?
What if 'tis high, or if 'tis flat?
I look within it for her mind,
To know if it is wise and kind,
Her spirits worthy, and if deep
Enough her tenderness to keep
My heart as warm as may behoove
The situation, as I prove
Me worthy as her lifelong guest,
And find myself sublimely blest.

An Excursion in Santa Barbara County.

EDITORS PRESS:—They were going to dedicate the new church at Ballards, so we thought that would be a good excuse for a trip to that pleasant berg. A delightful companion, a driver and a gentle team, good roads and glorious weather, made the journey of 16 miles seem quite short. We arrived at Mr. Shankland's house just before the evening shades began to fall, the day before the dedication Sunday.

After pleasant greetings and a refreshing meal, we all went to practice singing together for the next day. After a good night's rest, we were aroused at the peep of day by the rusty squeak of the swallows, who were building their nests under the eaves. Such a comically horrid noise they made. One has to laugh, although somewhat annoyed by being awakened so soon. Being unable to sleep, we soon arose and dressed. We wandered in the garden, admiring the beautiful flowers, especially the grand La Marque rose, whose trailing masses of sweetness covered the whole front of the lower story of the house. The honeysuckles, passion flowers, and pink, red and yellow roses, claimed their share of praise. After breakfast our hostess and companion gathered great masses of the flowers to decorate the little chapel that was to be dedicated to God's service that day. Willing hands had arranged everything but the fresh flowers the day before. The time for Sabbath-school having arrived, we walked with others to the little schoolhouse where it was usually held. It is a neat building, and the walls had been beautifully decorated with wild trophies, such as birds' wings and plumage, pretty grasses and butterflies, curious bugs, and even a tarantula was among the collection. The neat arrangement of the articles and the artistic drawings upon the blackboard all attested the skill of the teacher who had gained the love of the scholars by her affectionate care for her pupils, and they delighted in assisting her in every way they could.

The Sunday-school session was shortened, because of the extra service to be held at the church, which all had assisted to erect in the valley. Soon the church was filled with eager people; quite a number of campers from Santa Barbara, some from Santa Ynez and Los Alamos, and, of course, all the Ballard folks. After the service by the Rev. Selah Brown, assisted by the pastor, the Rev. Adam Bland, the people were informed that a debt of $80 was due upon the house. It was all finished except plastering, and that would cost $80 more; so they asked for assistance to make up the $80 due before the dedication of the building, and for the amount necessary to plaster it, if it could be obtained. The money was soon given and subscribed, and the church was dedicated to the service of the Lord. As the Methodist pastor had been the leader toward getting the church, it was to be held by that society, but other evangelical societies were freely offered the use of the building.

How pleasant it is to see the faces of old friends, and grasp the extended hands of those we have not seen for a long time. We enjoyed that pleasure, and then went home with one of them, Mrs. Davidson, and partook of an excellent dinner; then to the house of a new acquaintance for supper; then to the church again to listen to a sermon on Heaven, by the Rev. S. Brown; then to bed to dream of the beauties and delights mentioned in the sermon.

The swallows awoke us again in the morning, and hearing plenty of stir below stairs we went down to find ourselves too late for the first table, although it was only half-past 5 A. M. We decided to visit the Santa Ynez mission that morning, and then go to the house of an old friend for dinner, according to request. So we filled out a program for the day: A visit to the mission, dinner at Mr. Coiner's, a call at Mr. Lyon's, tea at Mr. Smith's, two more calls and then a voyage as far around the world as we could get in two hours, with the Rev. Selah Brown at the Ballard Church.

At the mission we were shown around by Mrs. Donohue. She and her family have been living in the building for five years. She escorts every one through the building who desires to go, and is a delightful guide. The part that left the most impression upon us is the little cemetery about 50x150, opening from the church and inclosed by high adobe walls, where 3000 bodies are said to be buried. The priests are buried in a vault beneath the church. The five bells were visited and a grand outlook was obtained from the belltower. The valley, once cultivated by the padres, is now again in a state of cultivation. The olive orchards and the vineyards look fine from the tower. In the gallery were some hymn-books of parchment, so tempting that a collector of antiquities could hardly refrain from coveting them.

Begging one of the tiles that had been re-

moved from part of the building for a memento of our visit, we wended our way through the valley. The road is bordered each side by waving billows of grain. The rich green of the fields is compassed and dotted over with the wild mustard, whose yellow and fragrant blossoms relieve the scene.

Mr. Brown's lectures are very interesting to read, but they are very much enhanced when heard delivered by the author, who has the power to make one see just what he has seen and feel the influences he felt while seeing them. You read that a thing is 1200 feet or 3000 feet and you do not get a very good idea of the hight. But you realize every foot of the distance when he tells you about it. And his power to make one laugh or cry is great. He left us at the tomb of Jesus in Bethlehem. As we started with him from California we felt that we had certainly made a good long journey for the small amount asked by the guide. Our trip home the next day was enlivened by songs and reminiscences of our visit and the lecture, and a feeling of gratitude to those who had made our stay with them such a pleasure and such a rest.

MRS. J. HILTON.

The Heroine of Hawaii—Defying Pele.

In 1825, Kapiolani, a native woman of noble blood, commanding presence and large landed possessions, having become a sincere convert to the Christian faith, conceived the idea of breaking, by one bold stroke, the chains of idolatry and superstition which bound her people. This superstition was centered in the marvelous volcano of Kilauea, and in Pele, whom they believed to be the goddess of the volcano. To accomplish her object she resolved to visit Pele in person, and in presence of the worshipers of the goddess to defy her, and let them see that this could be done with impunity. Notwithstanding the remonstrances of her relatives and friends, who said and did everything to prevent her from carrying out her resolve, she set out upon her difficult journey of 100 miles, on foot, with a band of 80 followers, and, after several days' travel, approached the largest known active crater in the world, whose lake of lava and brimstone has rolled and surged for ages. There she was met by the prophetess of the goddess who forbade her further approach, and threatened her with the anger of Pele if she persisted.

Kapiolani tried to concilitate her by treating her kindly, and offered her refreshments, but the priestess scornfully refused to eat.

"What is it you have in your hand?" asked Kapiolani.

"It is a palapala (a message) from the goddess Pele."

"Ah, read it to us, then." After the priestess had uttered a torrent of unintelligible sounds, Kapiolani said: "I have a palapala as well as you, and mine is one that can be understood." Producing her Bible she read various passages, and finally succeeded in silencing her opponent. Then, with her followers, she ate of the berries that grew on the mountain-side, which were considered sacred to Pele, and to eat of which without first having made an offering to the goddess was accounted sure death, and, in full view of the terrible fires of the volcano, made an address, defying Pele and denying her power and existence.

"If I perish through the anger of Pele," she said, "then you may believe in Pele and fear her power. But if not, then believe in the God of the Bible, which is my God. All the gods of Hawaii are vain." A hymn of praise to God was sung and then all knelt in prayer.

This act of sublime heroism on the part of Kapiolani made a deep impression upon the minds of the Hawaiians. The missionaries were reminded by it of the prophet Elijah, defying Baal on Mount Carmel, and they gave their fearless convert the name of "The Heroine of Hawaii."

The foregoing narrative, obtained by the S. F. *Chronicle* from a returned missionary, is all the more interesting from the fact that the present Queen Kapiolani is a descendant and namesake of her who set at naught the reputed goddess of the volcano.

How History is Made.

The Woodland *Democrat* the other day observed: "We were shown this morning by David Barnes a chump of wheat. The remarkable thing about the chump was that 161 wheat-stalks had spread from one grain. It was raised in the yard of Mr. Barnes' brother, Sam, who resides near the courthouse."

The Woodland *Mail* says:

"Tom Barnes brought to our office Monday a single stool of wild oats that grew in his yard on Second street. It measures six feet in hight and consists of 160 full-headed stalks. This splendid specimen comes from a single grain, as Mr. Barnes watched over it from the time the first blade came out of the ground."

These two little paragraphs—each plainly meant to give a truthful report of a simple incident—show how rarely it is that any two people see just alike. They illustrate the difficulty of getting at the cold facts in any given case, even when the honest intention of the witnesses is unquestioned, and evince what justice there is in the sarcastic phrase: "As false as history." We shall probably never know for certain—and certainly don't much care—whether it was wheat or oats and whether the yard it grew in was Sam's or Tom's.

YOUNG FOLKS' COLUMN.

Firelight.

[Written for the RURAL PRESS by AUNT SUSIE.]

"What makes you look at the fire so long, mamma?" said a bright-eyed little boy named Romney.

"I'm thinking, dear, how like my boy's life the fire is."

"Tell me about it, please, mamma."

"Well, dear, as I sit here by the fireplace, the big stick that looks so black and sullen makes me think of the naughtiness there is in my boy, and the bright, dancing, flashing flames in front of the good there is in him, and as I watch and see the flames leap all over the black log, and know that in a little while they will burn it all up, I can't help wishing that the good in my dear boy will burn out that naughtiness and all the black thoughts and actions; and now, my boy, when you feel cross and naughty you must say to yourself, 'I don't believe I want to be like that black log in the fireplace. I had rather be like the pretty bright flames; so I guess I won't be cross and naughty any more.'"

"All right, I'll try," said Romney, "and now, mamma, please tell me more about the wood."

"Well, dear, long ago a little acorn fell from an oak tree; the wind blew, and it was soon covered with leaves. Then some rain came, and, as the drops splashed down on the ground, little grains of dirt were thrown up over the acorn; and so, little by little, it was covered, and lay there asleep a long time. Then, all at once, it woke up and thought, 'Dear me, this idleness will never do. I must go to work and make an oak tree.' So it gave a stretch to throw off the sleepy feeling, and off came its shell and out burst a tiny green sprout. It kept on growing and pushing its way up, and, after awhile, was up out of the ground, and could look all around; and as it saw the lovely big oak trees, it said: 'O dear, I wish I was a big tree.' The leaves on a tree near by heard it, and, as they rustled in the wind, whispered: 'We were little once; push bravely on, little sprout, and some day you will be a big and beautiful oak tree.' So the little sprout took new courage and grew bravely on, and as the days and years went by, it grew to be a big tree with great branches spreading all around; then somebody wanted wood to burn, so the tree had to be cut down, and all those years of patient growing were burned up, but you see they were not lost; for you and I perhaps are made warm by the wood from that very tree. Now I'll sing you a little song about the acorns:

"Three little acorns on the ground
Lay helpless by the tree;
Nobody saw, nobody found
Those little acorns three.

"And so the little acorn grew,
First a tiny bit of green,
All the long day through
Was all that could be seen.

"One little acorn then did say,
'There's work for you and me;
We must work day by day,
To make a big oak tree.'"

"A City Girl's Adventure."

[Written for the RURAL PRESS by "THOM."]

When vacation came, ten-year-old Grace was going to the country to visit her five cousins, and have a "real jolly time," as she said. The cousins had written to Grace several times, and gave accounts of the good times they would have, so no wonder she was anxious for vacation.

Well, it did come in time, and such a time the cousins did have. Tina and Rose picked a few summer flowers and made bouquets for the parlor; Charley picked the nicest fruits for the lunch-table; Louis and Frank swept up the yards and sprinkled the long veranda so as to have it nice and cool.

"Oh! here she comes," cried Frank, giving the broom such a throw that it knocked down a little duck in the back yard.

Then there was such a clatter of young voices the girls had to take the visitor upstairs for fear the boys might carry her out to the barn to see the new calf or the horrid pigs that girls so dislike.

"Here's a mustard bottle for you, Grace," said Frank, brandishing a bottle in each hand.

The six cousins were going to the creek to have a good wade and catch little minnows. It would not be a very tiresome walk, for it was only a little way and a branch of the creek which they were to follow was covered with a large variety of trees; so it would be cool.

All went well until they sat down to take lunch. Frank's bottle, which contained his little minnows, was leaning against the bank close to the tin box that carried the crackers, when it upset and the little fish were struggling on the crackers for water. "Hi! a French dish, folks—fish on crackers," cried Louis, tossing a little fish in the creek. They all gave Frank three fish to make up for the lost ones, and all went right again. They were all very tired and a very hungry set of children when they reached home.

Next day they agreed to go to the clump of willows in the old pasture and pick blackberries. This seemed to Grace to be the most adventurous day in the country she ever had. All six started out after breakfast, each with a pail. In half an hour they reached the willows, and amused themselves by playing "horse" on the willow boughs.

"Oh! there's old Billy; let's give Grace a ride. Here is a rope on this 'willow horse,'" said Charley, getting the rope from around the limb.

"He is real kind, Grace," said Tina and Rose together.

Now old Billy, the donkey, was a good old fellow, and if you would not rumple his temper he would no more think of kicking than a rabbit.

"Well, I will," said Grace.

Grace had ridden the little donkeys several times in the parks in the city where she lives, so was not afraid of old Billy now.

Grace was quite pleased with the fun, and so started for the middle of the field for the third time.

"There goes Pup after a rabbit," said Frank, pointing in the direction Grace had ridden.

"Oh! I'm killed!" cried Grace, as the donkey began to kick, and landed Grace on the ground.

"Run, boys; the dog has frightened old Billy," said Rose.

They all ran to her relief, and Rose and Tina helped her on her feet.

"It's a wonder you were not killed," said Rose, brushing the dust from her dress.

"Well, I am nearly; look at that lump on my head, it feels as big as a marble," cried Grace, with tears in her eyes.

"Let's go home," said Frank, taking a berry and making a mustache.

So they all started home with very dirty hands and faces, looking like a demoralized set of children.

Grace remained in the country for three weeks, but never again did she get on old Billy, the mule.

Island Home Farm.

GOOD HEALTH.

Starving the Teeth.

"Teeth are just as easily starved to death as the stomach," said a lecturer before a Brooklyn audience the other night. "The fact is that you and your fathers have from generation to generation been industriously starving your teeth. In one way it is a blessing to have been born of poor parents. What food the poor give their children is of a variety that goes to make strong bones and teeth. It is the outside of all the grains of all cereal foods that contain the carbonate and phosphate of lime, and traces of other earthy salts, which nourish the bony tissues and build the frame up. If we do not furnish to the teeth of the young that pabulum they require, they cannot possibly be built up. It is the outside of corn, oats, wheat, barley and the like, or the bran so called, that we sift away and feed to the swine, that the teeth actually require for their proper nourishment. The wisdom of man has proven his folly, shown in every succeeding generation of teeth, which become more and more fragile and weak. These flouring mills in Minneapolis are working destruction upon the teeth of every man, woman and child who partakes of their fine bolted flour. They sift out the carbonates and the phosphates of lime, in order that they may provide that fine white flour which is proving a whitened sepulcher to the teeth.

"Oatmeal is one of the best foods for supplying the teeth with nourishment. It makes the dentine, cementum and enamel strong, flint-like and able to resist all forms of decay. If you have children, never allow any white bread upon your table. Graham bread is made of whole wheat ground, not bolted, so that the bran, which contains the minute quantities of lime, is present. To make a good, wholesome, nourishing bread, take two bowls of wheatmeal and one bowl of white or bolted flour, and make by the usual process. Nothing is superior to Boston brown bread for bone and tooth building. This is made out of ryemeal and cornmeal. Baked beans, too, have a considerable supply of these lime salts, and should be on your tables, hot or cold, at least three times a week. In brushing the teeth, always brush up and down, *from* the gum instead of across. Brush away from the gum and on the grinding surfaces of your teeth."—*Brooklyn Eagle.*

EXPERIMENTS WITH TAPEWORM EGGS.—Some weeks ago the distinguished scientist, Dr. F. Zschokke, and ten of the students at the zoological laboratory, Geneva, undertook a heroic experiment for the purpose of studying the development of tapeworms in the human system, to which end they swallowed the eggs of the repulsive parasite. From every part of Europe they received letters of approbation and encouragement—one single letter only blamed them for having made the dangerous experiment, and this came from the president of a society for the prevention of cruelty to animals! The eggs had been taken from a variety of fishes known or suspected to be the transmitters of tapeworm. For nearly two weeks all went well; but in the course of the third week the presence of the unpleasant guest manifested itself plainly with most of the experimentalists. In every instance a complete removal of the parasite was effected, the specimens extracted varying in size, two or three reaching a length of two meters. Dr. Zschokke is about to publish the result of his experiment.—*New York Tribune.*

RULES OF HEALTH.—A writer in one of our medical journals says that it is considered by all physicians impossible to lay down any rules for health which may be followed safely by all persons. Health depends largely upon the diet. Some people cannot eat newly baked bread; others cannot eat it when stale. Much fresh meat with some constitutions induces fullness of the head and a feverish state of the system, because it makes blood too fast. It should therefore be discarded, and a little salt, meat or fish if the appetite craves it, with fresh fruit and vegetables, will be found probably to be just what the system requires. In truth, with health, as in many other things, each person must be a law unto himself.

DOMESTIC ECONOMY.

CHICKEN SALAD.—Mince the white meat of a chicken fine, then chop the white parts of celery, and prepare a dressing as follows: Rub the yolks of hard-boiled eggs smooth with a spoon; put to each yolk one teaspoonful of made mustard, half as much salt, a wineglassful of strong vinegar and a tablespoonful of the best olive oil. Put the celery in a salad-bowl, lay the chicken on that, then pour over it the dressing. Lettuce cut small may be used in the place of celery, but the latter is much more delicious. Cut the whites of the eggs in rings to garnish the salad.

PICKLED EGGS.—Boil some four or six dozen eggs in a capacious saucepan until they become quite hard. Then, after carefully removing the shells, lay them in large-mouthed jars and pour over them scalding vinegar, well-seasoned with whole pepper, allspice, a few races of ginger and a few cloves of garlic. When cold bung down closely, and in a month they are fit for use. Where eggs are plentiful the above pickle is by no means expensive, and is a relishing accompaniment to cold meat.

CREAM CODFISH.—Pick into small pieces the salt fish, freshen with cold water, changing the water two or three times. Put it into a saucepan with half a cup of boiling water, and piece of butter size of an egg, a little cayenne pepper and slice of onion chopped very fine. Stir smoothly one tablespoonful of cornstarch in a little milk, add a cup of milk, pour it over the fish, and stir constantly until the butter melts and the whole is well cooked. Break two or three eggs into it and serve hot.

SALMON SALAD.—To a can of salmon take 8 or 10 stalks of celery; cut the celery into small pieces and mix with the salmon, which should also be picked into small bits; sprinkle over it a little salt and a very little pepper, and pour on some good vinegar. A small onion may be added if desired.

STEAMED VS. BOILED POTATOES.—According to Professor P. Wagner, steamed potatoes are far more nutritive than boiled ones. With the latter, not only is more water taken up, but also nutritious salts are extracted by the surrounding water. The author publishes analyses in upport of his opinion.

CREAM OF RICE SOUP.—Wash and parboil one-half pound rice. Drain and cook in one quart of white stock until soft. Run through a sieve; add one pint cream, one teaspoonful salt, one saltspoonful pepper, and one cup cooked asparagus tops. If too thick, thin with more stock.

OYSTER PIE.—Fill a shallow pudding-dish with oysters, cream, pepper, salt and butter. Let it stand on the top of the range until just boiling; then cover the top of the dish with a thick crust, about half an inch thick, and bake until the crust is a very light brown. Serve hot.

SILVER CAKE.—One cupful of sugar mixed with two tablespoonfuls of butter; add one cupful of flour with one teaspoonful of baking-powder, half a cupful of cornstarch, half a cupful of milk, the whites of three eggs; flavor with vanilla. Bake in a moderate oven.

CHOCOLATE CAKE.—Beat the whites of two eggs with a quarter of a pound of powdered sugar into a frothy cream, add the juice of half a lemon and six ounces of finely grated chocolate; drop this mixture in spoonfuls on a flat tin, and bake them slowly.

STRAWBERRY MOUSSE.—Mash one box strawberries, press through a sieve, sweeten with powdered sugar, and stir on ice until very cold; add one pint thick cream, beaten to a stiff froth; turn into a mold; imbed in a pail of salt and ice, and let it freeze.

STEWED CUCUMBERS.—Pare the cucumbers, cut them into quarters, remove the seeds, soak in salted water one-half hour, then put them into salted boiling water, and cook until tender. Season with salt, pepper and butter, and serve on toast.

The Week.

The vacation season is fairly upon us. The hot weather of last Saturday was the last feather which turned the scale in favor of knocking off work, and the flight of office-holders, professional men and women, and people of leisure—in fact, all who are not tied down to desks or counters by the pursuit of the needful, has fairly set in. The schools are closing, the courtrooms are given over to the janitors, and schoolma'am and judges are seeking the seaside, the brookside, the mountain-side, or taking ship or train for more distant parts.

Per contra, the agriculturist is girding his loins for the hardest working of the season, and the rural housewife is mustering all her strength and cheerfulness for her heavy end of the harvest work. The fruit crop is advancing fast and the shipment of the early varieties but opens the way for the great struggle. Things are looking fairly well for the disposition of the crop. The grain must soon be harvested and it does not make the burden lighter to have the probable outcome small. There is a buoyancy in the fact of a great yield, which nerves up the arm and heart, and the hope of plenty of funds for a vacation after harvest, or for needed home improvements, is wonderfully sustaining through the heat and hurry. Comfort can be had, however, from the fact that in many cases the situation might be much worse, and that a short year is generally followed by a long one. There are good times coming.

The Leland Stanford, Jr., University.

This new temple of thought is born of a feeling that the great schools and colleges are not doing their whole duty by this busy, practical age; that they take too much time and load the mind with a deal of stuff that is useless. "An Oxford education," says Froude, "fits a man extremely well for the trade of a gentleman. I do not know for what other trade it does fit him as at present constituted." Speaking of his plans, Senator Stanford says: "I have in my business experience found that too much of the current college training launches young men on the world void of much practical knowledge of any calling that will enable them to earn their living. Scores of educated youngsters have been sent to me seeking employment, and I could not do anything with them because they would not fit in anywhere."

Now this may not be wholly a matter of observation; perhaps the Senator knows how it is himself. When he was an undergraduate, the chief business of the student was to dig Greek roots instead of living plants; to watch the sprees and flirtation of rabble gods rather than the evolution of States and the problem of governments. It is true, they became familiar with the thoughts of Plato and Xenophon, Homer and Sophocles—noble, beautiful thoughts they are, too, but the thoughts of men who lived thousands of years ago, and in times very different from ours. Much time was spent in learning the angles of refraction of the different colored rays, but very little devoted to the handling of microscopes or telescopes in search of objects. They were taught the lines and curves in which the great orbs moved under the combined impulse of repellent and attractive forces, but the knowledge of the geologic growth of the great globe on which they lived, its races of animals, plants and men, was crowded into a corner. The whole system was too far away in space and time to be of any practical use. Under the old system, geometry, trigonometry, mechanics and physics are about the only things of real practical value, and in these branches more time is given to the theoretical and abstract than to the really useful. The whole scheme seemed to be devised to keep the student as far away as possible from all contact with the great actual world.

Nor is this state of things likely to change for the better. There has been a deal of talk but little done, or likely to be done inside the old establishments. It is hard to get out of ruts, and it is just about as difficult to recast a curriculum that has become venerable as an old creed that is sacred in memory. Take an illustration that happens to be at hand. The Adelbert College of the Western Reserve University, in the beautiful city of Cleveland, Ohio, may be regarded as a fair average specimen of this class of schools. According to the printed curriculum of this institution for the year 1884, there are during the four collegiate years and two years of preparatory training in linguistic, metaphysical and mathematical studies, 3550 hours of recitation and lecture, while to the whole group of physical sciences are given only 236 hours. Think for a moment of the vast and wonderful developments of our mines of iron, gold and silver, coal, petroleum and salt, and of the agricultural wealth in a large measure due to practical geology, and what are we to think of a course of training that devotes only 54 hours all told to recitations in geology and 1361 to Latin and Greek? Consider the ravages of pests and parasites upon grain, fruit, fruit trees, the diseases of domestic animals and the millions annually lost from these causes, and yet not one hour is given in the whole college course to entomology or biology. Not the slightest aid is given to our farmers and fruit-growers in battling these myriad foes. In this institution there are 535 hours of recitation given to mathematics, largely to the abstract relations of time, space and number, to sines, tangents and arcs, the forms and orbits of the heavenly bodies, and not a single hour to the study of one's own body and the laws of hygiene. The planets and comets may whirl in conic sections, the moons of Jupiter wax and wane, and Saturn move on a retrograde path, much to the confusion of astronomers, and the average man not find his happiness and usefulness aided in the slightest degree by a knowledge of the fact; but if he violates the laws of his body through ignorance or intemperance, his whole life may pass into a total eclipse. This ought they to have done and not left the other undone.

With all due respect for the dons and their ancient dignities, the education that does not put a boy in the way of earning a good, honest living is of very little value, and this we take to be the central idea of Leland Stanford, Jr., University. It is true we have technological and industrial schools that train the brain, eye and hand together, and are doing an excellent work; in the chemical, physical, botanical or mechanical laboratory; in the drafting-room, at the forge, power lathe or planer; in the foundry, machine-shop, printing office, shop, garden, field and stockyard; but the trouble is, they stand alone or as adjuncts of colleges, with slender means, and are looked upon with ill favor by the college dons. What is needed is to honor and dignify industrial training, by taking it under the wing of a munificently endowed university, where a hand-saw and a Greek lexicon are alike honorable. This idea is not novel nor experimental; it is in successful operation at the California State University and several other State Universities, and Senator Stanford's munificent gift is the indorsement of one of our most practical and successful business men. There are some that feign to laugh at what they call the "bread and butter" education, but better a discovery for killing pests than a new accent in Greek; better acrobats, gymnasts and stout baseball players than white-handed, pale young men, reciting whole pages of Horace and unable to earn the salt that goes into their mush.

Vegetables for the East.

The spud is a lowly growth; the cabbage-head is not adorned with the ringlets of poesy; the onion moves to tears by other means than sentiment. In short, garden-sass does not figure largely in idyls, nor bespangle the environment of epic scenes. The peas clustered in the pod approach nearest perhaps to the realm of the imagination, but the poor asparagus, which associates so closely with the sugary legume in kitchen economy, stands lower in literature than the toadstool. Who can help contrasting this degradation of the vegetable with the elevation of the fruits and flowers? We might turn to botany to solve the problem, for one might be led to higher honor for growths which are related to the rose than to those which are cousins to the deadly nightshade. But this does not afford broad enough ground for the solution. No poet would dare an ode to the bean, but sweetpeas and clovers are accepted themes. But these are things past finding out, like some of the problems which transcended the philosophy of old Job.

Nevertheless, garden-sass should be much higher regarded in our industrial calculations. Truck-farming is one of the pillars of strength in the uprising of the "new South," especially that portion of it which has quick conveyance to northern cities. Truck-farming is destined in the future to cut a greater figure in industrial pursuits in California. It is true that much of the field is now given over to the stranger from the shores of the Mediterranean and the east of Asia, but it is more than likely that in the future the high-born American citizen will be devoting a portion of his best land to the growth of the vegetables which carry best and sell best in the Eastern markets. Last fall we spoke of the movement in cabbage which resulted in large shipments to the Missouri-river cities and beyond, and relieved this market so that krout prices became respectable. The California cabbage for its immensity and solidity won laurels in the Western marts.

Providing fostering freight rates can be secured, there is destined to be a large trade in many kinds of California vegetables. Every year for a long time there have been spring shipments of asparagus and green peas, but the freight rates have been very high. Lower rates, with cheap cold storage facilities, will enable our growers to place even these more tender vegetables at the East at prices which many people can well afford to pay. We were thinking especially, though, of the more desirable vegetables, like cabbage, new potatoes and their kin. Whether there can be much done in new potatoes is now in process of demonstration. On Tuesday evening of this week a special potato train of 12 cars left the city for Chicago, by way of Ogden and the Union Pacific railroad. The rate made to the shippers was $1 a hundred pounds. The arrangement is not the same as that to be made for fruit shipments. While the train is run as a special, it is to make regular schedule time—seven days from San Francisco to Chicago. This is the second train of the kind sent out, and will be followed by others. The greater portion of the shipments is from Southern California. In getting their potatoes into the Chicago market ahead of the season in Illinois, the California producers command a good price, and it is believed that the enterprise will be a paying one—especially as there is little damage in transit. It is stated that the Atlantic & Pacific will soon run a potato train out of Los Angeles to St. Louis and Chicago, making the same rates as the Central and Union Pacific. The rate to the Missouri river is 90 cents a hundred pounds.

As we have said, this trade is promising. Los Angeles people have already said that in some cases cabbages paid better by the acre than oranges. There is much thermal-belt land in different parts of the State which can bring in very early potatoes and peas; and the cabbage area is vast. Let these things be looked after—not too fast, but as fast as the way can be opened up for the profitable disposition of the products.

The Hot Norther.

Since our last issue one of the hottest of hot spells known to Central California has come and gone. Saturday, May 28th, the mercury in the Hydrographic Office, S. F., beat the record by rising to 97°. The highest temperature noted here before was in 1872, when the line of 95° was passed.

The heats prevailed as far to the north as Oregon, Portland reporting 99° on Sunday—the warmest since the signal service was there established—and the Columbia river had risen seven feet within 10 days.

In this State, Yreka told of 103° in the shade, but no injury to crops so far as known.

In Butte, Colusa and Yuba counties, there was apprehension of serious damage from the norther to the grain in milk, especially upon the plains; but later telegrams were, as usual, more hopeful. Colusa, after subsiding from 102°, said (Monday): "It is now thought the reported damage done the grain by the hot weather of the past three days was overestimated;" and Marysville's dispatch of same date, announcing cooler weather, quotes Geo. Ohleyer of the *Sutter Farmer* as saying the damage to grain is slight—not to exceed five per cent—and the fruit crop in these counties seems unhurt.

Some parts of Napa county told of 103° in the shade, and blight in the vineyards.

In Solano, farmers were much disturbed about their wheat, and at last accounts were fearing serious shrinkage; but the barley was already safe, heading having commenced, and on the adobe lands south and east of Dixon the yield promises to be the heaviest ever known. No injury to fruit and vines is reported in this county; nor in Sonoma, save to strawberries and cherries about Petaluma.

About Livermore "the damage to grain is considerable and will cause more to be cut for hay. Vines and fruits are uninjured."

In Santa Clara but little harm to grain and none in orchard or vineyard was noticeable.

As to Monterey—Gonzales telegraphed 31st: "The barley crop shows great durability and is maturing slowly. The harvest is just commencing."

In the San Joaquin the mercury at some places reached 110°, with wind like a furnace-blast, and further damage to winter-sown grain was inevitable, but the summer-fallow was ripening fairly and fruit had experienced no material injury.

In Tulare the crops suffered less, and the heats were succeeded by a heavy thunder-storm with a sprinkle of rain, which in the mountains eastward became a down pour.

Bakersfield knew of no harm done fruit or other crops; but about Los Angeles the combined storm of rain and wind caused a vast acreage of barley to lodge badly. Santa Barbara, too, came in for a share of the unwonted lightning and thunder Sunday night, and as we go to press Wednesday, the wires bring tidings of heavenly pyrotechny at Marysville and Merced, with showers accompanying. The rapid melting of mountain snows has also caused a rise in the American and Sacramento rivers, and take it for all in all, the weather of the past week has been phenomenal indeed.

Grindelia Robusta.

We give on this page a native California plant which is becoming quite famous for its medicinal virtues. We take the engraving and description from a very interesting contribution to systematic knowledge of our American medicinal plants made by Dr. George Vasey, botanist to the Department of Agriculture in Washington.

The *Grindelia robusta*, or "gum plant," is an herbaceous perennial plant of the order *Compositiæ*, growing in California. It has an erect, leafy stem, one to two feet high, branching near the top, the branches terminating by a single composite head of flowers, somewhat resembling the flower-head of saffron, the body of which is about one inch across, with the narrow, strap-shaped yellow flowers spreading out in every direction from the margin. The leaves are alternate, rigid, mostly oblong, the upper ones lanceolate, the base sessile or partly clasping the stem, and the margins often with coarse, sharp teeth, the upper ones becoming entire. The flower-head, which is usually regarded as a single flower, is really a compact mass of small flowers of two kinds, the inner ones having a tubular corolla and the outer or marginal ones having a long, strap-shaped corolla. This cluster of flowers is surrounded by an involucre of many lanceolate-pointed, green scales, whose tips are recurved, presenting a rough appearance. This involucre is usually gummy with a balsamic exudation.

The central flowers of the head are generally infertile and are copiously supplied with fine bristle-like pappus. The outer flowers, or a few of them, are fertile, producing a small, oblong, smooth seed. This plant is common throughout the western part of the State of California, and is commonly known as gum plant, or sometimes, but improperly, tarweed. There are three or four other species of *Grindelia* in California, and several more in Oregon and the interior, extending to New Mexico and Arizona. They are all closely alike in general appearance, and probably also in properties. The species we have described has some reputation in California as a medicinal plant, particularly as an antidote to the poisoning of the poison-oak, *Rhus lobata*. It has also within a few years past been introduced into medical practice for use in chills and other diseases. Upon the right of the engraving, at Fig. 1, is an enlarged disk-flower, showing the achenium surmounted by the rigid, awl-like pappus.

Gambling in Breadstuffs, Etc.

The Hon. Edward Everett, the once eloquent orator and thorough and honest statesman, in an address before the New York State Agricultural Society delivered a few years before his decease, spoke in the following manner upon gambling in breadstuffs, a kind of business which was then practiced upon a very limited scale to that which is now in vogue. An anathema upon any business, coming from such a source, deserves high consideration. What would that great orator and thoroughly conscientious man say now, were he living and called upon to speak of the transactions of the present stock exchanges of the country, and of the innumerable stock-gambling transactions and mischievous combinations in every department of commercial, productive, and manufacturing industries?

In acknowledging, as I do most cheerfully, the important relations of city life and commercial pursuits to the entire social systems of the country, I leave of course out of the account—I have no words but of abhorrence for—the organized conspiracies, swindling and plunder which exist side by side with the legitimate transactions of the stock exchange. It is not one of the least perplexing anomalies of modern life and manners, that while avowed and thus far honest gambling—if I may connect these words—is driven by public opinion and the law to seclude itself from observation within carefully tiled doors, there to fool away hundreds, perhaps thousands in secret—discredited, infamous, blasted by the anathemas of deserted, heart-broken wives and beggared children, subject at all times to the fell swoop of the police—the licensed gambling of the broker's board is carried on in the face of day, its pretended sales of what it does not own, its pretended purchases of what it does not expect to pay for, are chronicled in the public prints to the extent of millions in the course of a season, for the cruel and dishonest purpose of frightening innocent third parties into the ruinous sacrifice of *bona fide* property, and thus making a guilty profit out of the public distress and the ruin of thousands.

Southern California.

[NO. 4.—CONTINUED.]

[Editorial Correspondence.]

Our last letter was terminated somewhat abruptly by the printer for want of room. We now resume where we left off at

The City of San Bernardino.

Coming back to the city, we find a thriving, beautiful town, containing a population of from 6000 to 7000 souls—nearly double that of one year ago. The city, as incorporated, is laid out just one mile square. The center of the main street constitutes a portion of the east and west base line from which all the Government surveys in the southern part of the State start north or south. This is known as the Mount San Bernardino base line. The city presents a bustling scene of activity; it is being well and substantially built, and is ornamented with a great number of fine public buildings and elegant private residences, with roomy grounds elegantly laid out and beautified with trees, plants and lawns; while from every direction the eye and senses are delighted with the beauty and fragrance of the orange, the lemon and every variety and color of shrub and flower. As already remarked, the climate of San Bernardino is delightful. The summer tradewinds from the ocean, as they reach the city after a passage through the San Gabriel valley, are mild and invigorating. The thermometer sometimes reaches 100° or 110°, but even at the latter point the air is not as oppressive as in San Francisco at 90°. This fact is due mainly to the cool air which comes down from the mountains during the night, cooling and gently modifying all the surrounding country from the noontime heat of the previous day.

San Bernardino County

Is the largest in the Union. It is a dominion in itself, exceeding in extent of area several important kingdoms and republics of Europe. It is double the size of the State of Massachusetts. It is one of the oldest American settled portions of California. True, much of the larger portion of its area is mountainous and comparatively barren; but it nevertheless contains within its borders some of the finest lands on the Pacific Coast, and there are none which excel it in the production of tropical fruits. There is scarcely a product of earth, mineral or vegetable, that cannot be produced in some portion of San Bernardino county. Even its most rugged mountains are not devoid of value, as they contain some of the richest mines in the State, and afford opportunities to gather up from their snow-capped summits winter water, which may be held and distributed as it is wanted during the drouths of summer. An important enterprise in this direction is just now being started by Maj. Bonebrake, who owns some 50,000 acres of land on the great plains north and west of San Bernardino. The winter waters of Lytle creek are to be utilized and stored up much after the manner of the Bear valley enterprise, which will furnish water sufficient to irrigate from 15,000 to 20,000 acres of the land above referred to.

A NATIVE CALIFORNIA MEDICINAL PLANT—Grindelia Robusta.

Four Papers Daily.

San Bernardino may well be proud of her ability and enterprise in supporting four daily newspapers. In the same proportion, San Francisco should support over 30.

Colton,

Situated directly upon the Southern Pacific railroad, four miles from San Bernardino, is rapidly assuming considerable importance as a business center and shipping point. Fourteen years ago the ground upon which the town stands was a worthless waste. Now it is an important railroad center, with a population of about 2000 souls, with a bank, cannery, fine stores, hotels, and a constantly increasing line of general business. The Southern Pacific and Atchison, Topeka & Santa Fe lines cross each other at Colton. It is connected with San Bernardino by a motor road, and another similar road will be built this summer to connect Colton with Redlands and Lugonia. The latter will be a broad gauge and fitted for both freight and passenger traffic. It is a terminal point of traffic on the Southern Pacific. The town is growing rapidly and increasing in wealth and importance. A fine hotel has been projected to be built upon Slover mountain, a short distance from the town. It will be built under the patronage of the Southern Pacific railroad, and will rival in magnificence and outlook the famous Raymond at Pasadena.

RIVERSIDE.

The fame of Riverside has become world-wide. It is a city of gardens—the whole a beautiful park. It is made up of beautifully embowered homes—of elegant villas surrounded by groves of orange and lemon trees. The scenery of Riverside is superb. Flowing streams and delightful homes with fruit, foliage, plants and flowers in endless variety, comprise the foreground; while abrupt but shapely hills, backed by lofty mountains, fill the distant perspective. The climate is delightful—there is no winter, while the heat of summer is so tempered as not to be oppressive. It is indeed

> "A Paradise to mortals given,
> To make us think the more of heaven,
> To make us prize the blessings given,
> Where hills and mountains e'en surround,
> Lulled by the winds to calm profound."

It is one of the most prosperous and beautiful settlements in Southern California. Fifteen years ago it was nothing but a barren desert, dry, uninviting and of little value. Now it is a prosperous city of some 5000 or 6000 inhabitants, with fully 6000 acres covered with grapes, oranges and lemons, all under a state of cultivation nowhere excelled on earth. Magnolia avenue, the most beautiful drive in California, extends for some eight miles directly through the center of the city, bounded on either side by rows of palm, cypress, pepper and eucalyptus trees, with hedges half concealing yet ever revealing continuous orchards and groves of orange, lemon, lime, olive, apricot, etc., interspersed with vines. Riverside is the center of citrus fruit culture in California. Not only does it excel any other locality, either in California or Florida, in the extent of its orange groves and the amount of fruit produced, but it is the most free from insect pests, and its fruit commands the highest price in the markets. Riverside is also especially proud of the great award given to her oranges at the late New Orleans World's Exposition as being the best in both appearance and quality of all the great number of orange exhibits made on that occasion. Two gold medals and one silver medal were triumphantly borne away from that exhibition—one gold sweepstakes medal for the best collection of oranges from any part of California, a gold medal for the best collection of oranges from any part of the United States, and a silver medal for the best collection of lemons from any part of the world. No triumph of the character in contest could have been more full and complete.

As a Raisin-Producing District,

It is equally well known. Its raisin product for the last six years has been as follows, expressed in boxes: 1880, 20,000; 1881, 40,000; 1882, 50,000; 1883, 70,000; 1884, 85,000; 1885, 110,000. The reader will notice the gradual annual increase of production. The amount of the product for 1886 is not before us as we write, but the total receipts therefor were something over $200,000. Five hundred carloads of green and dried fruit were shipped from Riverside last season.

The Orange Product.

We have no data at hand of the total amount of oranges shipped the present season to date; but we have a statement that up to about the first of May 300 carloads had gone forward, with about 100 carloads still remaining upon the trees and 50 carloads of oranges and 7 of lemons then in the cold-storage house and held back for a better market. This is all in addition to the large shipments which are made to this city and other parts of the State, where the fame of Riverside oranges has created quite a demand for her superior fruit. The home consumption is also very large, especially by Eastern visitors for their own use and for sample packages to send to their friends in the East. The sales, as above, to Eastern visitors are set down at about 100 carloads for the present season.

A Challenge.

It may be here remarked that Florida has challenged Riverside to an orange-exhibit contest, to take place next winter, under the auspices of the American Horticultural Society, which holds its next annual meeting at some point on the Pacific Coast. Of course, Riverside freely accepts the challenge, and expects an easy victory.

Old Riverside.

Those who were present at the late Fruit-Growers' Convention, held in Riverside, cannot fail to recollect the graphic description of the country in and about Riverside as given by the venerable General Vallejo as he saw it before any attempts had been made to introduce American improvements. It was then a pathless desert—beautiful and green in springtime, but dry, dusty and sun-scorched the balance of the year. In time came the American sheep-herder, who pastured his flocks upon those broad plains, then uninviting and apparently valueless to any other use. Gradually the sheep-herder passed away and men with brains

and energy came upon the scene. The soil was evidently rich and inviting, as was proven by the appearance of the old San Bernardino Mission and the new San Bernardino town which was springing up near by—each in districts well watered by artificial means. Hence there was no reason why other settlements might not be made with equally successful results. To the enterprising man from the East, a practical conception is quite generally carried out to its legitimate results, and no sooner was this idea conceived than capital was raised, engineers engaged and extensive works set on foot to bring in water from the adjoining Santa Ana river for irrigating purposes.

Magical Changes

Were soon wrought out. Cheered by the refreshing water, tickled by the plow and harrow, and urged and encouraged by the persuasive energy of the enterprising and intelligent cultivator, the once dry land soon began to bloom with every variety of blossom for fruit and flower, and we now behold thousands of acres of vineyard and orange and lemon groves, with miles upon miles of green and shaded avenues, dotted all along with cottages and villas, denoting the presence of happy and prosperous homes. Land that but a few years ago was not worth the care of occupancy is now readily selling with its improvements at from $400 to $2000 per acre. Business lots, in the center of the town, that two or three years ago were selling at from $1000 to $10,000 each, are now bringing from $10,000 to $15,000.

Does It Pay?

Of course it does. The evidence of the reality of these values may be seen every day by any who choose to observe and inquire into the results of fruit-growing in Riverside. The returns from the older orchards are surprising, to say the least. There are fruit-growers there who have realized $250 per acre from four-year-old budded trees, set out two years from budding, making the tree eight years old from the seed. Other orchards, say four years older, or 12 years from the seed, have netted from $400 to $500 per acre. These are not isolated examples. They are a fair average of yield and profit.

In setting out an orange grove where money and time can be utilized to its best advantage, the orchardist should buy two-year-old budded trees of the best varieties. These trees will give a small yield the second year, and by the fourth year, if carefully cultivated, will yield the handsome return as above stated. Two-year-old budded trees cost, at present rates, from $1.25 to $1.50 each and are set out about 80 to the acre. A budded orange grove comes into bearing in four years from the setting of the budded tree. A seedling orange grove comes into bearing two, and sometimes three years earlier. A vineyard comes into bearing the third year from the slip. Such statements seem incredible to the orchardist who has been working under the very different conditions of climate and soil which prevail east of the Rocky mountains.

Homes and Investments.

From what has been said it will be readily seen that Southern California, and especially the upper portion of the San Gabriel valley and the San Bernardino valley as well, present most favorable advantages to the seekers for homes, where a few thousand dollars of ready money are at command for the establishment of a country home, which may also be made a source of permanent and annually increasing income. The well-known climatic advantages of Southern California first induced settlers to go *there* in search of health. Many of these people had before made annual visits to Florida, on the same errand; but on once trying California they found the conditions so much more favorable that they have ever since continued to "go West" instead of "South." These advantages are now so well known to the great crowd of health-seekers that the main tide of summer travel is turned in this direction, and while the hotels of Florida are nearly empty, it is almost impossible to increase the hotel accommodations of California fast enough to meet the vast demand. No invalid now thinks of going to Florida for a permanent home. The summer climate is baneful rather than otherwise; while California offers the highest climatic advantages to the invalid seeking a permanent home for himself and family, where he may not only enjoy all the health advantages, but where numerous opportunities are also presented for profitable investments on either a large or small scale.

Will this Boom Continue?

Most assuredly it will. So long as the same unpleasant climatic conditions exist east of the Rocky mountains, and so long as the mild climate of California continues to invite health-seekers, just so long will the present movement—or *boom*, as it is sometimes called—continue, at least until the country is literally filled with new-comers. There will always be a great army of persons at the East broken down in health by the rigors of the climate—persons who have made money and who are well-to-do, and who are desirous and abundantly able to better their conditions, who will turn their faces to these Western shores. This army is being more and more largely recruited every year. No human agency can change the climatic conditions at the East, and no human power can prevent the suffering ones from seeking relief in the mild perennial spring and summer of Southern California. There will be enough of them who will come every year—many thousands who will come to stay. This is quite unlike the ordinary tides of human movement, which are usually set up by accidental circumstances, in which the moving cause soon disappears. In this case the cause is as immovable as the laws of nature, and nature alone has power to stop the movement. When the conditions are exhausted; when there is no more land that the wealthy invalid can buy, even at high fancy prices, then we may look for a cessation of the present influx into California—and not till then.

The Great Rush of '49 and '50

Is being repeated. The chief point just now is Southern California; it is already spreading north. The lower San Joaquin is beginning to feel the overflow from Los Angeles. This movement will undoubtedly be continued until the population of every portion of the State, from Oregon to Mexico, has been largely increased. Every part of California possesses climatic and other advantages for homes and business far superior to what can be generally realized in any of the States east of the Rocky mountains. The boom of the early years of California was initiated and kept up by the richness and abundance of her mines. When they began to be measurably worked out the boom as a matter of course died out. The climate and wonderfully productive nature of our soil, both of which are now discoveries to the majority of our Eastern friends, are the moving agents in the present boom. Neither climate nor soil will decrease in value or desirability, hence there will be no material diminution in the movement in this direction until the State is fairly filled up with people—not until they can be numbered by millions. W. B. E.

The Fetes of Flora.

The months of April and May are eminently the months of flowers in California. Before the April days were all gone by, floral festivals had been held in several places with delightful success, and those at Chico, Los Angeles and Santa Barbara were described at some length in our columns.

Among these earlier displays, that given by the ladies of

Woodland

Was quite notable. The large and usually somber Prior's hall underwent a surprising and beautiful change. From the ceiling hung long intertwined festoons of living green, and below were flowers everywhere—no corner was neglected, and each seemed fairer than the rest. There were "mounds of roses, waves of violets and oceans of every flower that blooms," freighting the air with delicate and various perfume.

The first thing to catch the eye of the visitor was a floral pyramid, ten feet high, made almost wholly of white flowers, but capped with bright red roses. Immediately in front of the pyramid lay a bed of white flowers, lettered in red with the words, "Woodland, Yolo County, Cal."

In a ten-minutes' opening address, Hon. C. H. Garoutte spoke of the blessed influence of the flowers, saying they were a solace and comfort to all, a promoter of virtue and a barrier to vice. He compared the California of to-day with that of '49, and told how the State had grown since then, and where once were arid plains there now bloomed the choicest flora of the world. The speech was excellent and listened to with rapt attention.

There are certain favorite subjects for floral designs pretty sure to be presented at every such exhibition. So we ask our readers to take it for granted that, beside all the array of cut flowers and potted plants, there were crosses, anchors and stars, hearts, horseshoes and pillows, with not infrequent easels, shields and flags, of divers shapes and sizes, and in various combinations of many-hued blossoms, to be seen at all the flower festivals this spring, Woodland's included, and that some were peculiarly tasteful and artistic.

Among the more novel designs were a full-sized armchair of roses, a four-leaved clover in geraniums, a golden harp of marigolds entwined with smilax, a variegated parasol of roses, and a bear—also of roses—with "N. S. G. W." at his head.

A huge rosebush, on which were no less than 1000 roses growing, excited much remark; and a block of ice, in which a beautiful bouquet had been frozen, was a novelty to many. In the words of a local reporter: "There were hundreds of other exhibits to which we cannot give space in this issue. The flowers were all beautiful and the different pieces showed rare ingenuity and taste."

The Rose Fair in aid of the Woman's Exchange, here in San Francisco, bound the months together with garlands of unbroken bloom; and since May-day, fetes in Flora's honor have been celebrated near and far. There was the show at San Jose, already noticed by a correspondent; and then certain enterprising ladies of

Pomona,

Stimulated by the success of Los Angeles, swiftly set afoot their first flower festival, to raise funds toward the establishment of a free public library, purely non-sectarian and non-partisan in character.

The festival was held in Taylor's Opera-house. On entering, one came first upon an imposing real-estate office, in whose construction, however, flowers were used. A sign, "Olmsted & Overton," hung over the door,

(*Continued on page 509.*)

ENTOMOLOGICAL.

Notes on Icerya.

Its Probable Origin the Islands of Bourbon and Mauritius.

[Written for the RURAL PRESS by PROF. C. V. RILEY, U. S. Entomologist.]

I have just read with a great deal of interest the letter of W. M. Maskell to State Inspector Klee, in your issue of the 7th inst. This letter really brings up quite an important question, so far as our White or Fluted scale is concerned. In an article in my forthcoming report, as U. S. Entomologist, of which I have sent you advanced page proofs, I have, without question, assumed that *Icerya purchasi* Maskell was a good species and distinct from *I. sacchari* Signoret, because Maskell, in his second article on the former species (Trans. New Zealand Inst. for 1883, page 140), after an examination of specimens of *I. sacchari*, sent him by Signoret, says that he finds the "Mauritian species undoubtedly and markedly distinct." This letter to Mr. Klee brings up, however, the whole question of the accuracy of his determination. He admits that he has never seen Signoret's *I. sacchari* alive. The only differences which he made in 1883 between *I. sacchari* and *I. purchasi* are as follows: *I. sacchari* does not seem to form an ovisac with longitudinal grooves, nor does the body of the insect, although somewhat hairy, show the great tufts of black hairs and the curious projecting glassy tubes springing from large brown coroneted bases which are marked features of *I. purchasi*. The number of circular spinneret orifices are much smaller in the Mauritian insects."

Now Signoret knew only two stages—the full-grown female and the newly hatched larva—while Maskell gave careful descriptions of the egg, the young larva, the second stage and the full-grown female, but had not seen the male larva, cocoon or adult. It is for this reason that I have given a very full characterization of the species in the article already alluded to.

Signoret's description, so far as it goes, applies thoroughly well to *I. purchasi* in some of its forms. His female had not formed the cottony or fluted-egg covering, at least he makes no reference to it. His figure, while showing a short truncated mass, does not indicate the flutings because the few lines upon it are evidently intended by the artist for the long, fine, glassy hairs. Maskell, following Signoret's description, rightly says that *sacchari* "does not seem to form an ovisac with longitudinal grooves." But Signoret himself says that *sacchari*, in the Island of Bourbon, "is confounded with *Lecanium gasteralpha*, under the name of louse-with-the-white-pocket." Whether Signoret assumed such confounding by the islanders because of erroneous supposition that this *sacchari* had no ovisac, or whether the islanders designate both the *Lecanium* and the *Icerya* under the characteristic vernacular, is not plain from the language, and is immaterial. On the principle of unity of habit in the same genus, I feel morally sure that Signoret's *Icerya* must produce her eggs in such an ovisac, and the Bourbonese are doubtless well aware of the fact, otherwise they would not so indicate it or confound it with *Lecanium*. We are justified in assuming that the female which my friend Signoret described and figured had only just begun forming its sac, and that its flutings had become effaced and the secretion unnatural in appearance. Maskell's second reason, viz., that *sacchari* "does not show the great tufts of black hairs and the projecting glassy tubes," will also lose force from the facts that Signoret particularly describes these glassy tubes as "long filaments, waxy, very fine, delicate, transparent," and that these tufts of black hairs are extremely variable in quantity, sometimes making the insect look quite dark and bringing out in strong relief the few smooth, orange-red or brick-red elevations, and particularly the series of about 22 around the border; at other times being so scarce that the insect has an almost uniform reddish-brown appearance.

It would appear, therefore, that, notwithstanding the differences in Signoret's and Maskell's characterizations, there is yet room for grave doubt as to the specific difference in the two insects, especially as upon restudying Signoret's description it accords in every other particular with *I. purchasi*.

You will pardon me, I know, for going into these technical details, because it is evident that the solution of these questions has a very important bearing. My own impression now is that future investigation will prove that the two insects are identical. The truth will in time be ascertained by getting all the different stages of *sacchari* from the Island of Bourbon or of Mauritius, and comparing them more carefully with *purchasi*, the different states of which I have fully detailed in my report.

Let me say in this connection that there is a great variability in *purchasi* as to the amount of matter secreted on the scale itself, which may very easily mislead, especially in dried specimens. In the orange groves of Southern California the general colorational aspect of the insect is, in all its stages, reddish-brown, the surface exudation being rarely excessive and never obliterating the reddish-brown color. This exudation is, in fact, more noticeable upon the male larva, which, together with his narrower, more elongate form, renders him easily distinguishable from the female. In the more northern parts of the State, however, I found that the general colorational aspect was quite different, owing to the greater excess of the surface exudation, frequently covering the body in little globular masses and giving it a whitish and even greenish aspect, and often rising along the middle of the body into a tufted ridge. This form corresponds more nearly with what Signoret has described, and it follows that this waxy surface exudation becomes denser and still more noticeable by contraction in the dried or cabinet specimens or whenever the insect has shrunken.

This question of the synonymy of the species bears directly on its original source; for if we have but one species of the genus, or even if there be two, and *I. purchasi* is found to occur on the sugarcane in the Islands of Bourbon and Mauritius, then the presumption will be that it originally came from these islands. In my address at Enterprise, I called attention to the fact that this Fluted scale seems to have become notably injurious almost simultaneously in Australia, South Africa and California, and on the assumption that it infests the sugarcane on the islands mentioned, it is much more easy to understand its introduction to the other countries. Sugar is exported from those islands into many parts of the world. The sugar, as it leaves those islands, is very coarse, and all the molasses or syrup is not extracted, centrifugals not being in use. For the purpose of draining, the sugar-makers are in the habit of putting a piece of cane in every hogshead, and, in addition, the top is sometimes covered with pieces of cane. In point of fact, I am informed that an insect, known in the trade as the sugar-louse, is of quite frequent occurrence in such sugar, and Prof. Wiley, of the Department of Agriculture, upon being shown specimens of *Icerya purchasi* (and he is quite familiar with the so-called sugar-louse), informed me that he thinks them identical.

On this hypothesis the initial spreading point is from the island referred to, and the insect probably made its way first to Cape Town and thence to Australia, New Zealand and California. This does not preclude the possibility of its importation upon other plants, but I think it highly probable that the chief method of distribution of an insect which is so tough as to bear long survival without food was upon sugarcane in sugar hogsheads, as it could be much more safely carried in this way than upon living plants. The determination of the original source of the pest is of vital concern in any study of its parasites, as such would be more apt to be found in its native country than in any countries of its introduction.

I have been quite anxious to settle definitely this question of its original home, and have lately had some correspondence with parties in Australia, New Zealand and Africa. The following extracts from such correspondence will prove of interest to the people of California. Mr. Kirk's statement will add weight to the hypothesis that I have ventured, while Baron von Mueller's statement also strengthens it. It may perhaps be impossible at this late day to definitely settle the question of this original source, especially as there may have been not one but several introductions (indeed we have evidence that such was the case) into all three of the countries in which it now occurs; but we can much easier understand its travels if it started as a sugarcane insect. I have italicized those parts of the following letters which particularly bear on the subject of this communication.

The sketch of the Dipteron which Mr. Crawford found attacking Icerya shows a great likeness in the body to some Hymenopterous Encyrtid; but the wings indicate its Dipterous character and that it belongs to the Dolichoponidæ near *Diaphorus*. So far as their larval habits are known, these flies are predaceous and live in the larva state in the ground. Perhaps Mr. Crawford has used the term "parasitic" synonymically with "predaceous," but I will not further anticipate what Miss Ormerod may report.

Extracts from Correspondence.

[The following are the extracts from the correspondence to which reference is made above.—EDS. PRESS.]

Letter from Roland Trimen, of Cape Town, to Prof. Riley.

As regards the evidence as to the Australian habitat originally of this insect, I regret that I have nothing to add to what has been already supplied to you. * * *

Since the Commissioner's report in 1877, the orange industry of the western districts has suffered most severely, scarce, very inferior and exceedingly dear fruit being now only obtainable where it used to be abundant, good and cheap. Where, however, the kerosene and alkaline solutions have been constantly applied by individual proprietors here and there, the result (as I am informed by Mr. MacOwan, Director of the Botanical Gardens) has been very encouraging. In the eastern districts the effects of the Icerya's attacks do not seem to have been nearly so serious, but whether this is due to a less suitable climate and other conditions,

or to more vigilance and exertion on the part of cultivators, I cannot at present determine.

The bug spread to Natal within the last few years, and last year I received specimens from them found on the common black wattle. Only yesterday I was sorry to receive a lot found there on the orange.

No public action in the matter has been taken since the Legislative Assembly, in 1887, threw out the attempted legislation on the subject.—*Roland Trimen, South African Museum, Cape Town, Cape of Good Hope, Feb. 8, 1887.*

F. S. Crawford, Adelaide, to Prof. Riley.

* * * Last year I entirely lost my colony of Icerya, owing to the attacks of a fly; a rough tracing of an unfinished drawing of the same I also forward. I know nothing about the Diptera and should be obliged if you can determine the insect from the drawing. I may say that I sent Miss E. Ormerod specimens of the fly about two months back, but, of course, have not had time to hear what she makes of it. This is the only instance I know or have read of, of a true Dipteron being a Coccid parasite. * * * —*Frazer S. Crawford, Surveyor-General's Office, Adelaide, South Australia, Feb. 21, 1887.*

Letter from Baron von Mueller, of Melbourne, to Prof. Riley.

* * * I beg to inform you that the *Icerya purchasi* (or a closely allied species) although occurring on *Acacia mollissima* and some congeners in the colony Victoria, has not attacked here (so far as I can learn or had occasion to observe) destructively attacked the orange orchards. I will, however, make further inquiries as well in this colony as in New South Wales, South Australia, New Zealand, and let you know the results.

Possibly the Icerya develops more readily in a moister clime than that of Victoria, and thus becomes more mischievous in California than here.

The introduction of this destructive insect into your States by means of Acacia seems to me very unlikely, because the various species of Acacias are so easily raised from seeds that no one will think to introduce them by living plants. Moreover, it could not have been the Acacia latifolia, which was the host of the Icerya, because that species is a native only of the north coast of Australia, and as yet nowhere existing in horticulture. Acacia armata certainly is grown for hedges, but always raised from seed, chiefly obtained from North Australia. It seems, therefore, more likely that when Acacias are grown anywhere, they would afford—particularly in humid climes—a favorable opportunity for the Icerya to spread. A similar circumstance occurred in Ceylon, and another in some parts of Brazil, where an indigenous insect plague became aggravated, when Eucalyptus, on which that insect preferably seized, became reared.* Whether the Icerya was originally an inhabitant of Victoria or merely immigrated, I will endeavor to ascertain; but such a subject of inquiry is surrounded with difficulty now after half a century's existence of the colony, particularly as the Icerya drew no attention here by any extensively injurious effects on any cultivated plants, though it may have caused on some plants minor or transient injury. * * * *Ferdinand von Mueller, Melbourne, Australia, March 21, 1887.*

Letter from L. M. Kirk of Wellington, New Zealand, to Prof. Riley.

On returning from a protracted tour of Forest inspection in the South, I find your letter of 22d December awaiting reply. My friend Baron von Mueller is mistaken in supposing that I have written recently on the *Icerya purchasi*. In a report on Fruit Blights printed two years ago, I drew attention to the pest, intending to treat at greater length at an early date; but my duties as Forest Conservator have prevented the intention from being carried out.

The insect is a native of the Fiji and other Pacific islands, from whence it has migrated, probably with orange trees, to Australia, New Zealand and California. Mr. Maskell states, I believe, that it is a native of Australia, and was introduced from that country on mimosa plants; but this is an error, and acacias are rarely or never introduced as living plants, owing to their being so readily propagated from seed.

The Icerya is abundant in the northern and middle parts of the Auckland district, and usually prefers citraceous fruits; it is, however, found in large quantities upon some of the wattles, evincing a decided preference for the silver wattle (*Acacia dealbata*). It is, however, occasionally found on furze, manuka (*Leptospermum scoparium*), peach and apple, but on these fruits only in small quantities, and not, so far as I am aware, doing serious damage; in fact it is only found upon these plants when growing in the neighborhood of infested Citrads. It is occasionally found on a few native trees, but it is not causing any great injury.

It is also found in Napier and other parts of Hawke's bay, on the eastern coast of North island, and in Nelson and the northwestern corner of the South islands. It is also said to be found in Canterbury, but I have no direct evidence of its occurrence in that district.

It is not found either in Taranaki or Wellington, in the North island, except Nelson and possibly Canterbury.

There can be no question that it is a serious foe to citraceous fruits and to wattles. In the vicinity of Auckland, and in many other parts of that district, it is abundant. I have seen trees greatly injured by its ravages, but cannot say that I have seen any killed. At present, orange culture has not attained large dimensions here, but there can be no question that Icerya is the worst foe our orange-growers will have to encounter.

I have not seen an acacia killed by this pest, although the under surfaces of branches are frequently covered. In a few established orange grounds, the yield of fruit is materially diminished by the ravages of this insect.

No official documents have been published respecting the Icerya, except the Fruit Blights report already mentioned, of which a copy of a Queensland reprint is inclosed herewith. The Forest Department has purchased Mr. Maskell's Account of Scale Insects, and is about to publish the same with colored plates; a copy shall be forwarded as soon as it leaves the press. * * * —*L. M. Kirk, General Crowns Land Office, Forest and Agricultural Branch, Wellington, New Zealand, March 25, 1887.*

From an Article by E. J. Dunn, in Melbourne Argus, Aug., 1886.

I desire to call attention to a species of coccus known as Dorthesia. *This destructive pest was first observed on the Island of Bourbon. Thence it spread to Mauritius, about 25 years since. In Mauritius it destroyed the orange and lemon trees, many of the ornamental shrubs and acacias, and wrecked most of the beautiful plantations and shrubberies. At Port Louis it still exists in loathsome masses on the handsome Talipot palms.*

About 12 years ago it was noticed for the first time in the Botanical Gardens, Cape Town, and most probably arrived there from Mauritius with plants sent to the Botanical Gardens. During the first summer it spread about three miles into the suburbs along the railway. Its fearfully destructive character now became evident, for the orange trees, the Australian wattles, the pittosporums and the blackwoods became loaded with this disgusting parasite, and the trees slowly but surely succumbed to its attacks. * * *

All trees of the orange kind, such as lemon, citron, shaddock, etc., proved especially suitable food for the Dorthesia, and once a tree became infested no amount of syringing or washing prevented its destruction. The disastrous results of its arrival at the Cape are all too evident.

Formerly in Cape Town itself, and throughout the suburbs, the orange tree lent a charm to the gardens that no other tree could give, and in the Western Province orange-growing formed a most important source of wealth, many farmers netting several hundreds a year from their orange groves. Some of these groves, planted by the Huguenots and their descendants, were of great age, and, beside being profitable, were objects of great beauty. Those of the Pearl, French Hock and Wagenmaker's Valley were especially famous.

To day this is all changed, and, except for a few dead stumps, these fragrant groves and this valuable asset in the country's wealth have disappeared.

Not so the Dorthesia; it is still advancing steadily, and leaving destruction in its wake, and will continue to do so as long as suitable food is within reach. * * *

*Always from seed.

For weak lungs, spitting of blood, weak stomach, night-sweats, and the early stages of Consumption, "Golden Medical Discovery" is specific. By druggists.

Prematurely Aged.

Many a woman is robbed of those charms which the gentler sex value so highly, and made old before her time by functional irregularities. To such the bloom of youth may be restored by the use of a remedy which has stood the test of time and which is to-day acknowledged to be without an equal as a cure for all female weaknesses—Dr. Pierce's "Favorite Prescription." By all druggists.

"Gentle as the Breeze of Evening."

This line of an old hymn is quite appropriate when applied to "Pleasant Purgative Pellets." "I don't like to take pills if I can avoid it," we often hear persons say, "because they constipate me so." Now the "Pellets" never do this. They are so gentle and mild that their effect is almost precisely similar to a natural movement of the bowels, and no unpleasant effects are left behind.

Send stamp for circular, and state how you wish the installments. GRIFFIN BROS., Cottonwood, Shasta Co., Cal.

THE VINEYARD.

A Destructive Grapevine Pest in Napa Valley.

EDITORS PRESS:—For several seasons there has been on the increase and appearing in new districts of Napa valley, an old and very destructive vine pest. It is a small beetle, black in color, with varieties brown and reddish chestnut, and in length from an eighth to a quarter of an inch. It was named by the great Linnæus in the last century *Adoxus vitis*, on account of its habit of feeding upon the grapevines. This insect is already so well known in Napa valley as to have obtained the local name of the "scribe," because its mode of feeding scores the leaves in many directions, by eating partly through them in short, straight lines. It attacks the green fruit also by just eating or nibbling the skin in a disconnected line, causing the grapes to crack and burst, and dry up. The same effect is produced on the leaves; the parts scored first turn brown and the sun dries up the whole leaf, because the venation being destroyed, the fluid circulation is stopped; the death of the leaf follows and in bad cases entire defoliation ensues. When Mr. G. R. Crotch, 20 years ago, visited California on an entomological tour, he found this species abundant.

The worm state of this beetle has not been observed in California, which circumstance would seem to make it appear that, like *Diabrotica soror*, it presumably feeds upon the hidden roots of other plants. But a reference to Baron Walckenaer's Memoir upon the insects of the vine, in Annals Soc. Ent. France, 1836, p. 247, makes the larval existence to be also on the vine.

The season of 1886 brought this pest in large number to certain vines belonging to Mr. Jacob Schram, of Schramsberg, between St. Helena and Calistoga, and these insects were so numerous as to reduce his wine average by several thousand gallons, and he would have been a greater loser had he not made a vigorous attack upon the pests. Mr. Schram, seeing that these beetles when disturbed fall to the ground, had constructed an area of canvas stretched upon a large hoop, and then divided so that the half could be thrust under the vine from each row; these half-hoops were each covered with coal-tar and silently thrust under a vine, a shake given to the vine, and the beetles, playing possum, are immured in the tar, and when the tar becomes surcharged with insects they are scraped off with a hoe or shovel. This method of destroying pests, though a good improvised plan, must necessarily make grape culture expensive. But this mechanical contrivance possesses an advantage over arsenical poisoning by spray and washes, in that it is surely innocuous; though arsenical solutions can be safely applied and with desired effect. The most recent treatment, and which would be worth a trial, because both safe and easy of application, besides being cheap, are those resin solutions propounded by Mr. Albert Koebele, agent of U. S. Entomological Department. If this solution, known as experiment No. 129, were used and applied by means of a cyclone spray nozzle, this insect would be under control. The following is Mr. Koebele's prescription:

Take of resin 4 pounds; sal-soda, 3 pounds. Dissolve the soda in 1 quart of water and add the resin. Stir them together and add boiling water *slowly* until 36 pints of the compound are reached. In applying this to the vines use one pint of the mixture to each gallon of cold water.

J. J. RIVERS.

University of Cal., Berkeley.

Pure Wines.

J. H. Wheeler, Chief Executive Viticultural Officer, has issued this week a bulletin giving full information as to provisions of the new law regarding the stamping of wines in this State, the way to procure the stamps, etc. The new law will go into effect June 5, 1887, and all wine-makers and dealers should fully inform themselves about it. Addressing Mr. Wheeler, at the office of the Viticultural Commission, 204 Montgomery street, S. F., will get the desired information.

The Pure Wine Law and Stamp Act will be enforced by the following committee which has been selected by Capt. H. W. McIntyre, superintendent of Senator Stanford's vineyard at Vina, to whom, as president of the Grape-growers' and Wine-makers' Association, was assigned the duty of selecting the committee: M. M. Estee, Napa; J. B. J. Portal, Santa Clara; Capt. Chamon de St. Hubert, Fresno; J. H. Drummond, Glen Ellen; H. A. Pellett, St. Helena; A. Erz, Anaheim; Jacob Schramm, Calistoga; H. A. Marriam, Los Gatos, and B. H. Upham, San Francisco. If the members of this committee find any adulterated wines they are to notify the district attorney to institute suit for condemnation. Under the head of adulterations are classed salycilic acid, glucose, cherry juice, aniline dyes and wines fortified by grain spirits. As every member of the committee is a wine-maker, and interested in protecting his wine from tamperers, effective work is expected.

Controller Dunn has forwarded the following circular to every wine-manufacturer in the State:

Arrangements have been perfected by which the wine labels authorized by the Act of March 7, 1887, commonly known as the "Pure Wine Law," will be ready for delivery at this office June 5, 1887, the date on which the Act takes effect, and will be supplied at the rate of $1.50 per thousand, plus charges for forwarding the same. Blank forms of applications for these labels, in accordance with said Act, will be furnished by this office. The price of the labels should accompany each order. Remittances may be made by express, postoffice, or Wells, Fargo & Co.'s money order.

The Fetes of Flora.

(*Continued from page 506.*)

and numerous town lots (of delicious roses), corner and otherwise, were displayed for sale. The "bulletin board" was covered with "bargains," and the "margins" on the sales of lots netted a neat sum. It was the hit of the festival.

One exquisite exhibit was a "floral parlor." A small rug of roses, dark in the center, changing to light pink at the edge, with a border of dusty miller, adorned the floor. The walls were ornamented with a handsome bunch of roses in a frame of marguerites and marigolds. An evergreen stand, an easel and palette, pincushions, sofas and wall decorations—harps, horseshoes, fans, etc., all of different varieties of flowers—made the work perfect in its way.

The *Times* was represented by a large floral newspaper, the columns being of geraniums and roses, the column-rules of cypress, and the heading of white daisies. It was a very handsome and unique design, and brought much credit to the ladies who wrought it.

A piece universally admired was Mrs. Kirkland's bank of roses. This began at the floor with roses of a dark maroon color, above which roses of a less brilliant hue were gradually introduced, until the bank faded at the top in pure white.

Elegant and elaborate was the "Throne of Pomona," upon which posed the lovely goddess, in becoming apparel, beneath a pendent canopy of roses.

The "Pagoda" in the center of the hall attracted a deal of notice. It was of octagon form, about five feet through and six feet to the eaves, terminating in a cone-shaped roof with a Japanese umbrella on top. Flowers of all shades and colors were used in its make-up, and within was a huge Japanese urn filled with calla lilies.

In the special "Rose Booth" could be seen nearly 300 varieties of labeled roses.

There were plenty of other designs and displays well worthy of mention; but we must cut short our account by stating that receipts and donations amounted to $585.

Santa Cruz.

The City of the Holy Cross is famous for its wealth of flowers, and one of the most brilliant festivals of the season was that which opened at Santa Cruz May 11th, under the auspices of the Development Association, and closed a six-days' course triumphantly.

The entrance to the great pavilion was made through what seemed to be the butt of a giant redwood, in which a doorway had been hewn, and then a scene of bewildering beauty burst upon the view.

The seven "Rainbow Booths" along the west side of the hall were immediately attractive. First was the yellow booth, where tea-roses prevailed, and a stile of Safranos had to be turned ere one could enter to inscribe his name in the visitors' register and inspect the various floral treasures. The front of the red booth was made with three open arches, decked with scarlet geraniums, while within were banks of red poppies, crimson roses and scarlet passion-flowers. In the orange booth, draped and curtained as became its title, there was a pyramid of Santa Cruz oranges, and nasturtiums and marigolds abounded. The keystone of the rainbow arch was the green booth, representing an overhanging cliff covered with ferns and mosses, and beneath it a grotto where flowed lemonade pure and simple. Above this refreshing spring was the legend: "Far hence be Bacchus' gifts." In the blue booth forget-me-nots and bachelors' buttons prevailed. Pink is not usually reckoned among the colors of the rainbow, but the panels of Homer and Hermosa roses, the fire-screen of 12 varieties of roses, the hawthornes and azaleas, made the pink booth fascinating. Lastly, the violet booth was very dainty, with its heliotropes and pansies and cages of song-birds. The booths were all more or less adorned with mottoes, and the charming ladies in charge were quaintly and becomingly costumed.

The Watsonville booth was greatly admired for its many artistic designs and choice, though bounteous, blossoms, to say nothing of the fair attendants. Among its features were a pyramid of 800 rosebuds in the center, an orange tree, from which they were selling fruit continually, and a swan, emblematic of Pajaro, carrying "Watsonville" in its beak.

The Garden City booth, where ladies of the Horticultural Hall Association were assisted by Mr. Bourguignon, was thus described in the *Courier-Item*: "Around two sides stand broad tables of moss, in which are half imbedded clusters of named roses, each specimen perfect of its kind. There are over 300 different named varieties of roses in this collection. In the center of the background stands a pedestal, banked with roses, the top being of moss buds, supporting a model of the great Lick telescope, wrought in vari-colored carnations and ferns. In the corner next is an inclined bank, where are seven feet by three of solid roses of many varieties and tints. A similar smaller bank on the opposite side supports one of the pink rose-wagons used with such good effect in the San Jose Fair, and above all, on a background of evergreen, is lettered in flowers 'San Jose.'"

The floral stores were replenished and renewed from time to time, and thus the recurring beholder found fresh surprises of delight.

In "Wonderland" booth, the little folks, under a loving leader, wrought wondrous things in the way of fernery, rockery, scenes from Cinderella, etc.

The "Conservatory" was a fairy bower, where a fountain was playing among choice exotics. Here, too, were shown over 50 species of wild flowers, gathered in and about Santa Cruz.

The "Farm and Orchard" booth, maintained by the *Daily Surf*, was in the shape of a log cabin, where the Eastern tourist might marvel at the display of cherries, apricots, peaches, grapes, apples, almonds, oranges, lemons, figs, quinces, nectarines, plums, gooseberries, currants and strawberries in all their glory.

Among the almost countless floral pieces was one from Reynolds Post, G. A. R., representing a miniature camp, its tents covered with smilax, a pot of beans by the fire, etc. Then there was Bunker Hill monument in La Marque roses, all cut from a single tree, with the name in scarlet geraniums.

Time fails us to tell of the Jap. tea-house and the New England kitchen, the dairymaids, the picturesque parade of the gypsies from Wonderland, and the visit of delegates to the Y. M. C. A. Enough to say that but one thing was lacking out of all the things that grow in Santa Cruz county—namely, poison oak—that the net proceeds were $1200, and that the fair's success surpassed the fondest expectations.

We hope next week to note the leading features of the flower festivals recently held at Santa Ana and San Buenaventura.

The Commencement Season.

Graduating exercises have come off, the past fortnight, at a number of the leading seminaries, especially in Oakland, the performances succeeding each other, as some one remarked, like a series of educational earthquake shocks.

On Thursday evening, May 19th, the friends of

Snell Seminary

Had occupied every seat in the spacious First Congregational Church of Oakland, when at 8 o'clock the doors were shut and locked to prevent a crush. The decorations of roses, ferns, evergreens, etc., were elegant and tasteful—the class motto, "Who Speaks Sows, Who Listens Reaps," in pink roses, having the place of honor. The principals, R. B. and Miss Mary E. Snell, Rev. J. K. McLean, D. D., and 14 candidates for graduation sat on the platform.

The young ladies delivered their compositions with a self-possession, clearness and grace that did great credit to their training, the reading being interspersed with music, and plaudits general and generous. When the valedictorian had ended, Rev. Dr. McLean briefly addressed the class, and Mr. Snell conferred their diplomas upon Hope Lillian Bliss, of Carson City; Jennie Clarissa Baldwin, of Danville; May Louise Dewey Baldwin, of Santa Cruz; Charlotte Louise Collins, of Oakland; Ida Frances Fox, of Oakland; Isabelle McCracken Fuller, of Honolulu, H. I.; Mary Eliza Hatch, of Suisun; Mary Luella Inman, of Livermore; Lucy Baker Knowland, of Alameda; Mary Emma Miller, of Dixon; Mary Elizabeth Perry, of East Oakland; Emma Julia Remillard, of Oakland; Laura Rosenberg, of Oakland, and Mabel Evelyn Williams, of Carson City, who constituted "the largest class ever graduated from any private institution in Oakland."

The commencement and oratorical contest of the

Sackett School

Were held the same evening, at Hamilton hall, in the presence of a large audience. The program consisted of declamations for prizes, and vocal and instrumental music, followed by a valedictory oration by H. S. Burdick, on "What Constitutes a State?" Harry Smith Burdick, Henry Workman Keller, and Alex. T. Stewart took diplomas for the full English course; and Jerome Leo Park, who had pursued a special course, received a corresponding certificate.

The commencement exercises of

Hopkins Academy

Were held the morning of Friday, May 20th, in Plymouth avenue church, Oakland, which was tastefully decorated for the occasion, and well filled by friends of the school and of its pupils. The members of the graduating class, namely, J. E. Coleman, of Grass Valley, E. F. Goodyear, of Oakland, J. G. Howard, S. F., H. F. Jones, of Vacaville, S. C. Mastick, of Alameda, E. S. Shanklin, of Sacramento, Walter Sink, of Cloverdale, and E. T. Wolcott, of Antioch, spoke their several parts—orations, addresses and essays—Jones being the class poet and Goodyear the valedictorian. Rev. Dr. McLean presented the diplomas, and Rev. H. E. Jewett, the principal, awarded the gold medals—one for excellence in mathematics to E. F. Goodyear, of the graduating class, and one for excellence in Latin to Norman Livermore, of the senior middle class.

After the exercises at the church the students, teachers, trustees, and friends held a pleasant reunion at the academy, where a bounteous collation was served. The school has enjoyed great prosperity during the past year, 60 students being in attendance.

The exercises at the

California Military Academy,

Also held on the morning of the 20th, embraced orations by Cadets A. H. Niedenhofen, M. E. Reed, F. H. Sharp, E. A. Stockton, and C. S. Wieland, as well as music and declamations. The graduates were addressed, and with a few parting words, Colonel O'Brien presented their diplomas.

The First Congregational Church, of Oakland, was again crowded the evening of the 20th, with those interested in

Field Seminary

And its students. The class motto, "To Be, not to Seem," appeared in pure white roses on the curtain across the organ alcove, and all around were lovely adornments of bloom and greenery. The names of the candidates for graduation and the titles of their essays follow: Salutatory, Unequal to Equal, Emma E. Cable; Diaries, Bertha L. Rickey; Alps of Thought, Lily B. Cockrill; Fountains by the Wayside, A. Lizzie Henry; Why? Mabel E. White; Influence of Poetry, Bessie G. Meserve; Scenes from Shakespeare, Anna M. Simpson; Failures, Christine F. Rongstoff; Valedictory, To Be, not to Seem, Kate L. Cornwell. Music, instrumental or vocal, after every second or third essay, varied the program, and the nine fair damsels read their parts with pleasing effect to an audience that lost no opportunity of expressing its kindly approval. Subsequent to the commencement exercises, a very pleasant reception was held in honor of the newly-graduated alumnæ.

The ceremonies incident to the season at

Mills College

Began Sunday afternoon, the 22d, with the baccalaureate sermon by Rev. C. C. Stratton, D.D., president-elect. Entertainments social, gymnastic, rhetorical and musical, succeeded on Monday and Tuesday; and the climax of concluding exercises was reached on Wednesday in Commencement proper.

The hall was beauteous and fragrant with flowers. The 20 graduates were simply dressed in white, without jewelry. Each had prepared an essay, but only a portion of them were read. Rev. Dr. Horton, acting president, addressed and presented their diplomas to Marie E. Ballard, Carson City, Nev.; Mary L. Davis, Helena, M. T.; Mary A. Faull, San Francisco; Minnie C. Fogg, Oroville; Fannie P. Freeman, San Diego; Belle W. Garber, Berkeley; Lizzie A. Harp, Modesto; Helen L. Hurd, Fresno; Louise L. Jacks, Marion M. Jacks, Monterey; Lillian M. Kimball, Westport; E. Isadore McGraw, San Francisco; Mary E. Newton, Alameda; Mary Paulsell, M. Jeanette Paulsell, San Jose; M. Alice Thompson, Woodbridge; Grace A. Wachhorst, Sacramento; Roberta Wilson, San Francisco; Jessie Lee Woods and Mary L. Woods, Stockton.

After the benediction, the guests were regaled with a lunch.

It is announced that Dr. Stratton will close his work at San Jose early this month and remove at once to Mills college, which begins the new year "with a president of great educational experience, a united Board of Trustees and large and growing financial resources."

The Wheeler Cannery Co.

The Wheeler process and appliances for home and orchard canning are widely known. There have been some hindrances to the introduction of the process, as is likely to occur with any new device. Many accessories had to be arranged and manufactured, and this may have occasioned some delay and vexation, but we never heard of anything which militated against the process itself nor the value of its products. In fact fruit has been put up by it every year since its first announcement, and some of the finest canned fruit we have ever seen has been that made with the Wheeler apparatus. Recently, we understand, the business features of the process have been cast anew by the organization of the Wheeler Cannery Co., of which Mr. Joseph Perkins is secretary and manager, and an establishment has been opened at 116 California street, S. F., where full information concerning the Wheeler cannery and its use can be obtained. We have just received a neat 12 page pamphlet issued by the company, which gives statements of much interest concerning the Wheeler process, and quotes rates for the *rental* of the cannery, for it is announced that no outfits are for sale. Quotations are also given of the Wheeler fruit jars, cans, labels, solder, etc. It seems to us that the announcement is worthy of investigation by those who expect to have a surplus of fruit which they desire to turn to practical account either for their own use or the market.

HOLSTEIN-FRIESIAN.—We have received a few catalogues of the stock from Ontare Ranch, Santa Barbara, to be sold at auction by Killip & Co., June 16 h, at Oakland Trotting Park. Copies may be had on application at our office.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Breeders' Directory.

Six lines or less in this Directory at 50c per line per month.

THE GRAND SALE OF THE SEASON!

OF IMPORTED AND NATIVE-BRED

GALLOWAY CATTLE

ON JUNE 10th and 11th,

At GEO. L. GOULDING & CO.'S City Stock Yards, Denver, Colorado.

LEONARD BROS., of Mt. Leonard, Mo.,

—AND—

BUSH & MORSE, OF WINDSOR FARM, DENVER, COL.

Will hold a joint public sale of **Imported and Native Bred Galloway Cattle.** The lot consists of 100 head of males and females of the choicest breeding and individuality, embracing selections from four different importations by the Leonards, who (it is a well-known fact) brought over only the best that money could buy and careful judgment select. Most of the cattle offered by Bush & Morse, of the Windsor Farm, are direct descendants of the stock imported by the Leonards, who, in breeding the same, combined some of the best strains of blood in their herd. It is once in a lifetime that such an opportunity is offered to the public of purchasing such a splendid lot of cattle, and the undersigned feel no hesitancy in endorsing what is claimed for them—"that they are the finest lot ever offered at public sale in the world." The fact that they were all imported or bred by the Leonards is sufficient guarantee that the stock is as represented—"the very best that can be found." Nearly all the young stock are by the famous sire, "British Nero," 1877, and the females are bred to that grand bull, "Borderer of Drumlanrig," 2628, whose cut appears above.

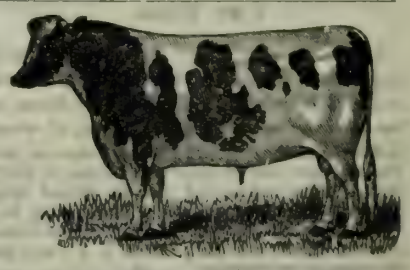
In the breeding are found such popular strains of blood as represented in the tribes of Drumlanrig Semiramis, Lady Satnley, Forest Queen, etc., embracing such famous sires as Black Prince of Drumlanrig Harden, Moss Trooper, Montague, Scottish Borderer, Pretender, Guardsman and others equally noted for their show-yard careers and the grand quality of their get

All necessary assistance will be furnished to buyers from a distance in loading and shipping their stock. Terms of sale, cash, or four months approved paper bearing 8 per cent interest. Catalogues furnished on application.

GEO. L. GOULDING & CO.

COL. S. A. SAWYER, Auctioneer.

NOTE.—During the sale there will be on exhibition some steers and bulls bred from Thoroughbred Galloway Bulls out of Shorthorn Cows. Cattlemen will be able to judge for themselves as to the result of the cross.



HOLSTEIN & JERSEY CATTLE

Heifers in Calf in such grand bulls as Netherland Star, Clifden Prince (Holstein) and Ashantee's Sultan (Jersey) for sale at reasonable prices.

Also POLAND-CHINA and BERKSHIRE PIGS.

POULTRY—All Varieties.

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources of their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.

THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitor anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. A NEW FEATURE has been added to the Premium List this year, in the shape of awards for a **Sheaf Display of Cereals.** Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor. Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

EDWIN F. SMITH, Secretary. L. U. SHIPPEE, President.

SAN JOAQUIN VALLEY ASSOCIATION
District Fair, 1887.

To Be Held Immediately After the Close of the State Fair, Commencing Sept. 27th and Continuing 5 days at the Fair Grounds and 11 days at the Pavilion.

NEW PAVILION.

A Large Exhibition of Field and Fruit Products.

HORTICULTURAL and MECHANICAL DISPLAY.

Live Stock Features to be Extended

AND INDUCEMENTS FOR BREEDERS

To Bring Animals from all parts of the Pacific Coast.

The Largest Purses Ever Offered at a District Fair for Speed Program and Premiums—Over $20,000.

S. F. Market Report

NOTE. Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, June 1, 1887.

A hot wave passed over the State on Friday and Saturday last, but owing to its short duration no great damage was done to crops. Cooler weather following almost immediately afterward and continuing up to this writing, has helped no little the growing grain crop. The European wheat market gained in strength throughout the week, closing today as follows:

LONDON, June 1.—Cargoes off coast, nothing offering; cargoes on passage and for shipment, quiet; Cal. wheat just shipped, 40s 6d; Cal. wheat nearly due, 40s 3d; French country market, firm; Liverpool wheat, spot, inactive; Liverpool wheat, Cal. 7s 10d to 8s 1d.

The British Grain Trade.

LONDON, May 31.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: The values of English wheat have hardened. Supplies are meager and prices have advanced. Sales of English wheat during the week were 45,198 quarters at 34s 6d, against 59,260 quarters at 32s 5d during the corresponding period of last year. Flour is very firm despite large receipts from America. Foreign wheat is slow and values are steady. Corn is quiet and in buyers' favor. Barley is dull. Oats were rather cheaper. Linseed advanced 1s.

Eastern Wheat Markets.

NEW YORK, May 29.—The close was weak at a slight recovery, May and June, 96⅞c, July 96¼c, August 94c, September 93⅛c, and December 96¾c.

CHICAGO, May 31.—The wheat market, being in the hands of the combination, presented no new features this morning. The first hour was marked by activity, and on the strength of enormous receipts there was a desire to sell, especially in June. This future would have taken a dip, but the clique have set 88@89c as the bound beyond which it must not pass at present. July had a more natural action, opening at 85½c, selling up to 85⅝@85⅝c. Deferred futures were in sympathy. There is no open evidence that the clique is packing up July, but in all likelihood it is.

NEW YORK, June 1—12 M.—97½c for cash, 97c for June; 96⅛c for July, 93¼c for August and 93¼@93⅜c for September.

CHICAGO, June 1.—To-day being the first of the month, the opening hour on 'Change was devoted to the delivery of June wheat. The clique houses took nearly all the wheat delivered, but it is stated on good authority that they did not get more than one-eighth of the wheat due them. About 2,500,000 bushels were transferred this morning and it is estimated the clique houses took in yesterday about 1,500,000 bushels in large blocks, to avoid a rush this morning. The office deliveries were large, as none of those who were short cared to have it known. The clique practically got all the wheat there was. At 1 P. M. wheat was stronger; cash, 89c; July 86⅜c; August, 83⅞c.

Crops at the East.

CHICAGO, May 29.—This week's *Farmers' Review* will say: Our reports indicate that local rains throughout the Western States have broken up the drought more or less. An improved condition of affairs in relation to the winter wheat crop is noticeable in Indiana and Ohio, and while other States have suffered from lack of rain, it seems probable that, should present conditions continue, the damage will be less than anticipated. More rain is generally needed except in the Southern States. As regards winter wheat, 23 counties in Illinois report the average condition at 83 per cent; 14 Indiana counties report the average condition at 87 per cent; 11 Ohio counties report the average condition above that of last week, and the prospect for a crop is much better. The condition is placed at 88 per cent in seven Michigan counties reporting. Counties reporting from Wisconsin this week give 75 per cent. The condition in Missouri is promising. Ten counties in Kansas report the condition of winter wheat at 68 per cent of the average. Complaints are numerous of drought and bugs. Hail killed most of the crop in Clay county, May 22d. Spring wheat in Minnesota is reported as good; Iowa promises to have a good crop. Seven Nebraska counties report the condition of spring wheat in that State at an average of 91 per cent.

Eastern Wool Markets.

BOSTON, May 28.—The week's transactions showed a better movement, especially in domestic grades. The market is firmer for medium wools of all kinds, while other grades are no higher, and there is a steadier feeling, resulting from the condition of the Western markets. Medium wools have been some time in small stock and are needed by manufacturers. New wools arriving find ready sale; buyers are obliged to pay full prices, and there seems to be a general feeling that the turn of the market is at hand. With the exception of medium wools, however, prices are as low now as at any time for six months. Quotations are several cents behind prices already mentioned in the country. In Territory wools there has been very little doing. Raw spring Texas wool has been arriving and meets with some demand. In most cases bids have been under the views of holders. Oregon wool is in fair demand at about previous prices. California wool has been quiet. Among the sales were 22 000 lbs California spring at 18@19c; 102,000 lbs California fall passed at 12c; 161,000 lbs Eastern Oregon at 17@24c; 49,000 lbs Territory at 17@25c.

BOSTON, May 31.—The demand continues for fine wool, and medium grades are active and firm. Blood wools are quoted at 34@35¼c; medium new spring Texas, 27c; fine do, 22@23c. Other grades are unchanged.

NEW YORK, May 28.—Neither buyers nor sellers are showing much energy. Sales, however, are fair, considering the season and the condition of the market. Among the sales were 2000 lbs scoured California at 45@56c; spring California at 18c; 5000 lbs Territory at 19c.

The Philadelphia market is quiet and stock small. Among the sales were 1000 lbs Territory black at 18c; 5000 lbs Territory fine at 20½@22c; 5000 lbs fine medium Territory at 18c; 3000 lbs Territory fine fat sheep at 21½c; 6000 lbs Territory fine heavy at 19c; 15,000 pounds Territory quarter at 27@30c; 1000 lbs medium Montana at 24c.

NEW YORK, May 31.—Wool is quiet but steady. Domestic fleece, 30@37c ₱ lb; pulled, 14@34c; Texas, 9@24c.

PHILADELPHIA, May 31.—Wool is quiet and unchanged.

California Fruit in Chicago.

CHICAGO, May 28.—The orange market is firmer. The demand is moderate for choice, but common lines are quiet and a little slow. California Bright Riverside, good to fancy, $3.25@4; San Bernardino, $3.25@4; Santa Ana, $2.90@3.25; St. Michael paper rind, $3@3.75; Orange, $2.50@2.75; Los Angeles, $2.50@2.75; Navel, according to quality, $3@4.50; San Gabriel, $2.50@3; Blood oranges, fancy, $4@6; culls, $2. California lemons were selling moderately at $2.50 ₱ box. California apricots, in 20-lb boxes, $2.75@3 ₱ box. California cherry-plums were bringing $2.50 ₱ 10-lb box. There was an ample supply of Southern sour cherries. The demand as yet is only moderate; boxes of 6 lbs of fancy large, white, nearly equal to California, sold at $1. California Black Tartarians, in 10-lb boxes, sold at $2@2.55 for choice sound, and soft ranged down to $1.

In the dried fruit market a steady feeling prevails. New peaches are salable and firm, but none are to be had. Old peaches are offered, but dull. California dried fruits are steady and firm, and in rather light supply. Plums, pitted, ₱ lb, 11@12c; raisins, London layers, 20-lb boxes, ₱ box, $1.50@1.75; loose Muscatel, ₱ box, $1.25@1.35; California layers, ₱ box, $1.25@1.35.

Dried Fruit and Canned Goods East.

NEW YORK, May 29.—In canned goods there is a fair trade, and the tone is generally firm at unchanged prices.

Dried Fruits—Raisins are quiet at previous quotations.

California Products at New York.

NEW YORK, May 29.—Beans—California steady at $1.80.

California cherries, 50 cents a lb.

Mustard continues to attract attention, with sales of 5000 bags of yellow California at 4½ cents, and 250 bags of brown at 5¼@5½ cents.

New York Hop Market.

NEW YORK, May 29.—The demand continues very good, running almost wholly on fine quality of 1886, Germans and Pacifics, and 1885 States. Inquiries by mail and other signs go to show that brewers have less abundant supplies than has generally been reported. Holders of the goods wanted are therefore very firm in their position, and in not a few instances refuse prices at which they would have sold a week ago. There is no rush to buy, however, nor anything outside of an ordinary seasonable demand. In short, the firmness is but a natural reaction from the late low prices. Coast crop, 1886, best, 19@20 cents; same, common to good, 13@17 cents; 1885, good to prime, 7@10 cents.

Local Markets.

BAGS—Quite a movement of a speculative character has been started, but who is running it and to what extent it will be successful are problematical. Sales are reported at 6@6½c for standard Calcuttas.

BARLEY—Owing to the delivery of about 16,000 tons on season contracts, the bears hammered options down, but the decline was not as much as was expected, showing that strong buyers are in the market. Transactions the past week on Call were large. To-day's sales were as follows:

Morning Session: Buyer 1887—300 tons, $1.19; 100, $1.18¾; 200, $1.18¾; 200, $1.18⅝; 500, $1.18½. Seller 1887, new crop—500 tons, $1.09½; 200, $1.09 ₱ ctl. Afternoon Session: Buyer 1887—200 tons, $1.18¾; 300, $1.18½; 100, $1.18⅝; 400, $1.18¾; 400, $1.19; 1000, $1.19¼. Seller 1887—400 tons, $1.08¾; 100, $1.08⅞. Seller 1887—300 tons, $1.06 ₱ ctl.

BUTTER—The market is very strong for the better grades, with an advance established. Large shipments are being made on distant orders.

CHEESE—Receipts are free, but as the call is increasing the tone of the market is to-day steadier.

EGGS—Strictly choice eggs are wanted, but poor are neglected. Receipts appear to be decreasing.

FLOUR—Trade is reported to be fair at full prices, with the more favored brands strongly held.

WHEAT—The sample market is stronger, with ready buyers at quotations. Exporting for the season is quite free. Call Board transactions the past week were large, with slight fluctuations reported. Sales made on Call to-day were as follows:

Morning Session: Buyer season—100 tons, $2.12; 100, $2.12¼; 100, $2.12½. Buyer 1887—400 tons, $2.07; 100, $2.07¼. Seller 1887—700 tons, $1.83; 100, $1.83¼; 100, $1.83½. Buyer August and September—500 tons, $1.87½ ₱ ctl. Afternoon Session: Buyer 1887—100 tons, $2.07½; 200, $2.07. Seller 1887—100 tons, $1.34½; 900, $1.83; 200, $1.82⅞. Buyer August and September—600 tons, $1.87¼ ₱ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

The general tenor of advices from Europe regarding wheat crop prospects is of a favorable character, but then the most trying time is yet to come. If the crops in Europe should be an average or even above an average, the marked reduction in stocks of old is of such a decided nature as to more than offset any increased yield. The statistical features of the situation verifying the above have been given in previous issues of the RURAL PRESS. Crop advices received from the Eastern and Western States are more favorable, owing to rains, still the general opinion prevails that the outturn will not be equal to last year's. Exporting from the Atlantic seaport continues on an extended scale, probably due to the wheat syndicate getting all their available supplies in position so as to feed the European markets up to August next, for shipments now made from India, Australia and this coast will not arrive out until after August. It is claimed that the carryover at the East into the incoming season will be quite light, not exceeding 30,000,000 bushels.

On Friday and Saturday last this State was visited by a hot wave, but owing to its short duration the damage done growing crops was light. The bulls on Call took advantage of it to advance the different options. The export movement from this State continues large for the season, giving currency to the belief that the carryover at the end of the season will not be more than an average.

It is claimed that all of 16,000 tons of barley were paid out the past week on seller and buyer season contracts. The knowledge of this quantity coming on the market caused timid operators to sell out their contracts held, and consequently the market is in a healthy condition, owing to the large concentration that has been going on. Prices did not recede as much as was expected they would at the close of the season, causing a more confidential feeling in the future. The barley crop was only slightly injured by the hot wave of last week, but then the outturn will not be much, if any, over 325,000 tons against 503,000 last year. The consumption is very large throughout the State; in this city alone it has grown to 5000 tons a month.

Oats are steady under moderate receipts and an inactive demand. Quite a number of consumers have substituted other feed.

Corn continues to hold strong, particularly the more choice grades. The crop this year in this State, it is claimed, will be below an average.

Feedstuff.

Hay of the new crop is not offering freely, causing a fairly firm market. The consumption this season promises to be larger than last, which if realized will create a scarcity, and higher prices later on. Choice old hay continues in demand, and fetches full prices; as high as $15 per ton was paid for something very choice.

In ground feed there is a good demand, but at unchanged prices. The consumption it is claimed is increasing, not only in this city but in the dairy districts.

Fruits.

The hot wave of Friday and Saturday last did not do any serious damage to the crops, owing to its short duration. Reports from some sections state that some fruit on the trees was cooked on one side, but then the percentage was light. The greatest fears are expressed about grapes, but so far as can be learned, no damage was done, but the cold wave a few weeks ago, it is claimed, did considerable damage, which will show itself later on in the season.

From the different fruit-growing sections there continues to be received advices of sales of the product of different orchards. Owing to the more active competition, horticulturists are asking an advance. The buyers are canners, driers, and shippers to the East.

In the local fruit market the changes for the week have been downward, under freer receipts. Cherries hold to strong prices for the season, as do strawberries. The first shipment of peaches of the season was received on Thursday last, and sold at 75 cents per lb. Apricots are coming in very freely, and sell for less money.

In tropical fruits there is nothing new to report.

Sour green apples are sent to this market. They are unsalable.

Dried fruits are very scarce, with no peaches or evaporated apples in the market. The Eastern markets are also reported to be lightly stocked, with a good demand ruling.

Choice raisins are scarce, and fetch full figures. The demand is light. Eastern advices report a strong market, with light stocks.

Mrs. M. A. Jackson, on the Sacramento river, sent the first pears this season to this market; Mrs. Pena, of Vacaville, the first Royal apricots, and F. N. Werner, of Winters, the first figs. The latter sold at $1 ₱ lb.

Live-Stock.

Bullocks have touched a lower figure than for several years past. The consumption of all kinds of meats, as usual at this season of the year, is light. Mutton sheep are fairly steady, as are hogs. In horses there continues a free demand for carriage, roadsters, and driving animals. Good prices continue to be paid for them. Work horses from Oregon have been arriving quite freely, but find ready purchasers at from $150 to $250 per head. The animals are well bred, being tractable and of good size, not too large or too small.

The following are the wholesale rates of slaughterers to butchers:

BEEF — Extra, 8c; first grade, grass fed, 7@7½c per lb.; second grade, 6@6½c; third grade, 4½@5¼c.

MUTTON—Ewes, 6c; wethers, 7c.

LAMB—Spring, 9@10c.

VEAL—Large, 6@8½c; small, 6@8c.

PORK—Live hogs, 4¾@5c for heavy and medium; hard dressed, 7½@8¼c per lb; light, 4¾@5c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Hops.

The tone of the market is stronger, owing to an increase in the consumption by reason of the hotter weather and a better demand for beer. An exchange reports that 12½@17¼ cts have been paid for this year's hops for future delivery. A local authority estimates the coming crop of the Pacific Coast at 80,000 bales, against 57,000 last year. California has 4305 acres, Oregon 808, Washington Territory 2094, and British Columbia the remainder. The crop of California will be increased this year by about 450 bearing acres. In Washington Territory it will be increased about one-fifth. In Oregon it will be increased a little—in Marion county about one-fifth, while in other counties but little. The principal hop districts in California are in Sacramento, Yolo, Mendocino and Sonoma counties, and all through these yards are looking remarkably well. The lack of rain last year in Oregon made the crop 25 to 50 per cent short. Indications are that it will be very different this year. Hops are now worth from 15 to 16c ₱ lb, but there is no demand for export.

Vegetables.

String beans and peas are stronger for the better qualities. Canners are still cleaning up the market for peas.

The first green corn of the season was received from Vacaville and sold at 25 cts ₱ dozen.

Summer squash, rhubarb and asparagus are weaker, but green peppers are stronger.

Tomatoes under freer receipts are weakening off, with a lower range of values reported.

Summer squash from the bay counties are coming, and, owing to their freshness, sell at from 3 to 4 cts ₱ lb.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	259,564	250,456
In port, disengaged	109,426	30,824
In port, engaged	18 999	27,869
Totals	387.989	309,149

The above gives a carrying capacity as follows: 1887, 616,067 short tons; 1886, 495,033 short tons; increase over last year, 121,034.

There is a good demand for beans, both local and Eastern.

Wool continues to move off freely. There appears to be a general belief that overland freights will be advanced next month, and consequently all parties are shipping East as fast as possible. Choice clear wools are in fair inquiry.

New honey is coming in, but as yet receipts are light. Dealers are holding off until receipts grow larger. The East reports a good demand and light supplies.

The stock of nuts is very light.

Poultry is generally weaker, owing to a light consumption. Receipts are only fair.

Considerable mustardseed is being shipped to France.

San Francisco, June 1, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

GET UP CLUBS.

THE JUSTLY FAMOUS

Anderson Springs

Are beautifully and delightfully located in a grand natural park, with fine large groves of forest trees, gurgling trout brooks, and the greatest variety of valuable mineral springs known in any one locality, including hot iron and sulphur springs and a cold iron spring.

These springs have been well established for years by the present proprietors, who furnish

Excellent Board with Good Home Cooking.

Good care is taken to make living at the hotel and cottages as pleasant and agreeable to all as possible.

The remedial qualities of the springs are indeed wonderful. Excellent bathing in both mineral and pure water, including natural-puffing steam baths.

Board, $10 to $14 per week. Children under 12 and over 3 years of age, half price; 2 and 3 years of age, one-fourth price. Route from S. F.: Take morning train to Calistoga, Napa Co., Cal. Stages leave Calistoga daily for Middletown, fare, $2. Private team to springs, $1. Express and P. O. address, Middletown, Lake Co., Cal.

Write for further information.

J. ANDERSON, Proprietor.

A Treatise on the Horse and his Diseases

By B. J. KENDALL, M. D.

35 Fine Engravings showing the positions and actions of sick horses Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines. Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year. It is printed on fine paper and has nearly 100 pages, 7½x5 inches. Price, only 25 cents, or five for $1, on receipt of which we will send by mail to any address. DEWEY & CO., 220 Market St., S. F.

LOANS MONEY ON FARMS.

Applications may be made at the counter, by letter, or through correspondents to be found in thirty counties of the State.

COME LOOK AT THIS!
The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

THOMAS D. POOLE,
1867 Encinal Ave., Alameda, Cal.

THE DOG In health, habits and disease. All breeds and treatment; 50 cuts; 25c. This office.

FRESNO COUNTY.

BRIGGS' SELMA TRACT.

This most desirable tract, comprising 1280 acres of first-class gray ash and sandy loam land (situated one and one-half miles from the fast-growing town of Selma, the second in the county, and two miles from Fowler, both being S. P. R. R. towns), has been subdivided and will be sold in 20, 40, 60 or 80-acre farms. The distributing ditches are now constructed, and convenient roads are laid off. The main canal is 60 feet in the bottom.

THE WATER RIGHTS

Consist of stock in the canal entitles and to the ownerone-eighth of 2 feet 6 inches of water, to 20 acres, being 2½ times the usual amount supplied for colonies. The owner of the water stock has a pro rata vote in the management of the canal, and the expense per year is $3.75 on a 20-acre lot.

A school-house is to be erected on the land this year, and it has two within two miles of it at present. Fresno, Selma, Fowler and Kingsburg are good local markets for produce. Opportunities to labor with or without teams are abundant, and land can be rented for wheat-growing in the neighborhood. The health of this region is perfection, and, in common with the plains generally, is an excellent sanitarium for persons affected with pulmonary and rheumatic complaints.

The best raisins in the world, wines unsurpassed, the finest grapes, the best peaches, apricots, plums, prunes, nectarines, figs and olives, and in fact all the choicest fruits and vegetables of the world are grown in this favored region. Raisin vines three to six years old yield per acre from four to seven tons, and increase to eleven. Wine grapes three to six years old yield from four to eleven tons per acre. Alfalfa is cut from four to six times a year, and yields from one to two tons per acre at each cutting.

Two good cows and 100 hens furnish more than half the living for a family, and can be kept, with a team, on three acres of alfalfa, the growth of which is incredible in this favorable combination of soil and climate.

A comfortable house for a small family can be built for $150.

The low price, taking into consideration water and transport facilities, should especially recommend this to seekers of homesteads. One-half already sold. The cheapest Colony land in the county, on very easy terms to actual settlers.

☞For further particulars call on or address

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOEBIG—Dear Sir: I have analyzed your sample of **"Nitrogenous Superphosphate,"** with the following result:

Soluble Phosphoric Acid	12.90 per cent
Reverted Phosphoric Acid	.95 "
Insoluble Phosphoric Acid	2.83 "
Potash	2.23 "
Ammonia	1.87 "
Nitric Acid	2.95 "

The above amount of **Nitric Acid** is equal to 0.85 per cent **Ammonia**, therefore, total of Nitrogen calculated as **Ammonia**, 2.72 per cent.

This **Fertilizer** is a **Valuable Manure** for vineyards, orchards, gardens, farms, and I **recommend** its use by the cultivators of the soil **generally**, in **California.** Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the **"Nitrogenous Superphosphate"** Fertilizer, analyzed by him at your request. It is a **high-grade article,** and as such returns the user a better money value than a low-grade fertilizer. It is **especially well** adapted to use in **California,** on account of the **predominance** in it of **Phosphoric Acid,** which is generally in small supply in our soils. Yet it is desirable that **"complete"** fertilizers be used in our orchards and vineyards, and **yours is of that character** in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of **Phosphoric Acid**—the chief element of all plant food—in combination with the necessary quantities of **Potash** and **Ammonia,** and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from ½ pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sobranto, Station of the C. P. R. R., 20 miles north of San Francisco, at $30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

BENICIA THREHING ENGINES!

WITH PATENT FURNACE BOILER.

Maximum Power, with Minimum Space and Weight.

The only Furnace Boiler that will Burn Straw, Wood, Coal or Oil Successfully.

IN USE IN ALL PARTS OF THE COUNTRY. BEST ENGINE and BOILER MANUFACTURED.

In again presenting the Benicia Engine with Patent Furnace Boiler, we do so with full confidence that it is the best the market affords. It is not new or untried. It has been improved during the past few years, until it is now the most perfect, economical and durable engine ever offered to the public. We deem it unnecessary for us to enter into a long and tiresome description of our Engine or call attention to any demerits of others, but we do make the broad claim that for the heavy work of this Coast it HAS NO EQUAL.

Mounted on Patent Iron Wheels, having 6-inch tires; has convenient and substantial brake, and two seats for driver and fireman.

Boiler is made of 5-16-inch "Fire Box," and "C. H. No. 1" best plate iron, having a tensile strength of 62,000 pounds, which insures safety and great strength. Is provided with all necessary hand holes and blow-off cocks, making it convenient for the engineer to keep it clean.

It is the best Portable Boiler and Threshing Engine in the market.

The peculiar construction of the Patent Furnace, which is applicable to all Locomotive Pattern Boilers wherein light or heavy fuel is to be used, such as straw, wood, coal or oil, and perfect combustion required. This object is accomplished by extending the tubes into the upper portion of furnace, securing them in a tube-sheet depending from crown-sheet at a point between the front and rear walls of the furnace. This tube-sheet extends across the furnace and unites with side walls, while the plate beneath that part of furnace extended, and forming the lower crown-sheet, has the form of an inverted arch. The flame is thereby concentrated at both sides of furnace and the heat intensified at the proper places, after which it is directed toward the aperture to meet fuel the instant it is introduced to furnace. This change of direction given to flames allows more time for consuming incandescent fuel usually carried with flame currents when light fuel is used.

We make one size only, No. 6, with 9x10 Inch Cylinder, 25 Horse Power, Price $2300.

In the Crescent City.

The kinship which has sprung up between the Gulf States and California, because of the propinquity in point of time by the Sunset route, warrants us in a passing glance at some of the notable points of interest in New Orleans, the metropolis of the gulf coast. New Orleans figures in a Californian's schedule when he "goes East," it is proving a good market for a number of California products, and in general is entitled to a better acquaintance within our borders.

The engraving on this page is reproduced from Major Truman's work, "From the Crescent City to the Golden Gate," and presents several of the best known municipal establishments and monuments. Following the numbering which the artist has introduced in his sketches, 1 is the Jackson statue; 2, the famous levee, the scene of the immense traffic by water which the city enjoys; 3, the French market of which 5 is an interior view; 4 is a glimpse of the city; 6 is a building of the Jockey club; 7 is the soldiers' monument, and 8 is the statue of Robert E. Lee.

From Major Truman's description of the city, we take this paragraph: The town is built on a crescent-shaped tract of land formed by a bend in the Mississippi river, which has given it the name of the Crescent City. At this point the sun seems to rise west of the river. It was first settled in 1718, by a small French colony, under Bienville, and named in honor of the Duke of Orleans. Commerce was first opened with Great Britain in 1764. The Spanish took possession in 1769. The first Americans settled there in 1789. Louisiana went back to France in 1801. It became the property of the United States in 1803. General Jackson arrived in New Orleans on December 1, 1812, and defeated the British on January 8, 1813. Farragut's fleet, after eight days' fighting, ran past the forts near the mouth of the river in April, 1862, and General Butler took possession of the city a few days later, and New Orleans remained in possession of the Federal army until the close of hostilities. The great riot of September 14, 1874, took place in front of the custom-house, on Canal street, and the Metropolitan police, under General Longstreet, was defeated by the citizens. The population of the city at the last census was 216,000, but it is believed to be upward of 250,000 at present. A large portion of the population are negroes, nearly all of whom speak French. Tens of thousands of whites and blacks speak no other language. Canal street, 140 feet wide, and one of the prettiest boulevards in the country, divides the city into English and French parts. Most of the cemeteries are in the heart of the city, and their dead are buried above ground. The French market is the first place visited by strangers, and occupies several blocks near Jackson square. It was built in 1813, and looks like a rookery. No other such place exists in the world. All nationalities are represented, and all languages may be listened to. Babel was a mere kindergarten compared to this polyglot.

New Orleans is very orderly, and most of the white men and women appear tidy and respectable. It is handsomely lighted all night. The leading newspapers are very newsy and readable. The city takes good care of its indigent and infirm. The fire department is notably efficient. Many of the churches and theaters are very fine. The private residences north of Canal are generally embowered amid orange trees and magnolias, and bespeak comfort and refinement. The people are described as polite and hospitable, and the city a desirable place to visit during the cooler portions of the year.

PRINCIPAL PLACES OF INTEREST IN NEW ORLEANS.

Hon. Wm. A. Wheeler, who was Vice-President of the United States during the Hayes administration, died quietly at his home in Malone, N. Y., on the 4th inst. Mr. Wheeler had been in both branches of the New York Legislature, and served several terms in Congress, before he was chosen to preside over the National Senate in 1877. He was commanding in presence, yet cordial in his manners, and singularly interesting in conversation.

Lassen County Sheep Tax.—The special license tax imposed by Lassen county upon sheep driven into the county for pasturage, has been pronounced unconstitutional by the Supreme Court.

The Fruit Movement Eastward.

Through H. A. Fairbank, secretary of the Fruit Union, who has now his office in Sacramento, we learn that fruit shipping eastward is opening in a promising manner. About a car a day is made up of fruit from Vacaville and Winters, and three cars have gone during the last week with fruit from San Jose, Healdsburg, Napa, Petaluma and San Lorenzo. It is expected that shipments henceforward will multiply fast and that next week two or more cars will be sent each day. Prices so far have been quite satisfactory. The last Pringle apricots did not pay well because others at the same time were sending Royals. A telegram from Chicago dated the 6th inst. reads: "Vacaville cherries, fair, selling at $1.50 to $1.75 and $1.75 to $2 per 10-pound box. Winters Royal apricots selling for $2 per 20-pound box. Seedlings, $1.75 to $2. Weather cooler."

Mr. Blowers' Eastern manager, who is now in New York, writes very encouraging letters. He has made Sgobel & Day agents in that city for the Union. We quote from a recent letter: "I spent some time to-day with Mr. Day inspecting the two auction-houses. If I could be as sanguine as he is about the amount he can sell and the prices the fruit will realize, I should feel that success was ours. The estimate, for instance, which he makes, with the $400 freight rate and 36-hour time from Chicago now obtained to New York, is that he can sell 50 per cent of our total shipments. The *net* prices he named for grapes would be very attractive reading at the end of an account sales, etc. Day considers Baltimore a small market, Philadelphia twice as large, Boston twice as large as both, and New York immense," etc.

With regard to the cherries in New York, Blowers writes: "It seems that although the cherries look well they do not keep, owing to the depth of the basket." This is where they were shipped in crates. The boxes (10 pounds) had carried better.

The general indications favor a considerable help to the fruit-market from Eastern shipments. There does not at present appear any sign of a conflict such as occurred last year, and if this carries through the season, there will be money reaped by the shipment. It is a fortunate thing to have the New York agency in the hands of men who believe something can be done there. It was one of the mysteries of the old regime that it was claimed that New York only wanted a little fruit sifted to them through Chicago, and rather liked paying extortionate prices for it. We shall see what men who believe in great sales can accomplish there.

The State and Mechanics' Fairs.—Efforts are still being made to agree upon dates so that the State and the Mechanics' Institute Fairs shall not coincide. We hope they will succeed in so arranging it.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

The Threlfall Farm, Stanislaus County.

EDITORS PRESS :—In the great central valley of our State, and in the low basins which the rivers choose for their course to the sea, which is almost one vast field of waving, nodding grain, there are many farms that show how surprisingly great are the harvests reaped from these rich wheat centers by the extensive improvements that are being made year by year, and the increased efforts for larger and better crops that reward the labor most gratefully. In the northeast corner of Stanislaus, where the low level of the valley is broken by rolling plains that border the foothills, R. and W. A. Threlfall own one of the largest and most prosperous farms in all that section of the State. It is six miles long by four and a half wide, all inclosed by fence, and is almost entirely cultivated in wheat. The R. Threlfall share contains 15,800 acres, of which 1300 have lately been added, having nine camps; and the W. A. Threlfall share 3000 acres, with three camps, the whole farm having on its southern border six miles of river front on the Stanislaus. Each camp is a general center for the workmen, where blacksmith-shops, sleeping-houses for the men, a few homes for families, huge barns, stacks of straw and all kinds of machinery are grouped together, several of them looking like good-sized villages. Scenes around the different camps are busy and interesting during the harvest season, where are heard the ring of hammers in the shops, the creaking of great derricks, the rumbling of teams and the loud blast of the dinner-horn that calls an army of sunburned harvesters from the thrashers in the hot, glimmering fields.

The different camps on the R. Threlfall place are farmed as follows: At Del Monte and Creek camps, 3000 acres, by R. Threlfall and son; Locust camp, 1500 acres, by John and James Watson; Fagan camp, 1500 acres, Frank Fagan; Sheep camp, 2000 acres, J. and R. Threlfall; Flint camp, 1500 acres, Vernon brothers; River camp, 1000 acres, James McLeod; Carp Lake camp, 800 acres, S. P. Doane; Dudley camp, 1300 acres, Wm. McGinniss. About 60 hands are employed and 240 horses and mules used—all the animals belonging to the renters—which figures are about doubled during the harvest rush. The three camps on the W. A. Threlfall place—Blue Cottage, W. B. Threlfall camp and Middle camp—are farmed by W. A. and W. B. Threlfall, who have about 10 hands employed and 40 horses and mules.

Other Uses of the Land.

A small proportion of the land is used entirely for grazing purposes and for raising hay, and there are also several orchards and gardens which bear well. Mr. R. Threlfall is the owner of over 700 head of cattle, and sheep are kept at the different camps in small bands, for mutton. At nearly all, also, vegetable gardens are planted, and remarkably fine large potatoes are raised for home use.

Although this year there is only a two-thirds crop, owing to the absence of rain, there is a general revival in the way of improvements, 30 miles of cross-fencing having been lately added; and four 18 foot windmills on 50-foot towers have recently arrived from Stockton, to be used at Creek camp for watering stock. At this place a young orchard of several acres adds its bright refreshing green to the golden wheat-grown fields around, and proves that fruit trees will thrive and bear well on this rich-soiled foothill border.

Descriptions of a Few Camps.

The W. A. Threlfall camp is situated on a little flat near the banks of a creek. Back of it are seen the timber-dotted ranges of the foothills in the horizon, and nearer, the fields of standing grain that stretch far out till the falling slopes hide them from view. It is a homelike place, with its neat, comfortable houses, some half covered with fragrant honeysuckles, its barns and large poultry-yard. Mr. W. B. Threlfall has had great success in the poultry business, which he once followed exclusively; but of late years he combines it with farming and finds it even more profitable than before, since the waste wheat left on the fields where the thrashing is done can be used for feed with no expense whatever. The eggs are marketed in Oakdale.

Blue Cottage, belonging to Mr. W. A. Threlfall, is about a mile from the W. B. Threlfall camp, on the public road to Knight's Ferry. Its neat house, windmills and barns are nearly hidden by green fruit trees, and on the northeast stretches the well-known vineyard that produces an abundant crop of many varieties of excellent grapes.

Then there is Creek camp, nearly a mile from Blue Cottage and across the creek, which is the largest of all the camps, and farther on about 2½ miles, Sheep camp is reached, which is also a large place. Mr. James Threlfall and family reside here, and, besides their house, there are sleeping-houses for the men, large barns, shops, etc., and a field inclosed which contains numberless huge stacks of straw that have remained here for years, ready for use when needed. This camp is pleasantly situated, and presents a busy scene at all times of day.

At River camp Mr. James McLeod and family live in a comfortable house on the river-bank. Their location is charming, beneath sheltering oaks and in view of long curves of the brimming river. A magnificent large barn has lately been erected at this camp.

Other camps are large and thriving, showing activity and energy; while the whole farm reminds one of a large and promising colony, planting and building to make the long dry stretches of barren hills bloom like the rose with silvery green seas of bending grain.

Thus the long struggling years that brought lands and implements to the farmers have brought them prosperity as well, with which to build broad and deep the foundations of our vast inland empire of golden wheat.

MAY BLOSSOM DAVIS.

In the Santa Clara Valley of the South.

EDITORS PRESS:—On our way from Bakersfield to Ventura county, over the high Coast Range and down the fast-descending yet long San Francisquito canyon, we enter the Santa Clara valley of the south, near Newhall, Los Angeles county. Santa Clara river rises high up in the mountains, and within a few miles west of Newhall enters Ventura county, extending westwardly until it empties into the ocean, a short distance to the southeast of San Buenaventura.

This valley is justly noted for many valuable and attractive features, such as its fertile soil, its mild climate, its healthfulness, its great variety of products. This portion of the Santa Clara valley affords very many desirable locations for health-seeking families, and the recent building of the coast extension of the S. P. R. R. from Newhall down this valley to San Buenaventura and on toward Santa Barbara has aroused the energies of the people, and marks of industry, thrift and enterprise are seen in every direction.

The valley varies from one to two miles in width till we get as far as Santa Paula; from there on down it widens till it reaches the Saticoy plains, where it spreads out for many miles, embracing the great level country lying between San Buenaventura and Hueneme. In this letter, we will only have reference to that portion which lies above the Sespe river, which is the most considerable tributary of the Santa Clara.

Upon entering the valley opposite Newhall we turn westwardly, passing over miles and miles of most beautiful farming country comprised within the great San Francisco ranch of the Newhall Bros., of S. F., containing in all about 12,000 acres arable land. We stop at the subdivision of 1000 acres now rented by Mr. Robert Dunn, who came from Scotland some 12 months ago. Mr. Dunn last year tried raising potatoes on a small scale. Only one acre planted, from which he raised two crops. The first was planted in April and dug in June. The second in July, and digging finished in the following February. This year 40 acres will be planted to potatoes, 12 of which were put out in March and would be dug some time before the 1st of June. The tubers are large, of excellent quality, and it would appear from the success attending the twice planting of one acre in 1886 that potatoes can here be made a paying crop.

For experiment, Mr. Dunn is this spring planting 20,000 Ramie plants. This will occupy about 10 acres. The Ramie plant is fibrous, and designed for use in the manufacture of fabrics much like silk. This is an interesting and may prove a profitable experiment, and Mr. Dunn promises to report to the RURAL PRESS his success in the undertaking, favorable or otherwise.

At the Camulos Ranch.

Seventeen miles west of Newhall, J. del Valle proprietor, we stop over night and have the satisfaction of looking over the handsomely improved place, with its large, single-storied dwellings, with its spacious porches surrounding three sides of a courtyard, and much in the style of the Mission fathers in use during many generations.

A well-designed flower garden occupies the courtyard. An orange orchard, nearly all composed of seedling trees, of various ages from 7 to 20 years old, still show, among the green boughs, much fruit not yet picked. We notice the very clean appearance of both tree and fruit. There are about 600 trees in bearing, the fruit of good size, sweet and of high flavor. We believe the orange raised here to be as good as the best which we have at any time had the privilege of eating among those native of California.

About 100 lemon trees of the same ages as those of the orange orchard, all seedlings of the Sicily variety, are now in fine bearing, the fruit generally large to very large and reported by Mr. del V. to be of first class. Also about the same number of lime trees, seedlings from what is here called the Mexican lime. Size large, and reported by Mr. del V. to be of high quality, and said to be the largest limes raised in California.

On this ranch are growing about 600 olive trees some 16 or 17 years old and all in fine bearing. A portion of the fruit is picked, and from the balance a very fine oil is extracted. The oil here manufactured is extensively used by the Roman Catholic church, it being first consecrated on Holy Thursday by a bishop, and afterward used by the church in the administration of the sacraments of baptism, confirmation, holy orders and extreme unction. Mr. del V. reports that because of the very fine qualities of the olive oil produced here, he has the furnishing of all the parishes of that church in the United States with olive oil manufactured on the Camulos ranch, and that it is regularly received by their high authorities and distributed to all the parishes according to a system. The olive, from its clean appearance of limb and leaf, its abundant supply of fruit and thrifty growth of wood, seems to be a great success here, and great expectations are entertained for its future in this upper portion of the valley.

About 200 English walnuts, about 20 years old, show a moderate success in the rearing of that fine nut-bearing tree. Further down the valley the walnut proves one of the most remunerative products of the country.

In this valley the almond is said not to be a great success. There are about 400 trees here of both paper and hardshell varieties, but in bearing they are not regular. Mr. del V., however, reports that they are perhaps doing better here than those grown in other parts of the county.

The Home of Ramona.

The Camulos ranch was made famous by Mrs. Helen Jackson (H. H.), who here took many notes for her book *Ramona*. This was the home of Ramona, and Mrs. Jackson's description of it seems wonderfully accurate. A pleasing retirement is afforded by the place, with its seats arranged under ample shades, with its walks ranging between banks of most beautiful flowering shrubs and vines, and handsome orange trees, and further out the graceful olive and stately almond. Still further away to the south, the orchard is terminated as we come to the banks of the Santa Clara, with its willowy fringes, its waters flowing on down their tortuous course, dividing, subdividing, and expanding over its wide beds of shifting sands.

To return to the main building, a few steps to the south, within the precincts of an inclosure composed of post and paling, and under the shades of some of the older trees, stands a small chapel, often in olden times visited by the holy fathers, where the vespers are still duly celebrated by the tolling of a bell and the lighting of the long-established little tapers. At this season of the year we observe the first newly grown, roasting ears of corn, lying on a table not far from the altar, carried there by fair young maidens as an offering of grateful hearts for incoming bountiful harvests so near at hand.

Fruit Ranches.

A few miles further down, near Cienega, on the north side, lives C. H Decker, a thriving farmer, engaged in fruit-raising. His very fine apricot and nectarine trees, richly laden with fruit, betoken the rich gathering in store for him. He has seedling oranges budded on to the Chinese lemon ten years ago, now in good bearing, and promising usefulness. Fruit is of good size and fine flavor. English walnuts, nine years old, are very thrifty, and, without irrigation, have borne two crops. The catkins last year did not set, and so the crop was a failure. The promise is very fine for this season.

While in a country so rich and varied in its products, we note the seemingly curious fact furnished by Mr. Decker that rhubarb cannot here be cultivated successfully.

On the opposite side of the valley and slightly above the last-mentioned place on the slope extending from the banks of the river to the foot of the spurs of the San Fernando range of mountains, we find the residence of Thomas Marple, showing 100 acres valley farming land and 300 in the hills for stock grazing. The soil here, as everywhere in this section of the valley, is sandy, yet very productive. We learn here and at other places inquired of that most fruits succeed excepting the cherry, which we understand to be a failure in most places over this county; the prune, which is here in nearly all places generally a failure, and the almond, which is usually a partial failure; and among the small fruits we may add the gooseberry and currant, which at most places tried do not do well. Mr. del Valle informed us that small fruits have done well at Camulos ranch as far as tried, but no experiments in detail are reported.

Apples, pears, peaches, figs, all flourish and bring handsome returns for industry bestowed. Plums do fairly at most places.

Mr. Marple raises most kinds of fruit. His table and raisin grapes grow luxuriantly and fruit reported most excellent. The vineyard is not a mere matter of experiment in the Santa Clara valley, but an established success. The atmosphere is at the proper season very drying, and raisins are cured to perfection.

At this place we have a beautiful view of the Santa Clara valley from the Camulos ranch, 5 miles above, to Santa Paula, 16 miles below—the range taking in to a considerable extent the railroad traversing the northern side. Within the scope of this view the Santa Clara receives the influx of some important tributaries, including the Piru now above us and the Sespe only a few miles below.

We cannot but reflect what possibilities have been for ages slumbering within the bosom of this valley, and what a brilliant future is just now dawning upon it. We should be glad to know that we might enjoy the privilege of again beholding it, a few years hence, after the changes wrought by the new era, now being ushered in, have transformed our dream of wealth and power into a living reality.

Ventura Co. McD.

THE IRRIGATOR.

A Decision on Ownership of Water.

A decision has just been rendered in the Superior Court of the State of California, in and for the county of Butte, in the case of Irving A. Coonradt vs. George R. Hill, which will be read with interest by irrigators.

This is an action brought by plaintiff, claiming as a riparian proprietor to restrain defendant perpetually from taking a part of the waters of Clear creek, a natural and living stream flowing through the lands of plaintiff, which defendant diverts by means of a certain dam and ditch and carries across plaintiff's land upon his own, for domestic and other useful purposes.

It is unnecessary here to state all the facts as they appear from the evidence, further than such as become pertinent and necessary to point the propositions of law hereinafter discussed, which arise upon them.

The defendant interposed two special defenses, either one of which, if sustained, is determinative of the action: First, an estoppel *in pais*, and second, the Statute of Limitations.

The estoppel is thus plead: "Defendant avers that when he was negotiating for the purchase of his said land, the S. W. ¼ of Sec. 23 aforesaid, and for said ditch appurtenant thereto, and before he had paid the purchase price thereof, knowing and believing that said land was of little value without said ditch and water right, and knowing that said ditch crossed the land of said plaintiff, he went to said plaintiff and asked him if he, the said plaintiff, claimed any interest in said ditch or water right, and stated to him that if he did, he, said defendant, would not purchase said land; that the said plaintiff thereupon replied to and assured this defendant that he did not claim any interest in said ditch or water right; that this defendant had no means of knowing such fact other than asking plaintiff; that he believed what plaintiff said and relied upon it, and on that belief and acting on that assurance, he went on and purchased the said land and ditch and water right, and paid a full and valuable consideration therefor, and that he did so by reason of plaintiff's said disclaimer to him of any interest in or claim to the said ditch and water right; that had it not been for plaintiff's said disclaimer defendant would not have purchased or paid for said property."

These facts so alleged are clearly and satisfactorily sustained by evidence in which there is substantially no conflict, and the only question then is, are they sufficient to constitute an estoppel as against plaintiff in now asserting title or right to said ditch and water right? I certainly think they are. While courts are not ready in sustaining this defense, which closes a man's mouth from asserting title to his property in the enjoyment of another, excepting in a case where the party invoking it brings himself within the strict definition of the rule, the facts here to my mind make this such a case, and call for the application of this equitable doctrine.

The evidence shows that plaintiff, when he made the alleged declarations, was aware of all the facts affecting his rights in the premises, and knew that the defendant was seeking information upon which he intended to rely and act in determining whether to purchase. And he knew that the knowledge sought was peculiarly within his own breast, and that there was no other means by which the defendant could ascertain the fact. And knowing that his statements and declarations would influence the conduct of the defendant in the premises, it is to be presumed that they were made by him with that intention. The defendant having relied upon and acted upon such declarations, and by reason thereof being now in a situation where he will be prejudiced by allowing their truth to be disproved, the plaintiff will not be heard to assert them false to his own advantage. * * * *

It is contended by plaintiff that his declarations cannot operate as an estoppel, because it appears that while he was acquainted with the facts concerning which the declarations were made, he was ignorant of the law applicable to those facts and his legal rights flowing therefrom. But I do not think the contention tenable. A party will not be protected under such circumstances by his ignorance of the law governing his rights. Such knowledge was perfectly accessible to him and it was his duty, at his own peril, to inform himself before inducing others to their injury.

It was further contended by the plaintiff that the defendant is not in a position to assert either of the defenses relied upon by him by reason of the fact that the deed from defendant's grantor, who has established the ditch and water right, did not in terms conclude or purport to convey said ditch and water right, and that consequently the title thereto never passed to defendant thereunder. But the evidence in the case shows beyond controversy, and I must so find, that at the date of the defendant's purchase this ditch and water right was an established and essential incident to the full and beneficial enjoyment of the land, for the purpose for which it was used. Under such circumstances the authorities fully sustain the proposition of defendant that the ditch and water right was an appurtenance and passed as

such with the land—not being reserved. These conclusions are sufficient to dispose of the case, but it may not be improper to add that, in my judgment, the plea of the Statute of Limitations must also prevail in this case.

The evidence shows that defendant's predecessor in interest dug and established this ditch and water right in the year 1875, and thereafter, from that time down to the commencement of this action, said grantor of defendant, and the latter after him, with the knowledge of plaintiff, have continuously and uninterruptedly held possession of, claimed title to and used said ditch and water right, openly, notoriously, adversely and peaceably as against all the world, down to the date of this action, on July 14, 1886.

This is sufficient to invest defendant with title. Where one has "the continued, uninterrupted and adverse enjoyment of the watercourse, or of the same certain portion of it, during the period limited by the Statute of Limitations for entry upon lands, the law will presume a grant of the right so held and enjoyed by him."

I understood plaintiff at the argument to make the point that under Lux vs. Haggin there is no such a thing as the acquisition of a prescriptive right to the adverse use of water as against a riparian proprietor. But that case does not hold any such doctrine. On the contrary, the potency of title by prescription, or adverse user for such a period as prescribed by the Statute of Limitations to bar recovery, is distinctly recognized in the exhaustive opinion of the court on the subject of riparian rights. The plaintiff further objects that the defense of the Statute of Limitations was not made out, because it appears from the evidence that the defendant has never paid taxes on said ditch and water right. Sec. 325 C. C. P. provides "that in no case shall adverse possession be considered established under the provisions of any section or sections of this code," except that it be shown that the party relying upon its provisions has paid all taxes, "*which have been levied and assessed* upon said land," and it will be conceded that this proposition applies to property of the character of that in suit. The evidence shows that this ditch and water right never have been assessed for taxes at all, as such; that the assessor had already assessed the lands of both plaintiff and defendant over which it runs without reference to ditch or water right, by description or otherwise, and each owner has paid the taxes upon his respective holding without regard to the ditch.

It thus appears that no taxes have ever been "levied or assessed" against this property. Under such circumstances was the defendant called upon to pay any in order to perfect his right under the statute? I think not. Plaintiff contended in effect that it was the duty of the defendant to see that the property was assessed and then pay the tax. But it is not the theory of the law, nor is it in accord with our observation of its administration, that the taxpayer hunts up the assessor to insist that he do his duty in that regard. The defendant, I think, could safely rest upon the presumption which the law indulges, that its officers perform those things with which it charges them and waits for the assessor to come around, and the partial failure in this instance of the familiar saying that "there is nothing surer than death and taxes" does not in my judgment defeat this defense. Nor can it make any difference if it be conceded that this ditch is of the character of those included in Sec. 3663 Pol. Code which makes it the duty of the assessor to assess them separately. No tax having been levied or assessed against, the defendant was not called upon to pay any. This conclusion I believe to be in accord with Ross vs. Evans, 65 Cal., 439.

Conclusions of Law.

1. That defendant is the owner of said ditch and water right and that plaintiff has no claim in or to the same.
2. That plaintiff is estopped from claiming said ditch and water right and from bringing this action, and from attempting in any manner to interfere with defendant in the use and enjoyment of said ditch and water right.
3. That plaintiff take nothing by his said action and that his complaint herein shall be dismissed on its merits.
4. That defendant have judgment against plaintiff for costs.

Let judgment be entered accordingly.

W. C. VAN FLEET, Judge.

THE STOCK YARD.

Our Beef Supply.

In last week's RURAL we gave an extract from a letter of G. M. D., of Sacramento, to the *Sagebrush Stockman*, on the beef outlook on this coast. The following are the closing paragraphs of the letter:

It is a well-known fact that our beef is not equal to the Eastern corn-fed product. Our Eastern immigrant wants good beef, with good climate, fruit and wine. There is already a scarcity of good beef at Los Angeles, caused by the increased demand for that article to supply the large influx of Eastern people brought there since the development of the boom. These are questions of considerable importance to the cattle interest on the Pacific slope, and their successful answer means prosperity and vast development for an important and necessary industry.

When the great country between the Sierra range and the Pacific ocean is settled up, as it soon will be, with a population as numerous as in Los Angeles county to-day, and chiefly engaged, as they will be, in fruit-raising, where will they get their supply of beef? The present supply will have to be doubled, at least, and how can it be done? Certainly not by continued overcrowding of the ranges or by raising a class of cattle whose steers must attain three years of age before fit for market.

That there will be a vastly increased demand and better prices is evident. But how can this increased demand best be met by a corresponding increase of product? I answer: Chiefly by pursuing two methods.

First—By increasing the supply of beef-producing food and radically changing the present methods of grazing and feeding.

Second—By rapidly improving the quality of our herds until they are developed to the highest point of rapid growth and early maturity.

If it is true, as stated, that our available ranges are already nearly, if not quite, fully stocked, we cannot expect to increase our annual beef product without providing by some means for an increase of our beef-producing and fattening foods, and that can be done only by raising alfalfa, grain and root crops on our fertile valley lands, upon which water can be got; and our coast has a wide extent of such productive soil, which at present produces but a small percentage of what it is capable of producing.

This method, however, involves a radical change in the methods of stock raising now in vogue here. Our ranges must be devoted exclusively to breeding and raising the young animal, and as soon as such animal has attained a certain available age, he must be placed in feeding-pens, to be matured and fattened into a ripe steer ready for slaughter.

The wise and far-seeing cattleman here to-day is the one who, in addition to his well-stocked range, provides in some one of the fertile, water-blessed valleys a ranch where he can produce sufficient food to mature and fatten his annual product of young steers. Such men will hold in hand both ends and the middle of the string, and can safely count upon a remunerative profit. The rangeman who sticks to present methods exclusively will then, when brought into competition with the progressive feeder and breeder, find his steers selling at a price far below that his neighbor can command.

The rangemen of the Territories east of the Rocky mountains are now rapidly adopting a similar method. They are combining and building vast feeding-pens in the heart of the corn-belt of Nebraska and Kansas, and place each season in these pens their annual product of steers produced on the range, and there feed them hay and corn until ripe for market.

It has been discovered that the average range-fattened steer has a poor show in market beside one of these ripe, well-fed steers.

This method is practicable here, for our alfalfa is fattening, while the Nebraska and Kansas hay is not, and our lands will produce tons to the acre of the various root crops, which nearly equal corn as fat-producing food. But this method cannot be profitably followed if the three-year-old steers at present produced on our ranges are to be placed in the feeding-pens, for the time and food consumed in placing mature steers of this age on the market will cut off all advantages otherwise gained. A better grade of cattle must be produced, which can be made as heavy and fat at two years of age as the present product is at three.

It is a fact susceptible of demonstration that if we can so improve our herds, we can turn off steers at two years of age equal in weight to the present three-year-olds. We have thus increased the annual product of beef just one-third, for the same food that will mature two steers in three years, in one instance, will mature three steers in the other, and the owner has made his capital pay as much in two years as it now pays in three—a double saving, you see. Thus he may be content with even a smaller margin of profit on each individual steer developed and placed on the market.

Let no cattleman think, however, that this is purely a question of feeding, and that he can attain these results by merely pen-feeding his present common stock. To succeed he must have and produce a highbred, rapid-growing, early maturing grade of cattle; and these once secured, the problem then resolves itself down to a mere question of judicious feeding.

A well-known cattle-breeder and feeder in Illinois now turns off all his steers fully matured as beef when from 24 to 30 months old, and they are made to weigh at the Chicago stockyards from 1400 to 1700 pounds a head, and many of them have been sold for export alive to England. His steers are a very high grade of a well-known breed of beef cattle, and to attain the above great weight at such an early age, they are forced by careful feeding from the time they are weaned as calves until matured as above. His beef product brings the highest price in the market, and that he is receiving a remunerative profit is evidenced by the fact that he steadily follows the method. He claims, and science proves it to be true, that an 18-month-old steer placed in the pens will show a greater daily increase in weight on a given quantity of food than with a steer placed in the pens when from 30 to 36 months old, for the younger animal has little waste of tissue, and the preponderance of food-supply goes to growth, and, if in sufficient supply, to fat, also; while in the older animal a certain portion of the food-supply goes to supply the waste of tissue, and is thus lost to the owner and feeder.

The steers above referred to as the result of this method are beauties to look upon, and no such beef has ever been produced on the Pacific Slope; but it can be, and will be produced in the near future, and it will find awaiting it a good demand at good prices.

How our herds can best be bred up to a point which will enable us to produce steers which may be thus early matured is a very important question. There are several plans of action which, if faithfully followed, will give the desired result, and cattle-breeders will probably never fully agree as to the best method; but in my next article I propose to indicate a good way and show what special breed of cattle offer the greatest promise.

I know from personal experience that good breeding pays, for I have for successive years sold to Nebraska feeders two-year-old high-grade steers off the range for as much and more money than my neighbors obtained for their common-bred three and four-year-olds.

THE DAIRY.

A Contra Costa Butter Dairy.

The editor of the Antioch *Ledger* recently visited a dairy ranch in his neighborhood, and as the establishment is operated upon the most approved methods and with the latest improved dairy machinery, we quote a part of the description as follows:

It was the early morning hour while the tide served, and Mr. T. L. Walker was the boatman that rowed us over to Winter's island. We clambered up a rather steep bank and found ourselves almost at the doorstep of the house and Mrs. Walker waiting to receive us. The milking was already well under way and the great 30-gallon can into which the new milk is first strained was rapidly filling. Mr. Walker caught his horse—the only one in the State he claims that can successfully operate a power similar to the one used—blindfolded it, arranged the De Lavel cream separator, and the whirr began that tells of rapidly driven machinery. When the motion had been kept up for some time and had thus without heat attained its maximum velocity, 6500 revolutions per minute, the eight gallon can from which the separator is fed was filled and the work of "raising the cream" begun. Very swiftly around the center of the conical chamber an apparent wall of alabaster was formed, for the rapid movement prevented any portion of the fluid falling to the center, and from the upper tube the yellow cream came forth accompanied by a wind that sprayed and cooled it, while from a lower tube, in another direction, the warm milk passed into a great tank, from which it was taken still warm and fed to the calves.

It was nine o'clock when the milking was done, and half an hour later the cream had all been separated from the milk, and the great can of yellow cream carried away to await its turn at the churn.

On the table in the butter-room a great heap of fragrant, golden butter of yesterday's churning was awaiting the final manipulation and segregation into two-pound rolls. During the time that this work was going forward an immense box hung upon uprights in the milk-room, which Mr. Walker insists upon mis-naming a churn, had received a large quantity of cream, and being tightly closed was connected with the power, and with great thuds began to revolve and continued to revolve for something like 30 minutes, when it was found that its contents was no longer cream, but a mass of golden butter and a small quantity of milk. The milk was drawn off and the butter washed until the water came off perfectly clear. Taken out and weighed—for everything is reduced to an exact science here, and there is no guesswork about anything—and found to be 48 pounds, "Two pounds short," said Mr. Walker, "there should have been 50"—it was carried to the butter-room and salted, the salt also being weighed.

The butter is placed upon an inclined plane and worked with a long corrugated roller, one end of which is fastened to the table and the other handled by the butter-maker. Sometimes the man's entire weight was required to press down the solid mass of butter under the roller. During no part of the process does the hand of the worker come in contact with the cream or butter. All manipulation, where any is necessary, is done by means of ladles of hardwood. The machinery employed is the De Lavel cream separator, an immense box-churn and an ordinary horse-power, with certain belts and wheels by which the desired speed is obtained. The separator is a wonderful exponent of the long years required to crystallize a well-known fact into a simple machine as perfect as nature's own. In one corner of the butter-room we noticed a monumental pile of discarded milk pans, commemorative of the slow and uncertain process of raising cream which Mr. Walker discarded three years ago. He then purchased the separator which he now uses—the first in the State—and which he has used continually since. The work it performs has been perfectly satisfactory and no repairs have been necessary during the entire period, though the speed at which it is driven is almost incomprehensible.

Mr. Walker now has about 90 milch cows at the island ranch. Three men are employed at present, and in a very great measure the success of the dairy depends on their skill and intelligence. They are natives of Switzerland, accustomed from childhood to dairy work. Their patience and deftness in their various departments was pleasant to witness, and could only be the result of long custom.

Mr. Walker's weekly shipment of butter is about 400 pounds, for which he receives the highest market price. During the winter he removes his dairy to his ranch in the hills near Stewartville, where he still has a herd of young cattle and horses.

THE FIELD.

Uses of the Mule.

The editor of the Willamette *Farmer* writes the following practical essay on the mule: A year ago we had horses at work, and by accident and disease buried three good animals, leaving only a young mare and her yearling filly. These were good animals, and by advertising a wish to exchange, we traded off the two for a good pair of mules, in their prime. They were not large, but were low-built and fair size, and could haul a cord of wood or do any ordinary farmwork. It was a good trade for us, as it proved, and an excellent one for the Polk county farmer who wished to quit plowing for wheat and raise stock. He now has three choice animals, all females, and soon his mules will result in a band of good stock, rapidly increasing. Another year there should be two colts, making five head in all, and wheat-growing would not yield him the increase he will have from the mare and filly.

But our point now is as to value of mules as a team for farmwork. In many years we have never had work done as satisfactorily as since these low-built mules have been passing under the limbs of the orchard trees. They work single, as well, and though not near the size of the horses we lost, one of them manages to pull a 14-inch plow, set to go about ten inches, and we plow up to the tree, so that the unplowed strip is only 10 to 12 inches wide. Not only have they proved useful as workers, but they have been economical feeders. It certainly has not cost much, if any, more than one-half to feed these mules than it did to feed the horses we used to have. Another fact is their hardiness and endurance. On much less feed, and few—much less—oats, a mule will outwalk a horse, and he cannot well be overworked, because he won't be. Pull a heavy load on a hill, or a plow in the furrow, and when the mule wants to stop, and knows he ought to rest, he will have his rest whether or no. That is a good quality, for the best horse we had died of overwork, but history does not tell when a mule ever did.

Take the mule, in all shapes and conditions, and he is basely slandered. Our mules never offer to kick and are as gentle as need be. They are tough on the bit and start when they get ready, but when they do start they keep going and are really a fast plowing team. We would not trade these little mules, for orchard work, and ordinary farm work, for the finest team in Oregon. It is true that the mule's ears are sizeable and his idea of vocal effort is apt to be parodied by the small boy, and at times by the humorous bray of older growth. When we occasionally ride Barney through the streets of our capital city, or drive him in the cart on some business trip, our friends and their small boys make fraudulent attempts at riot, flapping their hands above their heads for ears, and are seized with a desire to imitate Barney's guffaw talents. We follow his example and ignore these efforts, for we find the mule usually more dignified than his imitators.

Really and truly, leaving the question of beauty and vocal performance out of the question, we wonder why people don't raise more mules for work teams. They are more long-lived than horses; less subject to disease; cost less to keep and are more tractable and serviceable. We see a few teams of mules, but not one where there should be a hundred. They command a fair price and deserve to be well appreciated, because you can let a reckless hand, who might ruin the temper and habits of a spirited horse, drive your mules in perfect confidence that they will hold their own. There are, truly, many hired men who impose on animals, and it is some comfort to let such have a team that cannot well be imposed on. The mule deserves good treatment, of course, as does every animal that works for man, but the mule can get along with abusive teamsters far more comfortably than can a high-spirited horse that an ill-tempered man would soon goad to frenzy or make sullen and balky. Mules are neglected here in Oregon, and in this whole region, and we commend the fact to attention of breeders as well as to those needing teams, that in all matters of utility and economy, long life and endurance, the mule is the animal for the farmer's or teamster's work, and especially the poor man's friend.

NATURAL LUBRICATING OIL.—A well bored at Herscher, Illinois, to secure water for stock, throws out a barrel of dark-brown oil each day. Experts from Pennsylvania pronounce it fine lubricating oil, worth $9 per barrel, and have leased land to sink several wells.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

On Southern California.

At Temescal Grange last Saturday, much of the evening was spent in listening to an account given by Brother W. B. Ewer, A. M., of his late visit to Southern California. After describing some of the wonderful changes and great progress made in the "march of improvement" in various parts of Southern California, he explained some of the causes of its rapid advancement.

Brother Ewer thinks that the lot selling business has been carried to most ridiculous excess in many places; on the other hand, many parts of the country, which are the very best adapted to orange and lemon culture, he does not believe overrated in value. Perhaps the most interesting part of the exercises consisted in the questions put to and answered by the speaker, giving the whole proceedings a social and homelike aspect.

In reply to a question as to how the people of Southern California stand on the riparian and appropriation question, he stated that they were almost universally in favor of irrigation or appropriation; that the problem was more nearly settled in that section than in many other parts of the State, from the fact that a large proportion of the water was already appropriated, and nearly all that has been appropriated is owned with the land.

Speaking of cold storage for fruit, which has been tested more extensively in Riverside than elsewhere, Brother Ewer was confident that that system alone would add millions of wealth to the land for citrus-fruit growing. So far as tested, it is apparent that citrus fruits will keep better after cold storage, when transported, than fruit which has not gone through the process; that lemons especially are greatly benefited by the treatment.

Brother Ewer does not think that the time has arrived for the making of a new State out of Southern California, nor that many, if any, people desire a new State, except politicians and others who would be willing to sacrifice themselves to holding the extra offices which would result from the division of our present glorious State of California. He believes, however, that the tidal wave of immigration, which has been of so much advantage to Southern California, and has already begun to benefit Central and Northern California, will continue for some time, and result in doubling the population of the State within a few years.

Brother Ewer visited Dr. Ezra S. Carr and Mrs. Carr at their home, "Carmelita," in Pasadena, and reports Dr. Carr far stronger in body and mind than he had seen him for many years. The doctor has lost none of his love for the Grange, its aims and objects for the elevation of our fellow-men and women, and would, no doubt, be glad to see and entertain every brother of the Grange at his very genial and hospitable home.

Sister Jeanne Carr was absent, enjoying a much-needed rest, by way of a leisure journey to other parts of Southern California. Bro. Ewer verifies the report that they had been offered $250,000 for their land, consisting of some 20 acres, a portion of which is almost in the very heart of the town or city (which it is becoming) of Pasadena. He was not slow in advising the Dr. to secure the benefits of such a grand offer. Since that time, it is reported on good authority, Bro. and Sister Carr have been offered $275,000 for their whole property. They are inclined to sell a portion, but have no desire to sell themselves out of the beautiful home which they have so long struggled for, and naturally hope to enjoy throughout the rest of their lives.

Brothers Sewell, Goodenough and others made statements and recited humorous incidents, which helped make the occasion both interesting and lively. Sister Brooks gave an entertaining report of a recent visit to Eden Grange.

On motion of Brother Kelsey, the representatives of Temescal Grange were instructed to vote in favor of increasing the per capita dues to the State Grange from 10 to 20 cents per quarter.

Sister Dewey, W. L, read a humorous article on "Laziness," which was well received.

Sister R. M. Jones, from Chico, on a visit to her father, W. Renwick, was present, and received hearty congratulations upon the appointment of her husband, by President Cleveland, as Postmaster of Chico.

The next meeting of this Grange occurs Saturday, June 18th, at 2 P. M., to which all sojourning Patrons are invited.

Danville Thanks the Orator.

EDITORS PRESS:—The following was unanimously passed by Danville Grange:

Resolved, That the thanks of the Grange are hereby tendered to Dr. McKaig, for his able and pertinent address, delivered at the Danville picnic May 7th. C. R. GLASS, Sec'y pro tem.

San Ramon, June 5, 1887.

BRO. J. C. MARSH, of Placerville, has been appointed by W. M., Johnston, District Lecturer for El Dorado county.

Oregon State Grange.

At the late session of the State Grange of Oregon, the following preamble and resolution was adopted:

WHEREAS, It is reported in the public prints that the railroads of this State are violating the statute of this State known as the Hoult law, by charging more for a shorter than a longer haul, therefore be it

Resolved, That it is the duty of the Railroad Commission established by this State to inquire into this violation of the law and endeavor to have the law obeyed; also that it is the duty of said commission to generally inquire into the general management of the railroads of this State, and that said commission should do so of its own motion, without waiting for complaints from citizens who may be aggrieved.

The Committee on Agricultural College reported, regretting that the present agricultural college was so only in name, and recommending that the matter be carefully worked for until it was in correct shape.

The Committee on Good of the Order commended the principles enunciated in the Cincinnati labor platform, and pledged the cooperation of the Grange in advancing the cause of the laboring classes.

On a resolution as to aliens procuring land in this country, it was recommended that laws be passed forbidding the acquiring of titles by aliens.

On a resolution from J. D. Chitwood, advocating the postal banking system, it was advised that the matter be referred to the subordinate Granges and discussed, all of which was adopted by the Grange.

The report of the Committee on Education embraced the levying and distributing of a sufficient tax to give a free school to all children, the teaching of the effects of alcohol on the human system in the public schools, and the forbidding of the use of tobacco on schoolgrounds. The Grange adopted the report.

The closing session was devoted to conferring the Pomona degree upon a class of 37, and discussing a sumptuous Harvest Feast.

Wheatland's Festival.

The strawberry and ice-cream festival given by Wheatland Grange Saturday, May 28 h, was attended by goodly delegations from Lincoln and Yuba City Granges, as well as a number of visitors from Marysville, and according to all accounts proved a decided success. The *Sutter Farmer* speaks particularly of the decorations of the hall, which consisted of the products of the farm, orchard and garden—splendid specimens of their kind. There was wheat, by several parties, showing as fine, large heads and filling as ever was seen; barley and oats ditto, and the floral exhibit was magnificent; but the object of most attraction and admiration stood in the center of the hall and was composed of a little of everything in the vegetable kingdom—from onions to roses, and potatoes to cherries—all stuck together like the showman's "happy family," the whole bunch (or bouquet) measuring about 30 inches in diameter.

When he came to the work of the good sisters in the culinary department, Bro. Ohleyer waxed enthusiastic—thus: "The invitation mentioned only the 'Annual ice-cream festival,' but that was the least part of the menu. There was roast and fried chicken and chicken-pie, cold ham and a salad we never saw equaled, pies and cake in endless variety, together with strawberry shortcake, and O, what angel food! All this and more, shored up with tea and coffee, the whole making one of the grandest feasts ever set before a sharp and healthy appetite. After the repast, an attempt at oratory was made by D. A. Ostrom, C. P. Berry, Hugh Morrison, B. F. Frisbie, F. R. Lofton and others, and these were interspersed with vocal and instrumental music and choice declamations by the younger members of the Grange, showing talent and application rarely met with in impromptu gatherings."

Santa Rosa's Anniversary.

Brother Flint, W. L. S. G., attended the annual celebration of Santa Rosa Grange, May 28th, and has given a roseate report thereof in the *Patron*. The address of welcome, by Bro. Coulter, was felicitously given, and beside the literary program published in advance, W. M., Davis, having "corraled" some ten Masters and Past Masters in the rear of his desk, where they could not slip away, called upon them one after another, and got capital responses.

Bro. Flint commends especially two things about this Grange—that they have a lady Overseer, and that they open and close the Grange without depending on their books. He speaks in warm terms of the hospitalities extended him by the sisters in general, and Bro. E. W. Davis and wife in particular, and predicts a season of great enjoyment to those who attend the next State Grange.

BENEFIT TO EDEN GRANGE.—Miss Roxy Dennis, of Mt. Eden, assisted by Miss Ellen Coursen and other San Francisco talent, will give a grand benefit concert to Eden Grange at Oakes' hall, Haywards, on Saturday evening, June 25th. After the music there is to be dancing till midnight. Tickets (only 50 cents) can be had of Miss Dennis or members of Eden Grange, or at the door. We hope there will be a large turn-out on this pleasant occasion.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

Farmers in the past have given by far the greater proportion of their thought and time to the growing of crops, leaving the matter of sale and distribution almost entirely in the hands of others. But since the advent of the Grange, farmers are coming to learn that it is just as much a part of their business to sell a crop as it is to raise it. "To calculate intelligently upon probabilities" and "To open out the channels in nature's great arteries that the life-blood of commerce may flow freely," are a part of the Grange "Declaration of Purposes." Much has been done by local and State Granges in the matter of local markets and business at great commercial centers, and the National Grange, representing as it does the farmers of the whole country, has for several years carefully discussed the reports of its Committee upon Transportation and Commercial Relations.

At the last session of the National Grange, at Philadelphia, November, 1886, the Committee on Transportation and Commercial Relations, through its chairman, Leonard Rhone, of Pennsylvania, offered as a part of their report, which was adopted, the following:

"The importance of our commercial relations cannot be overestimated, nor can the duty of Congressional supervision over the commercial interests of the United States be questioned.

"With our vast area of cultivated and uncultivated lands and improved machinery, our possibilities of production are practically unlimited. It has been proven, however, that unlimited production is not, necessarily, prosperity. Hence it is of equal importance that the same care should be exercised in securing the profitable distribution of products as obtains in their production.

"Our country with her production of 450,000,000 bushels of wheat, without a market, is not so prosperous as she has been with a crop of 350,000,000 with a market. The question arises: What are our farmers to do with their surplus of 100,000,000 bushels, and indeed, with the many other products of which we have a surplus, and for which we have no market at home? Are we to go on blindly, in unlimited production, without reward, or can we, by intelligent and unbiased investigation, discover and establish a policy sufficiently liberal to enable the American farmer to dispose of his surplus products, for which there is a demand abroad and none at home? That the present policy of the United States Government is hostile to American agriculture is fully evidenced by the unfriendly attitude of the great nations of the world in their commercial intercourse with us. We see remote parts of the world, although only experimenting, as it were, in certain lines of agriculture, slowly but surely driving us from our long-established markets, while other States have closed their ports against some of our most valuable products. * * *

"May we not, however, appeal to every member of our Order to cast aside every prejudice, and examine the question from a purely agricultural standpoint? Although class in its character, it is yet in harmony in its results with the fundamental doctrines of the Grange—'The greatest good to the greatest number,' and consequently to the majority of the people of our country. The National Government has done comparatively nothing for our great industry in production, and less, if possible, in distribution. * * *

"Therefore, be it

"*Resolved*, That the National Grange, through its legislative committee, appear before Congress and urge an intelligent revision of all laws touching our commercial relations, and thus secure to the American farmer an outlet for his surplus products."

The farmer is the only conservative in any community. His interests are indissolubly connected with the soil which he tills. Through all changes of Government his lands remain. The capitalist, with his stocks and his bonds, has no such interest in the perpetuity and integrity of good government as have the agriculturists. He can transfer the contents of his vaults and money-chests from continent to continent in ten days' notice. If revolution and anarchy impend, he discerns the coming storm and transports his movables to happier shores. But the barns and granaries, the flocks and herds and lands of the husbandman, cannot be so converted and transferred. These remain to be burned and plundered and despoiled. Hence the farmer has a stake in the existence of civil government which the mere capitalist and broker has not. And if there be one debt, one obligation, which you owe greater than all others, paramount to all others, it is that you educate your sons to maintain and conserve and transmit the institutions which you have inherited, the wealth which you have created, the heritage of freedom which you have defended. —*President Patterson, of the Kentucky Agricultural College, at the Kentucky State Grange.*

It is quite reasonable to suppose that every farmer desires to better his condition, relieve himself of burdens that are unjustly saddled upon him, and realize something from labor. * * What is needed is a thorough organization and intelligent direction. How is it to be had? The farmer's club, though very good in itself, is far from meeting the requirements of the hour. The discussion of the succession of crops, the raising of stock and the application of fertilizers, all important topics, we concede, but not the real subject at issue, consume the time of the club. The farmers' institute, one of the best places in the world for airing pet theories and riding darling hobbies, also leaves the vital question unsolved. We must look somewhere else for relief, and there is only one source of help left. The Grange fills the bill, if that form of expression is admissible, and to its standard let the farmers gather from every nook and corner of our broad land. Bury all partisan differences, turn your back upon party leaders, think, act and vote for your own interests, and you can secure all you desire. Dissensions among farmers themselves render spoliation possible and profitable.—*Virginia Granger, Portsmouth, Va.*

In many Granges it has grown to be a regular annual custom to have in June, "pleasantest month of all the year," a floral meeting. Flora being the presiding officer, an exhibition of flowers held, hall, grounds and tables decorated with floral displays. The discussions consisting of flowers and home adornment, readings, essays, etc., on the same subject. The children of the Grange families and others in the neighborhood often take part, and all enjoy a respite from the busy "planting" season, and take up their summer's work with minds and bodies rested and better because of the meeting.

PROGRESS.—New Granges in Maine, New Hampshire, Pennsylvania and Texas.

One of the Subordinate Granges in Maine has a lady for Master, with an excellent record for the past year. The membership has been increased to over 200, embracing the best citizens of the place and its vicinity. Their store, with a trade of upward of $1000 a month, has done a profitable business. They have also erected a large building to be used for store and hall, which is nearly completed, and will be ready for occupancy in the early spring.

Church Hill Grange, Kentucky, held its eighth annual stock sale on Friday, May 27, 1887. About 200 head of cattle were on sale, mostly registered Shorthorn and grazing stock. Hon. J. H. Brigham, Master of the Ohio State Grange, delivered a public address to the large gathering of farmers who were present.

By a vote of the Legislature, the Master of the North Carolina State Grange has been again elected a member of the State Board of Agriculture.

"The Courage of His Convictions."

EDITORS PRESS:—With your permission I would say to your readers that I think one great obstruction of temperance work is an underestimate of general temperance sentiment. I seldom hear people say that, personally, *they* are not ready for prohibition; but many say "the people" are not ready for it yet. So they are waiting for the people to be "educated up" to where they stand; whereas the very people they wait for are also waiting for them. The waiting is reciprocal, but not at all promotive of progress.

Those who have changed their views or positions on temperance questions are, of course, the first to know of that change, and are sometimes quite slow to report it—and also slow to learn that others have changed as much as themselves. I have seen tests taken, with a view of ascertaining the general temperance sentiment of certain localities, that were a perfect surprise in results, showing that a community may be ready for an advance step before they know it.

I would here suggest to temperance workers that when they hear men say, "The people are not ready for prohibition," they carefully inquire of such whether they themselves are ready. I will venture the opinion that in nine cases out of ten they will report themselves ready, but waiting for the people to become ready.

Many temperance people have great fear of the results of an unsuccessful reformatory effort—they are overstocked with prudence, like the careful mother who would not have her boy go into the water till he had learned to swim. If all this class of prudent temperance people had for the last 50 years worked and voted for what they thought right, instead of what they thought the people were ready for, every licensed grogshop in the land would have been closed ere this. Let every one do *his* part, without waiting for others, and the work will soon be done. OLD WORKER.

Lodi Grange on Suffrage.

After having the Woman Suffrage question under consideration two months, Lodi Grange adopted the following, May 18th:

Resolved, That we favor extending the rights of suffrage to all persons of sound mind in the United States, without regard to sex (Chinese excepted), with the following restrictions, viz.: That all voters should be of the age of 21 years, and shall have resided in the United States five years, and become naturalized citizens, and shall understand the principles of a republican form of government; also be able to read and write; and

Resolved, Further, that all persons, to be entitled to vote, shall have a property qualification of not less than $200, or can show a receipt as having paid a poll-tax in the last year.

ZEITSKA INSTITUTE.—A large and fashionable audience greeted the pupils of Zeitska Institute at Metropolitan hall last Saturday evening, on the occasion of the graduating exercises. The participants in the exercises were the recipients of many beautiful floral tributes. At the close of a well-rendered literary program, Gen. O. O. Howard presented diplomas to the graduates. The graduates were: Miss Emma Kohn, Miss Lorene Ackerman, Miss Adele Dannenbaum, Miss Lily Behrendt, Miss Estelle Hellman, Miss Hilda Berwin and Miss Russelle Ward. Extra prizes were awarded to successful pupils as follows: Senior gold medal, Miss Emma Kohn. For the past two years this young lady has won the above medal. Junior class gold medal, Miss Rosa Steinhart; intermediate silver medal, Miss Hilda Steinhart; elementary silver medal, Miss Aimee Steinhart. An especial gold medal, given by Prof. Carl Eisenshimel, for drawing, Miss Emma Kohn.

THE OAKS.—Miss Tracy's school in Oakland, "The Oaks," closed last week with an evening "At Home." The year 1887–88 will begin on the last Wednesday in July. The school is located in one of the most picturesque spots in the "City of Oaks," being at the same time in a very central location. Ample, well-shaded grounds surround the commodious buildings. Miss Tracy is widely and favorably known among the educators of this State. A notice of the school appears on the educational page.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

VARIOUS CROPS.—Livermore *Herald*, June 2: Livermore is supposed to be a little dryer than the rest of the country, but there are more good-looking pieces of grain in this valley than in any other parts of the county.....Recent estimates place the hay crop of this section considerably higher than those of the early part of last month. The cool weather brought out the volunteer, while much grain has proved so foul with wild oats as to be more valuable for hay. Consequently, though our volunteer crop is nowhere near that of last season, our total yield of hay will be by no means inconsiderable. ....The barley on the "bolsa" lands, near Pleasanton, is simply immense, present estimates being from 30 to 50 centals per acre. The statements hitherto published, of the loss of the potato crop by frost, were without foundation—it never looked better at this time of year.....The biggest fruit-crop in this county will be apricots. The trees everywhere are loaded down. The cherries are comparatively light, and were in some places cooked by the late hot spell—for instance at Haywards, San Lorenzo and Pleasanton. The currants, also, in many cases have been cooked; perhaps one-fourth of the crop has been lost in this way.

Butte.

GRAIN OUTLOOK.—Cor. *Record Union*, June 1: Crop prospects about Gridley are promising, and fully one-third more than last year will be harvested of wheat and barley. The north wind of May 27th and 28th did not injure the outlook. Haying has commenced, and barley harvesting will begin on Monday next, and heading and thrashing wheat will be entered upon by June 15th.

SULTANAS AND FROSTS.—Biggs *Argus:* We are informed by a reliable vineyardist, residing a few miles from town, that the late frosts, while slightly nipping his Mission vines, did not touch his Sultanas in the same vineyard. This is strong proof that the Sultana possesses superior frost-resisting qualities, and seems to us to be a fact worth remembering by persons growing grapes in those counties occasionally subjected to spring frosts.

RAISING TEA.—Chico *Chronicle:* A. L. Harris, who lives 16 miles from Chico, at an elevation of 1400 feet, has a number of tea-plants growing on his ranch, and they seem to do as well as if in their native land. Mr. Harris raises and cures all the tea his family uses.

El Dorado.

CARSON CREEK ITEMS.—Cor. *Republican*, May 26: The farmers are all busy harvesting their hay and grain. Crops are not so good as last season, but are much better than we expected. The dairymen are all leaving for mountain homes with their stock. Our neighborhood will soon be very quiet for a few months, owing to the absence of so many people. The late frosts did considerable damage to the grapes and fruit. Mette's vineyard, at Mormon island, was damaged several thousand dollars.

Inyo.

HE THOUGHT OF THE OTHERS.—A number of horses are kept together at Independence; a few days ago a load of alfalfa hay was brought and put in a yard near the stable; one horse was loose in the yard, the other two being tied up in the stable, the door being left open. After eating a few bites of the alfalfa, of which he is very fond, the loose horse appeared to remember that his companions were debarred from the feast; he took large mouthfuls of the alfalfa, carried it into the stable and placed it before the other horses. If reason had any part in the action of the good Samaritan, who shall say that it had no part in the action of this horse?

Los Angeles.

WESTMINSTER JOTTINGS.—Cor. *Times*, June 1: Apple, apricot and peach trees are loaded with fruit, and there will be a large surplus. The new railroad will give us easy access to Riverside for winter apples. The hay crop will be large and of good quality. Milch cows are abundant and cheap. Good horses scarce and dear. This is our most profitable industry, but the outside demand prevents any accumulation. Pasturage is still abundant and cheap. Many farms are now profitably used as pastures that would maintain fine orchards and bear close cultivation.

Mendocino.

POINT ARENA MATTERS.—Cor. Petaluma *Courier:* About the usual acreage of grain and potatoes have been planted. The farmers and dairymen have planted large quantities of beet and carrot seed, finding by past experience that roots make profitable feed. The cows are milking well and the late showers give assurance of a long season. This, together with the recent advance in butter, makes the dairymen good-natured.

Sacramento.

A NEW APRICOT.—*Record-Union*, June 3: O. O. Goodrich, of Sutterville, has propagated a new variety of apricot, which promises to be of great value. It is now ripe, or so nearly so as to be in good shipping condition, and is fully twice the size of any other variety at present in the market. It was grown from the pit of a peach apricot, and has something the appearance of this variety. Another very desirable feature is that it ripens on all sides simultaneously, and is not one side ripe while the other is green. The tree is standing in a nursery row and is only three years old. Thus far the variety has not been named.

GRAIN AND FRUIT CROPS.—The hot weather of last Saturday and the high wind prevailing at times since then does not appear to have done any injury to either grain or fruit in Sacramento or Yolo counties. In Sacramento the yield of grain will be larger than the average, while in Yolo it will fall a little short of the ordinary crop. In the latter county it will be very much better, however, than was expected two or three weeks ago. The wind was rather beneficial than otherwise to the fruit interests, relieving the trees of some of the surplus fruit, which otherwise would have to be pulled off. The season is a little later than usual for grain. Last year Capt. Foster had wheat from his West Side ranch in the Stockton market June 1st. Word comes from upper Sacramento that some growers have commenced cutting barley, but the harvesting of that grain is not general.

San Bernardino.

PLENTY OF FRUIT.—Colton *Semi-Tropic*, June 3: Oranges are setting very thickly, and the promise for next season's crop is excellent. A great many new orchards will come into bearing. The crop of early and small fruits is fast ripening. The blackberries are nearly ready for market in many places. In about ten days there will be sufficient early fruit to start the canneries. Prices for fruit will be good, but perhaps not so high as some years, on account of the heavy production.

San Diego.

FRUIT PROMISING.—National City *Record*, June 2: The fruit prospect throughout this part of California is very good. There will be plenty of peaches, apricots, grapes and other fruits.

San Luis Obispo.

OSO FLACO AND BLACK LAKE JOTTINGS.—Santa Maria *Times*, June 4: On the Oso Flaco and Nipomo flat, grain, potatoes and beans are looking well. The barley is well filled out, and promising a handsome yield. A sprinkle of American farmers and dairymen have mingled with our Swiss and Portuguese, and a rivalry has begun to be felt. As to economy in farming, the latter are hard to compete with; as to the former, they have no equal in the dairy business. Black Lake, or sandhills, as it is generally called, has the best prospects for a good harvest. The grain is well filled out and of average size.

Santa Barbara.

A NOVEL FRUIT.—The Ventura *Free Press*, referring to the exhibit from Goleta, made by Joseph Sexton, at the recent flower festival, observes: The custard apples (cherimoyer) are the first seen by our people. It is common in Brazil and Peru, but we have never before heard of its being grown in California. It is pear-shaped, of grayish color, and grew from the size of an orange to more than a dozen pounds in weight. It is pronounced the finest-flavored fruit in the world. When a tree is in full bloom its fragrance is overpowering.

BEES ON MUSTARD.—Lompoc *Record*, June 4: The bees are working finely on English mustard. The air is so filled with their busy hum that one mistakes it often for swarming. The honey season may prove better than has been estimated. At all events, take prime care of your colonies, as next year promises to find the market entirely depleted, and prices will be high.

Tulare.

BARLEY ROWEN.—Visalia *Times*, June 2: Farmers east of this city state that after cutting a crop of barley for hay on their ranches, a second growth begins, attains a hight of from 10 to 12 inches, and heads out. The kernels do not fill, but it makes excellent food for fattening cattle and hogs, and is often more valuable than the first crop.

THE WATERMELON CROP will be almost a total failure in the section of country usually relied on to supply the market of this city. The heavy hailstorm early in the season destroyed the first crop, and later plantings die down shortly after getting out of the ground without apparent cause. The crops of Joseph and Horace Thomas are a failure, and Uncle Joe says that melons which were formerly sold at 25 cents will bring 50 cents each this year. One person who has an acre of growing vines has been offered $150 for his crop—which he refused.

Yolo.

MILES OF WHEAT.—Woodland *Democrat:* Having heard much of C. F. Reed's 10,000-acre field of wheat, which lies along the levee for miles up and down the river, and in sight of the landing, we took the road which led through the center of the waving grain. While the field is of immense size, the quality of grain corresponds; it is as thick as it can stand on the ground, and as tall as the back of a horse, with long, well-filled heads. The prospective average yield per acre is estimated by good judges as high as 40 bushels, making the total amount of the field 400,000 bushels, or 12,000 tons, which, allowing 2000 tons for a shipload, would fill six large-sized vessels.

Yuba.

ORCHARDING AT SMARTSVILLE.—Nevada City *Transcript:* Mr. Brand says that he has regularly for a number of years visited some of the largest orange orchards in the southern part of the State, but never saw the trees hanging as full as do the orange trees in the orchard of Mr. O'Brien, and that the lemon, apricot, peach, plum, almond, fig, apple and other choice fruit trees are bearing as prolifically. The three-year-old trees, selected, planted and cared for by James O'Brien, Jr., are wonderful in growth and in the quantity of fruit the tender branches are bringing rapidly to perfection. James O'Brien is having many miles of ditches constructed over his vast tracts of fine land, and intends to bring the same rapidly forward to a fine state of cultivation.

OREGON.

LANE COUNTY ITEMS.—Cor. Willamette *Farmer*, May 30: Fruit in Lane county will not be a full crop by any means. Baldwin, Spitzenberg, Newtown Pippin and some other kinds of apple are bearing well, but the earlier-blooming trees are generally light. The same is true with regard to plums, while the German and Italian prunes will bear a fair crop. The peach plum seems to set fuller and succumb quicker to cold weather than most other kinds. Cherries will only yield a partial crop, while pears seem to hold their own. Peaches all killed; also blackberries. Grain and grass look well and promise a good yield.

WASHINGTON.

HUGE HOP FARM.—Willamette *Farmer:* The famous Snoqualmie hop-growers' ranch, at Squak, in King county, is supposed to be the largest in the world. They have 20 span of horses and mules, a sawmill which is soon to be run night and day, a logging camp, 100 acres in oats and wheat, and 40 acres of potatoes, etc. They have their own carpenter and blacksmith shops, and they keep a hotel and large store beside, and by next fall will have 800 men in their employ.

From Vacaville.

EDITORS PRESS:—The weather is cool now—the mercury stood at 55° this morning—but it was hot enough Saturday and Sunday a week ago. The mercury went up to 111°, and along with the heat there was a heavy north wind, which did some damage to garden-stuff on Putah creek, but no great injury to fruit.

Messrs. Brink and Thissell have finished shipping their crop of seedling apricots, most of which went East. Mr. Thissell had over 5000 boxes, and is now shipping Royal apricots and Alexander peaches.

There is a great deal of dissatisfaction among the fruit-raisers here with the so called Union. They claim that there is no Union, but that Mr. Porter took advantage of his position last year to freeze out other buyers, at the expense of the dear people, and is now buying for himself. At any rate, but few around here, except large producers, are shipping East. This partly accounts for the low price ($1.60 per hundred) at which a few crops of apricots were sold here a short time since. People generally calculate to ship to San Francisco while it pays, and when the price of fruit gets low they will dry.

Help has been pretty scarce. There is a rumor that Chinese will strike for $2 per day as soon as the crop of 'cots comes in. If they should, it would be the best thing that ever happened for Vacaville, for, while it would be almost if not quite impossible to get help to save the canning crop, it would result in the discarding of Chinese labor. While there are some here that prefer a Chinaman to a white man, there are many that will not hire a Chinaman unless obliged to. Several who have large crops to dry have made engagements with women, girls and boys—the help to board themselves, and the rancher to haul them to the ranch in the morning and back to town at night. One great point in favor of John is that he is no bother about the house. He can be put into a henhouse, or any kind of a hut, and generally will stay with a man as long as he can get a dollar; while much of the white help (not all) will only stay until they get money enough to get drunk on.

"Truth-seeker" of Los Angeles wishes to know about gooseberries. As to there being so few in the market, I think if the price paid was high enough there would be plenty, as they are certainly low in San Francisco. As to raising them here, I do not think many have made a success of it. The small kind seems to do pretty well, but the English gooseberry bush soon dies out—I think on account of the heat. They will mildew, and can be sulphured the same as grapevines. G.

Vacaville, June 5th.

Saloonists Defiant.

The Santa Rosa Prohibitionists have called a mass meeting for Friday of this week; and it is given out that they mean to form a thorough organization for political purposes. Officers in that city continue to arrest saloon-keepers for non-payment of licenses. Several of the alleged offenders have pooled their issues to resist prosecution, employed counsel, and had a day set for trial.

In Oakland, also, the liquor interest has conspired to evade the payment of high license and thwart the legally expressed will of the people. As we note the lawless and arrogant demeanor of the tipple-venders at large, we cannot but recall the ancient adage: "Whom the gods would destroy, they first make mad."

Barley Review.

[Written for the RURAL PRESS by J. R. F.]

The Call Board season closed on June 1st, although new barley did not put in an appearance till June 4th. The regular crop season will hardly commence before July 1st, when the stock of old barley in the State on that date will be made public. Throughout the season drawing to a close low prices ruled, which unduly stimulated consumption and exporting, and, notwithstanding the crop was the largest in the State's history, still the carry-over into the incoming season will not be more than a general average. For the sake of comparison the following tables of crops and also of carry-overs are given. The crops were as follows:

Years.	Centals.	Years.	Centals.
1869	6,147,000	1878	7,475,000
1870	3,699,000	1879	8,250,000
1871	3,643,000	1880	7,360,000
1872	3,679,000	1881	5,070,000
1873	5,107,000	1882	4,500,000
1874	5,500,000	1883	5,060,000
1875	4,525,000	1884	8,100,000
1876	5,900,000	1885	5,900,000
1877	3,900,000	1886	10,060,000

The stocks in the State on the 1st day of July for several years past were as follows:

Years.	Centals.	Years.	Centals.
1886	114,850	1881	595,000
1885	608,150	1880	908,000
1884	640,000	1879	806,500
1883	820,000	1878	147,598
1882	162,000		

This important fact must not be lost sight of that the stocks do not include the invisible supply—that held on the farm. Probably last year came the nearest to it, owing to the very heavy deliveries by farmers before the close of the season of 1885–86. This year the invisible supply promises to be very small, owing to the drain by short sellers on Call to meet their contracts. A crop of 503,000 short tons last year, and a carry-over of 5700 tons—total, 508,700 short tons—were enough to stagger the most confirmed bull, particularly so as the average consumption in this State for three seasons past, ending with the season of 1885–86, did not average more than 300,000 short tons. For the season drawing to a close the consumption was very large, placed at fully 400,000 tons. Accepting this as correct and it leaves of the crop and carry-over 108,000 tons. Of this there has been exported by sail and also overland, fully 50,000 tons, leaving 58,000 tons, which will probably be reduced by July 1st, next, to 50,000 tons, which will be carried into the season of 1887–88. Latest crop returns do not warrant estimating the outturns this year at over 325,000 tons, which, if correct, will give us with the carry-over fully 375,000 tons, a shortage compared with last year of 133,000 tons. This, too, in the face of a large increased consumption, owing to more railroad building, more teaming, and more general outdoor work. For the sake of comparison, and also general reference, the following table of arrivals of new barley in this city, and also the price at which sold, is given:

1870	June 19	$1 20	1879	June 30	75
1871	" 12	1 57½	1880	" 24	68¾
1872	" 6	1 40	1881	" 21	90
1873	" 5	1 10	1882	" 12	1 65
1874	" 9	1 45	1883	" 25	94
1875	" 20	1 35	1884	" 9	90
1876	May 30	90	1885	" 16	1 25
1877	June 30	1 55	1886	May 27	1 10
1878	" 11	80	1887	June 4	1 15

Stockton Notes.

[Written for the RURAL PRESS by MRS. W. D. A.]

The sudden flaming heat of May 28th, which hurt the whole crop greatly and advanced wheat to $1.80, has been succeeded by cool weather, which helps the crop to fill better, though it is ripening fast, and some will begin cutting next week, and another week will see the great harvesters busy.

The hot wind, that blew day and night, seemed to have passed in currents, blasting some fields, missing others, scorching berries and tender things. With it returned the beetles, taking garden-stuff, except cabbage. Turkeys pick them off, but pick onions and cabbages, too. Lime dust and plenty of water and continually annoying with ashes save a part of the garden—better than none! Fruit looks well, except that the leaves are eaten from pear trees somewhat.

A moderate crop of hay of the best quality is now about finished. It has sold in the fields for $10, but most of it has gone into barns or stacks for winter sale or home use.

Three smart shocks of earthquake shook up our ideas after having haying without any rain last night.

The Gridley monument did not arrive, but Decoration Day was very satisfactory with marching, an eloquent oration by Judge Swinnerton, singing by 50 young ladies and Miss Short's elocutionary entertainment Monday evening, to raise the lacking funds. It was held Tuesday evening, too, to the great credit of the participants.

The accidental drowning of two promising youths, Frank Reed, son of Wells, Fargo & Co.'s express agent, and a son of Dr. Giesea, in the San Joaquin, just below Rough and Ready, from rowing too close to a steamboat, has saddened all and brought lasting grief to their happy homes.

Stockton, June 4, 1887.

Where We Wandered.

[Written for the RURAL PRESS by MALLIE STAFFORD.]

Deep, into the old oak forest,
Where the drooping branches twine,
And the dying rays of sunset
Only on the treetops shine—
Where the cool shades lie forever
And the little lakes enshrined,
There we wandered, young and happy,
In the hope of young life's time.

Yes, we wandered where the red man
Erst had skimmed the lakelet blue,
And upon its limpid waters
Launched his little birch canoe;
But long ere then his savage warwhoop
Ceased to echo in the glen,
Where you and I with childish voices
Mocked the robin and the wren.

But the years that circled o'er us
Since we trod those banks and braes,
Like the foliage of the forest,
Dim the light of other days.
In the golden land I'm writing,
Where the wild pines sadly sigh,
And that childhood's sun is lighting
The winding aisles of memory.

I often ask myself, old playmate,
Will we ever roam together?
Hear the robin and the wren
Where the lakelet laves the heather,
Breathe the hopes we cherished then?
Something speaks, I fear tis' reason,
These and youth have had their season.

Arcadian Hights, Napa Co.

Springtime Amid the Rockies.

[Written for the RURAL PRESS by FANNIE ISABEL SHERRICK.]

No matter how late spring may be in coming, she is always charming, and never more so than in this mountain town. April was a stormy, wintry month, with scarcely a hint as to the crowning loveliness of May; and even this beautiful month was ushered in with one of the biggest snowstorms of the season. Nearly a foot of snow fell on Mayday, and the mountain gleamed above the valley as white and cold as if it were midwinter.

But underneath the snow the buds were growing, and, strange as it may seem, the flowers peeped above it, sweet messengers of spring. Along the snowbanks the crocus-buds lifted up their purplish heads with a shy wonder at the cold world about them, and as the snow melted it showed the emerald carpet of the grass beneath. This union of winter and spring was not only wonderful but most beautiful to see. Even now the traces of the frost-king's icy fingers still linger on the edges of the mountain-slopes, but these are fast disappearing under the gentle smiles of May.

It seemed like a long and dreary winter, but the splendor of the budding world about amply repays one for the months of silent, desolate grandeur. The aspens are of the most tender, delicate green, fairly illuminating the mountain-sides, and every slope and mesa is starred with daisies and buttercups. The flora of Colorado is brilliant and varied and all its mountain types are represented in this blooming valley.

Most of the ordinary garden flowers are raised here without difficulty, and people are beginning to take especial interest in the cultivation and care of gardens. For a new mining camp the improvements in this direction are rather remarkable. The smooth lawns and beautiful flower-plots in some parts of the town are very attractive, and even the poorest dwellings have some efforts in this line.

The tin can is the typical flower-pot here, the earthen ones being rather expensive and difficult to obtain. The amount of canned goods used by this community is almost impossible to realize, and many are the uses of the discarded can, but none more useful, economical or ornamental than that of flower-growing. It speaks well for the esthetic taste of the people that one scarcely sees a window, even in the rudest log cabin, that does not contain flowers of some kind; and it is even the more remarkable since it takes considerable patience and care to bring them safely through the long, severe winters. Many of the houses are not plastered, and the flowers, if not removed from the windows and walls to places of greater warmth, will inevitably be killed by the frost.

Pansies, however, seem to be exceedingly hardy here, and they survive the winters out of doors, their cute monkey faces appearing saucily in the spring above their beds of snow.

The sun is very powerful in this climate, even in winter, and did it not come so late and go so early there would really be no winter at all; but, owing to the high mountains that shut the valley in, the winter sun has but little sweep and the days are exceedingly short.

Arbor Day was celebrated here in a very pretty manner by the Chautauqua circle of ladies in planting trees. Each one was named after a favorite author, your humble correspondent being among the honored number. The train of thought suggested by this unique celebration was quite interesting. Truly, this might be called a poetical garden, graced by its galaxy of writers. Wandering through it at even-tide in the distant future, what thoughts might not surge through the brain, what beautiful dreams of the imagination be conjured up by the low murmurings of the wind-swept branches! The tender strains of Longfellow would mingle pathetically with the English harp of Tennyson, the thunder notes of Milton attune themselves to the wistful cadence of his lowlier brother-poets. What a sublime song of harmony it would be, rising like an earth-hymn to the bright star-world above, and the planets, gazing downward through the leafy branches, would seem but the bright symbol of the star-flame that shines for every child of genius. In this thought-garden the very soul would thrill with higher aspirations born of the invisible atmosphere of noble dreams and ambitions.

I think were all the gifted poet-souls on earth and could wing their way to this far-off western world, they would bless the fair and loving hands that there gave delicate tribute to those who have graced the world of song.

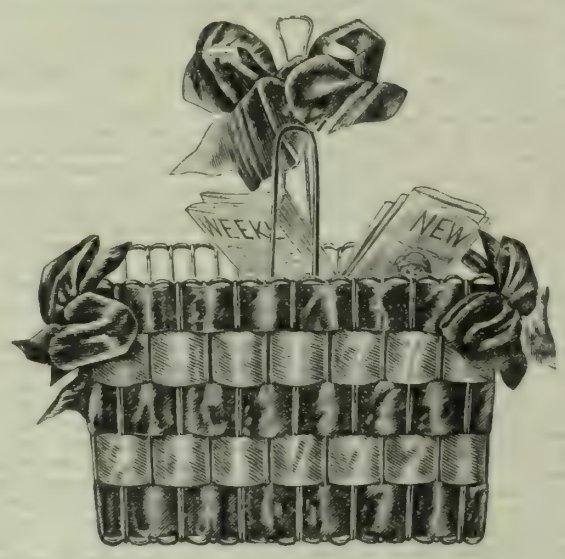
Lost in such thoughts as these, one might almost wish this world were not so prosaic and oftentimes commonplace, yet those who seek will find, and there is a noble and poetic side to nearly every phase of life. It depends upon the eyes that see and the ears that hear. The world is always beautiful to those who see clearly, and so may life be, under any circumstances, to those who have the spiritual insight, the key that unlocks the doors of hope and knowledge. We must not shut our eyes would we behold the flowers growing at our feet, and how often are they compensation for all the deluding mountain hights we cannot, dare not, climb. In looking toward the far-away, inattainable objects that allure us, we are prone to forget the quiet sweetness of the pleasures within our grasp.

Yet the inexplainable mysteries and sadness of life follow us everywhere, and nowhere are the vicissitudes of life more clearly shown than in this mining camp. Preposterous as the idea is, one could almost believe in "luck" when he sees the surprising manner in which fortunes are made by some and lost by others. One man comes to the camp and becomes a bonanza king; another comes, risks his all, and becomes a beggar. Surely it would seem as if the decrees of fate were most arbitrary, yet I believe undeniable all this apparent inequality, the great law of compensation is supreme. For every gain we must lose something, and the man who reaps a million shining dollars may lose that which no money can buy. So the man who remains poor and humble may retain that which is dearer and more precious than gold. I think God never takes away without giving, only sometimes we are so blind we cannot see nor understand.

They are the wise ones who do not risk their all in the mines. Thrift and industry will succeed anywhere, and as the town grows, those who help to build it up will grow with it.

This camp has undoubtedly a future of great promise. New strikes are constantly being made and the mines and tunnels already worked are rich in mineral.

Two railroads will probably enter Aspen next fall. This will change the aspect of things considerably. Mine-owners will set to work in earnest then, for there will be little difficulty of shipping ore, and it will bring improvements and advantages to the town.



Even now this little mountain city, isolated so entirely from the rest of the world, is a marvel in its way, having many of the improvements of larger cities, such as electric lights and water works; and when one considers the fact that it is 50 miles from any railroad, and its only connection with the outer world a stage road, over snow-clad mountain ranges, then, indeed, the energy and determination of its pioneers seem wonderful.

Nearly all of the freight is brought over the high passes in large wagons, to which are attached from 4 to 12 or 14 horses, and it is a wonder to the uninitiated as to how these immense freight teams ever cross the range in safety. Some of them do not, as is attested by the wrecks strewn along the precipices in these steep places, but considering the danger, there is slight loss of life or property.

The burro is one of the most essential features of the mountains. This little pack animal is invaluable to the mountaineer and the freighter. The pack train coming down the mountain road is a novel sight to the tender-foot. These queer little animals, bearing packs sometimes larger than themselves, are most comical to look upon, their huge ears flapping disconsolately above their loads; but their patience and endurance excite the sympathy of the beholder. In the spring, when the roads are almost impassable, these enduring creatures take the place of the freight-teams, plodding with meek indifference through the mud and storms. Horses cannot take their places, and without them the people of the mountains would suffer many inconveniences.

The melting of the snow on the range has made the roads very bad, and it takes the stages two days now to make the trip from Granite—a journey which is usually made in one. In some places passengers have been obliged to walk part of the way. The poor horses are most to be pitied, struggling through the soft snow and mud. But men are now at work on the road shoveling out the snow, and it is hoped the roads will soon be in good condition. There is a good deal of travel in this direction at present, and there will probably be a great increase when the roads become passable. During the winter and spring the mines are rather inaccessible, but soon the climb up the mountain-sides, though arduous, will amply repay one in beauty and interest. Some of the mines are so high that at night their lights shine like stars against the somber shadows of the mountains, seemingly on a line with the Pleiades and faintly rivaling the wondrous orbs of Venus and Jupiter who nightly pass above and beyond them. So do our poor human eyes measure the illimitable distances, matching the puny lamps of men with the vast star-world of God.

Aspen, Col., May 21st.

A WALL POCKET FOR NEWSPAPERS.

A Neat Wall Pocket.

Wall pockets are often quite an aid in breaking up the waste of a plain wall, and they are always handy receptacles, aiding to keep the table clear and still have the papers within reach. The engraving on this page shows how a pretty pocket can be made of wirework, with ribbons interwoven and with bows at the corners and top. Where the colors are well chosen, the effect is very charming.

There are many styles of pockets which do not depend upon store goods in the shape of wirework. A neat one can be made of matting bound at the edges with ribbon and rolled at the bottom to form a cylindrical pocket, in and out of which papers may be slipped. The decorations may consist of applique sprays of vine blossoms and a large bow of ribbon at one corner. A ring fastened to each upper corner may provide the means for suspending the pocket, the rings being passed over nails secured in the wall.

HE TOOK IT BACK.—A friend of mine, a musician and a wag, was approached after a certain concert by the indignant father of a young lady who had on that occasion made her first formal public appearance, and who had proved conclusively, by the way, that she could not sing in tune, whatever her other merits might be. "Say," exclaimed the angry parent, "I just heard a fellow in the lobby say that Lizzie flatted. What the dickens is he talking about? *You* heard her sing, and *you* know. Did she sing flat?" "Oh, no," replied my friend, gravely; "she didn't sing flat. The trouble was that *the piano sharped on her a little.* Those pianos will do it now and then. I've noticed it before."

Boys and Girls and Farming.

I. P. Roberts, professor of agriculture in Cornell University, delivered an address recently upon the subject of "The Boys and Girls of the Empire State," a synopsis of which is as follows:

We have met to-day to sow the seed which we trust may bring an abundant harvest in the future. How closely boys and girls resemble trees. Some trees grow straight and handsome—these are the dudes. Some are sturdy and tough—these resemble those men who cross seas and found new empires; these are they whose examples yield good influences. As with the trees, so with the boys and girls; they must be nursed and trained. There is much for them to do, and the way to get this done is to give them credit for that which they have already done. Some complain that the boys are being educated above their work. The pessimist says that the smart ones all go to the cities; if so, the dull ones have done considerable good work. The grain raised annually upon the farms of the United States would load a train one and one-half times the length of the world's circumference. Each June morning there stand upon our broad domain 8,000,000 cows to be milked. Then think of the cotton, rice, sugar, fruit, etc., annually produced on our farms. We glut every market of the inhabitable globe with our produce. The earth may bud and blossom, the cattle feed upon a thousand hills, but all in vain, if the young grow up indigent and ignorant. Our Government lays down lives by the thousands to save this nation for the coming generation. Shall we do nothing to prepare this generation for the reception of such a gift? Boys and girls, I come to you with plain words. I warn you that you cannot battle with this intensified civilization without knowledge. If you fail to fit yourselves to grapple with the questions of the day, say nothing when you find that the world has nothing for you to do except to become a hewer of her wood and drawer of her water. You cannot become learned without labor. If you think that the world owes you a living, that all this vast wealth will some day become yours, you will find to your sorrow that the world owes no man a living, that success comes only through toil. Ninety-nine per cent of all the boys and girls are born poor. This is a blessing, for toil and labor elevate. Sow if you would reap. In former times muscular strength ruled the world; now it is intelligence. A gloved boy of to-day will reap more grain than an army of his ancestors. The world wants painters of portraits as well as painters of houses. If wealth is not used to gratify that taste for the beautiful which God has given us, then it will corrupt and debase. Are you, young men, I ask, fitting yourselves for the work of life? Our ancestors wrought out inventions that enable us to rest. The dress of our mother, for instance, cost months of labor. The same now costs but two days' labor. It took your grandfather and team one hour to haul a ton of salt a mile, thus earning in your money 2½ cents per hour. How would you like to work for your grandfather? With these advantages can you find no time for study? I do not mean read; we read too much. Reading is living upon the thoughts of others. But an hour of solid thought is an hour of hard work. Read no trash; there is no time for it in this busy American nation. Study and work; fit yourselves for some honest calling. The world cares not for you unless you bring her something that she needs. A man stands at a table and with knife in hand carves a fish. We call him a fish-monger. There at his side, before a similar table and with a similar knife, stands a man carving the same kind of a fish. Him we call Agassiz. Thus, think as you work, if you would become an Agassiz and not a fish-monger. Remember whose sons and daughters you are. Your ancestors may not have had long pedigrees, but they had sterling worth. Reserve force is my closing thought. We admire and honor the athlete who has stored up in his muscles more strength than he is ever called upon to use, the intellectual giant whose store of thought seems exhaustless. Therefore, store your minds with useful knowledge, train your thoughts that you may have such reserve as shall stand you in time of need—reserve force, physically, mentally, morally.

WOLFF'S LION.—One of the most celebrated sculptors in Berlin in Albert Wolff, and one of his works, a lion, is in the Thiergarten. A young gentleman from the Hub is now making the grand tour to improve his mind. He writes home that he is much pleased with the German capital, but does not think the Berliners very intelligent. "The other day I took a walk in a pretty park called the Thiergarten, and saw a very handsome work of art representing a lion. Anybody would know it was a lion. But they don't seem to know much of natural history here, as they have marked this particular work 'A Wolff.' Think of it! Such a thing could not happen in Boston. And look at the spelling!"

A MAD DOG visited a town in this State a few weeks ago. Subsequently a child died of hydrophobia, and every dog in the place was slaughtered. A man died in the same place of delirium tremens a few days later, but up to the hour of going to press a war had not been made upon the whisky there.—*Norristown Herald.*

YOUNG FOLKS' COLUMN.

My Boys.

[Written for the RURAL PRESS by AUNT SUSIE.]

Aunt Susie has three little boys,
As good as good can be,
Only when King Temper reigns,
Then naughty boys we see!

With frowns, and scowls, and angry looks,
Whose toys are tossed about,
And little clothes thrown here and there,
All in a fearful rout.

And so the battle rages on,
'Twixt Temper King and Love,
One as fierce as the lion,
One as meek as the dove.

At last King Temper yields to Love,
He loses in the battle so,
For every cloud, however dark,
Has a silver edge, you know.

Then little arms twine round my neck,
And eager lips do say:
"Aunt Susie dear, I sorry now,
I'll sure be good all day!"

Then all the angry looks and words
Quickly are forgiven,
Even as Christ bids us do,
"Until seventy times seven."

The Lost Spurs.

[Written for the RURAL PRESS by M. B. D.]

"Alvah," said Mr. Tay to his son, who stood mixing great quantities of bran and sour milk together for pig feed, "you may throw the saddle on Kit and take a ride for me after the chores are done."

Alvah looked up with a flash of pleasure in his eyes. He could imagine nothing more pleasant than a ride over the hills in the pure air and sunshine. With his ladle, he gave the contents of the tub a quicker whirl, and dipped out the breakfast for the pigs with more than usual cheerfulness. Down splashed the food into the trough, and the pigs squealed in chorus, expressing their eagerness to begin the meal. He watched them a moment. They ate so heartily and with so much satisfaction that he liked to see them.

He brought in the wood for the day and piled it neatly in the wood-box, behind the stove; then he saw that a good supply of water was drawn from the spring. All of his work was done as usual, without haste or slight. Alvah was as prone to carry the "lazy boy's load" as any other; but his father, who was very methodical in all his work, never permitted his son to do otherwise than to follow his own example.

He had helped to harness the horses for the hired men, and had driven the lively calves through the bars into their pasture. When he felt at liberty to saddle Kit, with the curry-comb he smoothed down her sleek sides, and he patted her velvet-like nose, that seemed so sensitive to his touch. Kit's brown eyes expressed the fondness that he had won by always being kind to her. He hoped to own her soon, for his father had promised to give Kit to him upon his next birthday, if his conduct should merit such a reward. After this, he found his work very pleasant. Every good action, he knew, brought Kit nearer to him.

"Well, I am ready now, father," said he, after he had seated himself in the saddle and ridden around to the shed where his father was at work.

"You may ride up to old Mr. Culver's, and get my Mexican spurs. No need of being in a hurry, but don't stop on the road anywhere."

"Whew!" thought Alvah, "a six-mile ride," and he would have blown a long shrill whistle to express his satisfaction, if that would not have been disrespectful.

Kit started off over the winding road as gaily as if she too enjoyed the prospect of so much pleasant exercise. The hills were green and the road hard and smooth. For a couple of miles Kit galloped along, and then they had to leave the turnpike to follow a bridle-path that wound up the mountain-side. This track shortened the distance by a mile and a half; but it lay through woods and thickets so wild and lonely that Alvah preferred it to the greater length of the high-road. Flocks of quail rose from the chaparral with loud whirrs as he passed, and now and then a rabbit started from some thicket and sped with long bounds away out of sight.

After awhile he stopped for Kit to get breath, and, in looking around, spied a rude nest, built in the broken trunk of an old oak. Directly he rode over to it and looked in it. There lay two small white eggs, and when he touched them he could feel that they were still warm from the mother-bird's wings. A pair of wild doves fluttered anxiously about, in fear of the stranger so near their nest. He did not stay to tease them, but, as Kit had rested, started on up the path. While he rode through the woods and bushes, he even wished that he might meet a bear or a wildcat. Kit was so fleet he would not have been afraid if he had; but before any such animal appeared, he caught sight of Mr. Culver's chimney above the trees. Soon he rode up to the gate, and, reaching down from the saddle, slipped off the iron band hoop that fastened it to the last post of the fence. Two dogs gave loud barks to warn their master that some one was coming.

Mr. Culver came out of his dwelling, which was a large cabin with a couple of rooms, from one of which rose the chimney, and at its base a big open fireplace glowed with burning wood. The old man lived by himself in that lonely place.

Alvah told his errand, and Mr. Culver invited him in.

"You must be hungry, my boy," he said, after Alvah had seated himself upon the bench which had been offered to him.

A kettle of beans hung bubbling from the old-fashioned crane over the fire, and a pitcher of milk had been set on the hearth to warm. Mr. Culver placed a loaf of bread and some dishes on the clean pine table, and took up a portion of the beans in a deep yellow bowl. With the hot milk he filled two mugs and invited Alvah to lunch.

How delicious that simple meal tasted! The bread was fresh and sweet, and the meat, that had been cooked with the beans, was hot and tender.

"Have some of this dried apple-sauce," said Mr. Culver, holding a large spoonful over Alvah's plate; but he had already eaten enough.

After the meal was done, he took Alvah over the yard and barn. It was such an odd, wild place all about. The woods grew up to the gates, and woodpeckers and bluejays lit on the cabin roof. Mr. Culver sprinkled some grain on the ground and called his flock of turkeys, which came from the thickets and brought with them a little wild quail to feed. Alvah thought what a fine thing it would be to have a quail among the flock at home, and resolved to tame one if possible.

When it was time to go he fastened the keen steel spurs to the back of the saddle and started homeward. He rode on until he came to Littlejohn's creek, where the water was so high that he had to hold his feet up to keep them from getting wet. He was looking down into the smooth, clear stream, when his eyes chanced to rest on the back of the saddle where he had tied the spurs, and he saw that they were gone. Anxiously he turned back to look for them over the road which he had just passed. Although he went back several miles and carefully watched the ground, he saw no traces of them, nor did he meet any one who might have found them. At last he thought they must have fallen into the creek. When he recrossed it he looked down at the pebbly bottom as carefully as he could, but had to give them up, as the hour was growing late.

When he reached home his sister Jennie said that their father had gone to town. He put Kit in the stable and gave her a generous portion of hay. Losing the spurs took away all the satisfaction he would have felt if he had been more careful. He dreaded to meet his father and tell him how careless he had been.

"I will not be sent again upon such an errand very soon," he kept thinking. Another thing worried him. He would soon be 13 years old, and, as he was very fond of Kit, he had tried hard to do well.

At dinner-time Mr. Tay had not returned, so Alvah did not see him until the next morning at breakfast. When the meal was over, a neighbor rode up to the house and told them some sad news. Mr. Culver had died in the night. They all felt sorry and very much surprised, although he was over 70 years old. Mr. Tay said he would ride over with his neighbor, to do all that he could for him.

A wicked thought came into Alvah's mind. "I can tell my father that Mr. Culver did not give me the spurs, and he will never be the wiser; or that he had already sent them by some one else." He thought of this idea all day. It was a great temptation, for his father was rather stern, and he so wished to be sure of owning Kit that he felt he could not risk the chance of making him angry.

At dinner-time, Mr. Tay was engaged in talking over the sad news, and Alvah did not speak of the spurs. The hours slipped away until the clock struck ten, his bedtime, still he had not spoken; and he was thinking of slipping off with that duty undone, when he felt ashamed of acting so cowardly.

"Father," he began, almost before he intended to speak, "I lost those spurs that you sent me for yesterday. It was somewhere between the bridle path and Littlejohn's creek, I think, and I went all the way back looking for them, but I could not find them."

He waited for his father to speak, but as he only looked surprised, Alvah went on, humbly: "I am very sorry. I did not mean to be careless."

"That does not mend the matter much, does it?" inquired Mr. Tay.

Alvah stood a moment and hoped that his father would say something more; but as he did not, he answered "No," and wished him good-night.

After he had reached his own room, he was surprised at the amount of satisfaction his telling the truth gave him, as he came to think it all over.

"I have done right, and even if I lose Kit, that is better than doing a mean thing to get her," was his last thought.

In the weeks that followed, he heard nothing more of the lost spurs; still he did not forget them, and he often wondered if his father had forgiven him for losing them.

When his birthday arrived, no one mentioned it until dinner-time. Near his place at the table, his mother set a large frosted cake, saying that "she had made it in honor of his thirteenth birthday." As the dessert was brought in, Alvah cut the cake into 13 pieces and passed it around to them all. The dish was returned to him, and the pieces that had been taken showed that a folded slip of white paper, bearing his own name, had been placed beneath the cake. He opened it eagerly and found that it was a deed of gift, signed by Mr. Tay, which made him sole owner of Kit.

He thanked his father heartily, and was so glad that he could scarcely wait until the meal was over, he wanted so much to go out to the barn and take possession of the long-wished-for prize. Kit never looked so fine to him as when he led her up to the garden-gate for his mother and the girls to see.

His sister Jennie said that she had a secret to tell him.

"Mamma told me not to let you know until this evening. Once you came awfully near losing Kit. After you lost the spurs, Ed Curtis found them and left them at the postoffice, where they were given to father the same evening. When you delayed telling him, he did not know what to think, and you looked so anxious that he wondered if you were not planning some story. It was lucky for you that you did tell him all about it."

Alvah said nothing, as he patted Kit with a proud air of ownership, but he thought that telling the exact truth promptly should be one of the good resolutions added to the list, which he had made that day, to keep throughout the year.

GOOD HEALTH.

Valuable Suggestions on Diet.

Most authorities are of opinion that cheese is indigestible, yet even on this point doctors cannot agree.

A distinguished French chemist has suggested that to make cheese digestible, a quarter of an ounce of potash should be added to every pound of cheese; while a German chemist has experimented upon several kinds of food—such as cheese, meat, milk and eggs—and he boldly declares that cheese is no more indigestible than meat and many other articles of diet.

Suppers are usually condemned. Some doctors assert that suppers are not only unnecessary, but positively harmful; that sound sleep cannot be obtained after them, and that three meals a day are sufficient.

On the other hand, others are of opinion that a light supper is necessary to procure sound sleep. After a meal, they say, blood is drawn toward the stomach to supply the juices needed in digestion. Hence the brain receives less blood than during fasting, becomes pale, and the powers become dormant. Sleep, therefore, ensues.

A doctor says that recently he was called at 2 A. M. to a lady who assured him that she was dying. The body was warm, he says, the heart doing honest work. To her indignation he ordered buttered bread to be eaten at once. Obeying, the "dying" woman was soon surprised by a return of life and a desire to sleep.

Milk is generally considered a peculiarly nutritive fluid—indeed, a perfect food—and therefore suitable for persons of all ages when it agrees with their stomachs; yet no less an authority than Sir Henry Thomson states that "for us who have long ago achieved our full growth and can thrive on solid food it is altogether superfluous and mostly mischievous as a drink."

He also says that the primary object of drinking is to satisfy the thirst, and that water is more powerful to this end when employed free from admixture with any solid material. Chocolate, thick cocoa, or even milk, are therefore not so efficacious in allaying thirst as water.

"So plentiful is nutriment," he adds, "that the very last place where we should seek that quality is the drink which accompanies the ordinary meal."

In this respect, at any rate, Sir Henry Thomson is at one with the vegetarians.—*All the Year Round.*

PNEUMONIA AND TYPHOID—HOW TO CURE THEM.—A correspondent of the Baltimore *Sunday News* says in regard to pneumonia: If you will permit me, I will give an unprofessional remedy or means of cure by which nine cases out of ten can be relieved in less than 24 hours, and cured in less than three days, instead of a "couple of weeks' time." Give some warm stimulating tea to help counteract the cold. Apply as soon as possible a poultice of hot onions to the chest and renew the application frequently until relief is obtained. The onions should be mashed and heated with a little lard in a vessel suitable for it, or take some life everlasting—if it cannot be had, any common herbs may answer; boil it well with vinegar and make a mush with cornmeal. Apply a poultice of this as hot as it can be borne upon the chest of the patient and repeat at short intervals. The congestion will soon be relieved, the pain will cease, the blood will flow freely in its accustomed channels, and the patient will be out of danger in 24 hours. I would advise to be given at the same time, as a valuable assistant, a purgative composed of equal parts of cream of tartar and aloes. Some pills, which the family may have been accustomed to use, may answer just as well. The simple thing is to assist nature to throw off disease. The same treatment will cure typhoid fever, but in this disease I know of many cures having been made by simply putting mashed raw onions to the soles of the feet. In high stages of the fever they will soon turn dark; several applications generally give relief. They induce perspiration, extract the fever, relieve the pain in the head and effect a cure. If these simple directions are observed, there will be very few deaths reported in our city from pneumonia or typhoid fever.

DOMESTIC ECONOMY.

Household Hints.

A good breakfast dish is rice toast with poached egg, made thus: Boil some rice the day before and set away in a flat dish until morning. Cut it in slices, brush each slice over with melted butter, slightly grease the broiler, and broil over a rather slow fire. Butter the slices and drop a poached egg on each.

To make good egg biscuits, take one quart of prepared flour, a tablespoonful of lard and twice as much butter, a teaspoonful of salt, two cups of milk, the yolks of two eggs, beaten light. Salt the flour and sift it twice in a bowl, rub in the shortening thoroughly and lightly; mix yolks and milk together, and pour into a hole in the flour, work into paste with as little handling as possible; roll into a sheet half an inch thick; cut into round cakes and bake in a floured pan. Eat hot.

Very palatable lunch cakes, especially for the children who take lunches to school, are made thus: One cup of green-corn pulp, one tablespoonful of sugar and enough fine oatmeal to make the mixture sufficiently stiff to drop it in spoonfuls on the pan. Bake for 15 minutes and serve cold.

Another good luncheon material for picnics, etc., is sandwiches of cheese and eggs, and the filling for these can be made thus: Grate the cheese, and to each cupful add the yolks of three hard-boiled eggs, minced fine; rub to a paste with a teaspoonful of butter, season to taste with salt and pepper, and spread between buttered bread or crackers. These are nice made of graham bread.

A rich batter and fruit pudding can be made by the following recipe: Chop up one pound of apples and put them in a greased pudding basin (gooseberries, plums or any other fruit will do), and sprinkle sugar over them; now make a batter of one egg, six ounces flour, and one breakfast cupful of milk; one-half a teaspoonful of baking powder must be added to the flour. When the batter is smooth, press it over the fruit and steam gently for one hour; care must be taken that the water remains boiling and does not evaporate too much.

If your lettuce is not delicate enough for salad, use it for greens, thus: Cut it in pieces and boil it soft in water slightly salted; when cooked, drain every drop of water from the leaves. Put some flour in a pan with some butter on the fire, and let it cook until it is yellow; turn the lettuce in it, and let it boil once or twice. Pour some stock over the lettuce; let it boil once again, and just before serving pour in a little cream. A little nutmeg is sometimes liked.

The following is the way our grandmothers made muster gingerbread, which is still dear to their sons: Three cups of flour, one cup of molasses, two eggs, one large teaspoonful of soda, one tablespoonful each of ginger and cinnamon, and milk enough to form a dough. Rub the flour and butter together, and add the other ingredients. Roll it out in sheets, cut thin, and spread with molasses and water before they are put in the oven. They require a very moderate heat to bake them, as they scorch easily.

Recipe For Washing Clothes.

EDITORS PRESS:—Mrs. Sarah Jepson, of Sespe, Ventura Co., furnishes the following:

Cut soap fine (petroleum or borax preferred), and put in kettle of cold water. Place the clothes in at once. Heat, and stir occasionally till the water comes to a boil. (If the water is hard it should be broken beforehand by placing in it either concentrated lye or lye from hardwood ashes.) Take clothes out, and rub on a board. Rinse through two waters, doing with the last whatever of bluing may be desired. Wring and hang out on the line for drying. Putting in with the soap a tablespoonful of coal oil is recommended.

Mrs. Jepson also gives the following for the use of soap-root in washing flannels and silks:

Take soap-root, and after the husks have been taken off, put the bulbs into a sack and mash by pounding or otherwise; put into tepid water; rub the material in the water until the water becomes sudsy; put the flannels in, rub out and rinse, using in the rinsing water a little of the prepared soap-root. For white flannels the water should be blued a little. Wring and hang out.

This is a fine way to wash any woolen goods, even dress goods and silk handkerchiefs.

McD.

SUET PUDDING.—Three cups of flour, one of raisins, stoned, one-half cup suet, chopped fine, one-half cup molasses, one-half cup sugar, one-half cup milk, two teaspoons cinnamon, one of cream of tartar, one-half teaspoon soda; boil 1½ hours.

The Week.

This week has started the harvesting machinery generally in the earlier parts of the State, though the sickle had been put in earlier in a few instances. The canneries have begun on the cherry crop, the market shows nearly all summer fruits have entered, and though the season has been peculiar and late, June brings its wonted bustle and hurry. Following the hot wave described last week, there came a reaction in the shape of a cold wave, which in some cases touched the vines again—a thing quite rare for June, but no great injury is reported. The greatest sensation of the week in the higher latitudes was the earthquake which came upon scenes unused to such affairs and frightened but did not work injury.

In the great valley the chief topic is irrigation and how to get it. In Stanislaus, though there is much opposition to action under the Wright law, the proposition carried and a district will be formed which will include the city of Modesto. It seems that opposition comes from different sources in different districts—some do not desire irrigation at all and in others those who have already provided themselves do not want a recasting of affairs. The question must, of necessity, be a local one, and we trust in all cases it will be argued with moderation and consideration and settled so as to best serve the common good.

Judge-Made Law.

There is grim humor in the boast of an English barrister that no law could be made he could not drive a coach and six through. This is not always owing to any tergiversation in the structure and intent of the law, but to the finical and tortuous rules of construction that have grown up in the courts. There are many cases where a valuable piece of legislation has been set aside owing to a misplaced comma, the incorrect use of a word, the mistake of an engrossing clerk, when the intention of the law was perfectly transparent. Then there is an art in legislation that causes a law to fly apart before an influential litigant, like those automatic gates we see in country fields, when a driver comes along who understands the trick. The people are satisfied when the law is enacted, for there it stands square, massive, and solid in appearance, an iron safe in which their rights and equities seem safely deposited, but smart lawyers know the combination and some day they find their treasures gone.

A recent dispatch states that it is almost certain that the Interstate Commerce Commission will interpret the law under which it operates as permitting the making of special rates by roads under special circumstances. The law as framed by the House was very rigid, and absolutely prohibited rates not proportioned to distance, but when it got to the Senate the clause, "under substantially similar circumstances and conditions," was inserted. It is foreshadowed that under this clause the Commission will rule against a strict enforcement of the long and short haul provision. Now, whatever may be said pro or con on the wisdom and beneficence of this interpretation, it cuts no figure in this article. The point we raise is, is this a consistent and fair rendition of the Interstate Commerce Act? It is certain the House never intended such a malleable, fast-and-loose application of the measure. Mr. Reagan, who originated the bill, and for 16 years stoutly championed it in the House, protests against such a construction. Whatever may have been the object of the Senate in inserting the aforesaid ambiguous clause, it was certainly not understood at the time as intended to render elastic or inoperative the short and long haul provision. Senator Cullom understood this clause was to be strictly enforced, and made a rattling speech in favor of it. Senator Stanford so understood it and made an ingenious speech against it. Charles Francis Adams, whose acuteness in railroad law and literature is well known, in a speech given at a dinner of the Commercial Club in Boston, so understood it, and put himself on record as in favor of the general provisions of the Interstate Commerce law, and of the long and short haul clause in particular. It beats Prof. Pepper's ghost show, if the Commission can, by a skip of the pen, resolve this clause into a rather harmless specter. As the RURAL PRESS has said before, all such radical legislation is experimental, and if an application of it should be found too rigid at one point or lax at another, it is the province of Congress, in the light of experience, to put it in practical shape; but we are doubtful of the power of the Commission to interpolate into the Act a meaning that was certainly not in the mind of a majority of the law-makers.

Taking the most favorable view of the case in behalf of the Commission, it is as clear as daylight that their foreshadowed interpretation of the law is a strained one and likely to give umbrage to the very class whose grievances the law was intended to redress. Already the President of the State Farmers' Alliance of Minnesota has filed a vigorous protest before the Commission denying the jurisdiction of that body in allowing the railway companies to make special rates. This protest was prepared by the executive committee of the Alliance, and takes the ground that "such business interests as can be sustained only by reason of the suspension of the fourth section ought not to be sustained at all. It is better that the business of the country be left to the natural laws of trade than that a few favored persons in certain places should be able to organize and carry on colossal enterprises because of the advantages in use of the railways of the country."

The Crops.

We like a large crop as well as any one, but as we have often said before, we do not like reports of large crops when the crops are small. We get too much of this, either in the interest of the "boom," which must never admit anything unfavorable, or in the interest of the buyers, who want to put in their own pockets the price of a small crop instead of distributing it among the many who need it to partly compensate for their missing bushels of grain. We have claimed all along that this year's wheat yield was being placed far too high by the roseate forecasts of the daily papers. This view is now fully verified by the publication of the reports from experts, received by Mr. Friedlander, secretary of the S. F. Produce Exchange. These reports are so important that we give the roll of the chief grain counties, reduced to table form, as follows:

County.	Percentage of Crop of 1886. Wheat.	Barley.
Colusa	90	100
Sacramento	135	...
Yuba	115	200
Yolo	90	90
Sutter	120	150
Butte	120	135
Tehama	125	135
Contra Costa	70	90
Alameda	40	65
San Joaquin	85	90
Stanislaus	65	65
Merced	25	35
Fresno	50	50
Tulare	50	55
San Mateo	20	55
Santa Clara	20	55
San Benito	35	45
Santa Cruz	125	125
Monterey	30	50
San Luis Obispo	50	80
Santa Barbara	65	80
Ventura	40	80
Los Angeles	30	35
San Diego	25	45

The foregoing shows that the only great grain counties which can be congratulated this year are the group of counties in the upper part of the Sacramento valley. The other counties which show an increase over last year's figures are, as a rule, but small grain-producers. On the other hand the deficiencies fall just where every per cent lost means a great deal of grain, and some of the losses are appalling. It is because of this great difference in the significance of the figures as applied to different counties, that no averaging would be of any account, except one worked the problem out carefully from the stated production of each county. Any one familiar with the facts can learn enough to convince him of the unfavorable character of the above report without computation. As a sketch or deduction from the reports which we have arranged in tabular form above, Mr. Friedlander says:

From the reports received it would appear that the northern half of the State, including Sacramento county, will turn out about the same amount of wheat that it did last year. Estimates on the San Joaquin valley are very difficult to make on account of the spotted character of the fields. Generally speaking, it may be said that the west side will produce next to nothing. From the river to the railroad the crops are not much better. From the railroad east there will be a good deal of grain, but not as much as this same belt of country produced last year, so that the whole valley may be put up at 60 per cent of what it turned out in 1886. From San Francisco south through the belt of country west of the Coast Range, reports are bad, and it now looks as though the yield for this part of the State, including all the coast counties, would not be over 40 per cent of what was raised in 1886.

An interesting sketch of the barley outlook is given in another column. The position there taken will be found to be sustained by Mr. Friedlander's report, in which he speaks of barley as follows:

Owing to a great extent to the increased acreage, the reports on barley average better than those on wheat, although the general conditions apply as well to one cereal as to the other. What may be called the barley sections proper all show a decrease, while the part of the State from Yolo county north shows an increase. Last year the San Joaquin valley had barley to spare; this year it will probably be forced to import to supply a deficiency. The islands at the mouth of the San Joaquin and Sacramento rivers that last year produced but little will this year turn out a large amount of barley. Taking it as a whole, the crop will be less than that of 1886.

Evidently 1887 will not figure as a great grain year. It will not be long before we can begin courting favorable glances from the triply alliterative eighteen-eighty-eight.

IT is decided that the Oceanic steamers will stop at San Diego.

Lubin's New Pulverizer.

David Lubin, of Sacramento, with the wonderful energy which is characteristic of him, has now brought to practical success an implement for soil pulverization which is altogether new in its method, and which bids fair to make a great stir, not only in the soil, but in the old means of tillage. His attention was called some time ago to the poor pulverization on some kinds of land, which was all that could be secured by harrows and cultivators. He was also troubled by the uneven surfaces left between trees and vines, by plowing and harrowing, and sought to obviate them. For several months he has labored to bring his ideas into practical working shape and has succeeded, both in getting Government sanction to his invention, by patents obtained through Dewey & Co.'s agency, and by actual fieldwork has satisfied practical agriculturists of the value and feasibility of his implements.

A field trial of Mr. Lubin's implement was held near Sacramento last Saturday morning, the following account of which is given by the *Record-Union:*

The trial was a complete success, and demonstrated the usefulness and novelty of the implement. The Lubin pulverizer consists of a series of wheels, playing independently upon a common shaft in a frame drawn by horses. The periphery of each wheel is armed with chisel-shaped teeth, extending outward six inches, and are about 3½ inches apart, which penetrate the earth as the wheels move forward. A cross-bar bears steel spring teeth curved forward—designated as crushing bars—so that they depend between the wheels. The bar bearing these teeth is operated by a lever to raise and lower them. When it is desired to stir up land packed by recent rains, the crushing bars enter the earth point first, tearing up the crust. The wheels rotating, carry the wheel teeth between the crushing bars, pulverizing the clods to a fineness in proportion to the gauge at which the machine is set—*i. e.* the width or space between the wheels and the crushing bars. Reversing the tongue for the horses, a different effect is produced, and puts the crushing bars at the rear, so that they follow the wheels and meet the earth curve first, instead, as in the first case, of preceding the wheel and meeting the earth point first. The revolution of the wheels now sends the wheel-teeth into the plowed ground and carries the earth to the rear against the curve of the crushing bars. As this motion is rapid, the clods and earth are dashed against the crushing bars, and the result is a shower of finely pulverized soil, which pours from between the crushing bars. The motion described is unlike that of harrow or cultivator in this, that in the latter there is a dead pull through the earth, while with this machine the earth is lifted up, the solid pieces broken, and the pulverized result showered back from above, thus completely loosening the soil, aerating it, and leaving it evenly and finely prepared, and without ridges, and thoroughly light and loose. The pulverizer stirs the soil the full depth of the wheel teeth described. The inventor stated his claims for the machine to those present about as follows: "That it does away with the necessity of irrigation on lands where thorough cultivation takes the place of irrigation, or renders it unnecessary." "That it reduces the most stubborn soil to the fineness and texture of alluvial bottom lands." "That the cultivation and tilth is uniform and to a depth of from four to six inches." "That it does not pack the soil but leaves it soft and mellow." "That the machine is as valuable for putting in grain as for fruit and vines. A broadcast seeder is placed on top so that seeding, cultivating and covering is done at the same time." "That it is simple in construction and light of draught."

"That such unbroken particles as are left by the machine are all on top of the soil and no clods are left beneath the surface."

"That while by other methods clods are broken accidentally, in this case they cannot escape, but are crushed intentionally."

All those present at the trial of the machine were unanimous in expression that it does what its inventor claims for it, and excels anything yet tried with the same ends in view, and that for thorough cultivation it will prove a great aid to agriculture.

Mr. Lubin's pulverizer will be made by the well-known firm, P. P. Mast & Co., of Springfield, Ohio; and H. H. Linnell, of Sacramento, has been appointed agent for California.

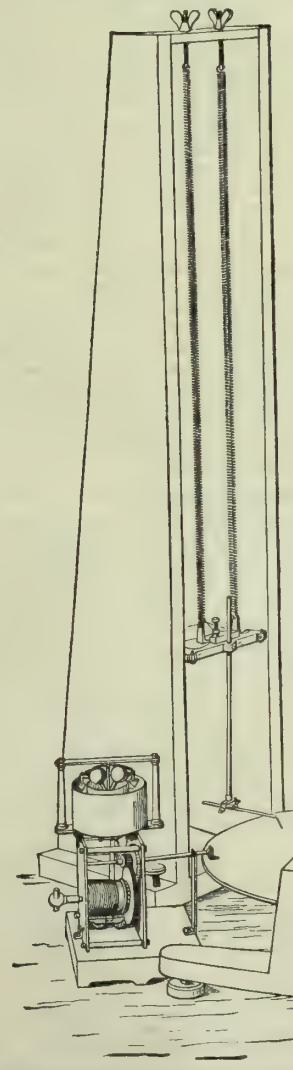
THE PURE-WINE STAMP LAW.—This Act, which went into effect June 5th, does not work smoothly. The large wine-dealers of this city have sent circulars to wine-producers that they will not buy their wines unless an analysis of each lot is furnished with the wine. This would throw upon the producer the burden of having his wine analyzed and paying for it, each time he made a sale to a merchant. A meeting of the Grape-growers' and Wine-makers' Committee was held in this city this week. Captain St. Hubert, of Fresno, moved that a committee be appointed to confer with the merchants and report at the next meeting of the Viticultural Commissioners on the 21st inst. The motion was carried and the chairman appointed as such committee Captain Chamon de St. Hubert, of Fresno, H. Merriam, of Los Gatos, H. A. Pellett, of St. Helena, B. H. Upham, of San Francisco, Julius P. Smith, of Livermore.

Earthquake Detectors.

One of the most violent earthquakes which has visited the mountain region of the State occurred on the morning of June 3d. The commotion was felt as far east as Virginia City and is said to have been the first one which was severe enough to make itself felt in the lower levels of the Comstock—thus showing that the miners cannot count upon freedom from these phenomena, as they have claimed hitherto. The shocks visited the line of the Sierra Nevada and its foothills and extended westward a certain distance upon the valley, the oscillation being quite marked at Sacramento. Reports also come of continued disturbance in the mountains in Arizona and southward in Mexico—a veritable volcano being reported as one of the resources of the latter country.

In view of these occurrences it may interest our readers to learn of the construction and operation of the instruments devised by science to make accurate record of earthquakes and which are called "seismographs." In view of the fact that people on this coast are specially interested in disturbances of the earth, a complete set of these earthquake recorders has been procured for the Lick Observatory, made from designs of Prof. J. A. Ewing, of Dundee. We give engravings of these self-registering seismographs on this page with description extracted from Prof. Ewing's note in *Nature:*

In the design of these seismographs, the object has been kept, in view of making them easily capable of use by observers who have not made seismometry a special study. They are entirely self-recording and require little attention during the long intervals which must, in most situations, be expected to elapse between one period of activity and the next.



One group of instruments is arranged to give a complete record of every particular of the movement by resolving it into three rectangular components—one vertical and two horizontal—and registering these by three distinct pointers on a sheet of smoked glass, which is made to revolve uniformly by clockwork. A single earthquake always consists of many successive displacements of the ground, hence the record traced by each pointer on the moving plate is a line comprising many undulations, generally very irregular in character. The amplitude, period and form of each of these are easily measured, and by compounding the three we obtain full information regarding the direction, extent, velocity and rate of acceleration of the movement at any epoch in the disturbance.

This group of instruments in shown in Fig. 1. In the center is a plate of smoked glass, which gets its motion through a friction-roller from a clock furnished with a centrifugal governor, acting by friction fluid, and balanced so that its speed is not sensibly affected by the shaking of the ground. The clock is started into motion by means of a Palmieri seismoscope, which appears in the figure behind the plate on the right. This is a small common pendulum, whose bob carries at the bottom a piece of stiff platinum wire that projects into a recess in a cup of mercury below—the recess being formed by an iron pin standing lower than the surface of the surrounding mercury. On the slightest shaking of the ground, contact with the edge of mercury takes place, and this closes a circuit which releases an electro-magnetic detent and starts the clock. This occurs during the preliminary tremors which are usually found in advance of the main movements of an earthquake. The same circuit starts another clock (of the escapement type), which fulfills two functions: It marks time on the revolving-plate during a part of the first revolution, and then continues to go as an ordinary clock, so that, by inspecting its dial afterward, the interval which has elapsed from the occurrence of the earthquake is known, and the date of the shock in hours and minutes is thus determined with as much precision as the phenomenon admits of. This part of the apparatus is omitted from the figure. The two horizontal components of motion are recorded by a pair of horizontal pendulums set at right angles to each other, but with their indices inclined so that they write side by side on one radius of the plate. The pendulums are supported on a single stand, but with independent adjustments for position and stability. Each has two pivots, consisting of hard steel points which turn in sapphire centers. At the pivots and at the tracing points every effort has been made to avoid friction. The indices are of aluminium, and a part of their weight is taken by springs (not shown in the figure), so that their pressure on the plate may be no greater than is necessary to produce a trace on the sooty film. The vertical component of motion is recorded by the instrument which appears behind the clock. A massive bar, free to move vertically about a horizontal axis, is held up by a pair of long spiral springs. Its equilibrium is made nearly neutral by applying the pull of the springs at a suitable distance below the horizontal plane through the axis of support, in the manner described in the article, to which reference has already been made. A bell-crank lever with a jointed index gives a multiplied trace of the apparent vertical oscillations of the bar, which correspond to vertical displacements of the ground. In this instrument, as in the others, sapphire centers are used to minimize friction.

Records inscribed on the plate are preserved by varnishing the plate and using it as a negative to print photographs. The motion, as recorded, is magnified to an extent which experience of Japanese earthquakes has shown to be desirable in dealing with disturbances ranging from those which are just recognizable as earthquakes up to those which are, to some extent, destructive. For great earthquakes, separate apparatus of the same type is designed, in which the multiplying indices are dispensed with, and the scale and style of the other parts are considerably modified.

Another and distinct instrument is the duplex pendulum seismograph, shown in Fig. 2. A massive bob is hung by three parallel wires from the top of a three-cornered box, and is reduced to nearly neutral equilibrium by being coupled by a ball-and-tube joint to the bob of an inverted pendulum below it. The two form a system which can be made as nearly astatic as is desirable, and so furnish a suitable steady point for the horizontal part of earthquake movement in any azimuth. The motion is magnified and recorded by a vertical lever geared to the upper bob by a ball-and-tube joint supported on gimbals from a bracket fixed to the box, and furnished with a jointed index which writes on a fixed plate of smoked glass. Records of the kind which the duplex pendulum gives are, of course, incomplete in two important particulars: they show nothing of the vertical motion (which, however, is usually a comparatively small part of the whole), and they show nothing of the relation of *time* to displacement throughout the disturbance. But they exhibit very clearly the change of direction which the movements undergo, and the actual direction taken by any pronounced element of the shock.

FIG. 1.—Complete Three-Component Seismograph, for Motions in all Directions.

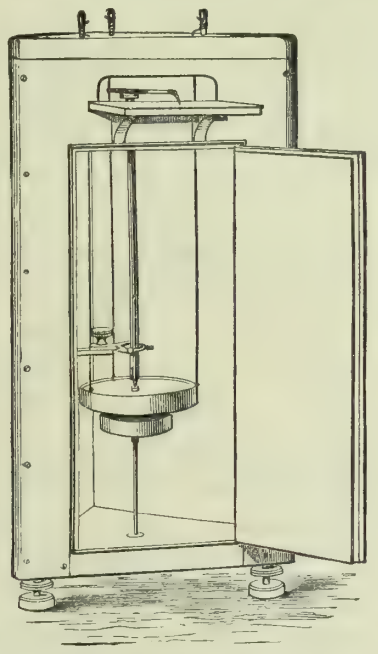


FIG. 2.—Duplex Pendulum Seismograph for Horizontal Motion.

SELF-REGISTERING INSTRUMENTS FOR RECORDING EARTHQUAKES.

A HARE, NOT A RABBIT.—During the excitement over the threatened importation of rabbits from Australia, last winter, some one made a loose assertion in print that our little California "cotton-tail" is very rabbit and burrows in the earth. This was denied at the time, and the *Appeal*, having submitted the question to a certain old hunter near Marysville, reports as follows: "He says that in all his experience as a hunter he has never known the cotton-tail to make a burrow of its own, although it will frequently bolt into holes made by gophers or other animals. He has made hunting his sole business for the past 30 years, and says that there used to be thousands of cotton-tails in this vicinity. He is very observant, and his testimony ought to be sufficient to settle this little point in natural history. It would appear that the cotton-tail is not in reality a rabbit, but a hare."

VALUABLE SHORTHORNS FOR NEVADA.—We learn from the St. Paul *Pioneer Press* of May 25th that at H. F. Brown's Eighth Annual Sale of Shorthorn Cattle, which took place the previous day, there was a large attendance and heavy bidding, and the sale was probably the most successful ever held in that city or State. Thirty-three head were sold, averaging $417 per head. The highest-priced animals were bought by W. J. Marsh, of Fort Churchill, Nevada, as follows: Wild Eyes Duchess 12th, $1450; imported Duke of Waterloo, $1500; Wild Eyes of Browndale 6th, $1800. These animals will be a great acquisition to the Shorthorn interests of Nevada, and we are glad our friend Marsh has captured them.

THE Pacific Kennel Club clearly believes in taking time by the forelock—having determined to hold a bench show April 5–7, 1888.

Southern California.

[NO. 5.—CONTINUED.]

[Editorial Correspondence.]

In continuing our notes upon Southern California, we now come to the extreme eastern portion of the great San Bernardino valley. At this point, and at an altitude of from 1600 to 1800 feet above the sea level, we find a plateau of some 10 or 12 square miles, which, for beauty of location and surroundings, fertility of soil, excellence of climate, facilities for irrigation, etc., cannot be excelled by any other locality in California. There are three centers of settlement near the central portion of this area, so near to each other that they must soon merge into one town or city. The several locations are now known as

Lugonia, Redlands and Crafton.

While this locality, taken as a whole, is unsurpassed in grandeur and beauty of prospect and scenery, it also possesses the most substantial elements of prosperity. The climate is that peculiar to the warm belt of the foothills in every portion of this and the neighboring valleys. The air is singularly dry, pure and salubrious, and especially adapted to persons suffering from pulmonary and nasal or throat complaints. As a place for home-seekers who desire a warm, dry climate, with plenty of water for irrigation and good drainage, by means of underground pipes, which preclude all possibility of malaria, it cannot be excelled. As an evidence of the healthfulness of the climate and locality it may be stated that the average of deaths here for several years has not exceeded 6 in 1000. This is only about one-third the average death rate of country places; and this, too, notwithstanding large numbers come here on account of ill health.

The Soil is a Rich Red Loam

From which the central locality—Redlands—takes its name. It is composed of vegetable mold and decomposed granite. Both climate and soil are peculiarly adapted to the culture of citrus fruits, while the deciduous fruits and vines also do equally well. In no other part of California or the world can better oranges be grown than upon the redlands of this locality. As an evidence of this, the fact may be cited that here and upon its counterpart at Riverside, seedlings almost invariably produce fruit of an especially delicious character. This locality is destined to become the garden of the State—the queen settlement of Southern California.

The Boom and its Progress.

The recent advent of the Atchison & Topeka railroad into and through the heart of Southern California, and the railroad competition thereby created, coupled with the unfortunate attacks of King Frost upon the orange groves of Florida, have gradually led to the getting up of numerous large excursion parties into that part of the State without the necessity of having to encounter the storms, snows and winter blockades of the Central route. These excursionists have seen and been charmed with the natural loveliness and climatic advantages of this truly wonderful portion of the Golden State. Nearly all who have made these trips are people of means, or invalids more or less well-to-do, who have become tired and disgusted with the winds and storms and snows of the Atlantic and Northern States, and have made the trip to escape for a season from the inclemencies of their Eastern climate. Under these circumstances large numbers have either settled at once or returned to the East merely to close up their business and return to make California their future home. The objective point of these excursions has generally been the city of Los Angeles, where thousands have purchased suburban homes in that vicinity or gone into business within the limits of that rapidly growing city. At first the overflow from Los Angeles was into Pasadena, one of the most favored localities in Southern California. Gradually, however, it was discovered that the farther back they went, up the San Gabriel valley, the better the climatic advantages. Riverside, with its vast spread of loveliness and floral and pomological beauty, attracted not a few. Ontario, Cucomongo and other places all along the beautiful San Gabriel valley, picked up many of the Eastern visitors and seekers for new homes. Still retreating up the valley in search of newer, and if possible, better resorts for health and other natural advantages, the tide finally found itself blocked by

the grand old mountains which look down upon the San Bernardino and San Gabriel valleys, and from whose lofty summits

"The eye may scan the distance from the mountain to the sea,
Where the quiet is delightful, and the prospect unsurpassed,
Where hill and valley, copse and orchard, and the mountain ranges mass,
'Midst the bloom of Nature's dressing, filling space with odors sweet."

Here, in this loveliest of Nature's valleys, nestled upon its eastern border, fully above all the surrounding country, looking down from its gentle elevation upon San Bernardino, Colton, Riverside and all the many settlements along the upper San Gabriel valley, may be found the delightful retreat of Crafton, the beautifully terraced Lugonia with its orange-fringed slopes, and the broad and luxurious plains of Redlands just blossoming into fruitage—a trio of natural loveliness nowhere else excelled, and separated from each other by imaginary lines of demarkation, but bound together by common locality, common interests and the manifest destiny of a great and common future. Well may it be said of this beautiful locality:

"Fair is the valley where the spring ever reigneth
Full in the light of the soft summer sun;
Blue lie the mountains above and around it,
Sleeping like Titans whose labors are done.

"See in the distance the snow-crowned Sierras,
Whereon the Ice-King reigns all the year round;
Far from his glance in the valley we wander,
Down where the wild flowers carpet the ground.

"Sweet is the perfume the zephyrs are wafting,
Star-like the blossoms the orange trees bear;
Rich is the promise of golden-hued fruitage,
Sure in this vale is the harvest so fair."

In writing of this locality we fully agree with Mr. Frank L. Morrell, who writes of it as follows: "If any one thinks he can describe Redlands upon paper, let him try it; and after he has exhausted his noblest efforts, let him pay a visit to the location of even one half-hour, and as he stands upon the commanding hights and drinks in the beauty of the spreading landscape at his feet, turns his eyes to the grand old mountains which, but a few miles away, look down from the clouds upon the quiet valley; quaffs long drafts of the pure, exhilarating mountain air, and feels the thrill of new life and energy coursing through his veins; gazes upon the beautiful homes, the magnificent orchards and the thrifty vineyards all around him—then let him read what he has written, and he will realize how impossible it is to reproduce Nature with a pen."

This locality was, at the time of our visit, some two months ago, a great center of attraction. The hotels were filled with visitors in search of health or homes. Real estate agents were driving hither and yon, each with one or more at his elbow in search either of a home or a good field for investment. New streets and roads were being laid out in every direction. Houses of brick and wood were going up as fast as laborers could be found to build them. Scores of plows were to be seen everywhere breaking up new ground or cultivating old. Orange orchards and vineyards were being set out; the streets were crowded with teams, hauling building materials, household supplies, merchandise, etc.; land which had already doubled and trebled, and in some places quadrupled in value within the past few months, was still going up; and everything betokened

A Busy Scene of Enterprise and Industry,

Which indicated, in a most unmistakable manner, an early and prosperous future for the large and important town which must soon cover the present site of the three localities named. Spacious blocks and trade palaces may never be realized there, but lovely homes, elegant villas, crowded hostelries, beautiful parks, extensive streets and shaded avenues will soon cover many square miles of this portion of the San Bernardino valley. What the future name of the town may be is as yet undecided; but the feeling is continually growing stronger that some common name should be decided upon. If we were allowed to make a suggestion, we would submit that of Lugonia, which is already well known as the postoffice name. It is short, easily pronounced and spelled, euphonious, and has no similarity in sound to any other town or city on the Pacific Coast. Moreover, it is derived from the name of the first settler who obtained a grant of all this portion of the valley from the Mexican Government. Surely his name should be kept in remembrance, and what more appropriate way to do so than to affix it to the future city which is to grow up on the land which he was the first to cultivate and improve?

A steam or motor road has been projected to connect this locality with Colton and San Bernardino and the continental system of roads which concentrate there.

Redlands and the Chicago Colony.

The Chicago colony, as it is called, has been one of the chief factors in giving the recent impetus to business in this neighborhood. It was organized some year or more ago, at the suggestion of Mr. I. N. Hoag, late of Sacramento, then a resident agent of the California Emigrant Society at Chicago. It consists of a membership of over 100 persons, mostly heads of families, who were largely prompted by the first California citrus exhibition in that city to seek new homes within the citrus belt of this State. A committee was appointed who visited California and thoroughly examined all the citrus-producing portions of the State, from Ventura on the north to San Diego on the south. After viewing all the desirable localities within that area, they finally decided upon a large tract of land lying between Redlands proper and Crafton, which has been purchased and is now being prepared for occupation as fast as money and labor can do it. A very large area has already been broken up, and the plows are still at work preparing for orchards and vineyards and in opening up streets. Preparations will be made for 40 or 50 families who are either already here or will come out during the present season. The committee which made the selection consisted of R. J. Waters, of Chicago, chairman, and H. C. Malone, of Grand Crossing; Jacob W. Ludlum, of Evanston, Illinois, of the Board of Directors, who said in their report that, "considering the soil and climate, the abundance and advantageous combinations of water for irrigation, and the perfect system of its distribution on the lands, transportation facilities, educational advantages, ample home markets and general surroundings, they could find no place equal to it." From the above names it will be seen that the membership of the association is not confined altogether to the city of Chicago. The success with which these gentlemen have already met will no doubt be the means of sending many more to this locality from that portion of Illinois. The land and water purchases which have been made by this colony are worth today fully three times what they have cost. Mr. Walters, with Mr. R. B. Lane, also of the association, are gentlemen of means and energy, and are personally superintending the general interests of the colony and the erection of buildings for banking purposes, for stores, offices, etc., at the new center of business, which will also constitute the railroad terminus for a time at least. There are now a dozen or more brick buildings at this point, in addition to a still larger number of wooden structures. A bank, known as the "Union Bank," has been incorporated, with a capital of $50,000. The officers are Curtis Wells, president; Samuel J. Hayes, vice-president; and R. B. Lane, cashier. The directors are Curtis Wells, R. B. Lane, S. J. Hayes, J. F. Drake, E. G. Judson, Louis Jacobs, H. M. Barton, R. J. Waters, Dr. Craig and R. J. Kimball. All over the Redlands tract, for two or three miles in extent, neat cottages or more elegant and pretentious dwellings are being erected. A company has been organized to erect, on the corner of State and Fourth streets, a hotel to be 80 feet frontage by 160 in depth. It will be three stories high, will contain 60 rooms, with a large observatory on the top.

The Episcopalians have secured both land and money, and have already prepared plans for a fine church building. Other denominations, the Presbyterians, Methodists and Baptists, have also secured lots for the same purpose. The Young Men's Christian Association will soon commence—if they have not already done so—a large two-story brick building for their use. From these facts it will be seen that Redlands is fast taking its place as a prosperous and growing town.

The Prospect House.

This is the only hotel now open in Redlands. It occupies a commanding site on the terrace which forms the eastern border of the settlement. The view from this house is magnificent. It is under the management of Dr. J. A. Mack, lately from Chicago, and is constantly full of boarders. It is one of the finest hotel sites in the valley, and will no doubt soon be greatly enlarged and improved in its architectural appearance.

Lugonia.

Which is located less than half a mile from Redlands center, is already rapidly growing in importance and population. A fine block of buildings is just being completed on the "Terrace," just opposite the postoffice, one portion of which will be occupied by the bank, and another portion by stores, offices, etc. All the land along the Terrace and the Sankey from this point to Dr. Stillman's vineyard—about one mile—has been laid out in lots for building purposes, with wide streets and avenues. The most of this land has been bonded to Mr. I. N. Hoag, formerly of Sacramento; at the time of our visit, he was making preparations to build a residence for himself upon one of the lots. Mr. Hoag has transplanted to his lot a large number of 8 or 10-year-old orange trees, which were taken up to make room for the bank building. They were all in full bloom at the time of removal, and at last accounts were doing well—not even losing the fruit which was just then setting. He will, no doubt, have the pleasure of surrounding his new home at once with a grove of bearing orange trees.

The Terrace Villa Hotel

Is a very handsome and highly ornamental structure, situated upon a slightly elevated terrace, near the center of the beautiful village of Lugonia. The view from every part of the house is both beautiful and grand. Lofty snow-capped mountains are seen at a distance upon three sides, with an open vista to the west, which looks for fully 60 miles down the San Gabriel valley. The hotel is located directly in the midst of an orange grove, with orange orchards and vineyards covering all the country around. It is also embowered in roses and flowering plants and shrubs of every variety. It is supplied with the purest mountain water and fitted up with every modern convenience. The table is supplied with the best of everything and elegantly served. The interior is roomy, well furnished, well ventilated and contains 48 rooms, 16 of which have been recently added to accommodate the rapidly increasing numbers of roomers and visitors. The dining-room of this hotel is one of the finest in Southern California. Mr. Frank Smith, the landlord, is well known throughout the central portions of the State as having formerly presided over the Piedmont house at Oakland and Highland springs in Lake county. The regular boarder or transient visitor will find in him a pleasant and accommodating landlord and a thorough gentleman, while Mrs. Smith is a host in herself—everywhere present, looking after everything in person from the kitchen to the parlor, making all her friends and guests completely at home in all their wants or pleasures. No pleasanter place for a visit or a domicile can be found in all Southern California. There is a good livery stable connected with the hotel, and nothing, in fact, is wanting to make it a most enjoyable place of resort at any season of the year, for here spring and summer are blended in ever and delightful presence from January till December. W. B. E.

THE VETERINARIAN.

Notes on Dogs and Dog Shows.

EDITORS PRESS:—Now that there is much conversation upon the topic of "dog shows," perhaps a few suggestions upon dogs generally may be in order. To say that the numerous breeds of these animals, from the Newfoundland to the pug, all originated from the process of man's selection, would be stating too much, yet it is a fact that we have done a great deal to alter the physical character of many of the different families. For instance, it is almost a recognized fact that the Scotch collie has descended in this manner from the common fox. These noble dogs undoubtedly belong to the oldest race of the canine species. Italian greyhounds are small or dwarfed by climatic influence and selection. And again things go to prove that the old-fashioned bull-baiting dog—the bull-dog—is a descendant of the mastiff. To my mind it is not correct to state that the greyhound has deteriorated in sagacity. If he is less affectionate than other breeds, it is due to the fact that he has not been made so much the companion of man. The weight and grand convolutions of the brain of "Master Magraith" do not favor the theory of degeneration. That this family of dogs hunt by sight and not by scent is interesting.

Preparing Dogs for Show, Etc.

"Faking," although a slang phrase, is expressive; and by it we understand that certain dishonest means have been adopted to enable an animal to make a good impression on the judges. In the case of fox-terriers, black spots are often made with nitrate of silver, in desirable places, to wit: on each side of the face. And it is well known that bull-terriers should be white; where this color is not as wished for, it is made artificially by the application of pipe clay. Sometimes enough of this has been rubbed into the hair to cause quite a cloud to ascend, when the dog has jumped up affectionately to his master in the ring, and Mr. Owner has been requested to retire, and has done so not at all in a dignified style. In the preparation of dogs for exhibition, it is necessary to feed them well, upon natural food, plenty of pure water and exercise. An occasional bath in cold water, and when dry, a meager application of oil, three or four drops well rubbed into the hair, is enough for the purpose. When he is tied up upon the bench, it is most important not to tie, in such a way that he may get off, as in this way valuable dogs have hung themselves, not purposely—dogs are not inclined to suicide.

Peculiar Canine Characteristics.

Dogs are of an intensely nervous temperament, and if one is much with them he will see how difficult it is for this animal to control his temper when once aroused. As an instance of this: "There are several cases on record where the usual attendant upon the sporting kennels in England has had occasion to visit the hounds at night, in the dark, dressed in his night apparel, and they not at first recognizing their friend have attacked and actually torn him to pieces." I am perfectly certain that nothing tends to produce disease in this noble creature so much as want of exercise, being continually chained up, and I am inclined to think that rabies may be the result *per se*, and that some diseases may originate spontaneously and then become contagious. He has when adult 42 teeth, 20 in the upper jaw and 22 in lower. All become permanent at six and a half months. It is a good plan to allow puppies to have large bones to play with. It assists the removal of the milk teeth and helps dentition. Bones are easily dissolved in the stomach of the dog, due to strength of the gastric juice. Owners of stud dogs often allow too frequent sexual connection; once a fortnight is compatible with vigor and health. In applying external remedies, it is requisite to remember that the dog will lick off the dressing, and if poisonous the result may be fatal. Sometimes through dirt he may harbor lice. There are few things better for this than a thorough rubbing in of some vegetable oil, such as sweet oil, taking care that he does not catch cold, and thoroughly washing next day with warm water and a little potash. Bitches carry their young, on an average, 62 days. During this period good food is a mixture of oatmeal porridge and scraps of meat; in fact this is a good general meal for all kinds of dogs, varying the quantity of meat in accordance with the amount of work or exercise.

ROBERT J. DAWSON,
Veterinary Surgeon.
225 Geary St., S. F.

HORTICULTURE.

State Horticultural Society.

The last regular meeting was held in this city May 27th, President Hilgard in the chair. B. M. Lelong, secretary of the State Board of Horticulture, was elected a regular member. H. W. Rice, of Haywards, and I. Allegretti, of West Berkeley, were proposed for membership.

Mr. Coates, of Napa, exhibited the "Common Sense" fruit-drier and evaporator, and at some length explained its merits.

A report was read by B. M. Lelong regarding the fruit prospects of the present season. [It was published in last week's RURAL.]

Cold Storage.

Mr. Lelong read a letter from the Interocean Cold Storage Co. at Riverside, which reported having on hand 12,000 boxes of citrus fruits, oranges, lemons, limes, etc., which are in fine condition and looked as if they may be kept indefinitely.

There were shown samples of fruits and vegetables that were bought at a Market-street fruit-stand on the 14th inst. and submitted to the Allegretti cold-storage process. They consisted of strawberries and cherries, asparagus, tomatoes and cucumbers, and were in a fair state of preservation.

Mr. Allegretti, who was present, stated that the fruit was not in good condition when bought at the fruit-stand, and it was put in a refrigerator not specially made for fruit. Considering these facts, the result was very satisfactory. Mr. Allegretti now has his process improved and available for fruit at small cost to the grower. He disclaimed any feeling of jealousy toward rival cold-storage processes, for he thought the State capable of producing fruit in sufficient quantities to keep 20 or 30 processes in full blast. Mr. Allegretti has just put up a cold-storage house for S. F. Leib, of San Jose.

Pear and Apple Blight.

W. G. Klee, State Inspector of Fruit Pests, opened the discussion of the afternoon, which was on the pear and apple-scab blight. True blights, he said, are due to diseases. In many cases the blighting of fruit blossoms is due to changes of temperature. The true blights can all be traced to germs. Some of these germs have of late years become firmly established in California. One of these is the pear and apple-scab blight. A moist atmosphere is conducive to the rapid spread of this fungus, and a dry one is unfavorable. It may take a year or two or even more to cleanse your trees thoroughly from the germs which produce this most destructive disease. The spores may lodge beneath the bark and in the axils of the leaves and twigs to remain for several seasons. The peculiar climate of the coast of California, especially that of those sections within the more direct influence of the fogs of the ocean, offers specially favorable conditions for the development of injurious fungi, popularly known as rusts, mildews and blights, which, as cultivation extends, seem to increase and cause serious loss if not total destruction of our crops.

The effect of *Fusicladium* (as this fungus is called) on the fruit and foliage demonstrates its identity on both the pear and the apple. Ten years ago nothing was heard of this trouble. Winter Nelis bore and matured in many places on the coast where they are now being abandoned as a failure. About five years ago I noticed at the experimental orchard of the University the leaves of two trees in the extreme southwest corner of the orchard during the month of May becoming smoky looking, revealing under the magnifying glass a smut-like fungus. The trees produced but little fruit, and most of this was badly affected with the same smut.

Effect of Hot Weather on the Fungus.

The warm weather dissipated nearly all the signs of the fungus and it was not until next season that I discovered it again on the foliage of the same trees, as well as on six or eight adjoining pear trees, attacking the latter in precisely the same manner as it had the very first variety, affecting foliage and fruit as well. Next season again I was astonished to find, after a few days' absence, that the same blight had made its appearance in all parts of the orchard, affecting some varieties very severely, others less, and some not at all. It was the same year that the blight of the Winter Nelis was so general, as most people remember. The same year, according to J. McLaren, of San Mateo, was the first year the disease was noticed in San Mateo county, and the same year also in the Santa Cruz mountains that the so-called apple-tree blight proved very severe. In fact, from every quarter within the region of the fog belt complaints of this blight were heard of. This season I determined, if possi-

ble, to reach some definite conclusion in regard to the nature of the blight as reported from various quarters, and from a thorough comparison I am satisfied that the *Fusicladium dentriticum* is the cause of all the trouble.

Places in which Spores Are Protected.

In the case of the white winter pearmain, we have in the cracked bark peculiar to this variety abundant protecting-places for the resting spores, which carry the disease over from year to year. Most probably the spores, seating themselves under the scaly bark, are protected from such changes of atmosphere as are brought with the dry north wind, that destroyer to all forms of fungi. On the smooth branches of other varieties, comparatively little opportunity for the lodgment of resting spores is presented, and the time of blooming has passed before any great number of spores have developed, so the harm that is done does not show itself until the young fruit has advanced a little, while, on the other hand, varieties seriously affected have sufficient spores present to destroy the bloom.

The most successful remedy is the sulphide of soda, with whale-oil soap, prepared as follows: Dissolve 30 pounds of whale-oil soap (80 per cent soap, at the most costing 5 cents per pound) in 60 gallons of water, by heating the two together thoroughly. Boil three pounds of lye (American concentrated lye is what we have used) with six pounds of sulphur and a couple of gallons of water. When thoroughly dissolved it is a dark-brown liquid (chemically sulphide of soda). Mix the two—the soap and the sulphide of soda—well, and allow them to boil about half an hour, then add about 90 gallons of water to the mixture and it is ready for use. This was applied warm, at a temperature of 130° F., in the barrel from which it was sprayed. The remedy this time proved a decided success, and with the exception, the variety first attacked years ago, only such fruit as had not been covered with the solution was affected in the least. Such varieties as for years, and even last year, a favorable season, had suffered so severely that they were almost cracked to pieces, were perfectly smooth.

After Mr. Klee's address there was a general discussion on blights, in which nearly all present took part. The discussion wasin great part made up of reminiscences of the occurrence of pear blight at the East. Dr. Kimball, of Haywards, said that he had seen one case of the true Eastern "fire blight" in his neighborhood, but the tree was dug out and it had not appeared since. All other speakers thought they had never seen this form of blight in this State.

Professor Hilgard referred to a report from a French horticulturist, who suggests a mixture of copper sulphate (bluestone) and lime as a remedy for the pear blight on the leaves, but he thought this prescription less available than the wash recommended by Mr. Klee, and which had been so successful in the University orchard. Mr. Bogue, of Martinez, said he had seen the pear blight (*fusicladium*) at Santa Cruz three years ago, and had followed its spread in the other coast regions. He thought, as Mr. Klee said, its area would be confined to the moist coast valleys.

Did the Diabratica Do It?

Secretary Wickson read the following letter:

To the Horticultural Society: With but few exceptions the pear crop at Point of Timber (Byron) is a failure, and we are at a loss to account for it. It is not confined to any variety, but all have suffered alike. Such a failure has never been known here before. The season has been apparently all that could be desired, but the trees fairly swarmed with the striped budbeetle (*Diabrotica vittata*), and we incline to the belief that they caused the failure. They began upon the buds, and kept it up till the blooms were off, and then the pears began to drop. The pear did not grow a particle from the time of the bloom. The bugs would eat the white leaf of the blossoms, and often, but not always, into the calyx. They served the quince the same way, but with no fatal result, as the quince kept growing right along. They swarmed over the almond trees, and there are no almonds. My apple trees bloomed while they were finishing up on the pears, but a swarm of bees took possession of them and the bugs had to leave—the apples set full. The Winter Nelis has never failed here before as this year. I have 1000 Winter Nelis going into the seventh year, and will have some one-half dozen pears to the tree. I have several Bartletts adjoining that have set full. The bugs patronized them somewhat, but seemed to prefer the Nelis. Other Bartletts in the neighborhood are badly used up. All my apricots are gone except one tree, which is full.

The burden of our desire is to know to what extent these beetles are responsible for this failure. I tried the wash recommended (sulphur and whale-oil soap) to drive them off, with no success, on several trees. I immersed a branch, bugs and all, into a bucket of the mixture made strong, but next day that branch had its share all the same. I have made considerable inquiry among fruit men, and they generally held that the beetles did no harm, yet we doubt if they have had them in such numbers. We are very anxious to have some information on this subject, as we believe they have come to stay, and will be with us again next spring. How would it do to spray the trees when they appear next spring with the London purple, as recommended for codlin moth? Would it not kill every bug that took a bite? Would it injure the buds or blossoms? Any consideration you can give this subject for us will be truly appreciated.—G. W. T. CARTER, *Byron, Cal.*

No one present had been afflicted as Mr. Carter described. The opinion was that a spray of Paris green would probably kill the intruders. Mr. Hatch said that he had become quite confident about reducing all leaf-eating pests since he had begun the use of Paris green. He uses one pound to 200 gallons of water and kills all sawfly caterpillars, pear slugs, etc.

Gas Treatment for Scales.

By request, F. W. Morse, of the State University, gave an interesting account of his experience with gases for the reduction of scale insects. As an outline will soon appear in a University bulletin, we will not attempt to report Mr. Morse's address.

Other Matters.

The coming meeting of the American Pomological Society at Boston was mentioned. As it was requested that essays on fruit-growing in the different States be furnished by the State Horticultural Societies, Dr. John Strentzel, of Martinez, was, upon motion, requested to make such a contribution from California.

The subject for discussion at the June meeting will be the apricot in all its bearings. Upon motion, Mr. G. M. Gray, of Chico, was requested to communicate his observations on the diseases of the apricot. The society then adjourned.

Dr. Gally on Horticultural Association.

EDITORS PRESS:—I was never attendant at a fruit-growers' association, nor a horticultural society; but I have read about them and their proceedings in the RURAL PRESS. Very good reading it is, too; almost as good and quite as interesting as would be the report of a Methodist class-meeting, or love-feast. I only miss in the apple-sass class-meeting the associations of the sisters in the other class-meeting. I should like to attend an apple sass class-meeting. I do not want to make one of those long speeches, to which, as reported, the brethren are so addicted, but I would hope to help say "amen."

No, I was never there; but, for the last 12 years, I have associated with a congregation of fruit trees in California. That is a horticultural association which I have attended daily, and, there, I have warmed with the poetry of the opening blossom, have dreamed in the silence with the budding leaf and shouted at the eloquence of the abundant yield. We have had some very interesting meetings, but we never have been able to predict from the season of abundant apricot promise that there would also be an abundant yield of apples, plums, cherries, pears and strawberries (without irrigation). In fact, it is quite the contrary, for while the apricot belongs to the plum, or prune, family, it is the hot sun, dry weather plum. Its very name shows that. And its great abundance indicates that the season is not to be favorable for some other fruits. This is a pointer—don't give it away. It will not stand much water; it likes a little water and a steady, dry, but not too hot season. Ah! exclaim the newspaper reporters, look how the other trees blossom; and as to that let me say: Now, look here, you pencil-pushing fellows, before you predict in type a large yield from a great bloomage, hadn't you better explain how a bride can wear silks and diamonds on her wedding day and never have a baby—if she lives a hundred years. This blooming business is mighty deceptive—don't you bet on it.

Watsonville, Cal. J. W. GALLY.

[This communication should have been in the PRESS of last week, but was unavoidably left out.—EDS. PRESS]

Gossip About Prunes.

The *Morning Call* of June 31 has the following gossip on the prune industry of 1887:

There is a diversity of opinion among experts with regard to the yield of the prune orchards in the State this year. The most hopeful put it at a half crop, while others say not more than a third, and even as low as a quarter. Local influences, of course, have much to do with the varying reports that come from different sections. Referring to a New York dispatch about the prospect of a poor output from California prune orchards, and the statement contained in the dispatch that a syndicate had been formed here for the purchase and control of the season's yield, George W. Meade & Co., a leading house on Drumm street, said yesterday to a *Call* representative that there is no syndicate—four or five parties are buying, but they are not working together. This firm anticipates a half crop. There will be prunes enough for a healthy condition of the market. They said that reports differ with regard to the same localities. For instance, an extensive drier in Sacramento says there will be a good crop, while two weeks ago another Sacramento party said it would be short.

Mr. Justi, of the Pacific Fruit Co., Washington street, said, on being interviewed: "There is no syndicate, but three or four of the large dealers who have driers of their own, and plenty of money, are going around and buying up the crop at two cents a pound, green." Three pounds of green prunes are required to make one pound of dried. This puts the dried fruit at six cents, without counting the expense for labor and packing, which would be a half cent more on the pound of green fruit. Mr. Justi thinks that extra fine prunes this year will bring 12 cents to a bit, dried. In ordinary years they run from five cents up, according to the grade. All the prunes will be what are called "fancy," or very good, this year, for the reason that the large proportion that dropped from the trees before maturing gave the others a better chance to develop, so that while the crop will not be large the quality will, for the reason stated, be good. This year he has sold the old crop at prices varying from five to ten cents, and one or two fancy lots brought 12 cents.

ASSOCIATION OF NURSERYMEN, FLORISTS AND SEEDSMEN.—The twelfth annual meeting of this association will be held in the Exposition Building in Chicago, Ill., commencing Wednesday, June 15, 1887, and continuing three days. The association is the largest body of horticulturists in the country. The objects sought commend themselves to all engaged in any of the departments of the nursery trade. The discussion of questions directly concerning the welfare of the trade, new methods of propagating, new labor-saving devices, making of personal acquaintance of others in the trade, exchange and sale of surplus stock, exhibition of new trees, fruits and plants, are among the many reasons why every person interested in horticultural pursuits should be present at this meeting.

The Pumpkin Bug.

EDITORS PRESS:—I would like to know through the columns of your valuable paper a remedy to destroy the big black pumpkin bug. I would like to know soon. My vines grow luxuriantly, but the bugs are making sad havoc with them.—J. S., *Fresno.*

Powdering over the bugs and leaves with air-slaked lime is the usual remedy.

A Small Leak

Will sink a great ship; and what at first appears to be a trifling cough is apt to culminate in consumption, if not properly attended to in time. For consumption, which is scrofula of the lungs, and for all blood and skin diseases, Dr Pierce's "Golden Medical Discovery" has no equal. By druggists.

Our Progress.

As stages are quickly abandoned with the completion of railroads, so the huge drastic, cathartic pills, composed of crude and bulky medicines, are quickly abandoned with the introduction of Dr. Pierce's "Pleasant Purgative Pellets," which are sugar-coated, and little larger than mustard seeds, but composed of highly concentrated vegetable extracts. By druggists.

Young and middle-aged men, suffering from nervous debility and kindred affections, as loss of memory, hypochondria, should inclose 10 cents in stamps for large illustrated pamphlet suggesting sure cure. Address, World's Dispensary Medical Association, Buffalo, N. Y.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Consumption Cured.

An old physician, retired from practice, having had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung Affections, also a positive and radical cure for Nervous Debility and all Nervous Complaints, after having tested its wonderful curative powers in thousands of cases, has felt it his duty to make it known to his suffering fellows. Actuated by this motive and a desire to relieve human suffering, I will send free of charge, to all who desire it, this recipe, in German, French, or English, with full directions for preparing and using. Sent by mail by addressing with samp, naming this paper, W. A. NOYES, 149 Powers' Block, Rochester, N. Y.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

First-Class Mowing Machine for Sale.

A brand-new mower of well-known make can be obtained cheap for cash by addressing D. F., Box 2361, San Francisco, Cal.

Short Hand

Taught thoroughly by mail. Terms reasonable. Send for circulars. Miss Barrett, 240 Montgomery St., S. F.

20-ACRE TRACTS.

Fine, rolling, cleared, reddish-brown land, under cultivation in the Shasta Fruit and Raisin Colony. Twenty acres for $500. Terms: $200 cash, and balance in installments to suit purchaser, at 8 per cent per annum. Any tract will be set in raisins or fruit and brought to bearing by proprietor of colony, if desired. Send stamp for circular, and state how you wish the installments. GRIFFIN BROS., Cottonwood, Shasta Co., Cal.

THE VINEYARD.

Abnormal Deposits on Vine Leaves.

University Experiment Station, Bulletin No. 70

On May 14th a few leaves from a Muscat vine were received from E. H. Loveland, foreman of the Butler vineyard at Fresno. Mr. Loveland's attention had been attracted by what seemed to be a growth of fungus on the leaves and on one side of the trunk of the vine. He wrote that he had noticed the same thing before, but never in such amount as this season.

A preliminary examination of the specimens showed that the leaves, though appearing quite healthy in color, were thickly covered on both sides with a whitish substance occurring in irregular masses, and which at first glance might give some suspicion of a fungoid growth. Examined with a hand-magnifier, however, the material was seen to be of dense character and prone to lift from the surface of the leaf in scale-like particles—in fact, in some places, especially where it had extended over the ribs of the leaf, it had divided and partly lifted itself from the surface as though it had become shrunken and distorted by drying. No features of fungoid growth were discernible. Upon careful exploration with a three-fourth inch objective the marks shown by the hand-magnifier were made more plain, and the whitish masses gave indications of a crystalline structure, manifesting itself in two main forms. The thinner portions were chiefly made up of flattish crystallizations of arborescent form, spreading out upon the surface of the leaf, and the thicker parts were dense white masses covered thickly with acicular crystals. The whole appearance of the material was that of an incrustation held in place by adhesion and by interweaving of the leaf hairs through it, the latter fact indicating that it had come upon the leaf in a fluid state and had thus taken close hold upon the inequalities of the leaf surface. This being the character of the deposit as determined by the microscope, and as no traces of fungoid origin could be discerned, it was evident that the composition of the material, as determined by chemical examination, would be most apt to disclose its source.

The small amount of material which could be scraped from the leaves, somewhat less than one grain, rendered it impossible to come to perfectly definite conclusions regarding its exact nature.

The original material contained:

44.3 per cent insoluble in water.
55.7 " " soluble " "

Of the soluble part:

69.8 per cent was organic matter and water.
7.2 " " " soluble ash.
23.0 " " " insoluble.

The part insoluble in water contained:

81.1 per cent of organic matter and loss.
18.8 " " " ash.

The part of the original material insoluble in water consists mostly of lime, with a small amount of magnesia and sulphuric acid. A slight residue resembling mica (probably from the dust of the soil) remains after the treatment with acid. Sulphur is present in sufficient quantities to be easily detected when ignited—doubtless from the sulphuring of the vines.

The soluble part of the original material was slightly acid. On ignition it blackens, and emits a slight odor of burnt sugar. The presence of a little sugar is also shown by the copper test. The soluble part of its ash is strongly alkaline and consists largely of carbonate of potash with some sulphuric acid.

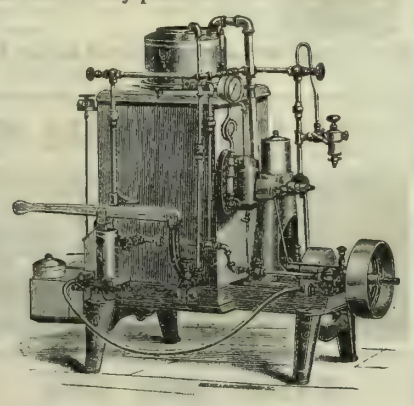
The insoluble part of its ash consists chiefly of lime with a small amount of magnesia.

The general result of this examination would seem to be that the white substance is a saline incrustation of organic salts of potash and lime. Such a deposit might result from the evaporation of vine sap itself, but its deficiency in gum and sugar and apparent absence of tartaric acid (judging from the crystalline form of the incrustation) renders this supposition unlikely.

Other Specimens.—Another specimen sent by J. S. Dore, of Borden, Fresno county, had all the characteristic marks of the specimen from the Butler vineyard, except that the material was less abundant. A specimen from Hiram Hamilton, of Orange, Los Angeles county, differs in some respects from the Fresno samples. The deposit is much thinner and looks as though drops of thin whitewash had fallen upon the leaf and spread out upon it. It is most abundant upon or near the outer edges of the leaves. Examined with the microscope, the deposit does not show the needle-shaped crystals as in the former cases, but has instead somewhat irregular, roundish masses, sometimes contiguous, sometimes separated enough to show the green color of the leaf surface beneath them. There is, however, no indication of fungoid form or growth, but rather of granular formation, presumably an incrustation. The material was not abundant enough to admit of chemical examination.

A specimen received from G. F. Merriam, of Escondido, San Diego county, resembles closely the one from Orange, Los Angeles county. Mr. Merriam writes: "You will notice along the edges of the leaves something white—as if lime-water had been thrown upon them." In this sample the thicker line of incrustation along what seems to be the part where most of the liquid would collect by gravitation is a noticeable feature.

Further Investigation Needed.—We make this preliminary statement concerning the nature of these abnormal deposits upon vine leaves, because of the interest which has been awakened in them in the localities where they have occurred, and to allay fears which seem to prevail that the peculiar appearances are due to the presence of "downy mildew" (*peronospora viticola*)—a disease of the vine which is properly dreaded. The wide announcement which has been made of the evil occasioned by this fungoid parasite, naturally renders vine-growers alert to detect signs of its encroachment. It may be stated that the "downy mildew" exhibits its presence by marks wholly dissimilar to the characteristics of the incrustation which we have described above. It forms "conspicuous white patches" of a fuzzy or downy character, as its common name indicates. These patches may be very small, but their soft, woolly nature is easily detected. As the disease progresses the patches become yellowish, then brownish, and finally the portion of the leaf affected exhibits all the marks of dead tissue. Sometimes the leaf is almost wholly covered and shrivels and dies. Microscopic examination shows that the fungus has penetrated the leaf substance and destroyed it.



In the case of the incrustation noted above, the material is wholly upon the outer surface of the leaf, merely resting upon it and easily separated from it. Careful examination of the epidermis from which the material has been removed does not show any invasion of the tissue. Nor does it appear from the samples received that the deposit, whatever may be its origin, does any injury to the leaf or its functions. Upon this point we desire more information from those who have observed the occurrence and traced its effects.

We desire more liberal supplies of the material to pursue investigations which we trust may disclose the origin of the peculiar phenomenon. We would also be pleased to have all vine-growers whose attention may be attracted by this announcement, examine their vines and send us specimens of anything which may seem to them to be of the character described. In many cases serious apprehensions may be allayed by determination of the real nature of what may seem to be threatening phenomena, and even when the matter is serious it is well to be advised of it as early as possible. The University Experiment Station is equipped for such work and its facilities are always at the service of the vine-growers and of agriculturists generally.

Berkeley, June 4, 1887. E. W. HILGARD.

The Shipman Automatic Engine.

The advantages of a cheap motor, easily available for all kinds of light work, can hardly be exaggerated. It is an age of machines, not only for great factories, but for the small arts of manufacturing and for doing away with much of the drudgery of every-day life. The Shipman engine, which is shown in the engraving on this page, has been widely introduced to meet the demand for a small motor, and so far as we have heard has given full satisfaction in work to which it is adapted. It is in small compass and yet capable of standing high pressure and doing effective work. It runs with kerosene or fuel oil, consequently is cleanly and the fuel is easily provided. It is automatic and

The Shipman Engine.

safe, and does not require the work or watchfulness of an engineer. It can be started in the morning and it will run all day without the least attention. The various parts are well designed and well made. It is portable and can be carried by two persons to any desired point. The engraving shows the latest improved form, and will give the reader a general idea of its appearance. It can be seen in operation in the Post-street end of the well-appointed store of Osborn & Alexander of this city, who are the agents for the Pacific Coast.

The uses to which the Shipman engine can be put are beyond enumeration. For running printing presses, it is widely employed. For grinding apples for cider, sawing wood, cutting sorghum, grinding and shelling corn, pumping water, propelling yachts and steam launches, and for nearly all imaginable uses, it has already made a good record. We design in this notice merely to call attention to the Shipman—its value for other purposes will suggest itself to those who desire to gain a cheap substitute for muscle of man or animal, or to supersede the variable agency of wind. The price places it within reach of all. Full information concerning the machines can be had by addressing Osborn & Alexander, 628 Market street, S. F.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours. Note "T indicates precipitation inappreciable.

Hay's Nut Lock.

Loose nuts on vehicles, machines, and in fact anything where nuts are used, are a constant source of annoyance; but on thrashing, harvesting and other farm machinery they are worse than elsewhere. This kind of mechanism is subject to all sorts of movements, and nuts are apt to get loose and cause delay and damage.

We give an illustration on this page of a new form of nut lock invented by John Hay, of Elmira, Solano county, who is at present at 426 Kearny street, San Francisco. This nut lock was specially devised to meet the requirements of thrashing machinery.

As will be seen from the cut, it is very simple in construction, but effective. Then the pawl-plate is set down over the bolt. Then the

Hay's Nut Lock.

nut is dropped into the slotted flange washer and screwed down. The corner points of the plate sink slightly into the wood, allowing the plate to bend a little, forming a spring that allows for shrinkage of the timber.

In unlocking, the corners of the plate are raised slightly and the point of a nail or any handy thing placed under the corner, and the whole thing is then turned back. The little pawls in the pawl-plate fit in the slots of the flange in which the nut sets. If there is a strong pressure, the pawls go in between the slots in the plate and the nut cannot get loose. The nut is securely locked and cannot jar back or turn in any way unless a wrench is used.

Nut locks of this make have been used by the C. P. R. R. Co. for five or six months past, and no wrench has been used upon them since. The Shippee harvesters are now supplied with these nut locks, which have been found very efficient. Different sizes are made for different bolts. The simplicity and effectiveness of the device is readily recognized by all who examine it. These nut locks may be seen at Truman, Isham & Hooker's, or Henry Bull's, in this city.

IMPORTANT!

That the public should know that for the past **Sixteen Years** our **Sole Business** has been, and now is, importing (**Over 100 Carloads**) and breeding improved Live Stock—Horses, Jacks, Short Horns, Ayrshires, and Jerseys (or Alderneys) and their grades; also, **all the varieties** of breeding Sheep and Hogs. We can supply any and all good animals that may be wanted, and **at very reasonable prices** and on **convenient terms.** Write or call on us. PETER SAXE and HOMER P. SAXE.

San Francisco, Cal., Oct. 22, 1886. **PETER SAXE & SON, Lick House, S. F.**

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOEBIG—Dear Sir: I have analyzed your sample of **"Nitrogenous Superphosphate,"** with the following result:

Soluble Phosphoric Acid	12.90 per cent
Reverted Phosphoric Acid	.95 "
Insoluble Phosphoric Acid	2.83 "
Potash	2.23 "
Ammonia	1.87 "
Nitric Acid	2.95 "

The above amount of **Nitric Acid** is equal to 0.85 per cent **Ammonia**, therefore, total of Nitrogen calculated as **Ammonia**, 2.72 per cent.

This **Fertilizer** is a **Valuable Manure** for vineyards, orchards, gardens, farms, and I **recommend** its use by the cultivators of the soil **generally**, in **California.** Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the **"Nitrogenous Superphosphate"** Fertilizer, analyzed by him at your request. It is a **high-grade article**, and as such returns the user a better money value than a low-grade fertilizer. It is **especially well** adapted to use in **California**, on account of the **predominance** in it of **Phosphoric Acid**, which is generally in small supply in our soils. Yet it is desirable that **"complete"** fertilizers be used in our orchards and vineyards, and **yours is of that character** in furnishing Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of **Phosphoric Acid**—the chief element of all plant food—in combination with the necessary quantities of **Potash** and **Ammonia**, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from ½ pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sobranto, Station of the C. P. R. R., 20 miles north of San Francisco, at $30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources of their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.

THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitor anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. **A NEW FEATURE** has been added to the Premium List this year, in the shape of awards for a **Sheaf Display of Cereals.** Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor. Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

S. F. Market Report

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, June 8, 1887.

The weather the past week has been all that could be desired for the maturing crops of grains. Continued absence of hot winds since that reported last week is considered a great blessing by farmers, now that grain is so high. European advices give a fairly steady market with fine weather in England, which is greatly wanted. To-day's cable is as follows:

LONDON, June 8.—Cargoes off coast, firm; cargoes on passage and for shipment, firm; Cal. wheat off coast, 39s; Cal. wheat just shipped, 45s 6d; Cal. wheat nearly due, 39s 6d; French country market, stiff; Liverpool wheat, spot, quiet but steady; Liverpool wheat Cal. 7s 9d@8s; weather in England, very fine.

The British Grain Trade.

LONDON, June 6.—The *Mark Lane Express*, in its weekly review of the British grain trade during the past week, says: The copious rainfall of Thursday and Friday, and the genial weather following, have improved the outlook. The aggregate benefit is immense. Supplies of native wheat locally continue variable. Sales of English wheat during the week were 48,857 quarters at 35s, against 49,763 quarters at 32s ₱ quarter during the corresponding period of last year. Flour was steady. The consumptive demand decreased. Foreign wheat was without feature. The market showed a weaker tendency. Ten cargoes arrived off coast; eight were consumed and two remained on sale, one being an Oregon cargo for which 38s is asked. White wheats were almost entirely in the hands of the Liverpool clique. To-day wheat was slow and unchanged. Flour was steady. Maize was weaker. American mixed was scarce and firm. Barleys were slow and unchanged. Oats are dull. Linseed was dearer.

Crops at the East.

CHICAGO, June 5.—The following summary will appear in this week's *Farmers' Review*: Continued rains throughout many portions of the West since our last issue have wrought a general improvement in crop conditions, especially in spring crops, and in meadows and pastures. The harvest has already commenced in the Southern winter-wheat sections, and this crop is nearly past all danger. Our reports on the condition are as follows: Eighteen counties in Illinois report an average condition of 87 per cent, and ten counties report injury from drought and insects. Seventeen counties in Indiana report an average condition of 85 per cent, and five counties report injury by insects. Fifteen counties in Ohio report an average condition of 76 per cent and some damage by insects. Nine Michigan counties report an average condition of 89 per cent, with some injury from drought and none from insects. Seventeen Missouri counties give an average condition of 96 per cent, and ten counties in Kentucky report an average condition of 87 per cent. Kansas falls away behind, nine counties giving only an average condition of 58 per cent. Elk county reports the crop all plowed up. That of Lincoln is a total failure, and that of Phillips is very poor. There is a very general complaint of insects doing injury. Four Iowa counties report an average condition of 97 per cent, and ten counties in Wisconsin give an average condition of 76 per cent. The condition of spring wheat is reported as follows: Nine counties in this State place the condition at 90 per cent, with some complaint of injury by drought and insects. In eight counties in Minnesota the condition is 88 per cent, in 11 counties in Dakota it is 99 per cent, in 12 in Nebraska it is 87 per cent, and in 14 in Iowa it is 93 per cent. The corn States report an acreage and condition above the average, with few exceptions. Oats show an average acreage and condition. Meadows and pastures are as a rule reported short from lack of rain earlier in the season, but are now on the gain. Potatoes and fruit promise fair crops, as a rule.

Eastern Wheat Markets.

CHICAGO, June 4.—The actual situation in wheat this week just closed has not undergone any important change, the market to all appearances advancing and declining at the will of large holders, or the alleged combination. In to-day's market there was a willingness all around to take wheat moderately. The morning hours witnessed quite an active trading and June advanced from 90½@91⅛ cents, July moved up from 84¼@84½ cents, September from 83¼@83⅝ cents. The probable outcome of the big combination deal is never lost sight of and trading to-day, more than any day of the week, was regarded as indicating a faith in the belief that the clique proposes to name a higher price for the vast quantity they have bought.

CHICAGO, June 7.—On the afternoon board the market was nervous, and advanced on indications of the clique buying. June closed at 93, July at 86¾ @86⅞.

NEW YORK, June 5.—Wheat closed firm at near to best points, June, 97⅞c; July, 95⅞c; August, 93¼c; September, 93⅛c; October, 93⅛c; November, 94⅞c; December, 95⅞c; January, 96¾c.

NEW YORK, June 7.—The Produce Exchange reports the visible supply of grain on June 4th as follows: Wheat, 42 450,000 bushels; corn, 12,709,000 bushels; oats, 3 453,000 bushels; rye, 259,000 bushels; barley, 194,000 bushels.

CHICAGO, June 8—1 P. M.—Wheat lower, for cash, and futures about steady; cash, 92¾c; July, 86⅝c; August, 83⅝c. Corn steady; cash, 38⅛c; July, 39½c; August, 40⅜c. Oats steady; cash, 25½c; July 26½c; August, 26c.

Eastern Wool Markets.

NEW YORK, June 6.—There is only a reduced and broken assortment of fleeces on hand and of low-grade wools. The accumulation is not sufficient to cause any trouble, even in the face of hesitating and, for the time, light demand. Among sales were 20,000 lbs Eastern Oregon at 21c, 6000 lbs spring California at 22½c, 1000 lbs fall California at 15c.

The Philadelphia market ruled stronger last week and closed 1@2c higher for all bright quarter and medium unwashed wools. Supplies are light, and manufacturers who want wool for current consumption are obliged to pay an advance. Among the sales were 8000 lbs Territory fine medium at 25c; 10,000 lbs one-fourth Oregon at 28c; 6000 lbs one-fourth Territory at 23c; 18,000 lbs Montana medium at 24c; 20,000 lbs Territory medium at 21@22c.

In the Boston market the demand is running almost wholly on medium wools, and fine wools meet with but a limited outlet. The tone of the market, except on medium grades, is unsettled. Among the sales were 216,000 lbs Territory at 18@25c, and 45,000 lbs Eastern Oregon at 18c.

BOSTON, June 7.—Wool is in moderate demand. Michigan extra is quoted at 31c per lb. Other grades unchanged.

PHILADELPHIA, June 7.—Wool is firm. Low and medium wools are in good demand. Medium unwashed, combing and delaine, 30c@31c; coarse do, 30@31c. Other grades are unchanged.

NEW YORK, June 7.—Wool is quiet and steadily held.

London Wool Sales.

LONDON, June 7.—The third series of wool sales opened to-day. There was a large attendance of home and foreign buyers. The bidding was not brisk, though better than was expected; prices of Merinos ranging from the lowest of April figures to ½d lower. Crossbreds were abundant at nearly 1d decline from April's closing.

California Fruit in Chicago.

CHICAGO, June 4.—The supply of oranges is fair, but only choice fruit is in demand. Prices are steady. Bright Riverside, good to fancy, $3.25@4; San Bernardino, $3.25@4; Santa Ana, $2.90@3.25; St Michael, paper rind, $3@3.75; Orange, $2.50@2.75; Los Angeles, $2.50@2.75; Navel, according to quality, $3@4.50; San Gabriel, $2.50@3; blood oranges, fancy, $4@6; culls, $2. Lemons are selling moderately at $2.50 for California.

Cherries—Offerings rather smaller; demand also limited. California cherries continue plentiful. Boxes of 10 lbs Black Tartarians sold at $1.75@2, and white, $2@2.25. In poor order, sold as low as $1 ₱ box.

Dried fruits rule very firm and there is a fair demand in a small way. Peaches are inactive simply because there is no desirable stock here. The offerings consist of old and common fruit. The California dried fruit supply is small and the market is firm. Plums, pitted, ₱ lb, 11@12c; raisins, London layers, 20-lb boxes, ₱ box, $1.50@1.75; loose Muscatel, $1.25@1.35; California layers, $1.25@1.35.

California Fruits in New York.

NEW YORK, June 6.—Green Fruits—Selected California apricots 25 cents a dozen; handsome California black cherries, 50 cents per lb.

Canned Goods—The demand is moderately active. California pears, $2.75@3.25.

Dried Fruits—The market is without important change. California loose Muscatel two-crown raisins, $1.25@1.35; three-crown, $1.50@1.70 London, $1.50@1.75¼.

New York Hop Market.

NEW YORK, June 6.—The trade is moderate in volume and the demand rather quiet. Coast crop, 1886, best, 20@21 cents; same, common to good, 13@16 cents; 1885, good to prime, 7@10 cents.

Local Markets.

BAGS—A pool is trying to advance prices, but owing to many held by outsiders it appears at present to be a difficult task. Calcuttas are quoted at 6@6¼ cts.

BARLEY—The market is very strong for both futures and spot. On Call, transactions the past were large. As a matter of reference we give the following quotations of options on June 9, 1886, which can be compared with to-day's prices: Buyer 1886, 75c. Seller 1886, 76⅜c. To-day's sales on Call were as follows:

Morning Session—Buyer 1887—1700 tons, $1.22½; 100, $1.22½. Seller 1887, new crop—100 tons, $1.10¾ ₱ ctl.

Afternoon Session: Buyer 1887—700 tons, $1.22½; 500, $1.22⅜. Seller 1888, new crop—1400 tons, $1.10; 200, $1.10½ ₱ ctl.

BUTTER—Receipts continue free, with a firm tone reported for hard fresh rolls both for pickling and for home trade. Off grades of butter are hard to place.

CHEESE—The market has an unsettled tone, due chiefly to the narrowing of the outlet, owing to lower prices at the West. Supplies here appear to be increasing.

EGGS—Strictly choice fresh laid are strong at an advance, with the tendency still upward. Off qualities continue slow.

FLOUR—In sympathy with wheat, millers have advanced prices 25 cts per barrel. The demand is good, with stock light.

WHEAT—The sample market has ruled quiet, owing to light offerings. On Call, trading was active, with prices maintained up to Monday, when they shaded off. Many are inclined to the opinion that the corner in wheat has not benefited farmers, but by comparing the price of options a year ago and now they will discover their error—at prices ruling to-day on Call the syndicate will buy all offered. On June 9, 1886, sales were made at the following prices: Buyer season, $1.27½. Buyer '86, $1.24⅜. Seller '86, $1.17¼. To-day's sales are as follows:

Morning Session: Spot—100 tons, $1.87. Buyer 1887—800 tons, $1.96; 200, $1.96¾; 100, $1.96⅝; 100, $1.96½; 100, $1.97; 200, $1.96½. Seller 1887—2000 tons, $1.83⅞; 100, $1.83⅝; 5100, $1.83¾. July—200 tons, $1.85¼; 800, $1.86. July, new crop—200 tons, $1.85; 200, $1.85½. Buyer June—100 tons, $1.88½. August—100 tons, $1.84½. Buyer August and September—200 tons, $1.87¼; 200, $1.86¼ ₱ ctl.

Afternoon Session: Spot—100 tons, $1.85. Buyer 1887—100 tons, $1.96; 300, $1.96½; 100, $1.96¾; 100, $1.96⅝. Seller 1887—1700 tons, $1.83⅛; 2700, $1.83¾; 900, $1.84; 100, $1.84½. Buyer September—200 tons, $1.84¼; 100, $1.85. July—100 tons, $1.85⅝; 100, $1.85¾; 1200, $1.86¼; 1600, $1.86½. August—600 tons, $1.85. July, new—100 tons, $1.87¼; 200, $1.87¾; 100, $1.88 ₱ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

The wheat and flour export demand at New York continues active from all the importing countries of Europe. If consumption in Europe shall be normal, with the late harvest in prospect there, the wants for foreign wheat from May 1, to the end of this crop season, about August 15, may equal 100,000,000 bushels. The area of Europe's supply is limited to Russia, south and north, the Danube provinces, Austro-Hungary, Indian shipments via the Suez canal, La Plate and the United States Atlantic ports. Shipments from Australia by sail via cape, from India via cape, from Pacific Coast of America made after May 1 cannot be made available for consumption in Europe this side of September 1 next. Crop advices from the East are of a more favorable character, but it comes too late to insure an average yield to the acre. Harvesting in several of the Southern States has been finished, with only a fair yield reported.

The first sample of a large parcel of harvested wheat was received on June 4. There are 3000 tons and it was raised by J. R. Briggs, of Winters. The grade is fully up to No. 1 club.

The first barley of the new season was offered by sample on June 4. It was raised by Wm. Hauke, of Fremont, Solano county. It was sold at $1.15 per cental.

On this coast harvesting is well underway in parts of Eastern Oregon and Eastern Washington Territory. The yield to the acre is said to be above an average for wheat, with a full average for barley. In this State cutting of early sown wheat has been commenced, but will not be general until toward the close of the month. Advices received so far state that the outturn is generally disappointing. The heads are short and the grain only fairly plump in some sections, and pinched in others.

The local wheat market has been very active, with considerable excitement reported, owing to short sellers not being able to secure enough to meet their contracts. The manipulators took every ton of wheat offered, and still called for more. After this the market options eased off only to be pushed up again on the shorts. It is claimed that there is a large line of shorts out and that the manipulators will force them to settle at still higher prices. Heavy sales have been made on Call of seller '87 and seller season wheat by farmers, and as prices advanced they were forced to put up considerable money to keep their margins good.

Barley has ruled very steady throughout the week, with a strong tone to the market, owing to the crop being estimated at only about 325,000 tons, which, with the carryover, will barely meet the consumption. In June last year the market was weak and tending down; this year it is steady and tending up.

Oats are steady, with both receipts and demand light.

Eastern advices report an increased acreage in corn, with a strong market ruling for actual corn. In this State the acreage is said to be less than last year, with the crop outlook only fair. In our market corn rules very strong at quotations.

A London correspondent of *Bradstreet's* writes under date of May 12th, as follows: "Winter wheat is more backward than I have ever before seen it in the middle of May, though I learn from a very old farmer that the crop was in about the same condition in May, 1847, when cold, dry weather prevailed till the end of the third week in the month. After that the season was so favorable to the rapid development of vegetation that the harvest was early and abundant, too. That, however, was a very fortunate sequence to a cold spring, and we cannot count on its repetition. It is possible that sunshine and showers may bring the wheat crop up to its normal stage of development by the end of June, provided that it does not meet with any further check from frost or a return of east winds; but the chances are greatly against anything but a late harvest. At any rate, the wheats to-day are not more forward than they usually are by the beginning of March. They are healthy in appearance and fairly thick on the ground, except where they have been thinned by wire-worm. The dryness of the soil throughout the long period of cold weather, which lasted all through March and April, was a great safeguard to the crop, which can stand a great deal of east wind and frost in spring, when there is but little rain. But now that the land is wet, a return of wintry weather would be fatal to the prospects of wheat and other cereals also." Further on in his letter, the correspondent says: "It seems impossible that Europe can obtain the unusually large supplies requisite for consumption up to and through a late harvest at anything like current prices, Russia having no surplus to speak of, India less than usual, and America only a little more than was available at this period of last year. This view of the position is very generally accepted, and yet there is no speculation, except in brief spurts, as a reflex of marked excitement on your side of the Atlantic. Apparently nothing short of the actual pinch of scarcity will move the trade here out of the deep rut of depression in which it has lain so long."

The bears on Call, aided by several commission houses, are trying to arrange to bring wheat from other States so as to break prices here. This is against California farmers' interest. The higher wheat is here the better for farmers.

Feedstuff.

Both bran and middlings have made several advances, closing strong at full quotations. Stocks are light and demand good. Receipts are expected to continue light, owing to few mills running. Poor pasturage in several dairy districts and also lumbering districts, is said to have produced the increased consumption.

Hay is very strong, with a good demand ruling. The consumption is largely in excess of what it was in June last year. For a straight parcel of new wheat hay $12.50 was bid but refused.

Fruits.

Cherries under heavy receipts sold lower. Canners bought freely, taking all the choice blacks at from 3 cts to 5 cts ₱ lb, and Royal Ann at 5@7 cts.

It is claimed that canners have contracted for all the products of orchards they wish, and will in the future buy in the open market when commission merchants, to clean up, are compelled to sell low.

Gooseberries are steadier.

The second crop of strawberries is coming in, and sell well. Owing to the high prices so far this season, canners have not been able to put up any.

Currants weakened off under freer receipts, which allowed canners to clean up the market at $2.50@3 ₱ chest.

Apples received so far this season have been too green to sell to advantage.

Peaches are coming in fairly well, but as yet sell high. Heavier receipts are expected next week.

Apricots are making a better showing. Prices as yet are too high in the open market for canners.

Dried fruits continue scarce, with a fair demand ruling. Eastern imported currants are higher, but prunes are lower.

Raisins are strong, with the stock light. The East reports a firm market for choice.

All kinds of vegetables fluctuate daily in prices according to the receipts.

Heavy shipments of vegetables are being made to the East, particularly of potatoes.

Potatoes continue to rule low under free receipts and only a fair demand. The crop this year is said to be the largest on record, both in this State, Washington Territory and Oregon.

Onions are weak under freer receipts. Owing to their better keeping qualities more are taken for filling distant orders.

Peaches are barely ripe and sell slow; only ripe fetch over $1.25. Pears and apples are too green to sell.

Honey.

This week's *Herald of Trade* says: With last month the honey season of 1886-87 ended. The season opened with low prices, owing chiefly to the impression that the crop was the largest on record. By the end of June this belief was dispelled, and a slight improvement set in under an increased export demand from the East. The European demand was light, much less than for two years past. The lessened demand from Europe was due to that market being overstocked by the excessive shipments from the 1884 crop. The exports from California in calendar years were as follows:

	Pounds by Sea.	Pounds by Rail.
1880	1,097,606	861 050
1881	1,124,580	378,370
1882	433,440	527,680
1883	799,560	266,400
1884	1,728,600	2 352,000
1885	1,490,670	1,313,260
1886	867,480	2,676,910

The above reflects the increased trade with the East, and the large falling off in shipments to Europe. The Eastern States took more honey, owing to a light crop at the West and also East, and also to the low overland freights combined with low prices on this coast. The heavy shipments the past season cleaned up our market more closely than ever before known, and consequently the new season begins with comparatively no stock on hand. Not only is the new season entered with an almost exhausted stock, but prices are fully one-third higher than in June, 1886. All present indications do not justify us in estimating this year's crop at over 2,500,000 lbs against 5,000,000 lbs in 1886; 1,250,000 lbs in 1885 and 9,000,000 lbs in 1884. This large carryover from the season of 1884-85 into the season of 1885-86 caused the light crop of 1885 not to be felt. This season there is no carryover and a very small crop to draw from, with a large increased consumption to be met. The estimated small crop is founded on the unfavorable weather for flowering shrubs and plants and also during the best part of the honey-making season, to cool nights and windy days, which kept bees more confined.

Live-Stock.

Beef cattle are in lighter offering, but owing to the light consumption the market rules easy. There is a growing impression that values will probably begin to advance soon; already extra conditioned sell readily at over 8 cts against 7½@8c last week. Mutton sheep are steadier. Several shipments are being made to points east of the Rocky mountains. Hogs are fairly steady. The inquiry is light. Milch cows are moving slowly. In horses, several sales are reported of fair-sized draft horses at an average of $200 each. Small draft horses are slow at over $100. Carriage teams and roadsters are wanted.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 8c; first grade, grass fed, 7@7½c per lb.; second grade, 6@6½c; third grade, 4½@5¼c.

MUTTON—Ewes, 6c; wethers, 7c.

LAMB—Spring, 9@10c.

VEAL—Large, 6@8½c; small, 6@8c.

PORK—Live hogs, 4¾@5c for heavy and medium; hard dressed, 7½@8¼c per lb; light, 4½@5c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

The first crop of peas is going out, causing a stronger market.

String beans are coming in more freely, causing a gradual shading in prices.

Asparagus is scarce and higher.

Tomatoes continue to come in slowly. The crop this year is only a fair average. It is claimed that receipts will set in more freely by the end of next week.

Summer squash are making a better showing, with prices easing off.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	250,934	250,456
In port, disengaged	115,134	30,824
In port, engaged	20,167	27,869
Totals	386,235	309,149

The above gives a carrying capacity as follows: 1887, 616,067 short tons; 1886, 495,033 short tons; increase over last year, 121,034.

Wool is in better demand, particularly the medium and finer grades. This is due to an improvement at the East. Coarse grades move more slowly. Shipments to the East continue free.

Poultry has ruled steady throughout the week, with few changes reported. The demand is light and so are receipts.

Mustard seeds are very firm, owing to an advance at the East, and also a light crop in this State.

It is reported that the walnut crop of the State is pooled for higher prices.

Hops are stronger and improved demand at an advance. For choice new for future delivery, 20 cts is obtainable. Two weeks ago buyers had to be

looked up; now sellers are wanted. Bad crop prospects at the East cause the advance for future delivery.

San Francisco, June 8, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

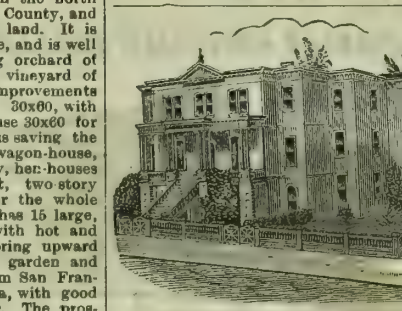
A. G. STONESIFER, Hill's Ferry, Stanislaus Co., Cal., breeder of pure blooded French Merino Sheep.

Glen Cove Rancho for Sale.

This Rancho is situated at tide-water on the north shore of the Straits of Carquinez in Solano County, and comprises about 415 acres of good grain land. It is fenced and cross-fenced with five-board fence, and is well calculated for fruit raising. Has a young orchard of upward of 700 trees now well started; also a vineyard of 7000 vines of wine-producing grapes. The improvements consist of a large barn covering an area of 30x60, with 15-foot stables on either side; also a warehouse 30x60 for storing grain (with wharf) at tide-water, thus saving the expense of hauling grain for shipment. A wagon-house, a conservatory, sheds for storing machinery, hen-houses and inclosed yards, with a modern-built, two story house with mansard roof and cellar under the whole structure, resting on an 18-inch stone wall; has 15 large, fine rooms, hard-finished walls, furnished with hot and cold water from two large cisterns and a spring upward of 100 feet above the house. Has a fine garden and pleasant surroundings; is about 30 miles from San Francisco and four miles from Vallejo or Benicia, with good roads by land and a pleasant sail by water. The prospective railroad from Santa Rosa to Benicia is expected to pass directly in front of the place, and a flag station is promised by said railroad company. The soil is of a rich loam and very deep. In point of health and climate no section of the State can surpass it. The live-stock and the farming implements will be sold, if desired, at very low figures. A rare opportunity is offered for any one who wants a very desirable place at a very favorable price For further particulars apply on the premises or address, JOHN F. DEMING, Vallejo, Solano Co, Cal.



HALL'S SARSAPARILLA

Cures all Diseases originating from a disordered state of the BLOOD or LIVER. Rheumatism, Neuralgia, Boils, Blotches, Pimples, Scrofula, Tumors, Salt Rheum and Mercurial Pains readily yield to its purifying properties. THE "NEW BECKER." SEVENTH IMPROVEMENT, April 1, 1887.

At Last to "Perfection."

SENT ON 60 Days' Test Trial.

AGENTS WANTED.

Approaches nearer to the old method of hand-rubbing than any invention yet introduced to the public. EASILY worked, and washes PERFECTLY clean. Owing to its intrinsic merits thousands have been sold all over the United States, and all giving PERFECT satisfaction. It only needs to be seen and tried to be appreciated. Awarded first premiums 1883, 1884, 1885 and 1886. In localities where as yet I have NO agent, I will ship sample Machine and Wringer on 60 days' trial, the party to pay for them at WHOLESALE prices and act as Agent, if found satisfactory, IF NOT, return them Do not lose money by waiting until SOME ONE ELSE orders samples and secures an agency for your locality. Farmers make $200 to $500 during the year. Ladies have great success selling this washer. WRITE AT ONCE for New Illustrated and Descriptive Pamphlet, which contains my liberal proposition. Mention this paper. DO NOT DELAY.

E. W. MELVIN, Proprietor and Manufacturer.
Office, 806 J Street, Sacramento, Cal.

MATTESON & WILLIAMSON,

THE PIONEER HARVESTER BUILDERS OF THE WORLD.

Not One of These Harvesters Has Been Returned.

Not One of These Harvesters Has Been Returned.

THE HARVEST QUEEN.

MATTESON & WILLIAMSON,

The only manufacturers in Stockton who make a specialty of making everything needed by the farmer in seeding and harvesting. Among their latest triumphs in harvesting machinery is the unrivaled

HARVEST QUEEN,

To Which They Invite the Attention of the Careful Farmer.

This machine was first placed in the field during the harvest of 1886. From the testimonials of those who have had it in use it is considered the peer of any now offered for public favor. For stanchness of build, lightness of draft, economy of manual labor and animal power, and in saving and cleaning the grain, its equal has yet to be produced. It is so furnished with efficient and ready-operating brakes that the lives and limbs of operators are in no degree endangered. A limited number of the HARVEST QUEEN are being constructed for the harvest of 1887.

ORDERS AND CORRESPONDENCE SOLICITED.

☞ We refer you to the following-named persons who have had the Harvest Queen in use during the past harvest season: D. P. Edwards, Maxwel, Colusa Co.; H. Beckman, Woodbridge; H. W. Childs, Acampo; Ralston & Grigsby, Acampo; Yosemite Stage and Turnpike Co., Maderia; H. W. Patterson, Borden.

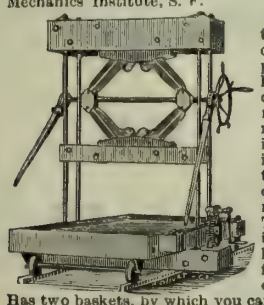
San Francisco, Jan. 15, 1882.

COME LOOK AT THIS!



The Great and Only Fence Loom!

Fully covered by patents. No danger of buying a lawsuit. We are now offering the public the best and cheapest machine in the field, because it will make more than twice the amount of fence per day than any of the so-called machines can make. Goes up or down hill with perfect ease. The loom only weighs 30 pounds, consequently can be handled by a child as well as a man. Neither are you compelled to pull any cumbersome track over the rough ground. All that is needed is a common board laid upon the ground. Estimates made for material when desired. Correspondence solicited with hardware men generally.

THOMAS D. POOLE,
1867 Encinal Ave., Alameda, Cal.

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Park Association, Santa Clara Valley Agricultural Society and Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. The follower has a movement of 26½ inches, the first revolution of the screw moves the follower 1½ ins., the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track. Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.

Printed Testimonials can be had on application of the following parties, who have bought my press: J. B. J. Portal, San Jose; Wm. Pfeffer, Gubserville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. Stiller, Gubserville; Lay Clark & Co., Santa Rosa; Vache Freres, Old San Bernardino; J. F. Crank, San Gabriel; James Finlayson, Healdsburg; P. & J. J. Gobbi, Healdsburg; Wm. Allen, San Gabriel; Wm. Metzger, Santa Rosa; J. Lawrence Watson, Glen Ellen; Walter Phillips, Santa Rosa; Geo. West, Stockton; Eli T. Sheppard, Glen Ellen; Rancheto Wine Co., Rancheto, Los Angeles Co.; Downing Fruit & Wine Co., Downey; J. L. Beard, Centerville; Wm. Palmtag, Hollister; A. Burnham & Son, Santa Rosa; Paul O. Burns Wine Co., San Jose; E. Emil Meyer, Santa Cruz Mountains, Wright P. O.; Marshall & Hill, Laguna Station; R. J. Northam, Anaheim.

Also manufacture Worth's Patent Hand and Power Grape Stemmers. W. H. WORTH, Petaluma Foundry and Machine Works, Petaluma, Sonoma Co., Cal.

The BUYERS' GUIDE is issued Sept. and March, each year. 312 pages, 8½ x 11½ inches, with over 3,500 illustrations — a whole Picture Gallery. GIVES Wholesale Prices *direct to consumers* on all goods for personal or family use. Tells how to order, and gives exact cost of everything you use, eat, drink, wear, or have fun with. These INVALUABLE BOOKS contain information gleaned from the markets of the world. We will mail a copy FREE to any address upon receipt of 10 cts. to defray expense of mailing. Let us hear from you. Respectfully,

MONTGOMERY WARD & CO

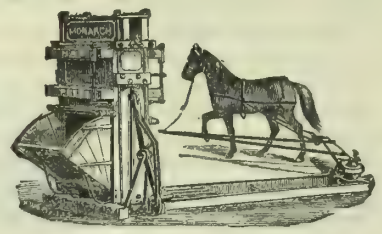
HAY PRESSES.

THE HURRICANE,

A Mounted Double-Ender Baling Machine, capable of baling 40 tons per day.



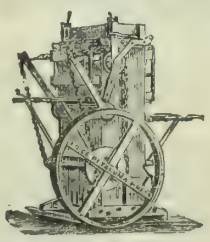
ITS RECORD

For the first year of its existence is as follows: **Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.**

Two sizes: Compressed bales and common bales. **Improved this year so that it is nearly one-quarter faster than before, and the back-and-forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.**

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., **$1000.**



THE JUNIOR MONARCH

Does its own Tramping. Feeds at Side, near the Bottom.

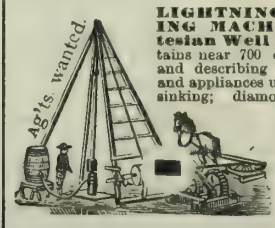
HAS THE FOLLOWING RECORD:

33 tons in one day; 105 tons in 3½ days; 20 tons, and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., **$500.**

—THE—

Genuine Price Petaluma,



With Latest Improvements.

Made under the supervision of the inventor, JACOB PRICE. Too well known to need further description. First-class material and workmanship Capacity, from 10 to 18 tons per day. Hay must be tramped in press.

—TO—

Invest in a Fresno Vineyard

We have for sale, till July 31st, a one-half interest in a fine vineyard ranch, 266 acres, all level and susceptible of easy irrigation, situated near Minturn, Fresno county; 135 acres in best varieties wine and raisin grapes three and four years old, in full bearing; low estimate is 350 tons this year; 15 acres in 8-year-old orchard and table grapes, full crop; 8 acres in 8-year-old almond in full bearing; 50 acres alfalfa; 40 acres grain. Entire tract under rabbit-proof, lumber fence; amply cross fenced. Main dam, gates, ditches, dykes and water, all belong to premises. No litigation, no riparianism, no costs. Undoubtedly best system of irrigation in the State; beautiful reservoir. Two good dwellings picturesquely located beneath the beautiful foliage of 9-year-old ornamental trees. Two very large barns, an abundance of shed-room. Agricultural implements, machinery, etc. Horses, hogs, mules, cattle and sheep. The object in taking a partner is to build wine-room, storage house and adobe cellar, and must be sold before July 31st in order to utilize the coming immense crop. Price $20,000. For full particulars address us or (better) come and see the property.

PACIFIC RURAL PRESS

TWENTY-PAGE EDITION.

Vol. XXXIII.—No. 25.] SAN FRANCISCO, SATURDAY, JUNE 18, 1887. [$3 a Year, in Advance; Single Copies, 10 Cts.

The Cottony Cushion Scale.

Pertinent to the very interesting letter from Prof. C. V. Riley, U. S. Entomologist, which we published in the RURAL of June 4th, and to the important announcement on gas treatment in this issue, are the engravings which we give on this page of the cottony cushion scale and its ruinous work. The engravings are reproduced by courtesy of Prof. Riley from plates prepared for his forthcoming report on this insect. We shall follow with other engravings of the same series, and accompany them with extracts from the report, which will show that Prof. Riley and his assistants have made most important discoveries in the life history of this insect, which may perhaps be called the most ruinous and detestable of our insect pests. We are disposed to give considerable space to this subject in our columns, because it is important that the presence of this foe should be detected at the earliest possible moment, and we are desirous that all our readers should get its forms so well in mind that they will recognize it if it should appear upon their trees or plants; also that they should be relieved from the anxiety which many have felt because they have mistaken some other whitish scale for this one. The most obvious marks of the insect are clearly shown in the upper engraving, viz., the ribbed or fluted form of the white sack which protrudes from the rear and sides of the female, and which incloses her eggs. The name "cottony cushion" was, if we remember correctly, suggested by Mr. Cooke. It is rather a cumbrous name, but it has served a good purpose. Prof. Riley in his forthcoming report describes it as "the fluted scale," which is an apt epithet—certainly not likely to be overlooked by the ladies. How many of our old bachelors are familiar enough with feminine adornments to know "fluting" when they see it, we dare not say. It would be best of all, if it could be done, that the scale be called by its generic name Icerya. It is a small genus, and if Prof. Riley's surmise, as described in his letter in the RURAL of June 4th, prove correct, the genus will be smaller still.

COTTONY CUSHION SCALES (Icerya Purchasi), AS THEY NATURALLY OCCUR.

The upper engraving on this page is from a drawing of Prof. Riley's and shows groups of females as they cluster on the twigs and branches. They multiply with such wonderful rapidity that they overlie each other, and the combined suction of such girdles of insects is beyond the strength of the tree to endure. In an almost incredibly short space of time, trees show the effects of the attack, with blanched leaves and sickly growth, and are soon done to death by the relentless foe.

The larger engraving shows a few trees which have been infested for a number of months. We have not the record of this case before us, but remember the period as less than 20 months. The trees, as can be seen, are losing their foliage fast. Upon the trunk and branches are the white patches which, upon closer view, would show the groups of insects as shown in the smaller engraving. Not only are the large trees in the foreground infested, but the farther rows are spindling, and evidently have a heavier load than they can long carry.

TREES INFESTED WITH ICERYA PURCHASI, SHOWING DEADLY CHARACTER OF THE PEST.

The announcement upon another page by F. W. Morse, of the results of his work this spring, when detailed for this special undertaking by Professor Hilgard, gives much hope that an effective and practicable vapor-treatment has been secured. The verdict pronounced by the horticultural officials of Los Angeles county, from examinations made after Mr. Morse had returned to the University, certainly gives strong presumptive evidence of the ultimate success and wide use of the treatment which he reached by careful study and experiments. Aside from the almost incalculable value of an adequate treatment for this pest, it will be gratifying to friends of the University to have this renewed evidence of the ability of the institution to apply science in such satisfactory and practicable way. We commend the points set forth by Mr. Morse to all students and experimenters, for they are of course public property, and we trust may lead the way to an easier and more effective scale-insecticide than has yet been introduced. It will, however, require much farther experiment to render the materials applicable for all orchard uses.

A REPRESENTATIVE of a colony of Eastern people is looking for 15,000 acres of land in Douglass county, Or.

The Canadian Competitor.

There seems just now to be no lack of competition among overland railways, and the result is a cheapening of rates both eastward and westward, which must be gratifying to the producers of material for Eastern sale and to our merchants who like to get in Eastern merchandise at low figures. The cut in western-bound rates, which has been made by the Canadian Pacific, will operate against the interests of some local manufacturers, who were counting upon better prices when relieved of the sharp Eastern competition.

The Canadian Pacific seems to be disposed to adopt a most aggressive policy. It carried off the prize in the strife for wool transportation. It has also secured a large traffic in beans and other articles. It does not propose to stop with Pacific Coast trade, but plans for carriage of mails and passengers from Oceanic and Asiatic points to Europe. It may have the advantage of some of our roads in its arrangements with the Dominion Government, but no matter about that, its service promises to be a very useful agency against the combination of United States roads. This combination, by the way, does not seem at present to progress much, and the Atlantic & Pacific is moving in its own interest in a very rapid and effective way. It looks now as though the road which is to have the business is the one which will do it with dispatch and at low rates. This is very desirable on the whole for the Pacific Coast. We seem to be in fact in a much better condition in our railway facilities than was even dreamed of a few years ago.

The Union Pacific has of late exhibited much enterprise in cheap wool rates and has captured much business, carrying out, it is said, over 300,000 pounds last week, and has announced that it will continue the rates of $1 and $1.50 per 100 pounds on greased and scoured wool respectively, notwithstanding the objection of Eastern connections that both rates were 50 cents too low.

THE Santa Rosa *Republican* says: The engineers of the Santa Rosa & Carquinez railroad survey are meeting with some difficulty in obtaining the right of way.

FLORICULTURE.

The Rooting of Plants from Cuttings.

EDITORS PRESS:—This is a much simpler matter than many suppose, there being few flowering plants which are not easily propagated in this way. Although the early spring, before the sap has started, is, as a general rule, the best time for putting them in, I have had good success with all sorts in every month of the year.

Those which are put in very early will probably yield three-fourths of the whole in young plants; those put in two or three months later (or even in the less favorable parts of the year) probably one-half, if reasonable care is given them.

A great many make the mistake of using the soft, new wood for cuttings which are to be rooted in the open air, and these, according to my experience, are almost sure to die.

Soft Wood Cuttings.

If you are going to root them in a hothouse, or hotbed, then take the tender ends of shoots which are just losing their first softness, or beginning to be very slightly woody. Take those which are just beginning to put out buds at the base of the leaf, cut them about four inches long, trimming off the top to prevent flower-buds forming, and insert for about two-thirds their length in the warm, moist sand, pressing it firmly around them. Keep them moist, not wet and not too warm. The great trouble in hothouse rooting is apt to be too much heat or moisture, rotting the cuttings.

Roses, heliotropes, fuchsias, pelargoniums (Lady Washingtons), geraniums, and most shrubs, are easily rooted in this way. Carnations or pinks need to be kept not too wet, as they rot easily. To propagate them, use the tenderest young shoots which grow at the base of the plant, strip off the lower leaves or trim the rest back.

The Rex begonia, the Hoya or wax plant, and all cactuses, are propagated by a piece of the leaf, cut smoothly and inserted in the sand, though the cactus leaf must be dried away for a couple of months beforehand by laying it in a place away from the sun till it has lost its plumpness and looks slightly withered.

Cuttings in Open Ground.

The cactus roots equally well out of doors in the same way, and indeed though hothouse cuttings rot rather more quickly, I rather prefer to root simply in the open ground. To do this, have your cuttings of good size and cut from the woody portion, using no new growth, except in a few instances which I shall mention. Trim off all, or nearly all, the leaves, and cut the rooting end with a clean, diagonal cut; or, what is still better, with a crosswise piece of the old woody branch at the end, making your cutting the shape of a letter T. This seems to make the most vigorous plant when once started, having more rooting surface.

Some in slipping roses always split the cutting for a half inch at the bottom and insert a grain of wheat, claiming that cuttings so treated are sure to root. I have tried it with good success, and it certainly gives, like the T-shaped cutting I have mentioned, a larger rooting surface than will otherwise be had. Cuttings of roses, fuchsias, verbenas, carnations, heliotropes and most shrubs, require a partial shady spot, or one which receives only the late afternoon sun. Have the ground thoroughly softened quite a foot deep, or put the cuttings in as thick as you please (they may be but ½ an inch apart if you choose), but be careful always to plant them deep, allowing but little to stand above the ground, so that the rooting end may never thoroughly dry out.

Be careful to press the earth very tight around them, and after they are in do not hoe around them nor disturb the earth in any way, no matter how hard it may pack, as the air getting to the new rootlets is sure to kill the cutting.

It is wise after they are planted to take a hoe and ridge the earth upon either side of them, leaving the cuttings in a sort of shallow trench; then when you water them, instead of running off, the water sinks in and you are sure they are moist clear to the end.

They should remain in the original position at least three months, and four or five is better than three. Do not be deceived by their putting out leaves or even flower-buds in a few instances, as they will do this often when not a rootlet has started.

When they have remained without withering for three or four months, and then send out leaf buds, it is safe to suppose that they are rooted. Then move them carefully to the places they are to occupy, shading for a few days till they show no signs of wilting.

Do not soften the earth too much after the first preparatory pulverizing, until they have taken a good hold upon the ground. Many young plants die in this way, killed by kindness.

Special Points.

Pink or carnation cuttings should be planted deep, and kept moist, not wet. Using as for the hothouse, the new shoots cut back, but selecting the larger and older, rather than the very tender ones. Pull off all the under leaves, and cut the others back to a small top.

Heliotropes are among the hardest plants to root from cuttings, being very tender. To do this out of doors, select the woodiest stalks, cutting off every bit of soft wood and all leaves. Plant them in a cool, shady spot and keep moist, never allowing them to dry out. It takes longer for them than some others, but they will root if properly cut or planted.

Magnolias, lemon verbenas, jessamine, and shrubs of that sort, are quite easily rooted by using the newer wood, taking large cuttings, giving them partial shade and keeping them moist. They require more time than roses.

Verbenas are easily propagated in this way—by simply laying a piece of a branch flat and covering with earth kept moist; they root at every joint.

Few know that pansies root quite readily from cuttings. Take the older branches, and bury deep, keeping them moist and shaded, and they soon root, if never allowed to dry out.

Pelargoniums, rose, and all varieties of geraniums (especially the high-scented ones) require heat and sunlight.

Select a place where the sun shines warm (for pelargoniums and scented geraniums, the hottest place you have), soften the earth well and put in woody cuttings deep (trimming off all, or nearly all, the leaves and all soft ends). Soak them well at first and afterward keep them but slightly moist, never at all wet.

Geraniums need even less water and will surely rot if they receive too much before they are rooted.

Some recommend drying them for a day or two before planting. They are among the few plants which root about equally well from either soft or hard cuttings.

Marguerites root almost as easily and will grow nearly anywhere and under almost any circumstances, though they rather prefer the sun. You may break off branches ever so carelessly and put them in with the tops nearly all on, yet if you only put them in deep and tramp the earth tight around them, they will soon begin to send out tops and blossom almost as soon as rooted.

Those who complain of their ill success at propagating plants in this way will probably find, if they study up the matter, that their cuttings were not properly selected or trimmed in the first place, and after that were kept too wet and cold. GARDENER.

North Temescal.

HORTICULTURE.

American Pomological Society.

At the last session of the American Pomological Society, held in the city of Grand Rapids, Michigan, September 8–11, 1885, the Massachusetts Horticultural Society, through its president, presented an invitation to hold the next biennial session at Boston. This was also the strongly expressed wish of President Wilder, who desired to meet the society once more in his own city. The invitation was accepted, and therefore the next session will be held in the city of Boston, commencing on Wednesday, September 14, 1887, at 10 o'clock A. M., and continuing three days.

The session will be held in one of the rooms of the Massachusetts Charitable Mechanics' Association building, and the exhibition of fruits will be held in conjunction with the Massachusetts Horticultural Society's annual exhibition in the great hall of the same building.

All horticultural, pomological, agricultural and other kindred associations in the United States and British provinces are invited to send delegates, and all persons interested in the cultivation of fruits are cordially invited to attend.

The society will not have the hoped-for pleasure of meeting its beloved president, who was stricken down by death, full of years and honors, just as he had commenced to prepare for this meeting; but it is hoped and expected that in honor of his memory there will be an unusually large attendance of members and delegates from all parts of the country, and that the session will be one of the most interesting and useful ever held by the society. The sad emergency which has arisen from the death of President Wilder, who had so wisely and successfully guided the society for so long a period—indeed it may be said through its entire progress—makes it incumbent on all its true friends to rally now to its support, that its good work may be carried forward without interruption.

During the 38 years of its existence, the society has accomplished much in the interest of pomology and the fruit-growing industry of our country. It has effected an organization, through its committee, in every State and Territory. In its biennial reports it has brought out the latest and best experience. It has made an important advance in the needful reform of pomological nomenclature, and has compiled a national catalogue consisting of 900 varieties of fruits adapted to the several States and Territories, with their varying climate and other conditions. Much is yet to be done, and with the experience acquired and facilities now enjoyed, the work of the future will be of greater value to the country than that of the past.

The Massachusetts Horticultural Society has, with its accustomed liberality, appropriated the sum of *five hundred dollars*, to be offered in special prizes for fruits to be exhibited at the meeting of the American Pomological Society in connection with the Annual Exhibition of the Massachusetts Horticultural Society during the pomological meeting. A list of these prizes furnished on application to the secretary.

Parties intending to exhibit should give timely notice to Mr. E. W. Wood, at Horticultural hall, Boston, stating what prize they will compete for, and the number of dishes they will exhibit, so that space may be reserved. Packages of fruits should be addressed to E. W. Wood, at the Massachusetts Charitable Mechanics' Association Building, Boston, Mass., freight and express charges prepaid.

P. BARRY, First Vice-President.
CHARLES W. GARFIELD, Secretary,
Grand Rapids, Mich.

The Canton Hybrid Orange.

EDITORS PRESS:—Per steamer City of New York I send you samples of a variety of orange growing here—a late-keeping variety which has not been exported yet. Being regarded as far superior to Oonshiu and Kino-Kuni and other oranges of Japanese origin, I am anxious to bring it before the public. It originated in China, but has been for years cultivated in Japan. The tree is a very vigorous grower. Can be grown bushy or cultivated as a standard tree. You can judge of size of fruit by samples sent, and I trust that they will keep good also of flavor, though when grown in California, fruit plucked fresh from the trees would naturally be far superior in quality. The trees attain a hight of 20 feet here, and can bear frost or a temperature of 20 degrees above zero, Fahrenheit. It is known as the Canton Hybrid orange and would certainly prove a valuable acquisition to the citrus fruits of California.

This is a wonderful country for all manner and sorts of trees and plants; the *Citrus Japonica* (of which you may remember having seen small plants at 317 Washington street) makes a large tree 18 to 20 feet high, with its branches laden with the golden fruit. It will certainly grow to be a great favorite in California.

My sojourn has been as yet so short that I cannot say much. We are starting for the south of Japan next week. On our return from there we will visit the northern provinces. I will take notes all along, and the first leisure moments inform you of any point of interest I may come across along my route.

We have eaten bamboo shoots cooked, which are used as a vegetable, and they can be classed with artichoke, to which they bear great resemblance in flavor. I will write all about bamboo varieties, uses and culture, later on.

HELENE BERGER.

Yokahama, Japan, May 13th.

[The fruit was unfortunately too closely packed, and was decayed and moldy when opened. We could judge of the size, which is certainly a desirable one. The flesh was tender, very juicy, the skin thin, but the flavor had departed. We shall be glad to hear further of our correspondent's observations in Japan.—EDS. PRESS.]

ENTOMOLOGICAL.

The Use of Gases Against Scale Insects.

University Experiment Station, Bulletin No. 71.

Some time ago the Agricultural Department was requested by Messrs. A. B. and A. S. Chapman, Mr. L. H. Titus and Mr. J. C. Newton, prominent orange-growers of Los Angeles county, to conduct experiments with the view of determining the efficacy of certain gases as insecticides—with special reference to the white scale, *Icerya Purchasi*. The following is a summary of results, of which a full report will be published hereafter.

The use of gases for this purpose has been long contemplated, and various appliances have been suggested for the ready application of any efficacious gas. The ease with which gas penetrates to all parts of the tree naturally suggests its use as preferable to washes, which at best leave many parts of the foliage and infested branches untouched, even when sprayed with the greatest care. In order that the gas may be an efficient insecticide, it must be so poisonous that even when applied in small quantities it produces fatal results; for in the application the air confined in the tent covering the tree dilutes the gas to a great extent. Again, the gas must be capable of being generated quickly in sufficient volume. The record below shows that only one of the gases employed fulfilled these conditions to a satisfactory extent. Preliminary experiments with some others having shown their unfitness for the purpose, either on account of expense or because of injury to the foliage, or imperfect action on the insects, their study was not pursued further.

Appliances for Application.

The tent for covering the tree is made of heavy bed-ticking, thoroughly oiled with linseed oil. This cloth serves the purpose best, as it is very closely woven, is pliable and easily folded.

The support of the tent, devised by Mr. Titus, is a very ingeniously contrived scaffolding mounted on wheels, which serve to move it from one tree to another. Its dimensions are 26 feet high, with a base 20x20 feet. Its upper part is 20x12, and carries upon the top a roller made of galvanized iron (6 inches in diameter and 12 feet long), upon which the tent is rolled when taken from the tree. Side guy-ropes are attached to the bottom of the tent and run through pulleys at the upper corners of the scaffold. They are used to open the tent when it is to be dropped over the tree, and to fold it up when it is removed. The lightness of the apparatus allows of its being easily removed by two men, who operate the whole. If necessary, two or more tents can be handled by the same scaffolding, one tent being left over the tree while the scaffolding is moved to the next.

In adjusting the tent, the bottom is placed on the ground about three feet from the tree and covered with earth. This brings the gas to bear upon the base of the tree and the surrounding soil.

The generator in which the gases were produced consists of a heavy sheet-iron cylinder, 11 inches in diameter and 13 inches high. The bottom rests on a plank, and to the top is fitted a movable cover suspended in a frame by a bench-screw. Into the cover are fitted two pieces of gas-pipe—one for the exit of the gas toward the tent, and the other, connected with a pump, carries the gas which returns *from* the tent. Two small reservoirs are also inserted in the cover; in these are contained the solutions which are to flow into the generator for the production of the gas.

In order to establish circulation and to force the gas into the tent, a pump is used, which also serves to exhaust the gas from the upper part of the tent and to force it again through the generator. It is proposed to replace the pump by a small fan-blower, which is much more expeditious than the common pump which was used.

The Gases Experimented With.

Among the gases used were chlorine, sulphuretted hydrogen, ammonia, carbon bisulphide, carbon monoxide, carbonic acid, hydrocyanic acid, and carbolic acid vaporized by heat.

Chlorine. — Some preliminary experiments were made in small vessels into which this gas had been introduced. Some infested branches were allowed to remain in them for times varying from 5 to 35 minutes, without any noticeable effect being produced on the insect. Atmospheres more strongly saturated with the gas proved fatal to the insect in a short time. In other treatments extending over 18 hours, with less saturated atmospheres, only a small percentage of the insects was killed. No decided effects were noticeable on the foliage unless the gas was very concentrated.

Carbon Bisulphide.—A lime tree, 12 feet in diameter of top, was treated with the vapor of 2½ pounds of sulphide of carbon for 45 minutes. At the end of this time the insects were lively, and during the treatment had crawled up and collected around a rope surrounding the tree, at the point where the gas was being injected from the hose. It proved that the gas thus used injures neither the insects nor the foliage. It is upon record, however, that in cases where the vapor has not been thoroughly diffused, but was allowed to flow down from an open vessel placed in the top of the tent, serious injury was done to the foliage at points where the undiluted vapor flowed down.

Sulphuretted Hydrogen.—Several treatments with this gas were made on a small scale, the application lasting from 5 to 35 minutes. The effects produced either with diluted or concentrated gas were similar to those produced by chlorine, except that even the concentrated sulphuretted hydrogen did not injuriously affect the foliage. An experiment in which a whole tree was treated in the tent for 45 minutes, with quite concentrated sulphuretted hydrogen gas, showed clearly that the effect was far from being satisfactory; the insects for the moment were stupefied, but in the course of an hour and a half the majority of them were again moving about.

Ammonia.—The vapor from one pound and a half of strong ammonia water was applied to an 11 foot lime tree for 30 minutes. The results were disastrous to the foliage; the leaves were all scalded, and in a few days all dropped from the tree, and even the newer growth of wood was injured. The insects, however, were not perceptibly harmed.

Carbon Monoxide.—Very strong hopes have been entertained by many for the successful application of this gas. Its apparent cheapness and easy production, when the necessary plant is once erected, would recommend it. Unfortunately our experiments show that it is not sufficiently effective to warrant its use. The gas was obtained by forcing air through a small furnace filled with red-hot charcoal, care being taken to cool and to measure the gas before applying it. No appreciable effect was noticeable after 40 minutes. In a duplicate experiment, in which the charcoal was more strongly ignited and continuously introduced into the barrel for 30 minutes, only slightly better results were obtained.

Oxalic Acid.—It was thought that the production of carbon monoxide by decomposition of oxalic acid by heat might be substituted for the previous method of generating this gas. One-quarter of a pound of oxalic acid was ignited, and the gases applied in a manner similar to that of the preceding experiment. Neither the insects nor the foliage were harmed in the least. This experiment has incidentally shown that the vapor of formic and oxalic acids, also produced during the heating of the latter is likewise ineffective.

Carbolic Acid.—It had been suggested that

carbolic acid vaporized by heat would prove fatal to the insect. A dose of half a pound of liquid acid was volatilized in the furnace, and the vapor blown in the vessel containing the infected branch. At the end of 20 minutes all the old insects were still alive, and some of the young ones, just molted, were moving about. An hour later the foliage appeared as if scalded.

Hydrocyanic Acid.—It was only with hydrocyanic, or prussic acid (generated by the action of sulphuric acid on potassium cyanide), that sufficiently fatal effects were secured to warrant a more thorough determination of the time of exposure and quantities of material which would produce the best results. Numerous experiments were carried on for this purpose, and it was shown that even small amounts were effective. It was also shown that even in these small quantities an injurious effect upon the foliage was produced. In the beginning of the experiments, "mining cyanide" of potassium was used. It is a very impure material and contains along with the cyanide a considerable amount of carbonate of potassium. For this reason many of the first treatments were practically ineffective.

Later treatments with pure cyanide were more successful in destroying the insects, but the foliage was proportionally injured. Treatments varying in dose from 4 to 12 ounces of cyanide, and in time from 15 to 60 minutes, showed that the effect produced on the foliage by longer treatment was not proportionally greater than that produced by short treatment. Neither was the effect of longer treatments proportionally more fatal to the insects. It was thus clearly shown that the gas mixture should be of considerable strength in order to insure rapid action.

The effect of the gas was so disastrous to the foliage that it became necessary to find some means of remedying this trouble. This was sought in applying a second gas, which might preserve the foliage. Sulphuretted hydrogen was therefore injected into the tent, together with the cyanide gas, both from the same generator; a portion of the sulphuretted hydrogen being introduced before the cyanide was generated. It was found that the insects appeared stupefied when the tent was raised, but large numbers revived in a few hours. The effect of the cyanide seemed therefore to have been decreased by the sulphuretted hydrogen. The foliage was not preserved, although not so badly affected as by treatments with cyanide alone.

Carbonic acid gas was next tried. Trees were treated with larger doses of cyanide than heretofore used, and the carbonic acid from 1½ pounds of carbonate of soda was at the same time introduced with these doses. The insects were killed and the foliage of a 12-ft. tree remained unharmed, while that of a 14-ft. tree with the the same amount of carbonic acid was slightly injured. Thus it was shown that it would require 1½ pounds of bicarbonate of soda to preserve tree-tops 12 feet in diameter, and that with this protection the deadly cyanide could be successfully used.

The regulation of the doses for the different sized trees so as to produce uniform treatments is calculated on the basis of the results of the experiments which determined the amount of each constituent for a 12-foot tree. The following table indicates the amounts for trees of different dimensions of top, based upon the rates of cubical contents:

Size of Tree, feet.	Cyanide of Potassium, fluid ozs.	Bi-Carbonate of Soda, pounds.	Sulphuric Acid, fluid ozs.
4	.7	.05	.4
5	1.6	.11	.3
6	2.5	.20	1 3
7	4.0	.29	2.1
8	6.0	.44	3.1
9	8.5	.63	4 5
10	11.5	.87	6.2
11	15.5	1.14	8.2
12	20.0	1.50	11.6
13	25.4	1.90	13.5
14	31 6	2 50	16 6
15	39 2	2 92	20 7
16	47.5	3.53	25.2
17	57.5	4.23	30.1
18	67.7	5.05	35 8
19	70 9	5 93	42.1
20	90.5	6.93	49.2

In order to apply the doses easily they are prepared so that the required amounts of each ingredient can be directly measured. The cyanide solution is prepared by dissolving say 10 pounds of the solid salt in about 2¼ gallons of water, warmed nearly to the boiling point, stirring at intervals, cooling, and then diluting to 2½ gallons. This solution will contain about one ounce of cyanide of potassium to 2½ fluid ounces of the liquid.

The bicarbonate of soda is pulverized finely and measured off in a vessel marked, so as to designate pounds and fractions of a pound of the solid material. It is then placed in the generator and the dose of cyanide mixed with it, and, if necessary, a little water added to make it into a thin paste. After adding the measured dose of sulphuric acid, the pump is worked slowly at first, and more rapidly after the gas has passed into the tent. The time for each treatment must be determined by future experiments; 15 minutes seemed to be quite sufficient when the cyanide alone was used, but it may be desirable to extend the treatment to 30 minutes when the foliage is protected by the carbonic acid gas.

It is advisable that the treatments should follow cultivation after about four days, so that all weeds and places where the insect may find lodgment would be destroyed. The insect will then be on, or very near, the tree; the fitting of the tent to the ground is thus also much easier.

The eggs of the insect remained apparently uninjured, wherever protected by the woolly covering. A second treatment, to destroy such as may afterward hatch, will therefore be necessary.

It must not be understood that these experiments definitely settle the mode of operation and the size of the doses to be used. They are merely suggestive of a general plan which can be so perfected in the future that the application of this remedy to other kinds of trees and insects must be attended with good results. It simply remains for the ingenious cultivator to devise the necessary appliances for its use, on a small scale, on all sorts of fruit trees, shrubs and plants.

It must not be forgotten that extreme care in the handling both of this deadly gas and of the cyanide itself is necessary. To inhale the one, or to taste or touch a wound with the other, may lead to serious consequences.

Berkeley, June 12. F. W. MORSE.

Action of the Los Angeles Supervisors.

Just after the foregoing was written, the following letter was received from A. Scott Chapman, of San Gabriel, member of the California State Board of Horticulture:

SAN GABRIEL, June 8, 1887.

F. W. Morse, University of California—DEAR SIR: The Board of Horticulture of Los Angeles county have been out to examine the work done by you at Mr. Titus' place and have pronounced it the best "killing" that they have ever seen.

They asked my father (Mr. A. B. Chapman) to go before the Board of Supervisors and make a statement of your work. He went before the board and explained things to them. They then agreed to pay all the expenses incurred by him and Mr. Titus; they further agreed to ask you to come down again and carry your plan to completion, agreeing to pay all your expenses and salary, the same as was done by Mr. Titus and my father, during your previous visit.

Very respectfully yours,
A. SCOTT CHAPMAN.

SERICULTURE.

Government Purchase of Cocoons.

Hon. N. J. Colman, U. S. Commissioner of Agriculture, issues the following circular, which will be of interest to our silk-growing readers:

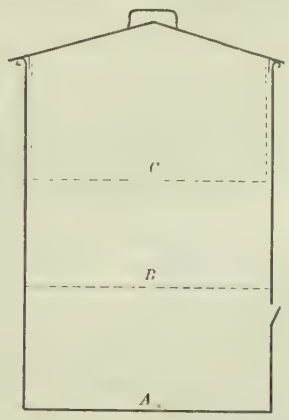
At the last session of Congress additional appropriations were made for continuing the work of this Department for the establishment of silk culture in the United States. Under the provisions of this Act I shall continue the experiments in silk reeling in this city, and shall purchase the cocoons necessary therefor on the following terms:

From the States bordering on the Gulf of Mexico, lots will be purchased at any time after the first of July, 1887. From all other portions of the country they should not be shipped before October 1st. This distinction is made on account of the difference in the seasons in the several parts of the country, and the fact that cocoons produced in the north would hardly be dry before October, while those of the extreme south, being raised much earlier, are sooner ready for the market.

The highest price that will be paid will not exceed $1.15 per pound, and this will be given only for cocoons of first quality. For those that are inferior such prices will be paid as their quality will justify, and it must be remembered that very poor cocoons cannot be reeled and are only salable as waste, and as such bring excessively low prices. In the present state of the industry in this country, but few raisers produce cocoons of such quality as will command the maximum price quoted.

Persons having cocoons to sell should notify this office before shipment, so that they may be informed whether or not the full quantity required has been purchased. This may be done upon the inclosed official postal card. No cocoons will be purchased except by previous agreement, and lots shipped without regard to these instructions will not be returned to the shipper at the expense of this Department. With the notification should be sent a sample of cocoons, which may be mailed without payment of postage if the inclosed franking label be used. This sample should be sent in a tin or wooden box, and should consist of at least 20 cocoons. Upon its receipt the shipper will be informed, approximately, of the price which will be paid for the cocoons. But as it is extremely difficult to judge of the value of the whole lot by the inspection of a small sample, I cannot undertake to bind myself by the estimates thus given. The experience of the past year, however, has shown that, while many lots were not equal in value to the sample sent me, others were of superior quality, and in such cases the prices paid for the lots were better than those quoted on the samples. Such a policy will always be followed. Lots of cocoons weighing not more than four pounds may be sent by mail with one of the inclosed slips attached.

In shipping samples or lots of cocoons it is very important that the name and the address of the shipper should be placed inside of each parcel or box. All freight and express charges must be prepaid by the shipper.



In order to save transportation expenses it is suggested that neighbors combine their small lots in one case and ship them by freight. The lots should, however, be separately packed in the case and each labeled with the name and address of its owner. It is also suggested that all lots that are large enough be shipped by freight instead of express, as there is no danger of the cocoons spoiling, and a great saving of expense will result.

No special instructions are needed as to the packing of cocoons for shipment beyond calling attention to the fact that crushing must be guarded against. Much breakage has occurred in pasteboard packages sent by mail, and shippers are advised to avoid this mode of packing. No soft or foul cocoons should be placed in the case.

The following extract from the forthcoming report of the Entomologist will prove of immediate importance to such silk-raisers as have not yet stifled their cocoons.

Instruction for Stifling Cocoons.

"Our experience in the filature has shown us that our people are sadly deficient in their knowledge of the art of stifling cocoons, and many lots have been received which were of otherwise excellent quality, but which had been burned by the employment of improper means for destroying the life of the chrysalis. It is the custom in Europe for the silk-raiser to dispose of his cocoons at the filature as soon as they are raised and before they have been stifled. The raiser then has the advantage of getting payment for his work as soon as it is completed, and the silk-reeler is enabled to stifle his cocoons in large quantities and by the most approved process. This scheme, however, has thus far been found impossible in the United States, as silk-raisers are, as a rule, located so far from the available markets that there would be danger of the moths piercing the cocoons before they could be choked. American buyers have therefore been obliged to purchase only stifled cocoons which have been thoroughly dried, and as this process of drying requires several months, silk-raisers have not received the proceeds of their season's labor until well into the autumn. And again, through inability to purchase apparatus, or through lack of knowledge on the subject, they have resorted to such means of stifling as were at their command, and have destroyed, in many cases, an otherwise excellent crop. This burning of the cocoons may always be obviated by using steam in their stifling, and afterward thoroughly drying them to prevent molding. A very efficient though simple piece of apparatus for thus stifling cocoons was purchased last spring by this Department of the New York Silk Exchange, and is within the means of most silk-growers. A sketch of it, in a slighly modified form, is shown in the figure. It consists of a tin reservoir, about one-third filled with water. Slightly above the surface of the water is a movable

perforated partition, *B*, intended to prevent spattering during ebullition. The upper portion contains a perforated pan for holding the cocoons, while all is tightly closed by a cover. Cocoons may be thoroughly stifled by exposure in this apparatus over boiling water for 20 minutes. It will be seen, too, that much the same apparatus may be contrived by the use of a deep kettle, into which is set an ordinary colander full of cocoons. It is well to avoid, however, so filling the kettle with water that it will splash upon the cocoons in boiling, as they should only be subjected to the action of steam. The apparatus owned by the Department is 12 inches in diameter and 13 inches deep, and will stifle from three to four pounds of cocoons at a time."

Silk-growers will find complete instructions in the art of raising silkworms in Prof. Riley's pamphlet, "The Mulberry Silkworm," which is gratuitously distributed by this Department.

Encouragement given in the past has, unfortunately, led to the production in large quantities of eggs of inferior quality, for which raisers have found practically no market, and they have therefore failed to earn even that sum of money which they might have realized had they stifled their cocoons and sold them for reeling. The policy, therefore, adopted last year not to purchase American silkworm eggs and to discourage the extensive production of such eggs will be adhered to, for I deem it unwise that raisers should be assisted in this direction. In this connection the Entomologist says:

"In 1885, as stated in our last report, a quantity of silkworm eggs were purchased of American silk-raisers and 150 ounces were distributed to applicants in different parts of the country. The general result was so unsatisfactory as to prevent the repetition of the experiment. There were but few of the sellers who had the slightest idea of the care to be taken in egg production, and it has not been thought wise to continue the encouragement of this kind of work. There is, too, undoubtedly, evidence of the existence in the country of much 'seed' of inferior races, and it is our aim to prevent the use of this as much as possible by the gratuitous distribution of choice qualities."

With this object in view, I shall purchase foreign eggs from reliable houses and distribute them (between January 1 and June 1, 1888) in limited quantities to silk-raisers. Applications may be made directly to me. While thus discouraging any attempts to raise silkworm eggs with a view to sale, I am ready to afford any aid in my power to raisers who desire to produce eggs for their own use. Extreme care in such production cannot be too strongly insisted upon, as two silkworm diseases are hereditary and may pass from one generation to another through the eggs. Before attempting egg production, therefore, raisers are recommended to give careful attention to the contents of Chapters V and VI of the pamphlet mentioned above. All the precautions therein set forth may easily be taken by any person of ordinary intelligence. In case the lack of a microscope should deter any person from submitting the moths to a proper examination for pebrine, such examination will be made at this Department without expense to silk-raisers so far as the eggs produced may be intended for their own use and not for sale. Instructions in regard to such examinations will be furnished upon application. It is suggested also that the worms destined for reproduction should be raised apart from the others and that they be chosen from those born the first day. They should, too, be fed more plentifully than the others with a view to bringing them sooner to maturity. Each time the litter is removed the backward worms should be discarded. If it is too late on receipt of this circular to effect this choice after birth, make it from the worms which first emerge from the next molt.

Special arrangements for the safe-keeping of eggs during the winter have been made here, and persons who so desire may send their eggs to this Department for hibernation. Such eggs should be sent in bulk, in proper boxes, after they have been washed from the cloths on which they were laid.

NORMAN J. COLMAN,
Commissioner of Agriculture.
Washington, D. C., May 9, 1887.

THE FIELD.

Suckering Corn.

EDITORS PRESS:—The custom of suckering corn, so common in this State, is, it seems to me, not only a foolish one, but absolutely injurious to the plant. I have grown corn for the last 50 years, at the East and in this State, and never did such a thing as to wound the growing stock by tearing from its roots what nature evidently designed for its good. As I have heretofore remarked, nature makes no mistakes. No more leaves are furnished to a plant than are necessary for its healthy growth and full maturity of the grain. What the parent stalk lacks in leaves is made up by the leaves of the suckers, and they are produced just at the critical time when all the powers of the plant are required to mature the grain. The "dent" variety of corn usually has no suckers, for the reason that the leaves are much larger than those of the smaller varieties. If suckers are left to grow, many of them will produce good sound ears of corn, besides furnishing an abundance of most excellent forage for stock. A neighbor raised a fine patch of corn last year, and took up with my advice not to sucker it, and he said he never raised a better crop. Some of it took first prize at our district fair.

If people would cut up their corn as soon as the kernels are out of the milk, and while the stalks are yet green, and set them in shocks, putting 25 to 30 hills in a shock, binding the tops securely with two bands, instead of leaving it in the hill, exposed to the scorching sun and dry winds, their corn would be much plumper and heavier, and the stalks would be found to be equal to the best of hay for all kinds of stock. If a grain-producing plant of any kind be severed from its root as soon as the grain is out of the milk, all the needful nourishment to the grain will go directly to the grain; whereas, if left standing, the sap or juices in the stalk will be dried out by the sun and wind. I have found, by actual experiment in this State, that a bushel of ears of corn, taken from stalks cut up green and bound up snug, weighed considerably more than the same quantity taken from stalks left standing in the hill till they dried out. J. S. TIBBITS.

Santa Rita.

WORK OF A PUMP.—The amount of water a pump will throw equals the displacement, *i. e.*, the area of the plunger multiplied by its stroke in inches. Multiplied by its number of strokes per minute, this divided by 231 (cubic inches in a gallon) will give the duty in U. S. gallons, always presuming the water cylinder to be completely filled and emptied at each stroke, a condition that rarely occurs.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Arcadian Promises.

EDITORS PRESS:—Some time ago I promised to review last year's contributions to the kitchen literature of the PRESS, but so far I have failed to keep my word. I like to keep my word; in these days of sharp practice it is all that ordinary men can keep. Still my conscience troubles me more for making the promise than in not fulfilling it. The tempter whispers in my ear: let the dead past bury its dead; let us have living issues. Nevertheless the whisper is not strong enough to quiet the sneaking consciousness of a duty unfulfilled and that all the fine talk about a dead past means only an excuse to get out of a task, for I do find that my promise involved more work than I had supposed, and (to be plain and truthful) I am not as much interested in the subject as I was.

I believe I told you that a "ministering angel" came to my assistance and took supreme and unlimited control of the kitchen and all the rest of the house, myself thrown in. I abdicated at once and made an unconditional surrender. It is really wonderful to notice how easy and simple the whole thing now appears.

I sometimes take a glance, a passing glance, at the former scenes of my labors, where stewing, sweating and s——g used to prevail. (Please spell that word *singing*.) Everything is now going on admirably, and I do not now see the need of making such a fuss about kitchen slavery. I find, too, that to propose any effectual remedy would be simply the inauguration of a revolution in society, to be cheeky enough to ask all men and women to step down and out of their present absurd positions and assume that of what may be the prevailing fashion of 1000 years hence,

> When man to man, the world o'er,
> Shall brothers be for a' that;

When the lion and the lamb shall lie down together, with the lamb outside of the lion—when, in short, the world will be one great consolidated Grange, with all its inhabitants Patrons of Husbandry and all of them readers of the RURAL PRESS and the *Patron*. Selah.

In the articles furnished the PRESS on the kitchen, I found many very useful and sensible hints and suggestions, but the principles involved in them all, when boiled down, were just as applicable to outside as to inside work, to work in a machine-shop, in a printing office or in a counting-room. Care, thrift, efficiency, system and order; an orderly arranged kitchen, with a good supply of everything needed, with all the latest improvements; a place—the best place for everything, and everything there all the time, with a full knowledge of the best methods of cooking, supplemented by an acquaintance with hygienic and sanitary laws. This, I think, is a compressed summary of all that has been said. But the whole farm—in fact, the country at large, is on the strike for the same thing, and I would not wonder, if the matter was statistically looked into, but we would find that the condition of the farm and its kitchen ran on parallel lines.

If system and thoroughness be found on the farm it will be reflected in the kitchen.

I see as much slavery outdoors as indoors—too much drudgery everywhere, and—I hope it is not profanity—I have ever before me an irrepressible protest against the original curse, an inherent dislike to labor—laziness, if you will have it so. I do protest against the everlasting tread-mill of arcadian drudgery. I receive through the mail agricultural papers, political papers, economic papers, philosophical papers and local papers, and find no time to read them. All day long and every day there is on the farm an ever-present imperative demand for labor, nay, a dozen demands all clamoring for instant attention. The farmer cannot finish a fine piece of work and look at it with complacency, satisfaction and admiration as in other crafts; while he is admiring his work a new demand will grow out of its completeness demanding further improvement. Work on a farm and in a farmer's kitchen is like the little boy's nose, when he was asked why he did not wipe it, "I did," said he, "but it won't stay wiped."

Call me lazy or compliment me as you may, I do not believe this condition of things should be. Neither in the kitchen nor in the field should work assume the form of drudgery.

The farm should be my servant, but it is my master. Even farmers are made for other objects beside labor. They are, believe me, human beings with an intellectual, moral, and spiritual nature as well as a physical framework; and on the farm the intellectual, moral and spiritual ought to have a show, especially as in no sphere of life are the potential elements by which they can be developed so abundant as on the farm.

Face to face with nature continually and away from the artificial, deceitful, hypocritical life of the city, he should be able to live continually in blessed heavenly communion and

> Find tongues in trees, books in running brooks,
> Sermons in stones, and good in everything.

Why is it not so? What is it that is needed to rouse the farmers from the stupor which lies like a pall over them all? Will some Demosthenes assume a mission among them and enable them to see themselves as they are, and show them how easy it is to be emancipated?

The Grange is all at present we can look to. To the Grange we must look and use it as a stepping-stone to the best that can be done for deliverance from drudgery in the kitchen and in the field. J. W. M.

Tulare, June 4, 1887.

The Worthy Master Goes to Sea.

EDITORS PRESS:—Mr. Johnston and I left home on the morning of the 23d of May, for a trip to the Sandwich Islands. After a night's rest in San Francisco, and a few hours spent in attending to business, we went on board the steamship Australia, and found it packed with people. We could not tell who was bound for the islands of the sea and who, at the call of the bell, would step ashore to watch the steamer carry their loved ones out into the bay and through the Golden Gate on the deep, blue sea.

The Masonic excursion party, of which we were a part, had hoisted on the stern a lovely banner of blue silk, bearing the Grand Worshipful Master's emblem. This beautiful flag, with its golden fringe, was presented to the Master by Mrs. Croly, of Sacramento, and then carefully put away for future use.

The next thing in order was an attempt to eat dinner; but this, to the inexperienced, was somewhat novel. One after another was compelled hastily to seek their staterooms; and I was unfortunate enough to be among the number. The next five days there was nothing new under the sun to see, but much to feel, with one continual rocking and rolling of the boat.

Sunday was regarded as the Lord's day. Notice was given at the breakfast table, and all were invited to meet in the dining-saloon at ten o'clock for divine service. A goodly number responded to the call.

The scenery, though grand in the extreme, was one continuous sameness. The only living things we had seen so far were a few large, dark birds, something like a sea-gull, which followed the ship constantly, to secure such morsels as were thrown overboard.

On the sixth day a few flying-fish made their appearance. By this time seasickness had almost all gone, passengers had got acquainted with each other, and became quite jolly. The Masonic members were called together frequently, their business seeming to be, as Nasby says, to "pass resolutions like anything." However, they put in a good deal of time in preparing toasts, to be offered and responded to at the dinner hour by chosen persons. It fell to the Worthy Master to respond to the toast of "the Grange and Farm." It should have been simply Grange, for this is farm.

Monday evening's dinner was the best effort in that line, and festivities were more indulged in than at any other time during the trip. This was the last evening out—next day we would take our lunch on shore, in the city of Honolulu. Shortly before dinner, the members of the Eastern Star were called together to draft resolutions expressing their sentiments. Some of the ladies responded to some of the toasts. (After about two hours and a half spent in eating and talking, drinking and talking, I am very glad that a toast can be just as well drank with water as with wine.) Our clever Commander, the Crew, the Masons, the Eastern Star, the Grange, and last, but not least, California, were toasted. The honor of responding to that was given to the Worthy Master also. The festivities closed by all rising, joining hands and, in concert, singing "Auld Lang Syne."

The twilight hour was usually spent in promenading the deck. A little device was gotten up early in the voyage for the amusement and entertainment of the passengers Two boxes were prepared by placing in them slips of paper, on each of which a number was written. One box was for the ladies, the other for gentlemen. These boxes were set near the door, and as each one passed out he or she was requested to take a slip. After reaching the deck each one was to find the corresponding number, and they should be partners for the next 15 minutes. In this, as well as in the hospital corps, I was among the unfortunate—or perhaps it was fortunate for me, as I had little desire to walk the deck of the rocking ship—that my number (I mean the one corresponding to it) was always left in the box; so if I did not get pretty well acquainted with at least a few of the gentlemen it was not my fault.

We all felt happy at the thought of seeing land, the beautiful land that would be in sight by daylight. Several hours out, our boat was slowed up in order to make the landing at the appointed time. A pilot was sent out to meet the steamer a short distance from the shore. It contained 20 men—some Masons of prominence—to extend a welcome to the party. The wharf was covered with humanity of all shades of color. The King's band was there, and when our line touched the wharf their sweet strains of music cheered each heart as we stepped ashore. Their music is charming indeed, as many Californians can testify from what they heard at the Conclave in S. F. We were only too glad to avail ourselves of the carriages which we found awaiting to convey us to our hotel. More anon. E. S. J.

Hawaiian Hotel, Honolulu, June 7, 1887.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

IT has been said that our cities are the storm center of our country. They are the starting-point of all the evils that threaten our land to-day. In them are found Anarchists, Communists, Nihilists, and all the other importations of mischief from foreign countries. The fact that the cities are growing much more rapidly than the whole population is full of significance, and should attract the attention of our farming population, for it is they who must bear the final and heaviest burdens that must surely come if, when "threatening perils wait," they are not promptly met and averted. In 1790, one-thirtieth of the population of the United States lived in cities of 8000 inhabitants and over; in 1800, one-twenty-fifth; in 1810 and also in 1820, one-twentieth; in 1830, one-sixteenth; in 1840, one-twelfth; in 1850, one-eighth; in 1860, one-sixth; in 1870, a little over one-fifth; and in 1880, nearly one-fourth. From 1790 to 1880 the whole population increased twelve-fold, the city population, eighty-six-fold. From 1830 to 1880 the whole population increased a little less than four-fold, the city population, thirteen-fold. From 1870 to 1880 the whole population increased 30 per cent, the city population 40 per cent. During the half century preceding 1880, population in the city increased more than five times as rapidly as that of the village and country. In 1800 there were only six cities in the United States which had a population of 8000 or more, In 1880 there were 286. These figures are from the U. S. Census reports and should set us to thinking.

WE have spoken of the evils in our cities as of foreign importation. The thrifty, moral, law-abiding emigrant is, and always has been, welcome to our shores, but as a rule he does not remain in the cities. The bad element centralizes in the cities.

A FEW more figures to think about. Our 50 principal cities contain over 39 per cent of our entire German population, and over 45 per cent of the Irish. Our 10 larger cities contain only nine per cent of the entire population, but 23 per cent of the foreign, while a little less than one-third of the population of the United States is foreign by birth or parentage. Sixty-two per cent of the population of Cincinnati are foreign, 83 per cent of Cleveland, 63 per cent of Boston, 88 per cent of New York, and 91 per cent of Chicago.

THE figures in the above items are given and will be followed by others to afford Patrons some light upon a question that should have a thorough discussion in all our Granges at an early day, viz.: Should the indiscriminate landing upon our shores of hundreds of thousands of all classes of foreign emigrants be in some measure restricted, with a view to the future peace and prosperity of our country?

A CORRESPONDENT of the Texas *Farmer* writes as follows: "For the past six years I have been only a spectator. I have looked down upon the Grange from aloft, as it were, and with more than ordinary opportunities for observing its effects—its successes here, or its partial failures there. I have not seen these through the clouded glasses of prejudice, nor those magnified by an intense enthusiasm. I have been somewhat silent, but always keenly interested in every move the Grange has undertaken for ameliorating the condition of mankind. And when I see it has taught us that our neighbor has some rights which we ought to respect; when I see neighborhoods brought into closest social relation through the instrumentality of the Grange; when I see better farmers and better farming as a result of Grange teachings; when we find educated and refined gentlemen and ladies forming the great rank and file of those who honor farming by being farmers; when we see agriculturists more fairly represented in the halls of our Legislatures, and needed legislation coming in answer to the demand of our Order; when we look about us and behold the shackles of ignorance broken, and superstition driven from our land, I am ready, with my brothers and sisters, to exclaim: The Grange, as the farmer's friend, is the grandest success of the nineteenth century!"

WM. SAUNDERS, one of the founders of the Grange, says the first duty of an organization is to educate its members to a true knowledge of their position as a part of a whole which must work harmoniously. Not until its members have become thoroughly impressed with the fact that unity of action cannot be acquired without discipline, will they have learned that one of the first duties of members of an organization is to see that discipline is rightly enforced. Before any organization can work effectively, its members, individually, must be intelligent in regard to the nature of the question upon which they may be called to give an opinion, and ever bear in mind that they should take a sincere interest in carrying out the minutest details of all duly prescribed plans, rules or laws.

THE cause of dormant Granges is not any organic weakness in the laws and principles of the Order, but a lack of proper observance of these same laws and principles. Nine-tenths of the members of dormant Granges will say "the fault is not in our stars but in ourselves."—*Rural Vermonter.*

PROGRESS.—One hundred and twenty-three new Granges have been organized in the United States so far this year, against 91 for all of last year.

RETURNS to the Secretary of the Maine State Grange, so far this year, show an increase by initiation of nearly 900 members.

GENERAL DEPUTY J. T. EATON, of North Carolina, has reorganized 11 Granges this year with a membership of over 500, among which are Palmetto, No. 120, with 72 members; Union, No. 199, with 80 members; Lenoir, with 83 members. Deputy National Lecturer J. N. Lipscomb is to give North Carolina a series of meetings soon.

MOLINE GRANGE, No. 248, Michigan, has recently taken in four new members. They are two men and their wives. How appropriate for man and wife thus to go together to enjoy the blessings of the Grange.

ALEWIVE GRANGE, Kennebunk, Maine, increased its membership 63 last quarter.

> Calm words, great thoughts, unflinching faith
> Have never striven in vain;
> They've won our battles many a time,
> And so they will again

The New Crusade.

Henry George is making a prodigious effort to popularize his scheme to banish the woes and ills of mankind by placing all taxation upon the land. His paper, the *Standard*, comes to us every week heavily freighted with elaborate editorials and ringing speeches. Societies are organized, money is flowing in and missionaries are sent out to preach the gospel of the new crusade. The good Dr. McGlynn has gone into the movement with a zeal that the pope, cardinals and councils cannot intimidate. Rev. Hugh O. Pentecost, pastor of the Belleville Avenue Congregational church, of Newark, said at the Academy of Music, in New York, the other evening: "We are going for the New Jerusalem. Why, under the sun, do you pay taxes on everything you use, when you might just as well put them on the men who own the land? Why do you pay ten cents for a cigar, when you might just as well get it for five? Why do you pay $25 for a suit of clothes, when you could have it for $12.50, and bigger wages to buy with? Why do you pay taxes for your carriage and your horse and cow, and dog and billygoat, when you might just as well take all that tax off and shift it on to the land?"

This mode of bringing in the New Jerusalem was greeted with an uproarious shout, but it certainly looks like an unjust and inequitable discrimination between property-owners. According to this theory, if A earns $5000 and expends it in purchasing a herd of Jerseys and Durhams, his property should not be taxed, as that would discourage enterprise; but if B earned the same amount of money and laid it out in a piece of land to build a homestead upon for his wife and children, his land must help carry the burden of the Government. A sporting millionaire may put all his vast wealth into blooded horses, and travel from turf to turf, and sweep the pools, and pay nothing toward the maintenance of schools, hospitals, asylums and the like, while a poor clodhopper, whose whole property is a five-acre potato patch, staggers under a load of taxes. Is not this discrimination on the products of one's industry, and is it not unfair and unjust? It is surely promoting one form of enterprise and discouraging another. As the State protects by its laws both property in things and property in land, each should be made respectively to bear the expenses of maintaining the Government. No law is just that makes the taxes of B's farm protect A's horses, cattle and sheep.

Then this scheme would certainly increase the price of living—the very thing these reformers are seeking to avoid. Nothing can be plainer; just as the importer who pays a heavy duty makes it up in the sale of his goods, so the taxes on the land would go into the wheat, corn and barley it produced. The consumer in the end would have it to pay, and the landowner, instead of being a tax-payer, would become a tax-collector. The poor day laborer would know that Rev. Mr. Pentecost's New Jerusalem had come from the high price of bread and meat.

It is a favorite hobby with Mr. George and his friends to descant upon the miserable condition of the tenant classes in all large cities. No doubt this is a sad state of things, but how can it be remedied by putting all the taxes on the land? Is not that putting the cart before the horse? Look at it; why is it that thousands of poor wage-receivers are compelled to huddle in vile dens and hovels? Owing to high rents. But what makes rents high? The high taxes on real estate. Take an illustration of the way Mr. George's theory would work. We have seen the statement somewhere that real estate now bears about 69 per cent of all the taxes in San Francisco. Whether correct or not, these figures will do very well for illustration of the fallacy of the land theory of taxation. There is some complaint of bad tenants and high rents. Now how is this state of things going to be improved by adding the 31 per cent now taxed on things to the burden on the land? This is exactly what Mr. George contends for. How would it work? The landlords would charge it upon their renters and their condition would become just 31 per cent worse than before. There may be a mote in our eye somewhere, but the whole thing looks like a scheme to make the rich richer and the poor poorer. In the very nature of things, if land must bear the whole expense of the Government it would be taxed out of the hands of the poor into the hands of the rich. The homestead would sink out of sight and the landlord become monarch of all he surveyed.

Land monopoly is a gigantic evil, and it would certainly be a great blessing if some just means could be devised for a more even distribution of the soil. We wish every man had a good wife, nice children, and could sit under his own vine and fig tree. But as a means of driving out laziness, shiftlessness, drunkenness and vagrancy, Mr. George's theory has just about as much relation as the Queen's jubilee to the price of sausages. W. M.

ENCOURAGING POMONA GRANGE EXHIBITS.—The San Joaquin county supervisors last week appropriated $300 to assist the Pomona Grange in making an exhibit of county products at the State, Mechanics' and Stockton fairs. The authority for the appropriation is the amendment passed at the last session of the Legislature, which authorizes Boards of Supervisors to expend $1000 per year in advertising their respective

counties. The Stockton *Independent* noticing this action, remarks that the Grangers made an attractive display at last year's Sacramento and Stockton fairs, but this year they intend to make a larger exhibit of the county's productions, and believe that it will be an excellent advertisement for the county.

OREGON PATRONS, too, enjoy picnicking in the season, and the *Willamette Farmer* gives notice that the Annual Grange picnic, under the auspices of the Linn County Business Council, will be held at Jefferson, on the south fork of the Santiam river, June 23d to June 25th. Hon. W. Cyrus of Scio has been appointed president, and Hon. Chas. Miller of Jefferson marshal for the occasion. Eminent speakers from different portions of the State will be present and a large attendance is promised.

EDEN GRANGE holds a special meeting today at Haywards—for work in the first and second degrees, we suppose. Next Saturday they have another Harvest Feast and instruct a good class in the fourth degree. Temescal and other Patrons are invited yet again to participate in the good work and refreshment. The way Eden Grange is forging ahead and doing up business before harvest affords ground for congratulation from all Grangers.

BRO. NELSON CARR, with Sister Carr, of Bennett Valley Grange, expect to visit Temescal Grange, Oakland, this afternoon. We hope other Patrons attending the Spiritualists' camp-meeting may also be present. Bro. and Sister Carr are charter members of the State Grange, and have served long and faithfully both as officers of State Grange and in their own Grange ever since its organization.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

BAYSIDE GRAIN.—Haywards *Journal*, June 11: About the first self-binder started cutting grain was on Peter Mathesen's place, below San Lorenzo, Monday. In this section the early sowed grain will turn out well, but many late-sown fields, especially near the bay, will not make much of a showing. The damage was done by the recent hot weather. In working the land along the bay, a farmer takes big chances in getting his grain in late. Along in May and June the salt underneath soon dries up the moisture, and when a hot wave comes it fixes it. Peter Mathesen has been farming close to the bay for the last 18 years. He had his grain in early this year, and claims to have the heaviest crop raised for years.

Fresno.

SERICULTURE.—*Republican*, June 10: On Monday last four barrels of silk cocoons were shipped from Fresno to S. F.—the first shipment of any size, we think, from this valley—the product of the labor of Mrs. A. B. Babcock and Miss Nellie Robinson, of Central Colony, Miss R. having raised about one-half barrel. Cocoons are quoted in the market at from $1@1.40 ₱ lb., and as the weight of each barrel is about 50 lbs., the ladies will have quite neat little sums to their credit. That the production of silk will continue to increase as a light, pleasant and fairly profitable occupation for ladies and children, we have no doubt, and here in Fresno county the mulberry grows luxuriantly and the silkworm thrives.

EUREKA APIARY.—*Free Lance:* In the extreme west end of Fresno county, 85 miles from Hollister, in the Warthan canyon, is situated the bee ranch of Messrs. Bray & Seacord. It has an area of 640 acres, is well watered, and covered with an abundance of wild buckwheat, Spanish pie-plant, sage, honeysuckle, lilac and alfalfa. These plants make the purest kind of honey. The bees are worked in a very systematic manner, so as to get the most honey in the shortest possible time. Among the buildings on the place are a storeroom, in which the honey is placed ready for shipment, a workshop where all the hives, frames and boxes are put together, and an extracting-room, where the honey is taken from the comb. At present they have 365 stands of bees at work, and in the hight of the season 520 stands. This fall they expect to add 300 more, making a total of over 800 stands. From the 1st of April to the 10th of July, 1886, they took out 55 tons of honey, over one-half of which was extracted. About the last of July, they took out over 3000 pounds more of comb honey. In 1885 they did not do much, owing to the dryness of the season. In 1884 they gathered over 65 tons, about one-half extracted. This year they expect to beat the record and take out 75 or 80 tons. The extracted honey is put up only in 5 and 10 pound cans and is disposed of readily in New Mexico, Arizona, Washington Territory and throughout the East.

Humboldt.

EDITORS PRESS:—Until within the past two days the farmers at Rohnerville and Ferndale, and on the island, have been complaining of a very late and wet spring; in fact, they have been unable to get in their full crops of potatoes. Some have been trying for the past 15 days to make hay, but have not had sun enough to cure it. The crops, however, look finely, so far, and of fruit they will have abundance. Very few trees show any signs of blight, though the curl-leaf appears in some orchards. Farmers in this section do not prune their trees—with one exception, Mr. L. Tower, who is a subscriber to your paper and a very practical orchardist, having spent some years in Lower California. Land is held at fabulous prices hereabout. A gentleman not five miles from Mr. Tower refused $250 per acre for 10 acres, not long since. It is a very black loam. Along the roads wild black, salmon, and thimbleberries grow so thickly that they cover the fences, hiding them from view; and in some places they grow at least 10 feet high. Mr. B. L. Wait has, in my estimation, the best-taken-care-of place it has been my good fortune to see. Everything seems in its place there—fruits, vegetables and flowers. Around Rohnerville the strawberry-fields look splendidly and there are a great many of them. Everything is non-irrigated through the county. All the stock is rolling fat, feed is plentiful and there is every indication of a bountiful harvest. —E. P. S.

ON SOUTH FORK.—Eureka *Standard*, June 2: Mr. Jacobson is now harvesting 75 tons of splendid oat hay. The hay was ripening so fast he had to get a new mower and send it out to save the crop. Potatoes and corn have just been planted; the ground was in admirable condition. There are 400 fruit trees on his place now. The peaches on his place are excellent; the young fruit coming on has been selected with great care. The South Fork section is fine for fruit of all kinds, and we believe this interest will overshadow all others in a short time. A good many new settlers are locating in this particular region who will pay special attention to fruit-growing.

KLAMATH RANGES.—J. H. Laam informs us that very few lambs were saved to the sheepmen this season in that section. The cold storms which prevailed about lambing-time were very disastrous. There was not much loss of old stock, but nearly all the lambs died. Feed now is splendid on all the ranges, and cattle and sheep are in excellent condition. The wool clip will be unusually large. Sheep never carried better fleeces. Some new settlers are coming in and taking up lands about Klamath Bluffs.

Inyo.

WILD HORSES.—*Independent:* For years past a number of wild horses have been seen at different times in Long valley. Recently a party of five or six men followed them a day and a half, and finally succeeded in getting a rope on a young stallion, which they brought into camp, the rest escaping. The only animal branded was an old mare, with the "scissors" iron on her. When ridden the stallion made no effort to buck, but ran for the hills. He got in with another band of horses, and his rider being unable to get him out, they were corraled. The horse, a well-built animal and quite fleet, is being broken by Oscar Hilton.

Lake.

ESTABLISHING A CREAMERY.—W. P. Clendenin, secretary, has furnished the county papers with report of a meeting held at Kelseyville, June 4th, for the purpose of organizing a company to establish a creamery. Thos. Porteus having been chosen chairman and W. P. Clendenin secretary, it was voted that the company issue 100 shares of $20 each, that no one person be allowed to hold more than five shares, and that the organization be known as the Lake County Creamery Company. J. W. Boggs, W. G. Young and J. H. Renfro were appointed a committee to incorporate, to whom the chairman and secretary were presently added. Committees were also appointed to circulate subscription lists, and to secure information as to plans and methods of running a creamery. Another meeting will soon be held.

Los Angeles.

VEGETABLES GOING EAST.—Florence telegram, June 10: Porter Bros. yesterday loaded 12 cars with potatoes at this place, which, with five cars in Los Angeles, will start for Denver, Kansas City and Chicago over the Santa Fe road, this morning, as a California vegetable train. Two of these cars are loaded with tomatoes and cabbages.

FOOTHILL FRUIT.—Orange *Tribune:* A branch of a gooseberry bush, grown at the ranch of Mr. Shrewsberry, in the Santiago canyon, is as full as it can hold of very large and fine berries. Currants, gooseberries, blackberries, etc., flourish in that soil and altitude. Fine specimens of orange trees also can be seen there. We have not seen Mr. Shrewsberry's, but can testify that at Mr. Joplin's place, four or five miles away, and at about the same altitude, we saw some oranges as clean, large and finely flavored as ever grew in Riverside.

Sacramento.

THEY ARE CHEAPER NOWADAYS.—Sacramento *Daily Union*, July 30, 1855: J. R. Ray, of No. 70 J street, presented us with a basket of large, luscious free-stone peaches yesterday. The specimens of this delicious fruit grown on a ranch some 15 miles below the city are fully equal in appearance and flavor with any we have yet seen in the State. A few more peaches are for sale at the above establishment at the low price of $1 each.

Marin.

A HOARD OF HONEY.—San Rafael *Journal:* Col. Sontag, who lately moved into the Orr house, was astonished during the late warm spell to find his eaves dripping honey. The bees seemed to come from the kitchen roof, and on taking off a board a compartment was found about 10 feet long by 1 to 2 feet square, packed solid with honey. Col. Sontag thinks that more than 100 pounds was taken out. His tubs, pails and bowls were all monopolized by the find, and they are having a very sweet time at his house. Immense numbers of bees were found, though the place was so filled with comb that ingress was nearly shut off. As it was impracticable to save them, the bees were killed as far as could be, but there are enough stragglers left to make the neighborhood uncomfortable.

San Bernardino.

CHINO RANCH TO BE SUBDIVIDED.—San Bernardino *Index*, June 11: The great Chino ranch, comprising some 50,000 acres of choice land, lying south of Ontario and Pomona, and owned by Richard Gird, is being surveyed and will soon be put upon the market in 10, 20 and 40-acre tracts. Mr. Gird retains about half the ranch, which will not be sold at present. The land to be subdivided consists of the bottom-lands lying to the north and east, the soil of which is moist, rich and adapted to agricultural products. The prices will probably be low and within the reach of a large class of people who find land in the majority of places too high-priced for them. The Pomona & Elsinore railway, of which Mr. Gird is president, will cross the ranch, giving good communication with the outside world.

San Joaquin.

IRRIGATED WHEAT.—Lodi *Sentinel*, June 11: About five weeks ago Messrs. Lawrence and Hutchins started their pump for the purpose of showing what might be expected from their irrigation project. At that time the ditches which had been constructed gave way and the water was turned into a field, a small portion of which was thoroughly soaked, and the crop thereon increased 100 per cent. Mr. Lawrence says that had the whole field, 160 acres, been irrigated in the same way, the crop would have been benefited to extent of $1000. The cost of irrigating that amount of ground would not exceed $100.

MOKELUMNE CANAL.—Lodi *Sentinel*, June 11: Thursday afternoon the controlling interest in the property of the Mokelumne Ditch & Irrigation Co. was purchased by E. A. Beardsley, Chas. W. McMaster, J. M. Logsdon and E. W. Fairchild, capitalists from Southern California. The consummation of this sale, which has been anxiously looked for, is hailed with delight by our people. Hon. B. F. Langford is the only one of the old directors who did not sell, he being ready to put up his share of the capital required to put the property in running order. The dam, which is substantially constructed, will be raised, and this will cost in the neighborhood of $5000. About $20,000 will be required to conduct the water from the dam to Bear creek, a distance of eight miles, from which place 100,000 acres can be irrigated. Over 76 miles of good canals and ditches are already constructed, and the interested parties assert that by next season they will be prepared to run water on nearly every acre of land in this section of the county.

Santa Barbara.

MUSTARD.—*Independent*, June 11: Thos. H. Hicks, just in from Lompoc, says the mustard crop will be the heaviest known for years, and that several farmers have already contracted their crop to San Francisco merchants at the rate of three cents per pound.

Siskiyou.

MULE-BREEDING.—Marysville *Appeal*, June 10: C. B. Boyce's range on Butte creek is partly in Siskiyou county, Cal., and extends into Oregon. In conversation yesterday, E. C. Hart, agent for Mr. Boyce, said that Boyce is the largest mule-raiser on the coast. His range embraces 5000 or 6000 acres under fence, and thousands of acres of Government land are also grazed by his stock. There are now about 3000 head on the range. There is money in raising mules, which bring $110 or $115 when three or four years old. There is more profit in mules than in horses, Mr. Hart thinks, but the proportion of mule colts is smaller than that of horse colts. From 100 mares the number of mule colts would be from 60 to 75, while of horse colts the average would be 80 or 90. On the other hand, mules can be sold at an earlier age than horses, need comparatively little breaking and are hardier, doing much better when snow is on the ground than horses. There are nine Kentucky jacks on the Boyce range, whose cost was from $1500 to $3000 per head. The stock raised is sold throughout the coast.

Sonoma.

SPRING CLIP.—Santa Rosa *Democrat*, June 11: Ex-Sheriff Bishop, just in from his mountain ranch, states that the quality of spring wool in this county is superior to any he has ever seen. Feed has been unusually good, and none of the ranches in Northern Sonoma are overstocked with sheep. The wool is clean and of remarkably strong staple. The shearing having been done before the grease rose in the wool, makes from a half to a pound's difference in weight to the fleece. George Jacobs, who is on the Geyser ranch, east of the Russian River valley, sold his spring clip of wool Saturday last to a Sacramento buyer for 22 cents per pound.

Stanislaus.

THE FIRST WHEAT.—Modesto *News:* Probably the first wheat of the season from this county was shipped from the Keys' Switch warehouse on Wednesday last for Port Costa. The wheat was cut from the summer-fallowed land of L. W. Hickman, on the Lide ranch. The yield per acre is 21 bushels. Mr. Hickman is the fortunate owner of 1150 acres, which will all yield equally as well, besides about 2400 of winter sown, which is estimated to yield 10 bushels per acre.

Tehama.

IRRIGATION ON THOMES CREEK.—Red Bluff *Sentinel*, June 11: W. H. Bahney, Dr. Westlake, and John Gleason have almost completed a large irrigating ditch running through their farms on Thomes creek. The ditch commences at the forks of the Tehama and Corning wagon-roads, on George H. Flournoy's farm, and runs a distance of about 3½ miles. It is eight feet wide at the top and four feet wide on the bottom, and will carry sufficient water to irrigate between 2000 and 3000 acres. Mr. Flournoy thinks the ditch will be completed this week, when the water will be turned into it, to test the strength of the embankments. Mr. Gleason has about 50 acres of growing orchard, and he and Mr. Bahney and Dr. Westlake will plant out more next winter and spring. Fruit trees and vines grow well and produce excellent fruit without irrigation, in any part of Tehama county, but water judiciously used stimulates their growth and increases the size of fruit.

Tulare.

THINNING FOR THE CANNERY.—*Delta*, June 9: "What shall be done with the boys?" For several days past Mr. Wheeler, manager of the cannery, has had boys at work thinning the fruit in Mr. John O'Connor's orchard. He says the labor is more tractable than men or Chinese, and quicker. He complains that many who have spoken to him about the cannery buying fruit have failed to attend to thinning out the surplus fruits from their trees, and in consequence they will have on their hands trash which the combined skill of canners and driers could not make presentable. The cost of thinning is about two cents to the tree, and this investment will return dollars of good salable fruit. It is not too late now to do this work.

ALILA THRIVING.—W. W. Hughes, of Alila, reports his section of the country prosperous and progressive, and claims at least a half-crop from the grain-fields in that vicinity. This may be a surprise to those who knew that broad, treeless expanse of plain a few years ago when a few sheep-herders' cabins were the only human habitations to be met with in a day's ride. Now a house—a *home*—is to be seen on nearly every quarter-section of land, surrounded by well-cultivated fields.

Yolo.

COCOONS.—Woodland *Democrat:* We have at this office several fine silk cocoons, raised by Mrs. Dr. I. N. Hodgen at her residence. They are healthy-looking and full as large as any displayed at the State Fair. Mrs. Hodgen has raised at least half a bushel, all of which are as fine as the ones on exhibition. She feeds them on common mulberry leaves and has never had the least trouble with them. The matter of raising cocoons should be looked into by the ladies of this county, as it is an easy and elegant mode of gaining a livelihood.

Yuba.

BIG HOP-FIELD.—Marysville *Appeal:* D. P. Durst and his son M. H. have 80 acres each in hops near Wheatland. They expect a yield of from 2200 to 2500 lbs. per acre. They employ white labor, so far as it can or will do the work, and also some Chinese help. The senior Durst says that active boys are much preferred to Chinamen.

A PROMISING OUTLOOK FOR THE STATE FAIR. The *Record Union* of Tuesday says that the prospect for a successful State Fair was never brighter than now. The greater part of the cattle and horse stalls are already engaged, and the accommodations of the society will probably be taxed to their utmost. Arrangements are in progress to extend present accommodations so as to afford more space for all kinds of live-stock and enable the display of all exhibits in the best manner possible. From present indications, the people and exhibitors of the interior propose to take more active interest in the coming session of the State Fair than ever before. Applications for space in the Pavilion are also being received quite rapidly. The plat of the halls is now ready for examination, and evidently no space will remain unoccupied this year.

FRUIT PROSPECTS.—The various reports, which reach him from different quarters of the State, lead Sec'y Lelong, of the State Board of Horticulture, to the following general estimates: Apples promise a fair average. Bartlett pears will be about half a crop; Winter Nelis almost a failure; other varieties good. Apricots, as a whole, nearly double the average. Cherries, rather scant. Plums and prunes, decidedly light. Peaches, very heavy. Raisins and table grapes very good indeed, the damage by frost having been overestimated.

A GOOD NUMBER.—The *Overland* for June has for its leading article an illustrated sketch of the Santa Clara valley. The engravings are from photographs and finely executed. Their artistic beauty is thus accompanied by actual truth to the scenes presented, which is very important. The literary contents of the number are quite up to the standard.

THE APRICOT.—The June meeting of the State Horticultural Society will be held at Irving Hall Parlor, No. 139 Post street, on Friday, June 24th, at 1 P. M. The subject for discussion will be "The Apricot in all its Bearings." All interested in horticulture are invited to attend.

Her Choice.

[Written for the RURAL PRESS by DAGMAR MARIAGER.]

She had of ardent suitors, four,
But only one did wed,
And he was neither less nor more
Than none, compared with Ned,
Or me, or Harry, either one,
For gallantry in courtship;
And yet her gentle heart he won,
And did it without hardship;
As tests we suffered, we who took
Her crushing answer "no,"
She said each soul was like a book,
And Jack's as pure as snow.
This was her explanation good,
And yet we fought her verdict.
Though true, we'd have it understood,
Each was a misjudged convict—
The martyr of some unknown cause,
Some groundless prejudice,
And each our hearts and moral laws,
More perfect were than his.

Santa Barbara.

A Story of the South.

Under the above title, we find in an exchange an interesting story, too long for our columns, from which we take the following:

In a Southern State, what the negroes called "De Bad Gang," with headquarters at a cross-roads whisky-shop, were in the habit of riding over the country nights, committing various outrages. Finally, they killed an old negro and others. The negroes became so alarmed that they hid nights in the swamps. The neighboring planters and good citizens offered $500 reward for detection of the criminals. But the outrages still continued. One night a colored boy overheard them plan to hang a colored preacher who had publicly denounced them. The boy hurried through the woods to warn the preacher, and here we begin the story:

Bursting into the cabin just as the venerable old man and his wife, Aunt Fay, were in the act of kneeling for their evening devotions, he startled them almost out of their wits by screaming: "Oh, unc', yuh's gone! Yuh's a los' man! De Gang's a comin' to kill yuh, suah! Oh, oh, unc', unc'!"

"Wut's de matter wid yuh, chile?" cried Aunt Fay, catching Lafe by the arm. "Is yuh done gone crazy?"

"Oh, Unc' Tobe," said Lafe, excitedly, "I'se done seen de 'Gang' up de road—tousans ob dem! An' I heerd 'em say dey was comin' heah to hang yuh? Oh, dey's comin', dey's comin, dus back dar!"

"Yuh's suah, chile?" queried Uncle Tobe, earnestly.

"Es as suah as I'se 'live!" replied Lafe.

"Oh, fadder!" cried Aunt Fay, wringing her hands, "run to de swamp, fadder, run! Oh, Lordy sabe us from dis wicked world! Run, fadder, run, run, run!"

The old minister drew himself up proudly. "Run, an' lebe yuh heah to be 'bused by de Philistin? Nebber! I trus' myself in the good Lord's han's. He sabed de Hebrew chillun, an' Jonah. He sabe all dat ax him prop'ly. Les us pray," and down the trusting old couple knelt, while Uncle Tobe poured forth a simple but eloquent appeal for succor in their present time of need. Lafe quietly slipped outside to see if the "Gang" were in sight. He had decided that the best plan would be to run for the plantation, nearly two miles distant, and give the alarm. A short, wide sack, half full of sweet potatoes, the donation of Uncle Tobe's former master, stood beside the door. Lafe picked it up, carried it to a thicket near by and emptied it. "Dey shan't spoil dem, anyway," thought he. Then he glanced up at the bright, silvery moon, and apparently made an important discovery, for he suddenly ducked his woolly head, ran a few steps, and stood like a statue fully ten seconds.

"Je—ru—sa—lim!" he slowly ejaculated. Stood a few moments longer, slapped his hands together, and exclaimed, softly, "I does it." His mouth spread from ear to ear, and he jumped up and down and turned a handspring. Three feet above his head hung the thing that had inspired his peculiar antics. Catching up an old stool, Lafe placed it in position, mounted it, took out his well-worn but sharp pocket-knife, and with the utmost caution and bated breath cut the thing loose. Another moment and he had dropped it into the sack and safely closed the mouth by twisting it like a rope. Then he drew his prize into the cabin, closed the door and bolted it just as the first of the "Gang" rode up. Uncle Tobe heard them, and quietly arose. "Unc' Tobe," said Lafe, holding to his sack, "yuh jus' lef 'em ter me. I take keer ob dem dis time."

"No, chile," replied Uncle Tobe, advancing toward the door, "let me speak wid 'em."

"Go back, go back!" cried Lafe, frantically waving his hands and excitedly rolling his eyes. "Don' cum near, don' cum near. Auntie, blow out de candle. Unc', don' yuh say one wud. I done talk wid 'em. I done tell 'em *somefin'!*"

Aunt Fay blew out the light, and in silence and trepidation the three awaited the coming of the evil-minded rabble outside.

The "Gang" dismounted and secured their horses, then approached the cabin door in a body.

"Uncle Tobe!" called out the leader.

"Wut yuh want?" answered Lafe.

"We want old Tobe. Come out of thar, Tobe; we want ter tickle yer eah."

"Wut fur yuh want Tobe?" asked Lafe.

"Open this doah."

"I'se afraid," replied Lafe, unwinding the top of the sack.

"If yer don't open it, we'll bust it open fur ye."

Lafe drew out the pin, jerked open the door, flirted the sack in their faces and threw it out, then instantly banged the door shut again and held it.

A volley of terrible oaths, quickly succeeded by yells of pain and dismay, followed this action, and soon there was a regular stampede of both men and horses.

"Chile, chile! wut yuh gone done?" cried Uncle Tobe, apprehensively.

"I done punish de 'Gang' wid de good Lord's weepins!" answered Lafe, triumphantly.

"Wut did yuh done punish 'em wid, chile?"

"Wid a big nes' o' 'ornets, unc'!"

"De good Lord hab done sabe us; bress His name!" cried Uncle Tobe, reverently. "Let us gib tanks fur our deliberance." And as they knelt, the devout old man offered up a heartfelt prayer of thanksgiving and praise. Immediately afterward Lafe made a run for the plantation. Arriving there, he lost no time in telling his employer of what had occurred. That gentleman promptly sent a guard of six trusty stalwart men down to Uncle Tobe's cabin to protect him from any further annoyance during the night.

Early the next morning, accompanied by Lafe, he drove to the village and notified the authorities of what had taken place. To say that the story created a sensation does not half express it. It created the greatest excitement ever known in that section, and Lafe was the hero of the hour. The Sheriff determined to bring the "Gang" to justice.

He first arrested the young son of a leading planter, whom he found with his face badly swollen from the hornet stings; and having a clear case against him, advised him to confess and turn State's evidence. In this he was ably seconded by the young man's father, who was terribly shocked by his son's complicity in such an affair.

The result was, nine men were bound over to appear at the next term of court, 14 precipitately left the State, the old "whisky-shop" was razed to the ground, and the "Bad Gang" was utterly extirpated.

At a meeting of the leading citizens it was unanimously decided that Lafe Bobbs had, by his stratagem, exposed and broken up the "Gang," and was entitled to the reward of $500 offered by the planters. The money was duly paid over, and Lafe invested it so wisely that to-day he is one of the wealthiest and most respected colored men in that portion of the State.

An Extra Motherly Hen.

A gentleman living in the outskirts of this city claims to have a hen that has taken a most peculiar freak. Some time ago a cat owned by the gentleman took possession of this hen's nest, and gave birth to several kittens. The hen upon returning saw what had happened and immediately drove away the intruding pussy. Her motherly instinct would not permit her to see the little kits suffer, so she assumed complete charge of them. The mother cat demurred to this, and attempted to regain possession, but a few fierce blows from the hen's beak and wings caused her to beat a retreat each time. When the hen is away the cat will venture to fondle her little ones, but when Mrs. Biddie makes her appearance, Tabby takes her departure, reluctantly. The hen still holds the fort, and probably will until she feels it convenient to surrender.—*Santa Rosa Republican.*

A WARNING TO NIBBLERS.—A young man in Healdsburg, the other day, stepped into a business house, and seeing some wheat lying on the counter, picked some up and ate it. Noticing a peculiar taste left in his mouth, he turned to the proprietor and inquired the cause. Imagine his consternation when he was told that the wheat had been soaked in a solution of poison for the purpose of killing squirrels. Emetics were quickly administered and the young man's stomach relieved of its dangerous contents before any serious results were experienced. This should be a warning to all those who are in the habit of tasting things carelessly.

"AM I MY BROTHER'S KEEPER?"—A well-known clergyman's little daughter had just been put to bed and upon the stillness comes a tiny voice in the nightly prayer. Then, silence, soon broken by these words: "And, dear Lord, this afternoon I saw out upon the cold sidewalk a poor little girl, and she had no shoes or stockings on—and—and" another silence as though staggered by the immensity of the problem—"it's none of our business, is it, God?"

Tobacco.

EDITORS PRESS:—Tobacco was unknown to Europeans until after the discovery of America. Some sailors having been sent ashore by Columbus in the West Indies, were surprised to see the natives of the island puffing smoke from their mouths and nostrils. This, they afterward learned, was the smoke of the dried leaves of tobacco.

The habit of using tobacco is fast gaining in young America. How strange that the glories of tobacco were never discovered till the last of the 15th century—about 1496! The lovers of the weed ought to raise a monument to the Spanish monk, Romanus Paine, whom Columbus met on returning from his second voyage to America and who first brought its virtues to light. This monument should be built of polished marble, laid in a cement of tobacco, fresh from the vat of the mills that grind it. How strangely blind have some been to its real benefits! In 1590 a Persian king prohibited its use. In 1610 a Turk at Constantinople, being found smoking, was led through the street with his nose transfixed with a pipe as punishment. In 1661, in Berne, Switzerland, in the police regulations after the form of the ten commandments, the one against smoking tobacco stood next to that which said: "Thou shalt not commit adultery." In 1690 Pope Innocent XII renewed a bull, issued at a former period by Pope Urban, which excluded all tobacco-users from the church.

You will see by this short history that tobacco is making rapid strides, being now found in the mouth of almost every man, from youth to the most advanced age.

The love of strong drink, after that thirst is formed, fastens with inveterate grip on the spirit of the man. It is one of the most enslaving of all hurtful appetites. Yet more potent and enslaving is the passion for tobacco. It is a lust not so noisy but more enticing and irresistible. It clutches its victim with greater firmness and holds him with a more determined and unyielding grasp. There is no other idol-god that requires so much to be laid upon its altar in the way of time, of money, and of physical and moral energies.

Some medical quacks have prescribed this dreadful poison to preserve the teeth, and I venture to say that it has worn out and destroyed more teeth, ten to one, than it ever preserved. As illustrating this position, and what came under my own observation—a youn gish-looking man who had been a tobacco user from early youth, and whom I interrogated as to why he used it, replied that he used it to preserve his teeth; and being asked if it had the desired effect, his answer was no—that his teeth had all been extracted within the last year—and yet he kept on using the weed to preserve his teeth! I now remember hearing of but one remarkable instance of its wonderful preservative properties, and that was an unfortunate shipwrecked sailor who happened to fall into the hands of cannibals, and whose whole system was so saturated with tobacco that his body could not be eaten—whereby the cannibals were disappointed.

If tobacco be an antidote for many of the ills that flesh is heir to, why not educate the young ladies to masticate the weed, till its delicious juices run down each corner of their pretty mouths in beautiful profusion? How pleasant it would be for a fastidious young gentleman to salute his lady-love and bear back the impress of such salutation, the delicious essence, upon his own lips!

The terrible ravages which tobacco is making on the bodies and minds of the young men seem to draw the attention of medical men in various parts of the world. No one conversant with disease can doubt that excessive smoking, more especially in the case of young men, must be highly injurious. Its effect is to depress the circulation, the heart becomes weak and irregular in its action, and the pulse is scarcely to be felt; the victim becomes weak, irresolute and nervous, his appetite fails, and his mind is filled with imaginary evils. LESTER CROSS.

Stockton, June, 1887.

THE MODERN PRODIGAL SON.—No, my son, it isn't that the world has grown hard-hearted; it isn't that we aren't just as glad to-day to see the prodigal come back, and just as lovingly anxious to welcome him home as ever was anybody in the fifteenth chapter of Luke. It is the manner in which the prodigal son of 1887 frequently returns that throws a wet blanket over the festivities of the welcome. When he comes down the road with his hat hanging on his ear and his hands in his pocket; when he kicks the faithful old housedog as he lounges in at the gate; when he calls his father "Gov'nor" and the hired man "Cul;" when he wants to know "What's for dinner?" before he has been in the house 15 minutes; when he gives his elder brother two fingers to shake and advises him to comb the hayseed out of his hair; when he throws himself into the easiest chair in the house, perches his feet on the window-sill and announces that he'll "take a tub before dinner;" when he comes back with a generally forgiving air of good fellowship about him and tries to make all the rest of the family feel very easy and assured—then it is, my son, that your father longs to run and meet you while you are a great way off and fall upon your neck with a plow-line and welt you into a state of becoming humility and penitence by the time you are able to take off your hat to the bound boy and crawl up the front steps to ask your brother to shake hands with you. Good people are just as glad to-day as ever they were, my son, to see the prodigal come home, but it does rattle them a little to see him come home in a hack and ask them to pay the driver and send for his baggage.—*Brooklyn Eagle.*

Is It Sanction or Restriction?

EDITORS PRESS:—As intemperance among farm hands is seriously detrimental to farming interests, it is but reasonable that agricultural papers should advocate temperance—which I am glad to know you do. And as there is a growing interest in the high-license movement, I have a few thoughts to offer.

I think it unfortunate that the term "license" is applied to our method of taxing the liquor traffic. The idea of giving sanction to such an evil is offensive to many who would otherwise approve of a restrictive tax. Unless the word "license" is construed as having a technical and peculiar meaning in this place, our license system would seem to present some absurdities. As our State never had any general prohibitory liquor law, the license system found the traffic as perfectly open and free and as fully protected as any other business, consequently license could give no additional freedom or protection.

License ordinarily implies removal of restriction, and our license practice seems to be by many so regarded; whereas, on the contrary, it takes away freedom, puts restriction in its place, and charges for it as for liberty conferred. But if that does not look more like getting money under false pretenses than conferring privilege, I mistake its looks. It may be a good thing practically, but, theoretically viewed, I fail to see its consistency. However, some things are much better than they look—let us hope this is one of them. Since license implies removal of restriction, there must be at least an implied restriction to remove before we can apply license.

We find that, under our county government license ordinances, the traffic is disallowed outside of paid-for privilege, and a discouraging price set on it inside; so that, practically, no new privilege is granted the dealer except that of paying for what is not taken away from him. License in this and all other cases is necessarily set in prohibition groundwork.

To deny the right of prohibition leaves no room for license; and to treat our license ordinances as in the main bestowing liberty, is quite unjust. But whether it is the best method of discouraging so great an evil, I much doubt. It looks too much like saying to liquor dealers: "Your business is wrong, but for a money consideration we will allow and protect you in it." That is very different from what we say to the unfortunate wretch who, in the use of his legally provided facilities for drink, gets crazy-drunk, kills his friend, and is told that, drunk or sober, it is murder, and he must hang for it. The real cause of the murder buys immunity, while the full measure of vengeance is dealt out to the effect. Sanction the cause and punish results is the language of such law; but I protest there is rank injustice in it. Would it not be better to say to the liquor dealer: "Your business fills the land with crime and misery, and you must desist or be punished like other evil-doers"?

THOUGHTOGRAPH.

We Beg Pardon.

The PACIFIC RURAL PRESS, California's best exponent of her agricultural interests, in its issue of June 11th, under head of The Dairy, quotes our article on T. L. Walker's dairy, introducing it thus: "The editor of the Antioch *Ledger* recently visited a dairy ranch in *his* neighborhood," etc. Not so, Brother RURAL; the we, us and ours in this case is the first person singular, feminine gender, and belongs to—the *Ledger*.—*Antioch Ledger, June 11th.*

[We beg pardon. We might have known that so good an account was a lady's.—EDS. PRESS.]

Exchanges.

EDITORS PRESS:—Will you please state in your paper that Mrs. H. Frederick, of Ripon, San Joaquin county, Cal., wishes to exchange beautiful stamped pillow-sham pattern, samples of hair flowers, oil chromos, quilt patterns, fancy crochet patterns, dahlia and gladiolus bulbs for sea-shells, star-fish, red or white coral, minerals and petrified wood, accompanied by name and locality, or any curiosities suitable for cabinet.

THE SALOON-KEEPER'S BEST FRIEND.—"See that $500 mirror? See that $1200 oil painting on the wall?" The double-barreled question came from a bartender. "Do you know how we get those things?" he continued. "All from the profits on the sale of whisky. You never stopped to think that a saloon-keeper's big money came from the sale of rye and bourbon. Beer won't buy a $500 mirror. Do you suppose the profits on porter, or sherry, or champagne, would buy a $1200 painting? Not much. It's whisky that brings in the money—rather one-year-old red-rye, with enough prune juice in to give it the color and smoothness of age. Whisky is the saloon-keeper's best friend."—*Chicago Herald.*

His Letters.

Dedicated to the Author of "Her Letters."

[Written for the RURAL PRESS by J. E. TOTHEROH.]

When my heart is sad and weary,
And life's path is lone and dreary—
Ah, alas! so cold and sunless—
Then I, sighing, take his letters,
Every line of which is fetters
Binding faint heart to the fearless,
And I read; and while thus reading,
My lone soul, with anxious pleading,
Launches forth on oceans shoreless.
But, dear lines, my eyes beam brighter,
And my heavy soul grows lighter
As I read: *My love is changeless!*

San Francisco.

NATURE'S MYSTERIOUS PROCESS.—Where the diamond comes from nobody knows. You can no more predict the existence of diamonds than you can the existence of genius, although, to be sure, all diamond-fields to a certain extent resemble each other; and all, borrowing as they do their light from the sun, are found only in warm climates. Nor can you tell where the diamond goes to on combustion. Burn it and it leaves no ash; the flame is exterior like that of cork, and when it has blazed itself out there remains not even so much as would dust the antennæ of a butterfly. If a man has his mysteries, his strange conversions, his going in a sinner, his coming out a saint, so, too, has nature. The philosopher's stone is formed of the vilest materials, and the chimney-sweep is covered with that which, under happier auspices, would be jewels. This mysterious process of crystallization places between two bodies of the same nature a greater difference than between bodies differently composed. And yet not so great a mystery, either, for every year a process is discovered for making diamonds—only somehow the diamonds are never made, or, at the best, so microscopic, and at such an enormous expense, that they are absolutely useless except to gum on cards at the British Museum. In France, they say, a solution of phosphorus in sulphuret of carbon yields minute diamonds, but things are better managed there than here, as has long been admitted.

A CAT AND A MILK-PITCHER.—The following story, by an Indian pupil at Hampton, is taken from the *Southern Workman:* A man, he has one cow and one old cat. One evening he want to get some milk, and he went to that cow. He is milk his cow, but he not get much milk. When the man go through milk, and when come home, that cat come with him. She want some milk to drink, and looked up all the time, but that man didn't want give to him, and that cat want some very much, and cry every minutes mew, mew, and that cat going try jumped up on that man, and holds up his tail and followed that man everywhere the man went. When that man got home his wife took milk-pail and poured in pitcher and put on the table, and that cat is watching all the time. And the pitcher is milk in it, but not much, just half. After she pouring this milk she go in other room, and she heard noise, and she come and see what is making noise, and there was the cat caught her head in the pitcher, and can't get out. After a few minutes he heard something, and he think some body come after him, and jumped up, and that cat come down from that table and cannot take it off that pitcher, and run away with that pitcher, and two boys run after him. Of course that cat can't see anything, so he just keep on running until he got into the water and got drowned, so I guess this cat is dead of stealing.

RATS!—Who says all women are afraid of rats? We know of one who is not, and Mrs. Dr. Newton, of Woodbridge, is the lady. For some time a rat of huge proportions had been the source of considerable annoyance to the members of that lady's household, and successfully evaded all traps and snares set for its capture. One day Mrs. Newton heard a chicken in the yard calling for help. Being always inclined to aid the suffering, she ran to the rescue and found her favorite hen in the clutches of that rat, her old-time enemy. Fully appreciating the imminent peril of the hen, and remembering how that same rat had regarded with disdain all efforts to catch him, she boldly caught the vile rodent by the tail and beat his brains out against a tree. We do not know whether the lady would have served a mouse in the same way or not, but that should not detract from her glory obtained in this single-handed combat.—*Lodi Sentinel.*

THACKERAY'S HATRED OF HYPOCRISY.—Of course in all families the mother is the one to whom the children cling. We don't talk to them, feel with them, love them, occupy ourselves about them as the female does—we think about our business and pleasure, not theirs. Why do I trouble you with these perplexities? If I mayn't tell you what I feel, what is the use of a friend? That's why I would rather have a sad letter from you, or a short one if you are tired and unwell, than a sham gay one, and I don't subscribe at all to the doctrine of "striving to be cheerful." *A quoi bon,* conclusive grins and humbugging good humor? Let us have a reasonable cheerfulness and melancholy, too, if there is occasion for it, and no more hypocrisy in life than need be.—*From "Unpublished Letters of Thackeray," in Scribner's Magazine.*

YOUNG FOLKS' COLUMN.

A Story for Boys.

[Written for the RURAL PRESS by MRS. J. HILTON.]

"Did you ever kill a bear?" I asked one of our wood-choppers the other day.

"Oh, yes—quite a lot of them. The first time I went out bear-hunting, we sighted a bear up a steep mountain-side. After a good deal of climbing I managed to get pretty close to him without being seen. I stood behind a tree and got my rifle into position, keeping my eyes and thoughts on the bear just ahead of me. When almost ready to shoot, I was trembling with excitement, and it took me quite a while to get ready. I became conscious of some one or some thing near me, and, looking around, there stood a half-grown cub. It was reaching out to grasp my coat, and it did get hold of it; but I had sense enough to drop my gun and slip my arms out of the sleeves and grab my gun and leave."

"Did you ever get your coat?"

"The boys found the remains of it that afternoon, when they were hunting for the bears. I did not get over my scare enough to be of any use that day. But the boys got both the bears, and we had a feast of broiled bear cutlets that evening. I killed several bears after that, and I got so that it took more than two bears to make me tremble so that I could not hold my gun still.

"One time we were all called out of camp by some of the town folks yelling 'Bear! bear!' We wanted to know what was the matter. They said that a bear had been at Mr. Brown's hogpen and had stolen one of his pigs. So, as we were out hunting bears, they wanted us to go for that one. Three of our band were good vaqueros, and they declared that if they came across that bear they would 'lass' him. We found the trail and followed it all the morning. Finally we caught sight of him in a narrow canyon. The boys got their riatas all ready and galloped up to Mr. Bruin. We were close behind them, waiting for the fun to commence. When they rushed up to the bear he raised himself up and snarled wickedly. In the meantime the boys had surrounded him, but at a safe distance. We had no dogs with us, but Bruin did not like the looks of so many around him, and he started to lope off; but the three ropes soon brought him to a standstill, and as they were thrown from different directions, they held him pretty tight. Oh, how he did pull at the ropes and snap at them, but at every move he made to bite them he got an extra jerk.

"He was soon too tired to do anything but snarl, and then the boys started him on the back track for camp—one going ahead and pulling, the others bringing up the rear, all of us keeping at a respectful distance, however. It was about four o'clock in the afternoon before we reached camp. We were as tired as Master Bruin, and as he seemed disposed to lie down and not bite the ropes, we proceeded to get our dinner. While eating it, Bill Bowers suggested that they put a bell on the bear and let him go. All took to that idea, and it was speedily done.

"Then came the problem as to who should let him loose. It had taken a good many turns of the riatas to make it safe to put the bell on. But as the bear was somewhat rested and the noise of the bell would be apt to make him extra cross, no one wanted the job of getting the ropes off of him. No one would volunteer, and the ropes had got loosened during the confab and Mr. Bear could not be approached without danger. Bill vowed he would rather pay for all the riatas than shoot the bear, because a lot of the town folks were now at the camp enjoying the sport. After a good deal of maneuvering they loosened all but one of the ropes so that they fell off, and that they cut, and away went Bruin, followed by a parting shout given to accelerate his movements; for what with the bell and the crowd of men, the bear was anxious to leave. We heard that bell several times when we were out—but he never troubled any of the settlers' pigs after that. And he must have frightened away other bears, for we did not bag any more that season."

Los Alamos.

Lillian's Letter.

EDITORS PRESS:—I wish to tell you about the hailstorm that we had the 31st of May on the Cholame Hills. My father, my sister and I had just returned from the postoffice, which is a mile and a half from our home, and had just tied the horses, when it began to hail and rain.

The horses did not know where the queer little pebbles came from, and tried to shield their faces, and at last, becoming frightened, tried to get away; but as soon as they comprehended that papa was unharnessing them they became perfectly quiet.

It only hailed long enough to give the ground a sheet of white, which almost immediately, as if by magic, disappeared; but the rain lasted quite awhile.

We have had for the past three nights regular Eastern thunder-showers, and one night in particular the thunder roared and clashed, while every now and then vivid flashes of lightning would illuminate the sky. It has not as yet rained enough to hurt the hay that has been cut, and we hope that it will not rain any more until it is under cover; and when that is accomplished we care not if it rain 40 days and 40 nights—it being such a dry season that the cattle do not have much green feed to browse upon.

Our handsome dog Prince, that I mentioned in my other letter, is dead. We were so sorry to lose him, he was such a good dog, and we called him our "Little Protector." A few days before he died we were presented with a tiny wee lamb, that looked as though hardly old enough to bleat, but we soon found out to the contrary. It was an odd-looking little creature, and seemed to be all legs. We call her Nannie, and, like Mary's little lamb, she follows everywhere we go. She runs and jumps, and when her front feet touch the ground, up go her hind ones in a playful manner.

Three rattlesnakes have been killed on our place, and one had 10 rattles; but we take long walks and seldom meet with anything harmful. The hills have been blooming with flowers; monolopias, nemophilas, and bloomerias, and many other beautiful flowers; and the most beautiful of all is the calochortus. Some of the hills are fairly purple with godetias. But the floral season is nearly past; but we will hope to see the flowers again next year.

On the hottest day in the month of May the thermometer stood at noon at 97°, and on the coolest day of the same month at noon it stood at 59°. On hot days it is a great deal warmer in the valley than on the hills, while in cold weather it is a great deal colder there.

The weekly coming of your paper is heartily welcomed by each one of the family. Your little 12-year-old friend, LILLIAN HOLLY.

Cholame Hills, June 2d.

GOOD HEALTH.

THE GERM THEORY OF DISEASE.—The theory that many diseases are produced by microscopic germs is generally supposed to be wholly a modern one; but some book-worm has recently unearthed the fact that the first statement of the theory was really published more than 150 years ago, by Doctor Guiffon. In a work by this author, entitled "Origin of the Plague," published in 1721, he says: "Minute insects or worms alone can explain these diseases. It is true they are not visible, but it does not therefore follow that they are non-existent. It is only that our microscopes are not at present powerful enough to show them. We can easily imagine the existence of creatures which bear the same proportion to mites that mites bear to elephants. No other hypothesis can explain the facts. Neither the malign influence of the stars, nor terrestrial exhalations, nor miasmata, nor atoms, whether biting or burning, acid or bitter, could regain their vitality, once they had lost it. If, on the other hand, we admit the existence of minute living creatures, we understand how infection can be conveyed in a latent condition from one place to break out afresh in another."

HYDROPHOBIA FROM MILK.—It has not hitherto been known that hydrophobia may be communicated through the medium of milk; but from the following note from the *Anti-Adulteration Journal,* it appears that the disease may be communicated in this way: A dog belonging to A. J. Hall went mad last week, and among the animals which it wounded in its wanderings about the farm was a milch cow. The cow showed no signs of being affected by the wound. Later, however, the animal began showing symptoms of hydrophobia, and at the same time the farmer's two little children, who had been nourished with the cow's milk, exhibited similar symptoms, and are in a most critical condition, suffering the most terrible agonies. The other members of the family are also ill, but their symptoms are not so alarming, and hope is expressed that they may recover.

DANGER FROM HOUSE PLANTS.—Dr. Saulsbury found malarial fever to be propagated among persons sleeping in a room in the windows of which had been placed a box of earth from malarious soil. House plants cultivated in pots filled with malarious earth are a constant danger. The germs grow luxuriantly in the moisture and warm air of closed rooms. Dr. Eichwald, Professor of Clinical Medicine in the University of St. Petersburg, has given to the public facts concerning a patient of his—a lady with malarial fever—who was easily cured by treatment when confined to her chamber, but who quickly relapsed on remaining during the day in her parlor. The easy cure and constant relapse went on for a long time. At last the doctor, having become suspicious of the flower-pots, removed them from the house, and there was no further recurrence of the disease.

BACTERIA.—It has been estimated that a single cubic inch of space will contain 8,000,000,000,000 of these little fellows, of average size. They also increase, by fission, at the rate of one division every hour; hence, a single one becomes the immediate parent of 16,777,215 every 24 hours, and the causative parent of 32,307,756 individuals in that length of time. Now, as each one of these 32,000,000 will become, during the next 24 hours, the begetter of 32,307,756 individuals, one can get a reasonable understanding of the virulency of some of our infectious diseases where there is a specific bacterium.—*Sel.*

DOMESTIC ECONOMY.

SWEDISH ROLLS.—Seven cups of flour, one pint of milk boiled. When cool, add one cup of butter, one-quarter cup of sugar, one egg, one-half compressed yeast cake. For tea, set them to rise at eight o'clock in the morning. At three in the afternoon, roll them out about an inch thick; put a small piece of butter on one side; fold them in halves; put in the pan a little apart, and let them rise till time to bake for tea.

COCOANUT CAKE.—Two cups of sugar, three cups of flour, two-thirds of a cup of butter, one cup of sweet milk, the whites of five eggs, two teaspoonfuls of baking powder. Bake in layers. Filling for the above cake: Take one pint of sweet milk, half a cup of sugar, one egg, three teaspoonfuls of cornstarch, and cook thoroughly. Stir in this one grated cocoanut, and spread between the cakes.

CHEESE STRAWS.—Take a quarter of a pound of puff paste and a quarter of an ounce of parmeson cheese (or any other good cheese) grated very fine, a little salt and cayenne pepper mixed; sprinkle the cheese, salt and pepper over the paste, and roll it two or three times; cut it into narrow strips about five inches long; bake them in a slow oven and send them up very hot.

RYE CAKES.—Two cups of sour milk; one egg, well beaten; one teaspoonful of soda, dissolved in boiling water; enough rye meal for a batter that will spread easily on the griddle. Mix together the milk, meal and egg, add the soda and beat thoroughly. Bake immediately on a hot griddle, or in gem pans well oiled; if in gem pans the oven must be hot and the cake should bake about half an hour.

CORNSTARCH CAKE.—One cup of butter worked to a cream with two cups of sugar; one cup of milk in which is dissolved one teaspoonful of soda; two cups of flour, in which is sifted two teaspoonfuls of cream of tartar; the whites, only, of six eggs, beaten to a stiff froth. Mix all of these ingredients well, then add one cup of cornstarch. Beat well. Bake in a moderate oven. Will make one large loaf.

SCALLOPED CORN AND POTATOES.—Mix together half a can of each; stew for half an hour with a tablespoonful of butter, a scant teaspoonful of sugar, and salt and pepper by way of seasoning. Put in a buttered dish, strew thickly with bread-crumbs, and dot with bits of butter. Bake for half an hour, and serve hot in the same dish.

POTATO SALAD.—Four boiled pototoes mashed and rubbed through a sieve. Mix one saltspoonful mustard, two teaspoonfuls salt, yolks of two hard-boiled eggs, a few drops onion juice, four teaspoonfuls oil, two teaspoonfuls vinegar and one teaspoonful anchovy sauce. Mix thoroughly with the potato. Garnish with parsley and serve very cold.

TOMATO SALAD.—Cut six ripe tomatoes into slices and remove all the seeds; rub a dish with onion and pour into it a mixture of oil and vinegar (in the proportion of two spoonfuls of oil to one of vinegar), sprinkle on the tomatoes pepper and salt, and leave them in the dressing two hours. They will then be ready to serve.

RICE WAFFLES.—Boil half a pint of rice and let it get cold, mix with it one-fourth pound of butter and a little salt. Stir in one and one-half pints of flour; beat five eggs separately; add yolks, together with one quart of milk; lastly, the well-beaten whites. Beat well and bake at once in waffle-irons.

WALNUT CAKE.—One cup of sugar, nearly one-half cup of butter, 1½ cups of flour, one-half cup of cold water, two eggs, one-half teaspoonful of soda, one teaspoonful of cream of tartar, and one-half pound of walnuts. Cut the nuts in fine pieces. Frost the cake, and put whole nuts on top.

BAKED STEAK.—A good way to cook steak when the top of the stove is occupied is to place it on a tin, season with pepper and salt, cover with another and bake about one hour. To those that relish them, onions placed between the slices make another dish for the table.

SNOW PUDDING.—One-half box of gelatine dissolved in one pint of water, two cups of sugar, juice of two lemons. Strain when it begins to thicken. Mix in the whites of two eggs beaten to a stiff froth. Mold it before serving; pour around it a soft custard made of the yolks.

GINGER CAKES.—One cup each of sugar, molasses, sour cream and butter, two eggs, five cups flour, one tablespoonful of ginger, one teaspoonful each of cloves and cinnamon, one-half teaspoonful of nutmeg; many add raisins—1½ cups, seeded.

FANCY ROAST.—Put one tablespoonful butter in a saucepan, add one-half saltspoonful white pepper, one teaspoonful salt and a few grains of cayenne; when hot, add one pint oysters and cook until plump and the edges curl; serve with toast.

The Week.

The week's weather includes several irregularities. Sunday afternoon a wind of considerable force and speed visited quite a large area of the State. In the city it contented itself with sanding the eyes of pedestrians and pitching around back-yard furniture at a lively rate.

At some interior points hailstones, which are uncommonly large and frequent this year, flew about in considerable numbers, pelting the poultry and in some cases lying a short time on the ground. The disturbance seems to have subsided by the relief which it found in a shower early on Monday morning, which laid the dust over the upper half of the State and in localities did somewhat more. We do not hear that the phenomena were productive of much injury. Since the storm the weather has been delightful beyond complaint.

The fruit crop is coming forward fast now, though on the whole it is late. Canneries and drying establishments are at work in earnest on cherries and early apricots. The outlook for the year's work in all lines of preserved fruit is excellent and the markets favor a large pack. Grain in some places is turning out better than expected and the fact is being spread out so as to cover the whole State. It is a misleading generalization. As for the East, the June report of the Government shows a decline of about 15 per cent from last year's crop.

The Wheat Corner.

The present wheat corner, with its radix in Chicago, is one of the most daring and enormous operations of the kind ever known. It seems that early last winter a combination of capitalists and dealers was formed to capture June wheat, and the secrecy and success with which the maneuver has been carried out confounds and amazes the oldest wheat sharp on the Board of Trade. Never has such profound mystery enveloped such a transaction. It is estimated that there are now $20,000,000 involved in this huge corner, and yet all the avenues of information have been so closely guarded that it is still only a matter of conjecture where the money comes from. This clique carried on its operations about three months before the trading community became aware of the mighty whirlpool forming in the ocean of trade, and for hundreds of unsuspecting operators this discovery came too late. The syndicate owns nearly all the wheat in Chicago, New York, Toledo, St. Louis, and San Francisco, and probably has control of more than half the stock in Liverpool, and for weeks the portentous shadow of this deal has played the mischief with the market of this staple all over the world. Honest dealers at first endeavored to protect their interests by boycotting every broker who was known or believed to be doing business for the syndicate, but, of course, this effort to seize a life-preserver was of little avail, as any broker could buy millions of June wheat during the day, and the sellers not know that it was all going one way, till the clearing house revealed the fact that it had all been swallowed up by the maw of the leviathan.

Now it is a little strange that while all our political economists agree in denouncing this sort of speculation, no one has yet suggested a practical legislative remedy. Of course, with the speculators it is a mere matter of gambling. They do not care a baubee for the derangement, the check upon exports, nor the hardship to consumers and small traders. They are after the gains, and are willing to take the chances. If capital can corner the monthly supply of any great staple, no scruples of conscience will deter it from making the combination. Now and then some great operator, like James R. Keene, is hoisted with his own petard; but still such operations occur and are likely to occur as long as an opportunity presents itself.

It is, indeed, really a serious question whether anything can be done by legislation to prevent this evil. It has been suggested that the speculative sales of "futures" might be interdicted by law, and that contracts for sale at a future time of what the seller does not have at the time the contract is made might be declared void. The Illinois Legislature enacted such a law, but it has proved ineffectual. It is contended there is a legitimate side to the selling of "futures"—that it is only another phrase for what all traders and merchants do, use their own sagacity and judgment in calculating the chances of the market and buy accordingly. But this is dodging the issue. The vice of this particular system is that where contracts on "futures" extend for two, four, six months, or even longer, as they frequently do, an opportunity is furnished and a temptation offered that few care to resist to get up a "corner" on the market, that, as in the present instance, often causes universal embarrassment and widespread ruin and disaster.

It is very easy to see how this is done. Suppose that a ring has good reason to believe that a large number of dealers in "futures" have extensively sold "deliveries" of wheat for a certain month, say June, and that the stock of wheat likely to be available on such contracts can be manipulated. They proceed quietly to buy up all the "delivery" contracts for that month. In the meantime they have all their confidential agents on the Board of Trade and out all over the country buying up all the wheat they can lay their hands on, and the result is, that when the month comes round that the delivery is to be made, the expanded operators suddenly awake to the fact that they are "cornered." Their contracts and all the wheat to tender against them are in the hands of a syndicate, who sucks all the vitality out of the market, and then the bloated spiders retire into the concealment of their web and wait another opportunity to catch another swarm of small dealers. It would be difficult to devise a more vicious system of speculation. In gambling, two sharps sit opposite each other to measure luck in a game of chance. They are both equally skilled and may closely watch each others' movements. But in this sort of speculation a sharp or ring of sharps take advantage of the quiet, unsuspecting public to get up a "corner" that will demoralize the market for a season, and beggar and ruin hundreds and thousands and roll up big fortunes on a single venture. It is robbery under the mask of legal and business forms. The remedial action of the natural laws of trade, as for instance the rush of Indian wheat to England to meet a vacuum created by an engorgement here, already makes too hazardous many repetitions of speculative combinations.

Since writing the above the news comes that the great wheat deal had collapsed, the enormous load proving too heavy for the clique to stand under. The collapse has been so complete, the rout so thorough, the excitement so indescribable, that at the present writing it is impossible to estimate the extent of the wreck and the disturbance of the market, but it is patent that when this cyclone subsides we will have a season of calm weather.

How forcible as an illustration of the utter fiction of values set by the grain gamblers is the following, which was telegraphed from Chicago on Wednesday morning:

The mere statement that cash wheat had shrunk 19 cents in three hours, and that July had lost 9¾ cents in the same length of time, is a very tame way of expressing the fact. Nevertheless, this decline represents an actual destruction of nearly $3,500,000 in the value of cash wheat that is now here in store and on the track. It represents the transfer of anywhere from $3,000,000 to $10,000,000 in profits on open trades in June and July from bull to bear accounts on the books of members of the Board of Trade. Individual fortunes were wrecked and other fortunes reared in an hour. It would probably be no exaggeration to state that the volume of business in the wheat pit aggregated 100,000,000 bushels, and it might have been much above that figure.

With all this fluctuation, there is not a grain of wheat less or more in the supply, not an iota of increase in the world's appetite, not a speck of war nor a breath of a storm which could affect future supplies—not a single consideration of legitimate production on trade involved in it. The whole movement is based upon men's greed and daring, and to minister to such lusts and passions, the people's food is made a shuttlecock. The whole business is wretchedly wrong and should be made criminal.

Our Market Reports.

We are devoting much care and space to our markets, endeavoring by personal attention to make them complete and reliable for the farmer. We would like to know how far we are succeeding to the satisfaction of our readers. We would also be much pleased to get the views of those who see wherein this department could be improved and rendered yet more valuable to our patrons. We desire and aim to make our market reports alone worth far more, to the many interested, than the price of subscription; and we try to have the RURAL PRESS so edited throughout that our readers can better afford to take it at $3 a year than accept any other paper gratis.

THE GREAT FAIRS.—It looks now as though the State and the Mechanics' Institute Fairs would coincide in the matter of dates, despite the effort put forth to arrange for different times. This being the case, the public can only try to make both fairs excellent and representative. We would have liked one to follow the other and thus prolong the time during which the visitor could have found a good display of California's industrial achievements. There is plenty of material, however, to make two notable exhibitions, and it is exceedingly important that it should be done.

A Good Point for American Ayrshires.

We have often alluded to the proof that Americanized Jerseys and Shorthorns have nothing to fear when shown alongside the best representatives of these breeds which have tarried in the land of their ancestors. The same could be easily shown to be true of the Holsteins, of American improved French and Spanish merino sheep, of the various imported breeds of horses—in fact, it is next to conceded that American breeders have, as a rule, handled animals to their improvement and not to their deterioration. Since some enterprising Americans are now breeding the sacred cattle of India for dairy purposes, it will not be long before the Brahmin will have to seek the best development of the bull of his father's beneath the stars and stripes. This is only what the world has come to expect of America—whatever the American touches is expected to go forward.

We are reminded of these things by reports which we read of the recent show of dairy cattle in New York City. A short time ago we gave the victors in the Holstein classes and a hint of the full competition therein. It seems that the fair was also notable for the interest taken by Ayrshire breeders. It is said that there were over 100 head of this breed exhibited, being second in numbers shown of the four dairy breeds, and probably the finest display of Ayrshires ever made in the United States, and are a credit to the breeders, in that it showed a uniformity of style and appearance, and a steady purpose to breed to one type. The herds were gathered from various sections, and some had been bred for many generations since importation, others were close to importation, and some imported stock which led into the ring; but the whole, with some few exceptions, showed that the breeder had the true type of an Ayrshire in his mind and had bred to this result, keeping the scale of points as the standard.

It is quite likely that the old Scotch Ayrshire breeders did not expect their favorites to be advanced or even held even. No doubt environment has something to do in shaping the type of a breed, and to get a breed in the wrong place is often to seriously change its characteristics. There is illustration of this, no doubt, in the experience of our readers even within the limits of California, but in the case of foreign breeds brought to America, as we have said above, the change has usually been in the way of improvement. Therefore, in the case of Ayrshires, we are not surprised to see Mr. Winslow, secretary of the Ayrshire Breeders' Association, giving the following incident:

The exhibition reminded me of a remark that Mr. John Lorne Stewart, of Scotland, made while on a tour of inspection of the Ayrshires of America. His idea was that the true type of an Ayrshire could not be perpetuated on American soil, and that we must constantly return to Scotland for renewal of blood. Not only did his examination of American breeding change this idea, but a glance at the animals as led into the ring would have shaken his opinion, for the premium cows gave a very good illustration of this, and greatly to the credit of the American breeding. The cow that won the first prize in the aged class has a very long line of American-bred animals behind her, while the cow that won the second prize was an imported cow of great merit. Nearly all the cows showed the idea of the breeder had ever been to bring out in every way possible the points that make up an economical milk-producer, in body and udder, the small, fine horn, the clear bony head, the fine neck and shoulder, the greatly increasing depth of body and heavy hindquarters, the capacious udder extending well back and strongly hung and lying well forward under the belly, with teats of convenient length attached to the four corners of the udder and filled up level between so as to give the utmost retentive capacity.

These statements will be of much interest to breeders of Ayrshires on the Pacific Coast. There are not many, it is true, who have bred the cattle pure, nor have they met with the encouragement they have deserved from dairymen, and yet they have done good service, and if they persist they will win prominence in the newer California which is now developing. We have room for all the good breeds, and situations specially adapted to each. With more people and more capital and more care in production, the improved breeds of cattle will advance in public esteem and their breeding will better reward the breeders.

CENTENNIAL CHERRIES.—Leonard Coates sends us a box of Centennial cherries picked June 11th. The fruit well sustains the fame of the variety. It is large, handsome and sweet. We shall reserve some to see how they will look at the meeting of the Horticultural Society on June 24th.

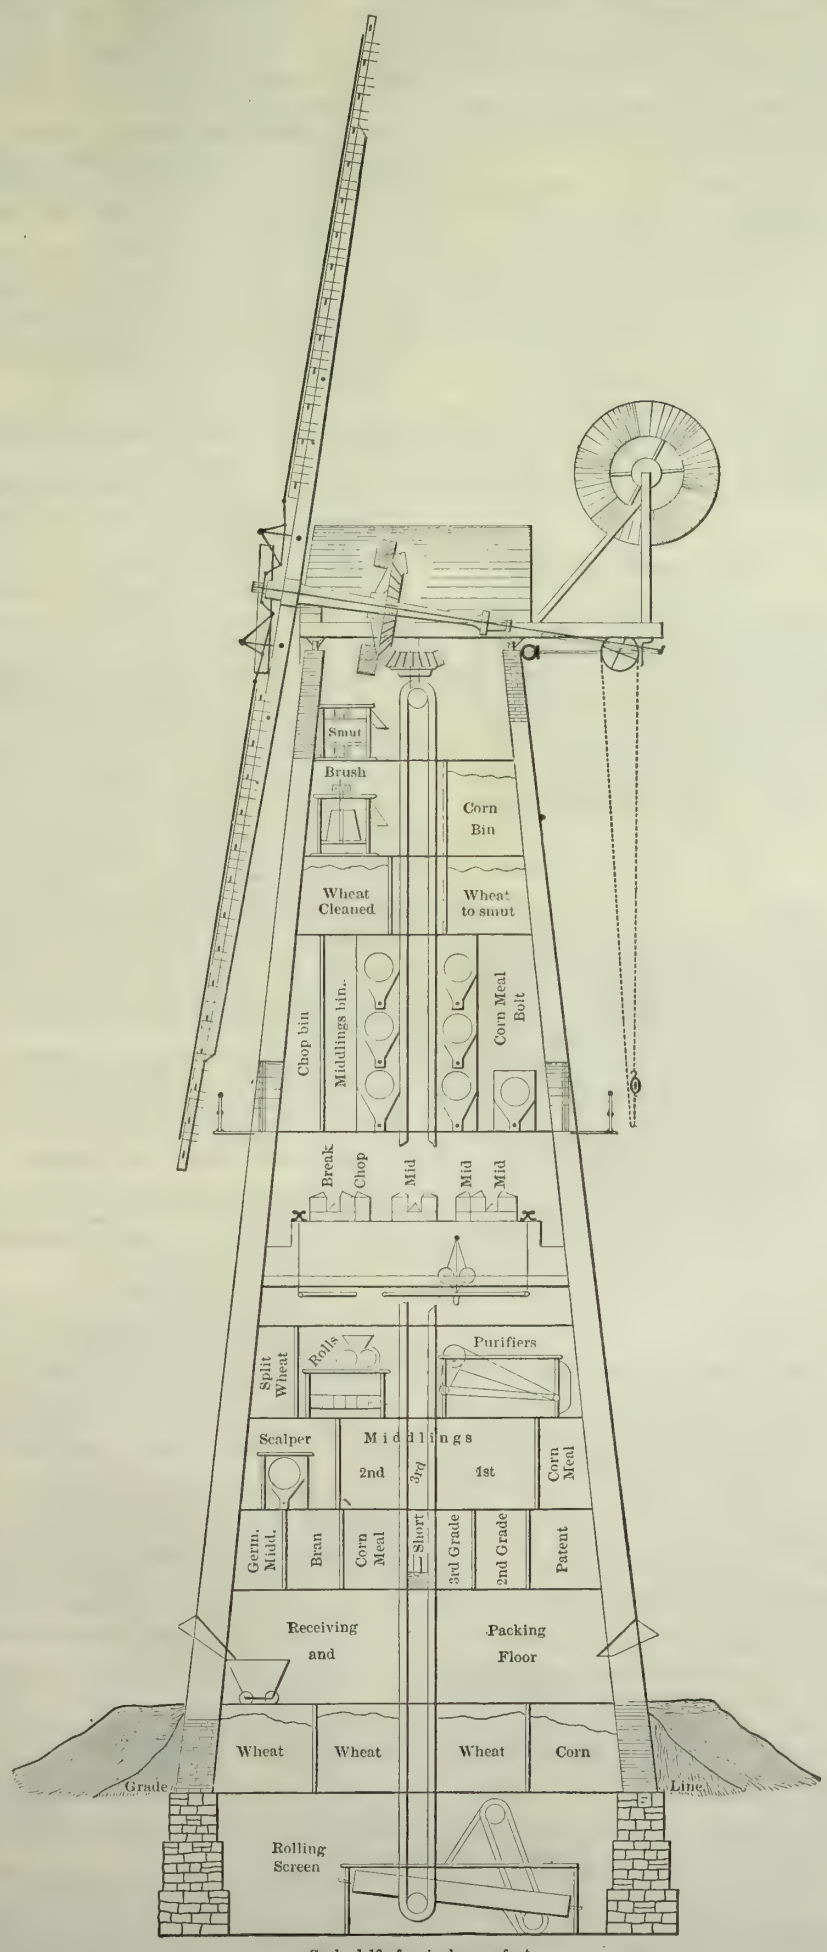
HOPVINES are beginning to entwine the poles in a clinging embrace. Hop-growers are anticipating a good yield in Sonoma county.

A Great Windmill.

Windmills are so common and so useful in this State that we have thought a picture of one of the largest windmills in the world would interest our readers. It is in fact a good-sized flouring-mill run by wind-power. It is situated in the town of Great Yarmouth, England, and is pronounced a perfect success. The plan of arrangement of milling machinery is different from that of the present day. The mill is working on the old principle of a full reduction at the first grind. J. H. Campbell, M. E., of Yankton, Dakota, who has just published a pamphlet on the windmill and its uses for flouring-mills, sawmills, irrigation, etc., has arranged a mill with machinery so as to use part gradual reduction with burs and part with rolls.

Of course, it is not necessary to build so large a mill as shown in the engraving, but it is desirable to build as high as possible for two reasons: First, to receive much more benefit by building a mill up to where the wind is fresh and strong; and, second, to get additional storage capacity, and it is much better to have that right in the tower of the mill than put up a building alongside; milling machinery can also be placed to much better advantage. A windmill built after the plan shown in the engraving will be 55-horse power, with the wind blowing at the rate of 25 miles an hour, and will make 120 barrels of flour easily in 24 hours. It is 11 stories high, with basement, and stands 99 feet above the foundation. At the base it is 35 feet in diameter, and 16 feet diameter at the top wall-plate. There are five run of burs in it. It has four sails on the patent principle, which are 40 feet and 9 inches long by 12 feet 6 inches wide. The sails are 100 feet in the clear, from point to point. They are provided with striking and regulating gear to keep the motion regular and to counterbalance any unevenness in the pressure of the wind. It is provided with winding gear, so as to keep the sails always square to the wind, and it is so adapted that it can be turned out of wind, if necessary, for repairs, etc. The speed of the sails is set to nine revolutions per minute, and the first motion from head wheel to wallower is two to one. The head wheel is iron, with heavy wood segments bolted around the rim of the wheel, so as to form the inner section of the gripe which is over and around it, and is used, when necessary, to stop the mill.

The milling machinery consists of one smut, one wheat-brush, two bolting chests, three reels in each; one cornmeal bolt, one break run of burs, one chop run, two run middlings and one run for either middlings or corn, as desired; one set of bran rolls, two set of smooth rolls, three purifiers, one brush-scalper for cracked wheat, and a rolling screen in the basement. It is provided with ample bin storage, so that any part of the machinery may be run and the product dropped without further handling, so as to make use of any and all winds which will turn the sails.



In his pamphlet to which we have alluded above, Mr. Campbell proposes to issue a more complete work, entitled "The Practical Windmill Builder and Millwright," which will give working drawings for making windmills either for flouring, sawing, irrigating, etc. We should imagine from the description that the book will serve an excellent purpose. Mr. Campbell's main design seems to be to induce a large increase in the use of Dakota winds for industrial purposes. We do not suppose that California can compete with Dakota in windpower, and yet the great use made of wind here for comparatively small purposes would indicate that in some cases extension could be profitably undertaken.

It seems that in the east of England, where there is no coal and water-power is scarce, the windmill still holds its own, and improvements have been many. Mr. Campbell says that the first set of patent sails ever used were made in the town of Great Yarmouth, England, which, by the way, his father constructed and put in operation. Thus the writer has an inherited right to talk about the windmill, and we are glad of an opportunity to introduce him to California readers as a devotee to still further progress in the use of wind-power.

LOCOMOTIVE OUTPUT.—The output of the locomotive works of this country at present is estimated to number nearly 40 engines per week.

Astronomical Observatories.

E. F. Spence, ex-Mayor of Los Angeles, and President of the First National bank of that city, has given a check for $50,000 to President Bovard, of the University of Southern California, to establish an astronomical observatory. It will be known as the Spence Observatory, and will be eventually thoroughly equipped.

Scale: 1-16 of an inch=one foot.

LARGE WIND FLOURING MILL AT GREAT YARMOUTH, ENGLAND.

Mr. Bovard thinks he will be able to raise $150,000 more in order to carry out the plans of the founder.

The State will soon be well supplied with astronomical observatories. The largest refracting telescope in the world will shortly be ready for use at the Lick Observatory on Mount Hamilton. The University of California has a telescope of its own, and there are several private observatories in Oakland. The Chabot Observatory, in that city, given to the public schools of Oakland by A. Chabot, is in constant use, and is well equipped. Two astronomers are employed, who are on duty every evening, and any one may visit the observatory on application to the Superintendent of Schools. The Davidson Observatory, in this city, belonging to Prof. Geo. Davidson, of the U. S. Coast and Geodetic Survey, is a very useful institution, and is constantly utilized. Of course our greatest observatory will be the Lick, for which $700,000 was bequeathed. Its equipment has been so elaborate and expensive, however, that it is now feared the income from the remaining fund will be too small to maintain it with the proper force of astronomers and assistants. The Regents of the University of California have decided that they will assume the expense of conducting the observatory when it is turned over to them, taking the money from the general funds of the University.

Another True Smyrna Fig.

California certainly deserves to have the "true Smyrna fig," even if she has not already obtained it. The persistence with which this variety has been pursued merits success. Its importance, too, has not been exaggerated; with the right variety, California can supply the world with choice dried figs.

Our readers are already familiar with the earlier efforts made to secure the true Smyrna fig. The latest expedition was also announced in our columns some months ago. It was the sending of Mr. W. C. West to secure the coveted treasure in the interest of Fancher Creek nursery, of Fresno. The Fresno *Republican* of June 10th gives an account of Mr. West's travels and return. He obtained valuable things in various places. We desire especially to quote that part of the narrative which bears upon the Smyrna fig, as follows:

At Alexandria, several varieties of dates, etc., were secured. From Cairo and other points of interest in Egypt, Mr. West went to Smyrna, where over three months were spent in active investigation of the horticulture of that marvelously fruitful land. Upon his first trip into the interior, the celebrated figs of Smyrna were just beginning to ripen. A number of the principal fig-growing districts were visited and a thorough examination made of the method of cultivation and manner of handling the crops. The olive orchards also came in for a share of attention. After a two-weeks' sojourn in the country, Mr. West returned to Smyrna and spent about seven weeks in the packing-houses, studying the methods employed in packing fruits for market. During his first trip in the interior he had carefully marked the fruit-laden trees from which he wished to secure cuttings, and, returning in November, he took from trees previously marked 11,000 cuttings of the Smyrna fig of commerce, grown in the Erbelie district, and also about 3000 wild or male figs, and 5000 of choice varieties of table figs. On this trip the curing and packing of Sultana raisins, then in progress, was carefully studied. As soon as the authorities discovered that the object of Mr. West was to secure cuttings of the fig of commerce, they issued printed orders that no cuttings from this fig should be permitted to cross the borders of the country. But Mr. West was not to be thwarted in the principal object of his trip by official orders, and hastily packing his cuttings in sacks, he smuggled them on board a ship in the night-time and there packed them for shipment. It was a bold move and met with complete success, as may be seen at any time by a visit to the Fancher Creek nursery.

This enterprise is by no means a small one to be undertaken and carried out by one nursery. Something of the extent of its cost may be judged from the fact that the cuttings of the fig of commerce alone cost over $500, exclusive of bribes and presents to those who assisted in procuring them. It is something no other nursery has ever attempted to accomplish. Mr. Roeding, the enterprising proprietor, deserves much credit for this invaluable addition to the horticultural resources of the Pacific Coast.

On Saturday of last week the cuttings, plants and seeds arrived at Fresno, and all in remarkably good condition. The cuttings were immediately planted in the nursery, and the percentage of loss promises to be very small.

Fruit-growers will await with impatience the fruiting of the new cuttings and hope that they will prove that the true variety has been obtained at last if it does not approve the truth of earlier importations which have been secured at high cost.

THE DRIVEN-WELL PATENT.—It is reported at the East that the U. S. Supreme Court has sustained the validity of the patent on driven wells, which has been for a long time contested by the patentee and the people who have driven such wells. The Supreme Court reverses the lower courts and holds that the invention had neither been anticipated nor used by others in a manner to invalidate the patent. The precise point raised that the patent covered a driven tube only, while the present practice is to drive a rod, insert a tube, and then raise the water by suction, was decided by the Supreme Court for the patent. The Indiana suit showed that 50,000 of these wells, on each of which $10 royalty was demanded, were in use in that State alone, and the number in the United States has been placed at between 500,000 and 1,000,000.

A DEVON COW, "Queen," owned by Chinn & Reddick, of Vacaville, gave birth to triplets on the 4th inst. A young Durham is the father of the calves, which are all perfectly formed, and were, like their mother, doing well at last accounts.

THE supervisors of El Dorado have abolished all tolls in that county, making the roads free.

THE VINEYARD.

Mysterious Death of Vines.

University Experiment Station, Bulletin No. 70.

An investigation into the causes of the mysterious decline and death of grapevines at certain points in Southern California has been in progress at the University Experiment Station for several weeks. The work was undertaken to test the results announced last year by reinvestigation, and because the loss and vexation resulting from death of vines continues in the same localities affected last year.

Quite a large collection of vines in different stages of decline was secured from the growers. In some cases the vine was almost lifeless and had made but the most feeble attempt to break its buds, in others one cane had made a fairly vigorous start while others did little or nothing; in others still all the buds had thrown out a few inches of very weak cane. Thus we had for examination vines in various morbid states. The examination of this material was also much helped by careful descriptions of the progress of the trouble by the growers and by personal investigation in the field by Mr. F. W. Morse. The results of the examination as to locating the trouble in the vine itself were mainly negative, as was the case last year. Although most careful microscopic examination of the leaves and wood of the affected vines was made, there was no parasite of either animal or vegetable nature found. In fact the tissue of leaf, cane and trunk was found to be perfectly normal, except that there were clear indications of defective nutrition resulting from a stoppage of the sap supply. Why this stoppage occurred there was nothing in the vines themselves to show. In some samples submitted, a part of the sap ducts were partly or wholly closed with gummy material, presumably the result of condensation of the small sap flow, because of lack of pressure to carry it onward to the nourishment of the newer growth, but there was not, on the whole, nearly sufficient obstruction to prevent the flow of sap had the flow been normal. In fact the decapitation of vines in the vineyard showed that there was in some cases very little sap flowing and in others none at all. This checking of the sap flow is not the immediate effect of parasite attack and where it sometimes results as a secondary effect, the tissue of the plant shows the disorganization produced by the earlier invasion of parasite growth. In the cases examined this source of trouble was plainly precluded because the tissue was normal and healthy, except in the noticeable deficiency in the sap flow. This fact was determined by repeated examination, both of cross and longitudinal sections of the new growth, the younger wood of the spurs, the trunk of the vine and the roots and rootlets—even to the smallest which could be found on the vines sent to us.

This conclusion is a verification of the results set forth last year by field examinations by Mr. Morse and by microscopic investigations in the laboratory—an account of which is given in the Viticultural Report of the University for 1886 (page 176 *et seq*), to which the reader is referred. His conclusion was that there was nothing found that would indicate a true disease which might increase and spread to neighboring vineyards, but that the phenomena were traceable to more or less accidental and local peculiarities of soil, season, moisture conditions, etc., which may not recur and produce similar effects for many years. It is altogether likely that the continued decline of vines observed this year is but the natural sequence of unfavorable conditions prevailing in the winter and spring of 1886. Since the loss has been greatest in districts where vines have been longest cultivated, it is possible that the evil has been aggravated by the gradual exhaustion of the soil; pointing to fertilization as at least a partial remedy and preventive by enabling the vines to rally from their enfeebled condition, through the recuperation of the root system.

Remedy for the Anthracnose of Vines.

A bulletin of the Agricultural Society of France, lately received from Mr. Chas. Joly (president of the Horticultural Society of France), gives the following information on the subject of the treatment of vines for anthracnose ("black blight," "sunburn," etc.)—*Sphaceloma ampelinum*:

The viticultural section of the Society of French Agriculturists has decided to render as public as possible the instructions given below, which have been published by the Bureau Directors of the Medoc syndicate under the signature of its president, Mr. N. Johnston, and whose object is to indicate the best means of dealing with the anthracnose of vines.

The members of the syndicate having repeatedly tried the application of sulphate of iron (copperas, green vitriol), have obtained satisfactory results, and intend to repeat its application on the whole of their vineyards. They do not intend to say that this remedy cures the evil completely, but they believe that if practiced with care it greatly diminishes its ravages, and they advise the members of the association to try it. They even believe that where the vine has been most seriously attacked, two applications should be made at intervals of 10 or 12 days, such treatment having given excellent results.

The solution to be used should contain at least three pounds of copperas per gallon of water, to which may also be added two ounces of copper sulphate or bluestone. The solution is best made in hot water, and it should not be allowed to get very cold, so that it may not deposit a portion of the dissolved substance.

The application is made with a brush, to the wood of the vine, taking care that all parts of the vine, from the base of the stock to the ends of the canes, are moistened with the solution. The capital point is, however, that at least the wood of the last three years should be well wetted.

The amount of copperas used is about 45 pounds per acre of (long-pruned) vines (on short-pruned kinds, of course, materially less in proportion).

The application should be made before the vines bud out, since the strong solution would seriously injure the tender foliage.

Experiments with sulphate of copper alone have also been tried and seem conclusive, but were on too small a scale to be made a rule. The use of a solution containing five per cent, or 2½ ounces, per gallon of water appeared perfectly effective; weaker solutions were not altogether satisfactory in their action.

While it is too late to apply these remedies in California this season, in the precise manner indicated, those noting symptoms of the disease on their vines might try spraying with weaker solutions, in order to check its progress, or at least to prevent its spread to neighboring vines. E. W. HILGARD.

Berkeley, June 4, 1887.

Grape-Growers' Meeting.

A regular meeting of the Grape-Growers and Wine-Makers' Association of California will be held at the Grand hotel, San Francisco, June 21, 1887, at 11 o'clock A. M. Members who have not paid the fee of $1 for this year are requested to do so. E. H. RIXFORD, Sec'y.

(*Other Viticultural Matter on page 549.*)

THE VETERINARIAN.

Colic or Gripes in Horses.

EDITORS PRESS:—In a great many stables horses are subject to frequent attacks of colic or gripes, indicated by pawing and rolling or attempts to do so in the stall. One very common cause—I may say the most frequent—is over-feeding. Animals that are over-fed are certain sooner or later to become the subject of indigestion, of which colic is but a manifestation. Horses that are once affected with pain in the abdomen or belly are much more liable to subsequent attacks. To say exactly how much food should be given would be absurd, as that depends upon the individual horse and the amount and kind of work he has to perform. Occasionally I go into stables where horses leave their grain; in such establishments they are over-fed, and to this may be attributed cases of indigestion. Not long since I made a post-mortem examination upon a horse that had for a long time been subject to attacks of indigestion, and his liver was nearly white in color and extremely soft in consistence, and altogether it was very evident that it was in such a condition as not to have been capable of secreting bile; and as this secretion is purgative in its nature, in all probability the lack of it in the bowels produced the obstinate constipation from which the horse ultimately died. The walls of the stomach were also very thin, due to repeated over-distention. Horses often die from rupture of this organ, induced by these matters of which I write. It is, with many people, customary to give as much hay to horses as they will eat, and there are often instances of gluttons among these animals as with men. In several well-conducted stables, an average sized horse is allowed 14 pounds of hay per day, and the same animal will be fit for a good day's work if he gets about 12 quarts of oats in the same length of time. It is well known among horsemen and practical veterinary surgeons that food given in excess of this often produces indigestion. In a state of nature such treatment is unnecessary, but considering that the horse is in an extremely artificial condition, it is important that he should be by the same means protected. And there are men who put their horses to hard work immediately after having eaten a very hearty meal.

Allowing horses to drink too much water at one time is often a cause of colic. "It is better to water horses five or six times a day, and so to avoid extreme distention of the stomach and its bad consequences. When some individual horse shows a tendency to be frequently attacked with colic, it is advisable to give him a dose of purgative medicine, and after he is put upon his regular diet, to give him a tablespoonful of powdered charcoal in his feed, three times a day. This tends to prevent fermentation in the stomach, and its use may be kept up until such time as the tendency to colic has subsided."—*Breeders' Gazette, England.*

I have found by *practical experience* that horses subject to frequent attacks of indigestion are much benefited by being turned out to graze for a season. The digestive system is allowed to recover itself by a return to natural conditions. ROBERT J. DAWSON,

225 Geary St., S. F. Veterinary Surgeon.

Santa Ana and Ventura Flowers.

Among the greater floral fairs of '87 must be counted those held the latter part of May at Santa Ana and San Buenaventura. The flower festival at Santa Ana took place in Spurgeon's pavilion, opening Tuesday evening, May 17th, and continuing through the week. It was gotten up by the W. C. T. U., in order to raise funds for building a temperance hall, with free reading-rooms and library. As the object was so worthy, it is particularly gratifying to know that the attendance was large and the receipts past expectation.

On the wall, over the entrance, wrought in flowers of various hues, appeared the emblem of the Good Templars—a cross, anchor and heart—with the letters F. H. C. across the heart. Above stretched a scroll of evergreens, bearing the symbolic I. O. G. T.

The ladies from Garden Grove had the name of the town worked in pampas plumes and red roses on the evergreen cornice above their booth. Among the various designs displayed was a beautiful floral map of the Golden State. And here were to be seen not only greenery and blossoms, but lemons, oranges and—new potatoes!

The verdure-thatched roof of the Orange booth ran up to a peak, which was fittingly crowned with a great cluster of the fruit that gave the place its name. Below, among bouquets and other pieces, were shown a Maltese cross in carnations, a violin of pansies, a banjo of marguerites, and a large panel of white roses, with the word "Orange" worked in carnations

The Tustin booth was elegant, and contained many tasteful designs, the chief one being a solid bank of white roses nine feet high, surmounted by a crown of red flowers, above which, in a semi-circle, was the motto of the W. C. T. U.: "God, Home and Native Land," of marguerites on a green ground Outside this booth, but making part of the Tustin exhibit, was a much-admired flower-piece representing a tank-house and windmill complete, with the fans revolving, composed of roses, marguerites, carnations, evergreens and smilax.

The G. A. R. booth was adorned with tri-colored national emblems, and two large American eagles, one suspended over the entrance, the other perched on a column to the left. The ladies of the Relief Corps exhibited a great variety of war relics. Near this was a floral ocean, blue and white, bearing upon its bosom a beautiful little steamer made of marguerites, geraniums and smilax, the name "Newport" at its masthead, which seemed to be approaching a floral pier.

The Santa Ana booth was the most extensive and ornate of all—a very palace of flowers. One of its principal designs was a lighthouse of marguerites, standing on a bank of evergreens, in a sea of azure bloom. The large bouquet, set in place of the lantern, was brilliantly illuminated.

Besides all floral attractions, the fair embraced an art gallery, Jap. and California curio booths, a lemonade well and refreshment stands, and musical entertainments in the evening.

Ventura's Floral Fair

Came off May 25th to 28th. By the tasteful industry of the ladies, with boundless floral resources at command, Union hall had been transformed into a vast bower of beauty, and was thronged with delighted admirers Wednesday evening, when W. E. Shepherd stepped to the footlights and announced the formal opening of Ventura county's second annual Flower Festival.

The stage appeared to rest upon a mound of verbenas, its front, from the footlights to the floor of the hall, being one bank of many-colored blossoms. On the stage, at either side, were easels supporting the floral emblems of the Good Templars and the Sons of Temperance, and we understand the proceeds of this fete, as well as that at Santa Ana, go toward providing a free temperance hall.

Near the entrance of the hall a pillar of wild and cultivated flowers, including mimulus, gladiolus, roses, snapdragons, etc., attracted notice. A table of cacti blossoms, night blooming cereus and *Fremontia Californica* (labeled "gold drops") from the Lexington mines, was quite unique; and the lily booth, trimmed with rushes and water lilies, had in the center an eight-foot pyramid of fragrant wax lilies, interspersed with ferns.

The Santa Paula booth was covered with palm branches and contained a beautiful bank of flowers, in the middle of which was a lyre composed largely of roses, while at one end appeared the monogram "S. P." wrought in carnations on a background of cypress, and at the other a great floral star. In front was a fine display of Santa Paula fruits—oranges, lemons, limes, loquats and cherries—contributed chiefly by N. W. Blanchard. The old oaken bucket, made of geraniums, lantanas and marguerites, was a remarkable piece of work.

J. Hobart, of the Ojai, displayed fine lemons, entirely free from scale or dark rust, with branches of the trees equally free from scale. Prof. F. S. Buckman, also of the Ojai, had a handsome exhibit of citrus fruits, arranged in the form of a monument 12 feet high, surmounted by a cupid holding a plate of oranges. About 3000 oranges were used in the construction. The space at the bottom and the pillars supporting the canopy over the pyramid were filled in and hung with clusters of oranges and lemons.

The Hueneme booth was much admired. It embraced a pyramid of roses, pillars of digitalis, clusters of fine seedling carnations, cacti, snowballs, orange blossoms, geraniums, magnolias, gladiolas, and two aquariums with pond lilies in bloom.

Mr. and Mrs. Joseph Sexton, of Goleta, Santa Barbara county, showed the flowering fence, a great number of seedling carnations, loquats and a plate of the Mexican custard apple, which Mr. Sexton has cultivated with success.

The Saticoy exhibit contained 25 varieties of roses, branches of camphor tree, Chinese pinks, coral plant, hibiscus, crinum, New Zealand flax, etc.

A bank of the wild flowers and ferns of the neighborhood, including lupines, California poppies, butterfly plants, Yucca Whipplei, etc., reached a hight of 12 or 14 feet.

Conspicuous in the center of the hall were the carnation booth of Mrs. Theodosia B. Shepherd and the rose booth of Mrs. H. W. Conner. The former, in the shape of a pagoda, was decorated with Norway pine and evergreens, and the pillars festooned with sprays of fuchsias of 30 different varieties. Around the pagoda, in banks of Oregon moss fringed with begonias, were 107 varieties of carnations—65 from Mrs. Shepherd's own garden—and many bunches of pansies. The latter, also pagoda-shaped, had its columns trimmed with pepper boughs, ivy and loquat, and here were artistically displayed about 300 varieties of roses.

Of course, there were cut flowers and bouquets in diversity and profusion, and multifarious designs; and what with all the evening entertainments—music, pantomime, tableaux, etc.—they had a merry and delightful festival.

Since the foregoing was put in type, we have been favored with a letter, giving other glimpses of the floral fete, which we take pleasure in sharing with our readers.

EDITORS PRESS:—San Buenaventura succumbed to the prevailing epidemic of flower festivals, and is justifiably proud of the grand display at Union hall, which commenced May 25th and continued four days and nights.

The festival was under the supervision of Mrs. Theodosia B. Shepherd, and to her admirable management and the hearty co-operation of the ladies of Ventura county the success was mainly due.

The lily booth was one of the most attractive. Of graceful design, trimmed with fir, wild rushes and palm blossoms, it was profusely decorated with lilies of different varieties. A pyramid of white lilies and an arrangement of pond lilies were the most noticeable features.

Thousands of roses were used in decorating the booth devoted to the queen of flowers, the pyramid in the center alone containing 1200. The mate and rival to the rose booth, the carnation booth, was ornamented with evergreens and palm branches. Begonias and fuchsias entwined the pillars and peeped saucily out of the gothic-shaped windows, and fringed a most magnificent and valuable display.

The candy booth was semi-hexagonal in shape, and had the appearance of being built of huge sticks of striped candy. The entire structure was covered with double red geraniums and white roses. The lemonade booth was tastefully decorated with evergreen, white roses and lemons.

Mr. Faulkner, of Santa Paula, had an exhibit of cherries and currants, and Mr. Maguire, of Ventura canyon, a display of cherries. Hitherto Ventura has imported this popular and delicious fruit, and it is gratifying to note that it, as well the currant, can be raised at home.

The Sons of Temperance had on one end of the stage a beautiful wreath in red, white and blue flowers—emblems of the Order—resting on an easel; below it a pitcher of water and a glass. At the other end of the stage the Good Templars arranged a monogram F. H. C. on an easel. From the top of the stage hung a handsome blue bow of ribbon, representing the Blue Ribbon Order, and the W. C. T. U. were represented by letters of white flowers.

In front of the stage was a bank of verbenas 20 feet long and 5 feet wide.

There was a fairy booth, where bouquets were sold, a popcorn booth, and a soda-water stand—all profusely and tastefully decorated.

The ice-cream booth was a thing of beauty, adorned with fan and date palms and loquat branches bearing fruit.

Santa Paula and Hueneme vied with each other in fine display of flowers and elegant designs. Much sought after and complimented were the sunflowers—eight handsome young ladies metamorphosed.

Each evening the audience enjoyed a musical and literary treat. The whole affair was a brilliant success, reflecting great credit upon the entire county, and the receipts aggregate over $700. I. M. W.

San Buenaventura, June 7, 1887.

The Gardens of Tuolumne.

EDITORS PRESS:—Leaving Copperopolis by the traveled stage route to Sonora, a few pleasant homes are passed, some hidden in the valleys below the grade that leads around and over the hills that wall in the foaming Stanislaus, and a few within easy reach from the road. One about three miles from Copperopolis is particularly noticeable—a home that has long been there by the wayside—recalling to the older settlers past associations and forgotten scenes, still quite unchanged through the slow wearing years that have destroyed and built up other homes. This place is the Empire ranch, belonging to Mr. E. W. Campbell. Of late years the wild, bush-grown hills have changed into bearded fields of barley, and around the house the garden has expanded far out in front, so that if those gay cavalierly vaqueros of the early days were to ride up on their fiery mustangs they would find no more the well-worn hitching-post and the trodden stamping-place where they so long remained in the distant bygone years. The house, a white two-story building, large and comfortable, partially hides itself behind stately balm of Gilead trees and a native oak, while beyond it stretches a cool, green meadow, where the calves and colts roam in the yellow sunshine. No wonder that in this romantic, quiet home its gifted mistress finds inspiration for her pen and time for her bright, spicy letters and stories that all take pleasure in reading! Mr. Campbell owns a large tract of land around this place, and uses it mostly as pasture for his horses and cattle.

Farther into the hills beyond the river, the gardens begin to appear, and near Tuttletown, in Tuolumne, they are quite numerous and look fresh and well kept. But it is around Columbia that our grand old orchards, famous from the early days for their delicious yield of red and golden fruit, stretch far and wide over the low-sheltered slopes and rustle myriads of shining leaves in the clear, cool mountain air. Rows on rows of stately apple trees promise a rain of red-cheeked, juicy apples in the red blaze of autumn suns, and nodding peach trees glow in mellow sunlight and bestow the last pink petal on the breezes sighing through the pines. There are vineyards, too, suggestive of green and purple bunches when fall comes to ripen the blooming grape. Sonora seems to be the very heart of all this fruit country, surrounded as it is by gnarled and aged trees, mingling with swaying seedlings on every hand. Over 30 years ago the first fruit-grower, O. S. Davis, set out the celebrated orchard on Wood's creek. It is now greatly disturbed by mining operations, but the larger part of it still remains, growing close up to the street, over which two ancient cherry trees have dropped their bright clusters for more than 30 years. An Alden drier was erected on this place, but it is now unused, and Mr. F. S. Macomber utilizes it for packing and storing his champagne cider, which is kept here for three years before being offered for sale. This cider is most excellent and receives high praise from all buyers, so the demand is large. Thus there is a ready home market for a large proportion of all the apple product in the vicinity.

Sonora and Columbia districts ship scores of tons of fruit every year and still hold their own among the favorite fruits, being pronounced as fine as any in the State. In the clear, bracing air of these higher foothills, and in the clear, warm rays of a fadeless sun, they obtain a high flavor and develop into fine large specimens of fruit, and receiving the praise that is due them, the enthusiastic fruit-grower studies and plans for still greater perfection. Sonora, surrounded by its sheltering gold-strewn hills, is still pressing on in its hurried pursuit of treasure. The reckless miners tear down, uproot and destroy, and then hold up their shining prizes for the admiration of the outside world; but there are many yet who still see the glory of their fair green orchards, and so plant deep and well for the sure rich harvest of after years. Thus it is we see the cool green trees almost shading the restless miners at their work. This town, so truly called the "gem of the mountains," so beautiful is it with its lovely homes, its winding shaded streets, and ever-present history of its past breathing in every seam and ragged spur of the blue hills, is the county-seat of Tuolumne and the great center for all kinds of business; and although it has passed the zenith of its reign as queen of all this great mining land, another future as hopeful lies before, when its hills shall be peopled by those who call it home, and love it, not alone for the ore in its rich, red soil, nor yet for its glorious golden past that stamps it best among things that were, and hopeful among the things to be, but as well for its clear, sharp airs, its sparkling dew-wet hills, its breezy pines, its trembling orchard leaves glinting in the fair, warm sunshine—which promise to expand all nature into life, and strength, and loveliness, and crown our beautiful Sonora among the fairest of earth's cities in years to come. MAY BLOSSOM DAVIS.

FRUIT MARKETING.

Our Fruit at the East.

EDITORS PRESS:—We have letters from Mr. Blowers, from New York, in which he speaks very hopefully of the situation this year. He says that he has interviewed the Erie express people, who promise to do all in their power to facilitate the unloading of our fruits at their terminal, giving us shedroom, etc. The selling by auction there necessitates our getting many concessions from the railway people, as we must have space in which to display the fruit and segregate it according to the catalogue, which has been previously prepared from information sent on by telegraph. Mr. Blowers says further, in regard to auction sales: "That they sell over 5000 boxes of European fruit in an hour. If our packers see to it that they send nothing but good, healthy fruit, well packed, uniform and full weight, we can sell at the proper time an immense quantity of fruit in this market at better net rates than we have been getting for many years. The small apricots I saw in this market to-day were held too high to make much headway—$1 per basket of five pounds. Strawberries are now plenty and good in the market, and Florida and Mississippi peaches have been in for two weeks, but are neither attractive nor plentiful. I think good progress is being made to start right. I regard New York, with its 3,000,000 people in a radius of 10 miles, and its contiguous towns and country, with as many more, as a key to the situation. If we can pull together and start right here, we can make the Union a grand success for the whole State. I am now more sanguine of our great success than I have ever been."

We hear from Michigan that the crop of peaches there this year will not go over 30 per cent of a full crop.

Telegram from Chicago June 13th: Peaches arrived in good condition, selling at from $2.25 to $2.50 per 20-pound box. Apricots selling at from $1.75 to $2 per 20 pound crate. The weather is very hot and muggy and hard on fruit. We are sending from one to three cars per day, all but two of which have paid extremely well. As soon as Crawford peaches are ripe, cars will go through to New York.

Dix & Wilkes have been appointed agents at Baltimore.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

SEASIDE RESTING PLACES.—To those who desire to fly the heats of the valleys and dwell beneath their own roofs by the seaside for a season, the announcement in this week's RURAL of sales of lots at Pacific Grove, Monterey county, will be of interest. It is proposed to sell residence lots by auction at the following times: Tuesday, at 1 P. M., June 28th; Wednesday, at 10 A. M., June 29th; Thursday, at 10 A. M., June 30th. Full information concerning the sales can be had by reference to the advertisement in another column.

Meeting of Viticultural Commissioners.

The State Viticultural Commissioners met in regular session at the office, 204 Montgomery street, Monday. There were present Commissioners Haraszthy, Wetmore, De Turk, Krug and Manlove, Chief Executive Officer Wheeler and Secretary Clarence J. Wetmore.

A communication was read by Mr. Wheeler from Dr. J. A. Bauer relative to his successes with his remedy for the phylloxera in the Hagen vineyard. Messrs Krug, Crabb and Wheeler were appointed to examine and report.

Mr. Wheeler was instructed to confer with the State Analyst, Prof. Rising, and arrange with the Regents of the University relative to giving Prof. Rising more assistance in making analyses of wine.

Dr. Manlove offered the following resolution, which was adopted:

Resolved, That the Chief Executive Officer is hereby instructed to issue a circular to local resident inspectors throughout the State, calling upon them to report promptly whenever they discover any violations of the Pure-Wine Act in the use of materials forbidden by law in the manufacture of wines sold as pure.

Mr. Haraszthy read a letter from C. P. Huntington, in which he agreed that the Southern Pacific Company should co-operate with the Commission in sending a representative from this State to the London exposition to do missionary work for California.

Estimates as to the amount of wine that would be made this year were made by those present, and they ranged from 15,000,000 to 22,000,000 gallons.

Dr. Manlove reported that the frost had done a great deal of damage to some of the vineyards in his district, but that the Natoma vineyard had escaped, owing to the smoking of the vineyard. Mr. Krug reported that his Rieslings trained on wires had suffered a great deal from the frost, and that where he got last year 12 to 13 tons to the acre he would not get three this year. He thought Napa valley was good for two-thirds of a crop this year.

The election of officers resulted in the re-election of the present officials: President, Arpad Haraszthy; Vice-President, Charles A. Wetmore; Treasurer, Charles Krug; Secretary, Clarence J. Wetmore; Chief Executive Officer, J. H. Wheeler.

The Pure-Wine Law.

In order to secure a more definite interpretation of the Pure-Wine law, which lately became operative, and to learn more of its object and effects by way of an authoritative opinion, Executive Officer Wheeler, of the Viticultural Commission, recently addressed another letter to Attorney-General Johnson on the subject. Several interested wine-growers desired the view of the Attorney-General on the legality of the recently adopted resolution by the merchants, requiring every vineyardist to send to them an analysis of all wines shipped by him to the dealers.

The Attorney-General replied as follows:

SACRAMENTO, June 10, 1887.

J. H. Wheeler, Esq., Chief Executive Viticultural Office, San Francisco—DEAR SIR: In yours of the 9th inst., you inquire:

First—Does the Pure Wine Act, approved March 7, 1887, "in any wise alter or interfere with the performance of contracts made for the sale and delivery of wines, whether such contracts were made previous to June 5, 1887, or after said date, provided the wine sold and delivered is pure wine according to the law and branded, labeled, or prominently marked 'Pure California Wine,' with the name and address of the vendor?"

Second—"Has the buyer of wine any legal right to demand of the vendor a certificate of analysis of the wine sent, when the vendor has become himself satisfied in making it that the wine is pure, and has duly branded, marked or stenciled the package, 'Pure California Wine,' with his name and address, in perfect compliance with Section 8 of said law?"

My answer is "no." The buyer cannot refuse to receive the wine because there is no analysis or certificate of analysis, but if the evidence should show that the wine so sold was impure, he cannot be held under his contract. Very truly yours,

G. A. JOHNSON, Attorney-General.

PACIFIC COAST WEATHER FOR THE WEEK.

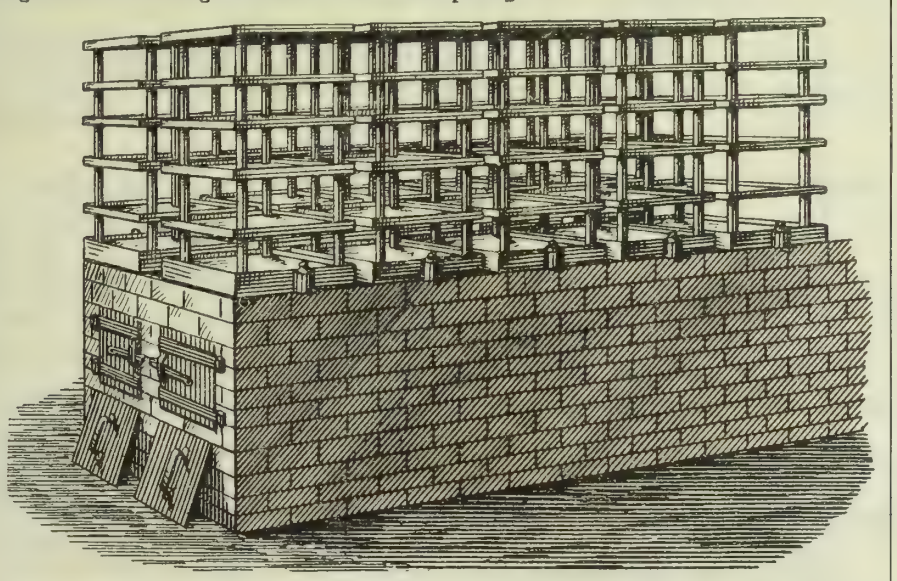
EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature; Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours. Note "T" indicates precipitation inappreciable.



The Common-Sense Steam Fruit Evaporator.

We presented to our readers a sectional cut of this new fruit-drier a few weeks ago. This one represents what Messrs. Bachelder & Coates call a "10-section," or 2-ton capacity, as it is claimed it will convert about two tons of green fruit into the dried article in 10 or 12 hours. The cost is small, and it is claimed that a much cheaper furnace than the one represented would answer equally as well.

In operating the machines, a light wooden trestle is used, on which to rest one end while pulling them from the furnace to refill or empty. It has been suggested, however, that a narrow-width furnace should be used and longer walls, arranging the machines broadside out. As heat is required merely to keep boiling one to one and a half inches of water, the length of the walls could be quadrupled, or more, without enlarging the furnace or grate. No movable trays are used, the fruit being placed directly upon the double steam-heat pans. This is done for a two-fold purpose: to save expense and to shorten the time in drying. The results show that fruit that requires 10 or 12 hours by other processes is perfectly cured in less than half the time by this plan.

The pans can be lifted apart readily, but it is best to fill and empty as they stand, never putting any fruit upon them until the steam escapes from nozzle at the top, and then commencing at the bottom pan or tray.

The cut is from a photograph of the capacity which Bachelder & Coates are operating at Napa. While some practical fruit men are inclined to think modifications may be made in the method of operating, all agree that the principle is the correct one.

ARRANGEMENT OF "COMMON SENSE" EVAPORATORS ON BRICK FURNACE.

Lime and Sulphur Wash for Scales.

Mr. Isaac H. Thomas, the well-known orchardist and nurseryman, of Visalia, pronounces unequivocally in favor of the following, especially as a winter wash for San Jose scale. We have published the same recipe before, but repeat it as evidence accumulates in its favor:

Ten pounds unslaked lime, 20 gallons water, 20 pounds sulphur, Boil until thoroughly dissolved, then add 25 pounds of lime, 15 pounds of salt, and water sufficient to make 60 gallons of solution. Strain and apply milk-warm with spray pump, using a rubber disk in the San Jose nozzle. This wash did not hurt the fruit, when applied after the trees had blossomed out. I would advise the use of it in the fall, as soon as the foliage drops. Then, if necessary, the second application in spring before the fruit trees bloom. The cost per tree is from four to five cents.

BERKSHIRE SALE.—Among recent transfers of Berkshire swine, of which account is sent us by Phil. M. Springer, of Springfield, Ill., secretary of the Berkshire Record Association, we find the sale of "Forest Prince" 17,215, "Forest Queen" 17,216, and "Forest Sally" 17,217, by Andrew Smith, of San Mateo, Cal., to E. S. Paddock, of Forestville, Cal.

"Hope on, hope ever" How many delicate ladies there are who, while they attend to their daily duties, do so with aching heads, a sense of fullness, pain in the back and depressed spirits, who are "only keeping about," as the phrase is. Some day they "go into a decline," and leave their children motherless. To such we would say, "Cheer up." Timely use of Dr. Pierce's "Favorite Prescription" corrects all female irregularities, weaknesses and kindred affections easily, pleasantly and quickly.

* * * * All diseases of lower bowel, including pile tumors, radically cured. Book of particulars, 10 cents in stamps. World's Dispensary Medical Association, 663 Main Street, Buffalo, N. Y.

Chronic nasal catarrh positively cured by Dr. Sage's Remedy.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
G. W. INGALLS—Arizona.
GEO. MCDOWELL—Santa Barbara Co.
J. L. DOYLE—Marin Co.
W. J. FREEMAN—California and Nevada.
WILLIAM POOL—Fresno Co.
M. S. PRIME—Alameda Co.
R. G. HUSTON—Butte, Montana.
E P SMITH—Humboldt Co.
S. J. LITTLEFIELD—Los Angeles Co.
EDMUND WRIGHT—Shasta and Tehama Cos.
H G. HAMILTON—San Mateo and Santa Cruz Cos.

THE sale of "Improved" New Becker Washers, unlike most labor-saving machinery, needs no advertisiug, no pushing by agents. Wherever it has been used in a neighborhood, orders come from all who know its work and are in need of a washer. Mr. E. W. Melvin has sold more the past season than ever before, and at times is not able to supply them as fast as wanted. The price is but little higher than other machines, and they are worth double anything in use. See his special offer.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Thoroughbreds by Auction.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOFBIG—Dear Sir: I have analyzed your sample of **"Nitrogenous Superphosphate,"** with the following result:

Soluble Phosphoric Acid	12.90	per cent
Reverted Phosphoric Acid	.95	"
Insoluble Phosphoric Acid	2.83	"
Potash	2.23	"
Ammonia	1.87	"
Nitric Acid	2.95	"

The above amount of **Nitric Acid** is equal to 0.85 per cent **Ammonia**, therefore, total of Nitrogen calculated as **Ammonia**, 2.72 per cent.

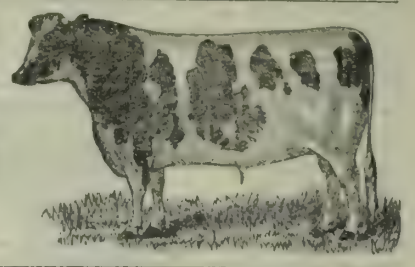
This **Fertilizer** is a **Valuable Manure** for vineyards, orchards, gardens, farms, and I **recommend** its use by the cultivators of the soil **generally**, in **California**. Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KOFBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the **"Nitrogenous Superphosphate"** Fertilizer, analyzed by him at your request. It is a **high-grade article**, and as such returns the user a better money value than a low-grade fertilizer. It is **especially well** adapted to use in **California**, on account of the **predominance** in it of **Phosphoric Acid**, which is generally in small supply in our soils. Yet it is desirable that **"complete"** fertilizers be used in our orchards and vineyards, and **yours is of that character** in furnishing Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of **Phosphoric Acid**—the chief element of all plant food—in combination with the necessary quantities of **Potash** and **Ammonia**, and the ease and cheapness with which it can be applied.



In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from ½ pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sobranto, Station of the C. P. R. R., 20 miles north of San Francisco, at $30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources of their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.

THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitor anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. A NEW FEATURE has been added to the Premium List this year, in the shape of awards for a **Sheaf Display of Cereals.** Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

EDWIN F. SMITH, Secretary. L. U. SHIPPEE, President.

SAN JOAQUIN VALLEY ASSOCIATION
District Fair, 1887.

To Be Held Immediately After the Close of the State Fair, Commencing Sept. 27th and Continuing 5 days at the Fair Grounds and 11 days at the Pavilion.

NEW PAVILION.

A Large Exhibition of Field and Fruit Products.

HORTICULTURAL and MECHANICAL DISPLAY.

Live Stock Features to be Extended

AND INDUCEMENTS FOR BREEDERS

To Bring Animals from all parts of the Pacific Coast.

The Largest Purses Ever Offered at a District Fair for Speed Program and Premiums—Over $20,000.

L. U. SHIPPEE, President. J. M. LA RUE, Secretary.

S. F. Market Report

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, June 15, 1887.

The past week has been favorable to the various crops, and also for harvesting. Advices from the different agricultural districts report farmers in more cheerful spirits, owing to the high prices, compared with last year, ruling for their products. European advices have reported a generally easy wheat market throughout the past week. To-day's cable is as follows:

LONDON, June 15.—Cargoes off coast, very inactive; cargoes on passage and for shipment, New York advices cause depression—all quotations nominal; Cal. wheat off coast, 39s 9d; English country market, inactive; Liverpool spot, New York advices cause depression; Liverpool Cal. wheat, 7s 8d to 7s 11d.

Foreign Review.

LONDON, June 13.—The *Mark Lane Express*, in its weekly review of the British grain trade, says: Promising crop prospects have weakened the values of British wheat, and ample deliveries at the provincial exchanges have assisted the fall to the extent of 6d. The sales of English wheat during the week were 39,614 quarters at 35s 4d against 42,936 quarters at 31s 11d during the corresponding period last year. Foreign wheat was unfavorably affected toward the close of the week; the belief that a breakdown in the American ring was imminent, the presence of a whole fleet of arrivals off coast, and the slackened Continental demand combining to cause a drop in quotations of ten per cental. Flour has maintained values. The demand, however, is slackened. Thirty wheat cargoes arrived; 9 were sold, 5 are withdrawn, and 16 remained. At to-day's market, wheat values of all kinds were against the sellers. Flour, corn, and oats were dull. Linseed was firm at 1s advance.

Crops at the East.

CHICAGO, June 11.—The *Farmers' Review* says: The wheat harvest has been somewhat retarded in the South by the showery weather, but in other localities the rain has had a beneficial effect. Missouri has the best prospects for an even and abundant winter-wheat crop. The corn crop, all through the corn belt, is above the average in condition, and the prospects are good. Oats and grass have suffered from the dry weather. Potatoes are in good condition, and fruits promise a fair crop as a rule.

Potatoes at Chicago.

CHICAGO, June 13.—Old potatoes are scarce, and the market is firm, with higher prices. New potatoes are in good request and choice stock is firm, but small and grubby. The stock is rather dull. The receipts of last week were a little larger than usual, the great part of the stock coming from the South. California potatoes sell fairly well at $2.75 ₱ 100 lbs.

California Fruit in Chicago.

CHICAGO, June 14.—There is a good supply of California oranges on hand yet and the market is rather dull and easy, especially for common stock. Fair to choice goods are quotable at $2@3 ₱ box, but there is a good deal of poor stock on the market which is dull at 50c@$1 ₱ box. The arrivals of peaches are small, and there is little demand for that variety of fruit, for the reason that retailers find that they cannot handle common early peaches to their satisfaction. Some very nice early peaches, received from California in 20-lb boxes, sell at $2.50. Plums are quite plenty, and 20-lb boxes of California cherries and plums are sold at $2.25@2 50 ₱ box. Ten-pound boxes of choice California Black Tartarian cherries bring $1.50@1.75, and White Sweet $1.50@2. The bulk of the cherries on the market are of ordinary quality. Sour cherries are scarce, not enough coming in or selling to make a market.

CHICAGO, June 11.—Choice California apricots in 20-lb. boxes are selling at about $2. Supply of California dried fruit is small and still continues to rule firm at the following figures: Plums, pitted, ₱ lb., 11@12c; raisins, London layers, 20-lb boxes, ₱ box, $1.50@1.75; raisins, loose Muscatel, ₱ box, $1.25@1.35; raisins, California layers, ₱ box, $1.25 @1.35.

California Fruits in New York.

NEW YORK, June 12.—Green—Choice California apricots, 25c a dozen; black ox-heart cherries, 40c ₱ lb, and tangerines, 75c a dozen.

Dried—Malaga raisins are dull, but for California there is a good jobbing trade reported. Loose Muscatel, two-crown, $1.20@1.30; three crown, $1.50@1.60; London layers, $1.50@1.70.

Canned—California pears are unchanged.

New York Hop Market.

NEW YORK, June 12.—The tone of the market remains very firm. Purchases are not large, nor do dealers manifest any particular anxiety. Coast crop 1886, best, 21@23c; common to good, 15@20c; 1885, good to prime, 8@11c.

CANAJOHARIE, June 13.—A careful review of the hop situation in the Mohawk valley indicates that, barring possible ravages by vermin, one-third of an average crop will be harvested. The decrease in the acreage is fully one-third and the average of the yards is only fair. Many yards were not cultivated. Ten and 12 cents is being offered for 1885, and 22 cents for prime 1886, and it is estimated that the new crop will start at 25 and 30 cents.

Eastern Wool Markets.

NEW YORK, June 12.—When manufacturers can find a medium grade of fleece, which is seldom, they do not object to paying at least former rates. They are also occasionally induced to handle other grades when parcels appear extra attractive, but trading is still confined mostly to the local line of operators. The tendency of the market, however, is toward strength. Among sales were 1000 lbs of California scoured at 45c; 40,000 lbs of California fall at 15½c; 35,000 lbs of Eastern Oregon at 21@21½c; 20,000 lbs of Montana at 22@22½c.

In the Philadelphia market there has been only moderate inquiry for wool, but the few lots changing hands bring comparatively full prices. Among the sales were 20,000 lbs of Territory at 23c; 3500 lbs of Territory fine sorts at 15c; 17,000 lbs of Territory fine medium at 21c; 12,000 lbs of Montana medium at 25c; 20,000 lbs Montana medium at 25½c; 1500 lbs Montana medium at 27c.

In Boston the tone of the market shows considerable improvement, and prices are held firmer and in many instances higher. The principal demand has been in medium grades, and these find ready sales on arrival. Fine wools have not been very active, but are firmer, and to some extent held off the market. Among sales were 288,300 lbs Territory at 17@25c; 65,000 lbs Eastern Oregon at 19@21c; 57,000 lbs California spring at 17@18c.

Eastern Wheat Markets.

CHICAGO, June 14.—The wheat deal collapsed today. The enormous load proved to be more than the clique could stand up under. There was a conference of principals and agents last night, at which it was resolved to abandon the deal, it is said, in any event. The result was a panic in the market. There was a scene of indescribable excitement on 'Change all day. Nothing like it was ever witnessed on the Board of Trade. The climax was reached at 12.30 P. M. when the secretary announced from the gallery the failure of M. Rosenfeld & Co. July broke from around 78 cents to 74 cents in less than two minutes.

NEW YORK, June 15—12 M.—93½c for cash, 92½c for June, 88½c for July, 87¼@87⅜c for August, and 87½@88c for September.

CHICAGO, June 15—1 P. M.—Wheat weak and lower; cash, 70¼c; July, 72⅝c; August, 74⅝c. Corn—Easy; cash, 36c; July, 37c; August, 38¼c. Oats—Easy; cash, 24⅝c July, 25⅜c; August, 25½c.

Local Markets.

BAGS—Under large cross orders, with a few legitimate sales, the bag pool has succeeded in advancing Standard Calcutta on Call. It is claimed that outside parties are selling at from 6⅜ to 6⅝ cts, in lots to suit.

BARLEY—Throughout the past week, prices for both cash and options held strong. In the latter, transactions on Call were very large. To-day's sales were as follows:

Morning session: Buyer 1887—400 tons, $1.21½; 1500, $1.21¼; 100, $1.21⅜. Seller 1887, new crop—400 tons, $1.10; 500, $1.10½ ₱ ctl. Afternoon session: Buyer 1887—100 tons, $1.21¼; 100, $1.21. Seller 1887, new crop—100 tons, $1 10; 300, $1.10½ ₱ ctl.

BUTTER—Receipts are free, but the bulk coming in is off color, and placed with some trouble. High color, choice to extra choice, is in light receipt and can be readily placed at full figures. Dealers claim that with an accumulation of second to third grade butter, first grade must weaken off.

CHEESE—The market is heavy, with an easier tone reported. Supplies are gradually increasing, while the outlet is growing narrower under stronger Western competition.

EGGS—Strictly choice fresh laid are scarce and hard to get by dealers, who are bidding up so as to obtain supplies to meet their trade. Eastern eggs are in lighter stock, as are store eggs.

FLOUR—The market is barely steady for outside brands at the recent advance, but standard brands are firmly held.

WHEAT—The sample market continues quiet, but all parcels offered at quotations are taken at quotations. On Call, transactions continue large, with heavy transactions in seller '87, July and August options. The refusal of the Produce Exchange to admit Oregon wheat on the same basis as Californian, evidently inspires the bulls with more confidence, and consequently they appear more disposed to operate. Many farmers are taking advantage of the present situation and selling seller '87 options against their wheat crop, believing that the price now ruling on Call for seller '87 wheat is quite high compared with the markets of the world. Transactions on Call to-day were as follows:

Morning session: Buyer 1887—100 tons, $1.90. Seller 1887—100 tons, $1.83; 2500, $1.83¼; 800, $1.83⅜; 6200, $1.83½. August—100 tons, $1.83¾ ₱ ctl. Afternoon session: Seller 1887—1100 tons, $1.83¼; 1800, $1.83⅜. August—200 tons, $1.83¾ ₱ ctl.

[COMMUNICATED.]

Market Information.

Cereals.

Harvesting is becoming more general in favored sections, with present indications favorable for it to become general in all sections within a fortnight. Returns sent in give an increased yield of wheat to the acre and of better quality than that first harvested. Although the yield is more, still it does not warrant raising the estimate heretofore given that the wheat crop will not exceed 900,000 tons (about 500,000 tons surplus) and the barley crop over 325,000 tons. The bears estimate the crop of both cereals considerably higher than the above, while the bulls place it lower than above given.

So as to work to better advantage, the wheat bears have, so it is reported, secured a daily paper to write down wheat; and the bulls another paper to write it up. If this is true, farmers and dealers will do well not to be influenced too much by these publications, for operators do not spend their money for nothing.

A Paris circular just received estimates that the importing countries of Europe will require to import from May 1 to August 31, 1887, about 120,000,000 bushels of wheat, which is 20,000,000 bushels more than has been pointed at by previous advices printed in these columns. North Russia, from the opening of navigation to May 20, has not exported any wheat to Northwestern Europe by sea, neither has there been any wheat of consequence imported from Russia at Konigsburg, Germany, by rail. In south Russian ports wheat stocks are small and fresh supplies also are small, and what little there is is being absorbed by Mediterranean ports. Indian wheat shipments have, as usual, been somewhat increased during May as compared with April.

Eastern mail advices are as a whole still more favorable to the crops in the Northwest, but yet they do not indicate that the improvement will offset the unfavorable weather in last April and May.

The past week corn was depressed and easier, under heavy receipts from the southern counties, and only a fair demand. Dealers claim that with higher overland freights in next month, the market will show more strength.

Throughout the week barley ruled steady, with a strong tone. The consumption continues to increase. It is claimed that brewers and also Eastern buyers are quietly taking in the more choice grades under the impression that a still higher range of values is not at all unlikely before the close of next month.

Oats have held to steady prices. Receipts are only fair, but the demand is limited owing to high prices. Crop advices are favorable from Oregon and Washington Territory.

Rye is very scarce and prices high, but buckwheat is weak, with a light call reported.

The first carload of this season's crop of California wheat, raised on the ranch of L. M. Hickman at Keyes Station, Stanislaus county, arrived at Port Costa Friday. The first wheat last year arrived at Port Costa June 5th.

The Eastern wheat deal had a severe setback on Monday and Tuesday last, but at the close more confidence is felt. The break in prices was due to the Chicago Board of Trade allowing wheat to be regular outside of that in the authorized warehouses. As the bulls fought this proposition and were defeated, many became nervous and began to unload, causing a panic to set in, entailing heavy losses, with several suspensions. The bears were not benefited, owing to the bull houses suspension not allowing them to pay margins on the lower prices.

Feedstuff.

Oilcake meal is strong at last week's advance.

Bran and middlings are easier at some shading in prices.

Ground barley is strong and in good demand at full figures.

All kinds of ground feed are in good demand, owing to the poorer pasturage.

Hay is very strongly held. Dealers express the belief that the market will hold strong throughout the year, with a strong probability that a higher range of values will obtain, owing to the poor pasturage, large consumption and only an average crop.

Fruits.

Cherries continue to come in freely, with the quality greatly improved over last year. Canners continue to buy white cherries quite freely, paying as high as 8 cts ₱ lb for choice Royal Anns.

Apricots and peaches are in heavier receipt, with lower prices ruling. The quality is not up to last year's, owing to the trees bearing too heavy.

Choice pears and apples are wanted, but off qualities are slow and hard to sell.

Blackberries are coming in more freely, causing prices to shade off.

The high prices ruling for strawberries operate against canners.

Raspberries are working to lower figures under freer receipts and only a moderate demand.

Figs are coming in more freely. The demand is only fair.

Oranges are slow. Limes and lemons are in fair demand.

The stock of dried fruits is very light, with no apples, prunes, peaches, apricots or pears to be had. A sample of dried apricots of this season's curing was received yesterday from Fresno by G. W. Meade & Co.

Raisins are in light supply, with a fair demand ruling. Choice grades are very firm at full figures.

Live-Stock.

Beef cattle continue to rule weak, under a moderate demand and free offerings. The quality of the bullocks coming in is, as a rule, first-class. Mutton sheep show a firm tone, but still the consumption is not over-large for the season of the year. Stock hogs are in better request; hogs suitable for the block are in fair supply. In milch cows, there is nothing doing. In draft horses, considerable trading is reported, but at unchanged prices. General utility horses are in good demand.

The following are the wholesale rates of slaughterers to butchers:

BEEF — Extra, 8c; first grade, grass fed, 7@7½c per lb.; second grade, 6@6½c; third grade, 4½@5¼c.

MUTTON—Ewes, 6c; wethers, 7c.

LAMB—Spring, 9@10c.

VEAL—Large, 6@8½c; small, 6@8c.

PORK—Live hogs, 4¾@5c for heavy and medium; hard dressed, 7½@8¼c per lb; light, 4½@5c; dressed, 7@8c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

String beans and peas are strong at an advance, under light receipts.

Asparagus has a wide range, with extra choice in light supply.

Tomatoes, cucumbers, summer squash, and green corn, continue to decline under free receipts.

Heavy shipments of potatoes are being made to points east of the Rocky mountains. The local market, under heavy receipts, is lower and weak, at the decline.

Under heavy receipts and only a moderate demand, onions are weak and lower.

Green peppers are lower and weak.

Cabbages and root vegetables are barely steady.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	272,724	268,549
In port, disengaged	105,655	37,600
In port, engaged	20,523	19,180
Totals	397,902	325,329

The above gives a carrying capacity as follows: 1887, 636,643 short tons; 1886, 320,526 short tons; increase over last year, 116,117.

Poultry has ruled fairly steady throughout the week, with choice conditioned fetching good prices, and hard to get.

Beans are in good inquiry, with the more choice grades hard to get.

Hops for future delivery are in better demand. While buyers appear indifferent, still they are willing to pay a slight advance for a round parcel. Spot hops are in light supply, with a fair inquiry. Choice is out of the market.

Wool moves off quickly at last week's advanced prices. Receipts are light, as the spring clip is about marketed.

Tallow is scarce, and if well cared for and packed, will fetch full figures.

San Francisco, June 15, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations. WEDNESDAY, June 15, 1887

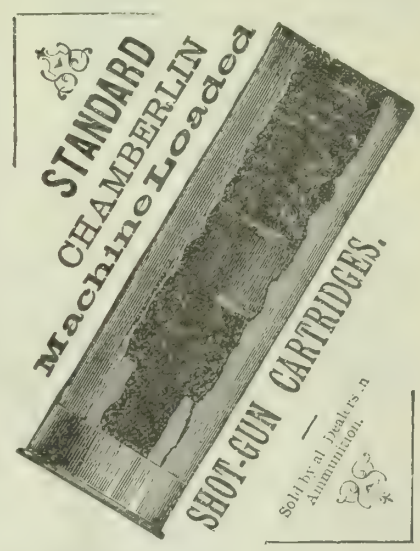
Deposits in California, value, - $130,000.

BUTLER & HALDAN, Gen'l Agents for Pacific Coast

413 CALIFORNIA STREET, SAN FRANCISCO.

For Sale—An Ideal Vineyard



THIRTY-ACRE TRACT

(Nearly square), Mountain View, Santa Clara County, Cal. Three miles from Railroad station, toward foothills, warm belt. Mountain View is 36 miles south of San Francisco, 12 miles from San Jose, and about 4 miles from the great Stanford University grounds. It is separated from the ocean by the high Coast Range, and possesses a remarkably genial climate. Three hundred olives ("Picholine"), one to four years old, surround the Vineyard; most of them planted spring of 1885—two years old when planted. There is a carefully selected home orchard of about 80 thriving trees, two years old when planted—1885—and two large oak trees reserved for the homestead lot.

The whole Vineyard planted in Resistant vines (Phylloxera-proof), Riparia rooted-cuttings and California Seedlings; the greater part planted spring of 1885, the reminder in 1886. About one hundred, scattered over two blocks, were experimentally grafted, spring of 1886, to "Crabb's Black Burgundy," and have made excellent growths. Soil is gravelly loam, easily worked, and, as analyzed at the State University, particularly adapted to vines and fruit Every foot of soil cultivable. The vines are planted on the celebrated "Chaintre system," long pruning (the latest and best system, now extensively adopted in France and Algiers), but can be trained otherwise.

Lands For Sale and To Let.

A GOLDEN OPPORTUNITY

—TO—

Invest in a Fresno Vineyard

We have for sale, till July 31st, a one-half interest in a fine vineyard ranch, 266 acres, all level and susceptible of easy irrigation, situated near Minturn, Fresno county; 135 acres in best varieties wine and raisin grapes three and four years old, in full bearing; low estimate is 350 tons this year; 15 acres in 8-year-old orchard and table grapes, full crop; 8 acres in 8-year-old almond in full bearing; 50 acres alfalfa; 40 acres grain. Entire tract under rabbit-proof, lumber fence; amply cross-fenced. Main dam, gates, ditches, dykes and water, all belong to premises. No litigation, no riparianism, no costs. Undoubtedly best system of irrigation in the State; beautiful reservoir. Two good dwellings picturesquely located beneath the beautiful foliage of 9-year-old ornamental trees. Two very large barns, an abundance of shed-room. Agricultural implements, machinery, etc. Horses, hogs, mules, cattle and sheep. The object in taking a partner is to build wine-room, storage house and adobe cellar, and must be sold before July 31st in order to utilize the coming immense crop. Price $20,000. For full particulars address us or (better) come and see the property.

STATHAM & HYDE,
Real Estate Agents, Fresno, Cal

A NEW COLONY

On the new extension of Southern Pacific Railroads, on the lands belonging to R. T. BUELL, Esq., near Los Alamos, Santa Barbara county, Cal. Parties desiring to visit the property now, can go via San Luis Obispo and take the cars from thence to Los Alamos, thence by stage to the Colony. **20,000** acres of the best lands in California, subdivided into 20, 40 and 80-acre farms; $20 to $30 per acre. INTERNATIONAL IMMIGRANT UNION, 401 California St., San Francisco.

20-ACRE TRACTS.

Fine, rolling, cleared, reddish-brown land, under cultivation in the **Shasta Fruit and Raisin Colony.** Twenty acres for $500. Terms: $200 cash, and balance in installments to suit purchaser, at 8 per cent per annum. Any tract will be set in raisins or fruit and brought to bearing by proprietor of colony, if desired Send stamp for circular, and state how you wish the installments. GRIFFIN BROS., Cottonwood, Shasta Co., Cal.

WEST COAST LAND CO.

TEMPLETON, SAN LUIS OBISPO CO., CAL.

Home of Wheat, Fruit, Wine and Olive; 15,000 acres sold in past 8 months to 220 settlers, representing a population of 1100; 49,000 acres—small subdivisions—average, $22.50 an acre; ¼ cash, balance 5 years, 6 per cent. Catalogues and maps free. C. H. PHILLIPS, Manager.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of this paper.

Small Farms on Easy Installments.

GRAIN, FRUITS and VEGETABLES RAISED WITHOUT IRRIGATION.

A choice portion of the Reading Grant, two miles from the town of Reading, hitherto reserved for farming purposes, now divided into 20-acre lots and thrown open to purchasers. River bottom soil, sandy loam and very productive. Prices from $30 to $50 per acre. Other agricultural lands, in lots to suit purchasers, at from $10 to $25 per acre. For circulars and maps call on

FRISBIE & WILEY, Redding or Anderson, Shasta Co., Cal.

FRESNO COUNTY.

BRIGGS' SELMA TRACT.

This most desirable tract, comprising 1280 acres of first-class gray ash and sandy loam land (situated one and one-half miles from the fast-growing town of Selma, the second in the county, and two miles from Fowler, both being S. P. R. R. towns), has been subdivided and will be sold in 20, 40, 60 or 80-acre farms. The distributing ditches are now constructed, and convenient roads are laid off. The main canal is 60 feet in the bottom.

THE WATER RIGHTS

Consist of stock in the canal entitles and to the ownerone-eighth of 2 feet 6 inches of water, to 20 acres, being 2½ times the usual amount supplied for colonies. The owner of the water stock has a pro rata vote in the management of the canal, and the expense per year is $3.75 on a 20-acre lot.

A school-house is to be erected on the land this year, and it has two within two miles of it at present. Fresno, Selma, Fowler and Kingsburg are good local markets for produce. Opportunities to labor with or without teams are abundant, and land can be rented for wheat-growing in the neighborhood. The health of this region is perfection, and, in common with the plains generally, is an excellent sanitarium for persons affected with pulmonary and rheumatic complaints.

The best raisins in the world, wines unsurpassed, the finest grapes, the best peaches, apricots, plums, prunes, nectarines, figs and olives, and in fact all the choicest fruits and vegetables of the world are grown in this favored region. Raisin vines three to six years old yield per acre from four to seven tons, and increase to eleven. Wine grapes three to six years old yield from four to eleven tons per acre. Alfalfa is cut from four to six times a year, and yields from one to two tons per acre at each cutting.

Two good cows and 100 hens furnish more than half the living for a family, and can be kept, with a team, on three acres of alfalfa, the growth of which is incredible in this favorable combination of soil and climate.

A comfortable house for a small family can be built for $150.

The low price, taking into consideration water and transport facilities, should especially recommend this to seekers of homesteads. One-half already sold. The cheapest Colony land in the county, on very easy terms to actual settlers.

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Park Association, Santa Clara Valley Agricultural Society and Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. The follower has a movement of 26½ inches, the first revolution of the screw moves the follower 1½ ins., the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track. Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.

Printed Testimonials can be had on application of the following parties, who have bought my press: J. B. J. Portal, San Jose; Wm. Pfeffer, Gubserville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. Stiller, Gubserville; Lay Clark & Co., Santa Rosa; Vache Freres, Old San Bernardino; J. F. Crank, San Gabriel; James Finlayson, Healdsburg; P. & J. J. Gobbi, Healdsburg; Wm. Allen, San Gabriel; Wm. Metzger, Santa Rosa; J. Lawrence Watson, Glen Ellen; Walter Phillips, Santa Rosa; Geo. West, Stockton; Eli T. Sheppard, Glen Ellen; Rancheto Wine Co., Rancheto, Los Angeles Co.; Downing Fruit & Wine Co., Downey; J. L. Beard, Centerville; Wm. Palmtag, Hollister; A. Burnham & Son, Santa Rosa; Paul O. Burns Wine Co., San Jose; E. Emil Meyer, Santa Cruz Mountains, Wright P. O.; Marshall & Hill, Laguina Station; R. J. Northam, Anaheim.

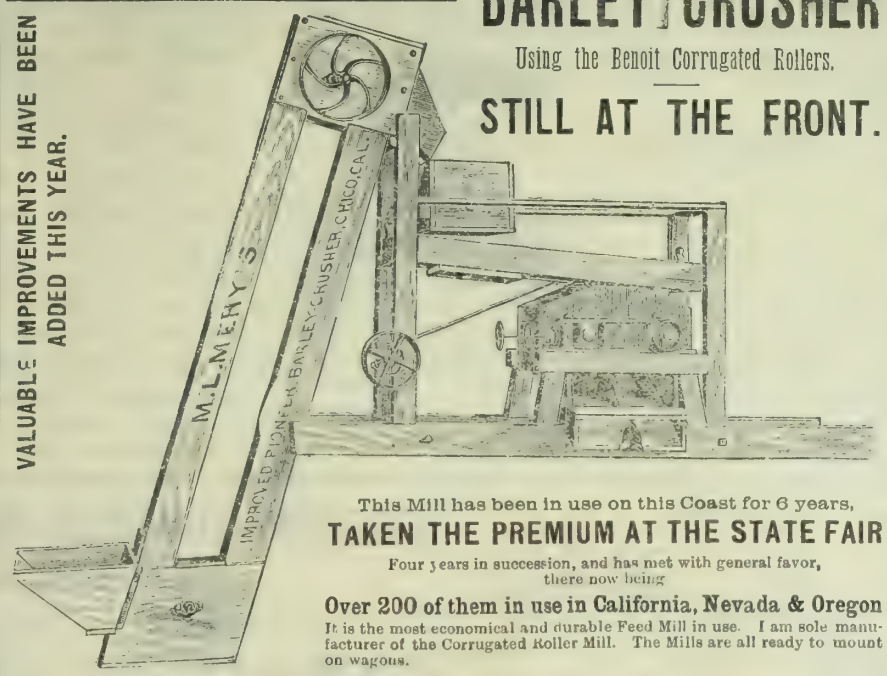
NOBEL'S DYNAMITE,
NOBEL'S EXPLOSIVE GELATINE,
NOBEL'S GELATINE-DYNAMITE,
Best and Strongest Explosives in the World.

JUDSON POWDER,

The Only Reliable and Efficient Powder

For Stump and Bank Blasting. From 5 to 20 pounds blows any Stump, Tree or Root clear out of ground at less cost than grubbing. Railroaders and Farmers use no other.

As other makers IMITATE our Giant Powder, so do they Judson, by Manufacturing a second-grade, inferior to Judson.



BANDMANN, NIELSEN & CO, General Agents, San Francisco.

MERY'S IMPROVED PIONEER **BARLEY CRUSHER**

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT.

VALUABLE IMPROVEMENTS HAVE BEEN ADDED THIS YEAR.

This Mill has been in use on this Coast for 6 years,

TAKEN THE PREMIUM AT THE STATE FAIR

Four years in succession, and has met with general favor, there now being

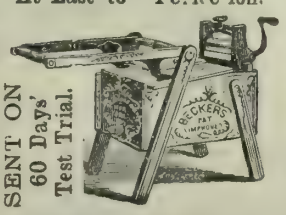
Over 200 of them in use in California, Nevada & Oregon

It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

M. L. MERY,
CHICO IRON WORKS, CHICO, CAL.

PRESCOTT HOUSE.



S. W. Corner Kearny and Montgomery Avenue, San Francisco.
Free Coach to and from the House. J. W. BECKER, Proprietor.

THE "NEW BECKER."

SEVENTH IMPROVEMENT,
April 1, 1887.

At Last to "Perfection."

SENT ON 60 Days' Test Trial.

Approaches nearer to the old method of hand-rubbing than any invention yet introduced to the public. EASILY worked, and washes PERFECTLY clean. Owing to its intrinsic merits thousands have been sold all over the United States, and all giving PERFECT satisfaction. It only needs to be seen and tried to be appreciated. Awarded first premiums 1883, 1884, 1885 and 1886. In localities where as yet I have NO agent, I will ship sample Machine and Wringer on 60 days' trial, the party to pay for them at WHOLESALE prices and act as Agent, if found satisfactory, IF NOT, return them Do not lose money by waiting until SOME ONE ELSE orders samples and secures an agency for your locality. Farmers make $200 to $500 during the year. Ladies have great success selling this washer. WRITE AT ONCE for New Illustrated and Descriptive Pamphlet, which contains my liberal proposition. Mention this paper. DO NOT DELAY.

AGENTS WANTED.

E. W. MELVIN, Proprietor and Manufacturer.
Office, 806 J Street, Sacramento, Cal.

O The BUYERS' GUIDE is issued Sept. and March, each year. 312 pages, 8½x11½ inches, with over 3,500 illustrations—a whole Picture Gallery. GIVES Wholesale Prices *direct to consumers* on all goods for personal or family use. Tells how to order, and gives exact cost of everything you use, eat, drink, wear, or have fun with. These INVALUABLE BOOKS contain information gleaned from the markets of the world. We will mail a copy FREE to any address upon receipt of 10 cts. to defray expense of mailing. Let us hear from you. Respectfully,

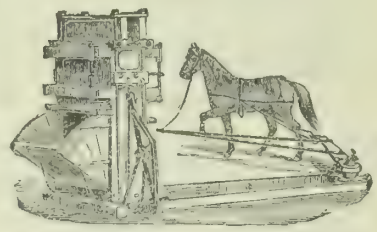
WEAK, NERVOUS PEOPLE

And others suffering from nervous debility exhausting chronic diseases, premature decline of young or old are positively cured by Dr. Horne's famous Electro-Magnetic Belt. Thousands in every State in the Union have been cured. Electricity instantly felt. Patented and sold 10 years. Whole family can wear same belt. Electric Suspensories free with male belts. Avoid worthless imitations and bogus companies. Electric Trusses for Rupture. 700 cured in '85. Send stamp for pamphlet.
DR. HORNE, INVENTOR, 702 MARKET ST., SAN FRANCISCO.

HAY PRESSES.

THE HURRICANE,

A Mounted Double-Ender Baling Machine, capable of baling 40 tons per day.



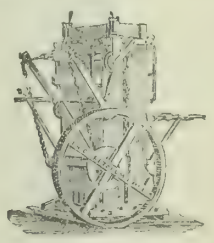
ITS RECORD

For the first year of its existence is as follows: **Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.**

Two sizes: Compressed bales and common bales. **Improved this year so that it is nearly one-quarter faster than before, and the back-and-forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.**

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., **$1000.**



THE JUNIOR MONARCH

Does its own Tramping. Feeds at Side, near the Bottom.

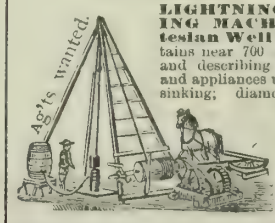
HAS THE FOLLOWING RECORD:

33 tons in one day; 105 tons in 3½ days; 20 tons, and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., **$500.**

—THE—

Genuine Price Petaluma,



With Latest Improvements.

Made under the supervision of the inventor, JACOB PRICE. Too well known to need further description. First-class material and workmanship Capacity, from 10 to 18 tons per day. Hay must be tramped in press.

Price, at factory, San Leandro, Cal., **$350.**

☞Send for large illustrated Catalogue of above presses. **Office and Factory, SAN LEANDRO, CAL.** Address

HARDWARE and AGRICULTURAL IMPLEMENTS.

H. W. Davis & Co's Celebrated Buggies.

These Buggies have been sold on this Coast for four years and have made a fine reputation.

Want of space prevents us giving as full a description as we would like. The principal points to which we call attention are:

CALIFORNIA BUSINESS BUGGY.

No. 120. Davis California Business Buggy, with Shafts.

AXLES. These are 1-inch DOUBLE COLLAR STEEL.

SPRINGS are SWEDE STEEL OIL TEMPERED, polished and fully warranted.

TIRES are made of the finest STEEL TIRE.

WHEELS are SARVEN PATENT STANDARD "B" WHEEL, made from first-class timber, having screwed rims, and the ROUSE BACK FLANGE, with PATENT DROP SAND BAND. We also furnish the BROWN'S SHELL BAND WHEELS.

No. 40. Piano Box, with Top, weight 320 lbs.

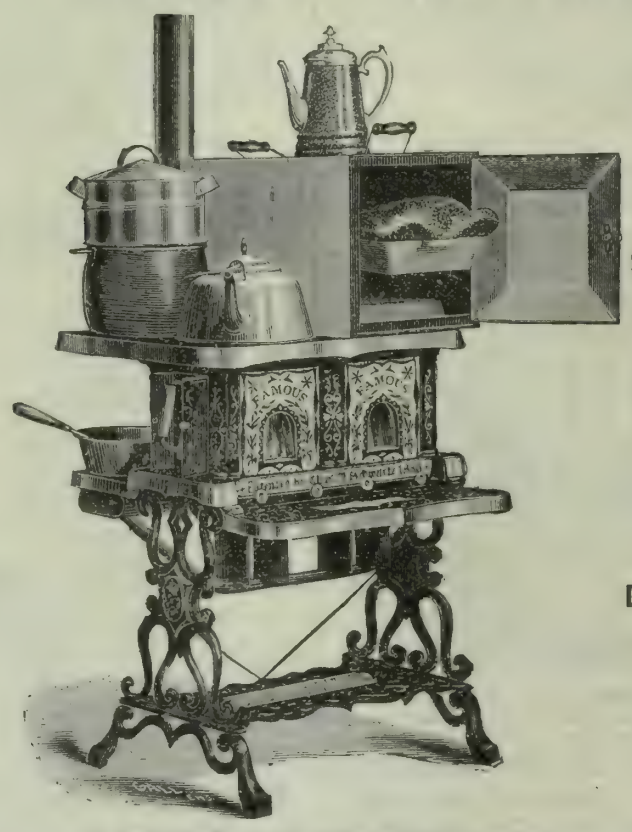
IRON WORK is applied and finished in a thorough workmanlike manner; it is all DROP FORGED WORK.

WOOD WORK. Corners are mitered, screwed, glued and plugged.

GEARINGS are choice selected HICKORY.

For further description write us for Special Circular giving fuller information about the various styles made by this factory.

PLEASURE PHAETON.



Style No. 81. Pleasure Phaeton, with Shafts.

Send for Prices. Special Inducements for Importation Orders in Carloads or less.

WHAT YOU WANT!

THE "FAMOUS" OIL RANGE.

Efficient! Economical. Reliable!

NO SMOKE! NO SMELL! NO DANGER!

No. 5 Showing Furniture in Position and Stove in Operation.

The only Oil Range or Stove which can be connected with Chimney Flue, if desired. Perfect Combustion! Perfect Operation! Perfect Satisfaction! Eight Irons may be heated without interfering with other work. It will bake as well as any cook stove or range oven 13x13x12 inches. Oil tank is self ventilating. The "FAMOUS" Oil Range is well qualified to be used as a heater. It is admirably adapted for sick rooms or sleeping apartments, because, when connected with the chimney, IT WILL ACT AS A VENTILATOR.

FOR SALE BY ALL DEALERS.

SPECIAL NOTICE **Agents Wanted!** If you cannot find our goods at your dealer's, write for Catalogue and prices. Descriptive Catalogue mailed free (postpaid) upon application. HEADQUARTERS FOR ALL KINDS OF WINDMILLS, Hand, Spray, Garden, Wine **PUMPS**, Iron, Brass, Copper, Galvanized, Single-Acting, Double Acting **PUMPS**. Rams, Footvalves, Cylinders, etc., etc.

ANDERSON & TALLON, Successors to Wm. S. Ray & Co.

12 and 14 MARKET ST., SAN FRANCISCO.

Manufacturers, Importers and Jobbers of Pumps, Windmills, Stoves, Ranges, Metals, Sheet Iron, Stamped Ware, Tinware, Lanterns, Hose, Pipe, Fittings, etc., etc. Correspondence solicited.

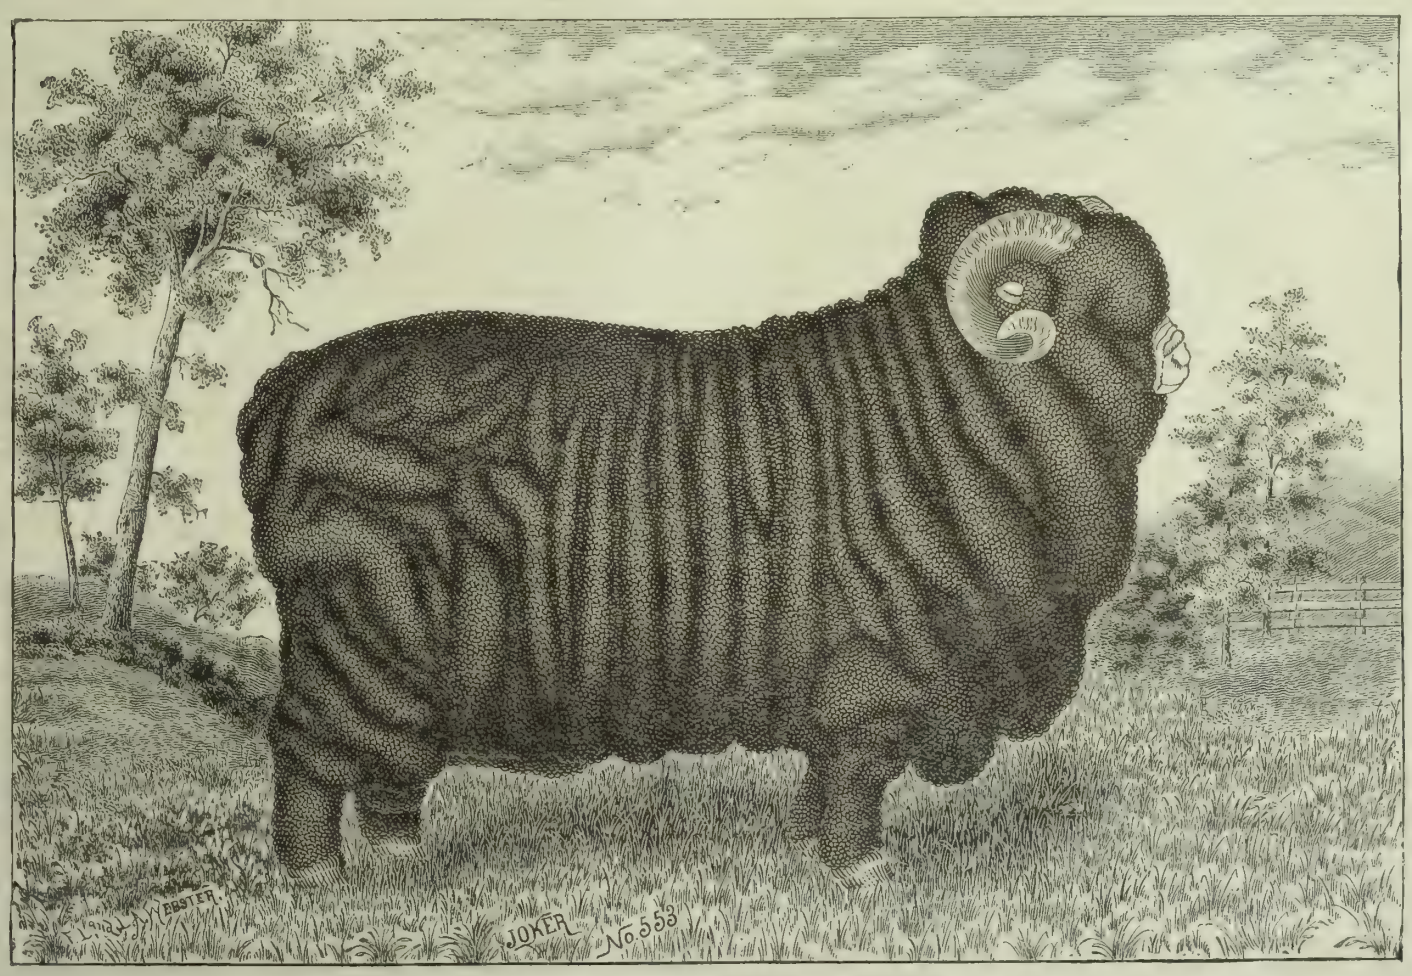
Caught on a Jury.

We were quietly walking along the street the other day absorbed in a "brown study," when we were suddenly made aware that we were an integral part of the great body politic. The trance was broken by the hoarse voice of a constable, with an authoritative accent, saying "I want you on a jury." Perhaps many of our readers have been unceremoniously nabbed in this way. Really, if there is anything more provoking than another, it is to have a bailiff drop in with a summons to sit on a jury when you are in the thick of business, customers waiting or engagements pressing. What shall be done? Get excused, but there is the rub. Pressure of business is not a good cause of exemption, and then the average judge seems inclined to think that the busy man of affairs is all the more competent to adjust the tangled affairs of others. And the judge is right, so go right along repeating in your mind one of the denials of the "mind-cure" people, "there is no evil," or better still, Pope's aphorism, "whatever is, is right." The duty of intelligent and competent men serving the public in this capacity needs to be urged, for it has come to be a standing complaint that the best men shirk the responsibility and leave the jury-box to be filled by loafers who hang around courthouses waiting for a chance to pick up a few dollars in this way. It is partly owing to this fact that trial by jury has fallen into bad repute, and is considered the refuge of lawyers who are conscious of having a poor case. So go joyfully along to your fate, remembering that some one must suffer for the good of the people.

You will find the jury a curious leveler; it is really a very democratic institution. In a jury recently impaneled in this city, there were 12 men representing nine different occupations. There were two merchants, two carpenters, one builder, a fisherman, jeweler, house painter and a reporter. They were all in different ranks of life—one was rich, several tolerably well-to-do, the others poor. There were two Catholics, one Jew—the rest were Protestants. All these persons, grouped in a jury-room, joined in a common discussion with equal voice. Whatever may be said of the verdict, the jury levels all ranks, equalizes all citizens, brings together the social extremes, bridges the gulf of caste and quality. Perhaps no more significant illustration of the spirit that pervades our free institutions can be seen than in a court, where the vast interests of millionaires or corporations hang for a verdict on the consenting voice of a few plain men who threw aside their jack-planes and leather aprons to serve on the case.



You will also find the jury a great educator. It may be just the kind of education you need, for it not only imparts a wide knowledge of the law, but tends to inspire respect for Government and social order. A man who serves a term on a jury can hardly go away without increased reverence, not only for individual rights, for justice and equity, but also admiration for that political structure that civilization has evolved for the protection of life, honor and property.

Silk Culture.—The State Board of Silk Culture held a meeting Saturday, June 18th, Pres. Trumbo in the chair, and Messrs. Carter, McDonald and Sellers present. A new reeling machine was reported to be on the way hither from Milan. It took the first prize at the Turin exhibition last year, and is one of the most perfect machines known. The Filature Committee said that cocoons are now coming in freely from the interior, especially from Fresno county, but that the demand is in excess of the supply. In the reeling school four young ladies are receiving instructions from the secretary, Mrs. Rienzi, who acquired a thorough knowledge of the work during a residence of several years' duration in Italy. There is room for a few more free pupils at the rooms, 21 Montgomery ave. The Board will make an exhibit at the approaching Mechanics' Fair.

Swiftly Built.—Among dispatches from Chicago it has been noted that the late corner in wheat is responsible for a miracle in the way of rapid building; its hero is an elevator-man named Hess. Beside the tracks of the St. Paul road, at the corner of Elizabeth street and Carroll avenue, where, on the 1st day of June, there was only a hole in the ground, now stands, complete in every department, an elevator of 300,000 bushels' capacity. It was built from foundation to roof-tree in 14 working days, and the sixteenth from the commencement of the foundation, 10,000 bushels of wheat were placed in one of its bins. The elevator is one of the regulation pattern, and has no lumber in it except that which is perfectly kiln-dried. It is stated that the elevator companies could safely have promised to have 10,000,000 bushels' additional capacity prepared for the last of the month.

A Hindoo broker at Chandanagore, India, has written to the Associated Press in New York City, asking for daily cable quotations of cotton receipts at all United States ports and of cotton futures at New York.

Serpent Skin is coming into fashion as a covering for books.

JOKER, A FAMOUS PRIZE-WINNING AMERICAN IMPORTED MERINO RAM.

A Fine Merino.

It is about the time of the year that flock-owners turn their attention to paternity in their flocks, and with a view of making good models more familiar we give herewith a portrait of an improved merino ram which has made a good record for himself and whose form shows many good points. He is "Joker" (553, Vermont Register), and was bred by J. T. Stickney, of Shoreham, Vt. He is a son of Wall Street and a grandson of Rip Van Winkle. Joker won the first prize of $100 at the National Shearing in St. Louis in 1886 for the best and heaviest fleece. He is owned by L. E. Shattuck, of Stanberry, Mo., who has a flock containing many prize-winners. At the same shearing in St. Louis, one of Mr. Shattuck's ewes won $100 for the best and heaviest fleece, and in the aggregate he took one-half of all the money offered for fine wool classes. He had seven ewes at that shearing which were suckling young lambs, and still made an average of 22½ pounds of wool, and three rams of his own breeding made an average of 37¼ pounds of wool—one year's growth. Mr. Shattuck breeds for large bodies and heavy fleeces. He exhibited at the State fairs, at the St. Louis fairs and at the New Orleans Exposition, and has made excellent records. Joker started out right by winning the first prize in the face of much competition at the State Fair in his native Vermont in 1885. His career at the West justifies the great claims made for him as a notable representative of the American improved merino type of sheep.

Desirable Seeds.—Seeds of the umbrella or stone pine (*Pinus pinea*) and of the Acanthus (*A. mollis* and *A. lusitanicus*), from the Italian Ministry of Agriculture, will, on application, be sent gratuitously by John S. Hittell, 1025 Hyde street, San Francisco, to the head gardeners of all public and private parks of California who have not already received them. These plants are highly desirable for ornament, and the pine is valuable for fixing drifting and for cabinet-work.

The hatchery established by the Fish Commission, half a mile from the mouth of Rogue river, is a pronounced success.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions

In the Valley of the Sespe, Ventura County.

EDITORS PRESS:—In pursuing our way down the Santa Clara valley of the south, about ten miles above Santa Paula, we come into the valley of the Sespe. This valley descends from the north side, and extends to within about two miles of Santa Paula, where its river forms a junction with the Santa Clara river, and loses its identity. Between the confluence of the valleys, where we first approach the Sespe, and the meeting of the streams, the Sespe embraces, it would seem by common consent, the whole area between mountains on both sides of the Santa Clara river, extending some eight miles up and down the valley. Out of this double valley, we ascend the Sespe valley proper, some three miles to its termination, a short distance above R. Wilkins' bee ranch, heretofore described by us in the RURAL PRESS. The valley is here cut off by precipitous mountains, and this fine, clear stream comes dashing from its mountain canyon over its rocky bed, and for the first two miles continues running so rapidly that it is sometimes called "the raging Sespe."

Mr. Wilkins has deeded to his daughter, Mrs. McIntyre, the very fine property partially occupied by his apiary. It is a beautiful place, with its dwelling, orchard and garden, surrounded by picturesque scenery and approached by a narrow wagon-road cut in the rocks on the western side of the Sespe.

Jepson's Ranch.

Below this one-fourth of a mile, where the valley on the west side has widened, we drive up to the unpretentious yet attractive place of T. W. Jepson. The luxuriant growth of vegetation, the fine rows of large, ripe strawberries growing in the garden and along the lower hillside, the cheerful hum of bees not far away to be heard all day long in all fine weather, the spray of bright, clear water piped down from a spring on the hillside, the exhilarating effects of sights and sounds, the inspiration felt in the very atmosphere, all tempt us to accept without hesitation the generous invitation extended by Mr. Jepson and his estimable wife to stop and enjoy with them, for a day or two at least, the hospitalities of their house and home. Mr. J.'s ranch occupies a portion of the valley and runs up on to the sides of the hills where the surface is very uneven, and yet the heavy growth of barley at the time of our visit standing in the more level parts, and the fine grasses to be found in abundance over the steep hillsides, on the ridges and in the ravines, attest the presence everywhere in the neighborhood of soil of very excellent quality. Several natural fountains in the heads of ravines on the premises afford an ample supply of water for irrigation purposes, and will ever enable the proprietor of the place to raise alfalfa in abundance for pasture or hay. This is a fine place for horses to pasture, and we rejoice in the consciousness of the freedom of the green hills extended to our own little roan mare during our stay.

This place has many advantages which we could not help noting. Its good soil and climate are, we may say, common in all this region; but when we add the waters which at all seasons run from natural fountains on the place and are so easily distributed, we can at once see its wonderful adaptability to the growth of the citrus family and such other vegetation as may require irrigation.

A very fine fishpond might be constructed on a point a short distance above the house, and with but little sacrifice could be furnished with a constant flow of fresh water from some of the springs, losing almost nothing for irrigation purposes, as the flow would simply pass through and on down to the garden.

Mr. J. keeps an apiary, and during most years bees are well provided with an abundance of honey-yielding flowers. This season the flowers are poor and the business is not, for the time being, expected to bring heavy returns.

Purple Mountain-Tops.

At this place, during our brief yet very enjoyable sojourn, it is pleasant indeed to be able to sit and look across the valley at the handsome and valuable farms of O. J. Goodenough and Mrs. Akers; at the groves of live-oak and the thickly set clumps of shrubs in great variety, growing up ravines, on the hillsides and over the rounded elevations; and to let the eye range still further up to the rocky hights overlooking the deep canyons and gulches up the river. These high summits, rocky and bare as many of them are, may be appropriately called "purple mountain-tops," the purple coloring supposed to be from stains of asphaltum or mineral oils so much abounding in all this country.

These mountains are, at most points, virtually inaccessible and impassable by means of ordinary travel; and where important discoveries of oil render necessary much travel and the introduction of machinery, a good road is a desideratum which money cannot reasonably furnish.

This bit of information is taken from personal observation of this section, and especially of the well-graded road leading from the head of the valley, over the mountain some six miles, to some

New Oil Wells,

Lately bored and now flowing at least one heavy stream of oil of good quality, at a rate, perhaps, sufficient to make all the stockholders in the enterprise rich within some indefinite period of time.

A drive over the road with some friends was undertaken. For awhile we highly enjoyed the travel up a canyon, as the scenery was attractive and the air bracing; but steep ascents and descents repeated continuously, and not to be helped by the grading, became serious to both man and beast, and eventually, while resting our horses on the crest of one of the sharp high mountains, we called a council, and after taking the advice of a gentleman on horseback whom we met here, concluded that we had already had sufficient experience and enjoyment in mountain climbing for one day, and that we were justified in leaving out of our personal history, for this time at least, that part bearing on the details of things lying at the further end of the road, and so as cheerfully as our disappointment would permit returned to the valley without the satisfaction of seeing the wells or obtaining definite information with reference to them.

On the slope of the "north side" some half mile north of the Sespe railroad depot, we called at the place of

Cyrus Kenny,

And as it may be considered a representative ranch, we note the following observations:

Mr. K. has a few orange trees 11 years old bearing large, clean-looking oranges of high quality. Also the Sicily lemon and several lime trees, all fruiting nicely and looking as if conscious of their triumph in behalf of the citrus family in the valley of the Sespe. We tested the juice of the lemon and found it decidedly good. There are several other places having orange trees, among them the Wilkins place above mentioned, and all doing very well as far as known.

Peaches and nectarines generally bear well, but usually only every other year. They are now richly laden with the incoming crop. It would seem that all the Santa Clara valley is the very home of the apricot, so extraordinary is its growth and fruitfulness.

Both the apple and the pear are cultivated with good success. For profit in apple culture, Mr. K. recommends the Newtown pippin and Yellow Bellflower. In the absence of marketing facilities, the apple raised beyond the supply of the wants of the family has heretofore been of little value. The long keepers were the only ones that could be relied on to bring anything in return for the time, labor and money expended in the cultivation. But the new railroad, now in process of construction, opens up a new world to the orchardists of this region. This fact may, for trial, encourage the cultivation of some varieties of the apple hitherto overlooked, and which might eventually become quite remunerative.

The Loquat.

We notice here, as in all this country, that the loquat, aside from its highly ornamental qualities, proves itself, as a fruit tree, worthy of a place in every orchard or garden. It bears well, and its fruit ripens early in the season, before most other kinds come in. It is long in fruit. It has much the flavor of the plum, and, during its season, may take the place of the plum and other acid fruits, then out of season. The fig also grows thriftily and bears abundantly.

Mr. K. has five acres grapes for raisins; variety, white Muscat of Alexandria. The distance of vines 8x8 feet. Set out in 1876. This is the surest crop known to Mr. K., as his have not missed since first coming into bearing. He has a southern exposure, and during the fall months the atmosphere is generally dry, and there is usually no trouble in curing on the ground to perfection. We had the pleasure of testing some of his raisins, and found them very perfect in point of good color and the rich properties of the Muscat highly preserved.

Mrs. E. G. Kenny (wife of C. K.), whose worthy literary productions have often appeared in the RURAL PRESS, takes much interest in flowers and arboreal ornamentation. In looking over her interesting flower garden, we feel obliged to specially mention by name a few of the lovely roses that adorn the walks, such as La Marque, Gen. Jacqueminot, Giant of Battles, Glorie de Rosemond, Bella, Louis Phillipe, Lucullus, Castilian. We see several others of most beautiful description, and will add the moss and cabbage roses. Such flowers as callas, lantanas, geraniums, etc., are blooming in rich profusion. The large pepper trees at the front and to the south of the dwelling, with their gracefully pendent small under-branches and leaves, add much to the beauty of the place.

Other Places on the Sespe.

There are many other places on the Sespe highly worthy of mention, some of which we had not the opportunity of seeing. Passing over both the rivers to the "south side," we find in the neighborhood of the Bardsdale tract, and for miles below, the surface generally more even than on the north side, and gradually sloping from the foot of the mountains on the south back to the river. Here more attention is paid to field crops, such as wheat, barley, beans, etc., and less to the orchards. The crops of grain appear to the eye of a stranger as at least good, but those well acquainted with the products of the country year after year represent them as not first-rate, at least not as heavy as might usually be looked for.

Since the building of the S. P. R. R. extension became a fixed fact, lands in all this country have greatly appreciated in value, and a number of sales have been made. The Atlantic & Pacific railway, controlled by the Atchison, Topeka & Santa Fe R. R. Co., has made a preliminary survey for a roadbed entering this valley from the south, nearly opposite Sespe (depot), and continuing down the valley in the direction of Santa Paula. We understand that perhaps another survey has been made on the coast, passing over the Saticoy plains, and the public are not as yet advised of the true intentions of the company controlling this important enterprise.

It is generally expected that the road may yet be constructed through the county. Such a consummation would, of course, furnish still greater advantages than those that may be afforded by the completion of the S. P. extension alone, and should the line pass through this valley, we might, in the land market, reasonably anticipate still greater activity. McD.

Ventura Co.

Napa Valley Notes.

EDITORS PRESS:—The rapidity with which time flies was never more forcibly brought to mind than this season. It seems but a few weeks since seeding-time, and yet the fields are whitening for harvest. The elements have, generally speaking, worked well for the farmer in this valley, and there greets him the prospect of an abundant harvest of hay, grain and fruit. The outlook, compared with that of many portions of the State, especially to the south and east of Santa Cruz, is flattering.

Haying is already commenced—is, indeed, well advanced. While the crop will aggregate far less than that of last season, the quality is superior. The weather has been favorable for its curing—much of the time pleasantly cool. Considerable of the old crop is held over, as there was not a demand for the large amount housed. The new crop is being baled and will be placed on the market in excellent shape.

Less Hay but More Grain.

That is, a greater area was sown to wheat and barley in the county than last year. Barley has filled well and will soon be ready for the header. We opine the quality will be above that of the average year. Of wheat, it may be said that rarely, in this highly favored county, has this grain made more rapid progress or at this date presented a better appearance—tall straw, well-formed heads, looking, in countless fields, as if one might walk on them, so thick are they. Never were the fields of this grain freer of weeds of every kind, and the product will be marketed in a very clean condition. The large prospective yield and the excellent prices now offered for wheat make glad the heart of the farmer who has a large acreage to harvest.

The Fruit Crop.

Likewise the orchardist rejoices in the abundance of fruit on trees of most every variety in our orchards. In no previous year in our history has there been such an abundance of peaches. Trees have been thinned of surplus fruit, and thinned again; otherwise the fruit would be small and the branches break. Apple trees hang full of fruit, and other varieties promise well. If good prices obtain the orchardist will do well. A greater area of bearing orchard is noted in different portions of this county, and a large number of fruit trees have been planted this season. Year by year orchards are making greater encroachment on grain-fields in the lower Napa valley, while in the upper portion there is a constant enlargement of already extensive vineyards.

This latter section is just now, and will be throughout the season, one of beauty. The vines have for the most part made rapid growth, are very thrifty, and promise to yield large returns for the great care bestowed upon them. As a rule, these vineyards are well kept, and one may ride for miles between long-stretching, evenly pruned rows of vines, and not see a single weed. The frost of one month ago, much spoken of, did comparatively little damage, and though since that time various reports have gone out as to injury done vines by high winds or cool weather, the resulting damage has been slight. If one wishes to obtain a view of an earthly paradise, let him ride the length of Napa valley, visiting the other productive valleys in our county as well.

Other Matters.

Corn, of which there is every year quite a large acreage planted, is growing finely, and the yield promises to be up to the average. Very few fields are summer-fallowed in Napa valley, though larger areas are thus favored in the fruitful Berryessa valley.

Several years' trial has proved that silkworm cocoons can be successfully raised here, and profitably as well. Miss Mary Geaford, whose home is just outside the limits of Napa City, takes great interest in this branch of industry, and has received medals from the San Francisco Mechanics' Institute in years gone by. The occupation is a light one, very interesting withal. This season our local cocoonery will produce many thousand cocoons which will be sold to San Francisco parties. Other ladies might profitably engage in this industry, which is destined to rapidly enlarge as the years go by.

Napa, June 8, 1887. R.

THE STABLE.

State Fair Speed Program for 1887.

The speed program for the coming State Fair at Sacramento has been published, as follows:

First Day, Thursday, September 15.

TROTTING.

No. 1—The Occident Stake—Closed in 1885, with 29 nominations. Value of stake January 1, 1887, $1045.

No. 2—Trotting Purse, $1000—2:23 Class.

No. 3—Pacing Purse, $600—2:30 Class.

Second Day, Friday, September 16.

RUNNING.

No. 4—The Introduction Stake—2 year-olds; $25 entrance; $10 forfeit; $20 added; $50 to second; third to save stake. Winner of any two-year-old race this year to carry three pounds; of two or more, five pounds extra. Three-quarters of a mile.

No. 5—The California Breeders' Stake—For foals of 1884; $50 entrance; p. p.; $300 added; $100 to second; 50 to third. Closed in 1886 with 12 entries. One mile and a quarter.

No. 6—The Capital City Stake—For four-year-olds; $50 entrance; h. f., or only $15 if declared on or before September 1st; $300 added, of which $100 to the second horse; $50 to the third. Weights, five pounds below the scale. Winner of any race over one mile, this year, to carry rule weights. One mile and five-eighths.

No. 7—Free Purse, $250—Winners of any race this year, of the value of $300, to carry five pounds; maidens allowed, if three years old, five pounds; if four years, or upward, 15 pounds. Mile heats.

Third Day, Saturday, September 17.

TROTTING.

No. 8—Two-year-old Trotting Stake—$50 entrance, of which $10 must accompany nomination; $15 payable July 1st, and remaining $25 payable August 10, 1887; $200 added by the society. Closed April 15th, with 18 nominations. Mile heats.

No. 9—Trotting Purse, $1000—2:27 Class.

No. 10—Trotting Purse—$1200—2:17 Class.

Fourth Day, Monday, September 19th.

RUNNING.

No. 11—The Premium Stake—For all ages; $50 entrance; h. f., or only $15, if declared on or before September 1st, with $300 added; $100 to second; third to save stake. Horses that have started and not won this year allowed five pounds. Maidens, if three years old, allowed five pounds; if four years old or over, seven pounds. Three quarters of a mile.

No. 12—The California Annual Stake—For foals of 1885; $100 entrance; $25 forfeit; $250 added. Second horse, $100; third horse, $50. Closed in 1886 with 24 nominations. One mile.

No. 13—The La Rue Stake—Handicap for all ages; $100 entrance; $50 forfeit, with $500 added, of which $150 to second; $100 to third. Weights announced September 10th. Declaration, $20, to be made with the secretary by 8 o'clock P. M. September 12th. In no event will declaration be received unless accompanied with the amount fixed. Two and one-quarter miles.

No. 14—Selling Purse, $250—Of which $50 to second. Fixed valuation, $1000; two pounds for each $100 below; two pounds added for each $100 above fixed value. One mile and an eighth.

Fifth Day, Tuesday, September 20th.

TROTTING.

No. 15—Three-year-old Trotting Stake—For all colts (except Ella, Soudan, Shamrock and Sable Wilkes); $100 entrance, of which $25 must accompany nomination; $25 payable July 1st, and remaining $50 payable August 10, 1887; $400 added by the society. Closed April 15th, with 14 nominations. Mile heats, three in five.

No. 16—Trotting Purse, $800—3:08 class.

No. 17—Trotting Purse—$1200—2:20 class.

Sixth Day, Wednesday, September 21st.

RUNNING.

No. 18—The Sunny Slope Stake—For two-year-old fillies; $25 entrance; $15 forfeit, or only $10 if declared on or before September 1st; $150 added; $25 to second. Those that have started and not run first or second in any race this year, allowed five pounds. Five-eighths of a mile.

No. 19—The Shafter Stake—For three-year-olds; $50 entrance; $25 forfeit, or only $15 if declared before September 1st, with $300 added; $100 to second; third saves stake. Winner of any race this year to carry five pounds extra; of two or more, ten pounds; maidens allowed five pounds. One mile and a quarter.

No. 20—The Del Paso Stake—For all ages; $50 entrance; $25 forfeit, or only $15 if declared on or before September 1st, with $300 added; $100 to second; third saves stake. Three-year-olds to carry 100 pounds; four-year-olds, 110 pounds; five-year-olds, 112 pounds. Sex, but not heat, allowances. Three-quarter mile heats.

No. 21—Free Purse $300—$50 to second. Horses that have started and not won this year allowed ten pounds. Winners this year of any race of the value of $400, to carry five pounds extra; winner of No. 7, ten pounds extra. One mile.

Seventh Day, Thursday, September 22d.

TROTTING.

No. 22—Trotting Purse, $1000—2:25 class.

No. 23—Four-year-old Trotting Stake—

(Conditions same as No. 15.) Closed April 15th, with ten nominations.

No. 24—Pacing Purse, $800—Free for all.

Eighth Day, Friday, September 23.

RUNNING.

No. 25—The California Derby Stake—For foals of 1884; $50 entrance; p. p.; $300 added. Second horse $100; third $50. Closed in 1885 with 17 nominations.

No. 26—The Palo Alto Stake—For two-year-olds; $50 entrance; $25 forfeit, or only $15 if declared on or before September 1st; with $250 added; $75 to second; third to save stake. Winner of any two-year-old stake, this year, to carry five pounds extra; of two or more, 10 pounds. One mile.

No. 27—The Golden Gate Stake—For three-year-olds; $50 entrance; $25 forfeit, or only $15 if declared on or before September 1st; with $350 added. Second horse, $100; third to save stake. Winner of any three-year-old race at this meeting to carry five pounds extra; colts not 1, 2, 3, in No. 19, allowed five pounds. One mile and three-quarters.

No. 28—The Nighthawk Stake—For all ages; $50 entrance; $15 forfeit; $300 added; $100 to second; $50 to third; $200 additional to the winner if 1:41¼ is beaten. Stake to be named after the winner if Nighthawk's time (1:42¼) is beaten. One mile.

No. 29—Free Purse, $250—For all ages; $50 to second. Horses not having won at this meeting allowed five pounds. Horses that have not run second or better at this meeting allowed 10 pounds. One mile and a sixteenth and repeat.

Ninth Day, Saturday, September 24.

TROTTING.

No. 30—Special Three-year-old Trotting Stake—For Ella, Soudan, Shamrock, Sable Wilkes, and others. (Conditions, same as Regular Stake No. 15.) Closed April 15th, with six nominations.

No. 31—Trotting Purse, $1200—Free to all.

No. 32—Trotting Purse, $1000—2:40 Class.

Future Events.

Entries for the following running events for 1888–89 were ordered to be closed at the same time as the races on the regular program:

No. 1—California Breeders' Stake—For foals of 1885, to be run at the State Fair of 1888; $50 entrance; $25 forfeit, or only $10 if declared January 1, 1888; $300 added, of which $100 to second and $50 to third. One mile and a quarter.

No. 2—California Annual Stake—For foals of 1886, to be run at the State Fair of 1888; $100 entrance; $25 forfeit, or only $10 if declared January 1, 1888; $250 added; second colt, $100; third, $50. One mile.

No. 3—California Derby Stake—For foals of 1886, to be run at the State Fair of 1889; $100 entrance; $50 forfeit, or only $10 if declared January 1, 1888; $15 if declared January 1, 1889; or $25 if declared May 1, 1889; $300 added; second horse $100; third horse $50. One mile and a half.

Regulations, Etc.

All trotting and pacing races are the best three in five, except the two-year-old, unless otherwise specified.

Entry blanks and racing rules will be furnished upon application to the secretary. Entries in all, except otherwise stated, to close with the secretary Monday, August 1, 1887.

THE DAIRY.

Prizes at New York Dairy Show.

Smiths, Powell & Lamb, of Syracuse, send us a circular announcing that at the recent New York Cattle and Dairy Show, which was unquestionably the largest and best exhibition of the kind ever held in this country, between 400 and 500 of the choicest representatives of the various dairy breeds being represented, the Lakeside Herd won the following prizes: Sweepstakes for best milch cow of any breed, won by Lady Fay, eight animals being entered for the test, six actually competing. Sweepstakes for best butter cow of any breed, the one producing the largest quantity of butter during 24 consecutive hours of the exhibition, won by Clothilde, 16 animals being entered for the test, and 12 actually competing, of which 5 were Jerseys, 1 Guernsey, and 6 Holstein-Friesians. Clothilde 4th, her daughter, 3 years old, by Netherland Prince, stood second, the judges commending the fine quality of her butter. Seven other members of Lakeside herd won prizes in their respective classes.

Holstein-Friesian butter from another herd won first prize on 5-pound package, 38 entries representing the various dairy breeds in competition; also won 2d and 3d prizes on 30-pound package, 18 entries in competition.

SALE OF HOLSTEIN-FRIESIANS.—The fine herd of Holstein-Friesian cattle from the Ontare ranch, Santa Barbara county, was sold at auction by Killip & Co. at the Oakland Trotting park, June 16th. The prices were fair and the bidding as lively as expected, the attendance of interested purchasers being quite large. The record of the sale is as follows: Bulls—Ontare Chief, sold to C. W. Faber of this city for $250; Omaha, to E. W. Steele of San Luis Obispo for $300. Cows—Aaggie Kathleen $310, Syppha $125, Aaggie Leila $115, to F. H. Burke; Puritania $90, Orphan Queen $122.50, Lakeside Lois $130, Lakeside Edelia $150, Olivia Lincoln $150, Portia Lincoln $150, Marie Valoris $125, to A. Forbes; Ontare Belle $155, Lakeside Pet $130, and Artis' Carisa $265, to E. W. Steele; Alexia of Lakeside $115, and Virgie Rooker $185, to T. B. Hall of Sacramento; Flora Lincoln $215, Artis' Sophia $195, Polly Ursem $125, Jacob Wit's Bernie $175, Myla $130, Jacob Wit's Watteau $305, to J. C. Steele of Pescadero; Vassar $150, Jacob Wit's Phene $170, Fanny Fern $145, Jacob Wit's Myth $185, St. Perpetua $180, Phyllis Lincoln $189, Sara Zeeman $165, Lakeside Camilla $150, to H. N. Buhne of Eureka; Emma Rooker $205, Artis' Cambrasio $170, Julia Arthur $160, Nerissa Lincoln $160, Lakeside Alida $145, Lakeside Agnes $130, Artis' Griselda $180, and Ellie Lee $170, to R. G. Sneath of San Mateo; Dame Trot $155, Miss Frisbie $170, and Rosabel Lincoln $270, to F. H. Kenfield of Redwood City; Riding Hood $145, Artis' Dorlisca $170, and Lakeside Amy $140, to Oscar Foss of this city; Annette Lincoln $240, to M. F. Tarpey of Oakland. A lengthy list of bull calves and heifers, numbering 64 animals in all, were sold at the same average of fair prices.

ENTOMOLOGICAL.

Strawberry Borers.

EDITORS PRESS:—When Prof. Riley was here in April, he visited strawberry plantations with me and carried home with him some of our strawberry borers. After making due examination, he sends the inclosed report:

U. S. DEPARTMENT OF AGRICULTURE,
DIVISION OF ENTOMOLOGY,
WASHINGTON, D. C., May 28, 1887.

My dear Mr. Wilcox: I have often thought of you since I got home, but now have a special reason for thinking of you and for writing you. Your strawberry borer, which I have succeeded in breeding to the perfect state, turns out to be, as I told you it would, an *Aegeria*. It corresponds with what has been described by Mr. Henry Edwards as *Aegeria impropria*. There are some slight differences between the specimen from your strawberry roots and the description, but I believe they are only variations. This determination of the species is of course only one step, and that not of a very great economic importance, in eliciting the full history of the pest. I will not attempt to suggest a satisfactory remedy until we have studied its full life-history through a whole year, except that I believe that bisulphide of carbon inserted in holes in the ground wherever the borer is found working badly will prove destructive to it. Sincerely yours.

C. V. RILEY.

It will be understood that this borer is unlike the one that is so common and injurious on the Atlantic side of our country, and which is widely known elsewhere.

While our borer works upward from the root, theirs works from the crown down, and is known as "the crown borer."

I am glad to place this borer where it belongs, in the category of fruit depredators, and am also glad that it is not so destructive as the Eastern pest. But this may be owing in part to our system of irrigation, which checks its ravages to a great extent.

It is a great wonder that the crown borer has not yet been brought into our State, as we are constantly bringing in all the new varieties of strawberries produced elsewhere. I will not further extend my comments on these borers, which I have repeatedly referred to heretofore in your paper. We cannot be too careful in bringing in new plants, and should promptly treat any of these borers with Prof. Riley's remedy or some other remedy more heroic. Better destroy the plants entirely than to run any risk. I. A. WILCOX.

Santa Clara, June 14, 1887.

The Hop Louse.

WASHINGTON, June 15.—Professor Riley, Entomologist of the Department of Agriculture, has made public the result of an exhaustive personal investigation into the habits of the *phorodon humuli*, or hop louse. His discoveries are expected to prove of great value to hop-growers, as he has succeeded in learning the habitation of this plant pest during the winter months, and tracing it through the varying stages of insect life. Before the Professor's investigation it was not known how or where the insects survived the winter.

As a result of his inquiries, the Professor has satisfied himself that the eggs laid by the female at the close of the summer are deposited in plum trees, where the insect hatches in the spring and resides until the third generation. This third brood, unlike its predecessors, is winged, and immediately after development abandons the plum tree and attacks the hopvine. In the autumn the counter-migration from the hopvine to the plum tree occurs, the winter eggs are deposited, and the cycle of life goes on in the same fashion.

It is a notable fact that in regions where the cultivation of hopvines is a new industry, the growers have had complete immunity for a while from the pest.

In California to-day they are not troubled by it. The Professor believes that the *phorodon humuli* has been brought to this country from Europe on plum stock, and there is reason to believe that phylloxera, the dreaded grape pest, was carried from this country to Europe on grapevine cuttings. Therefore California hop-growers are warned to beware of importing plums to California from Eastern hop regions. These discoveries render it possible to check the ravages of the hop louse either by the use of insecticides in the springtime before the insects have reached the winged state, or by the destruction of sheltering plum trees.

Experiments will be continued with a view of protecting hopvines after they have become infected with lice.

HORTICULTURE.

Thrashing for Walnut Dropping.

EDITORS PRESS:—I see a notice from Coloma, in El Dorado county, in your number of May 21st, asking "Why do walnuts drop?" and wishing a remedy for the evil.

I have some thrifty walnut trees at my country seat in Temescal, and they put it in their lofty heads to drop their fruit every year when the size of a marble, as your correspondent says. Then we remembered the method adopted in the European countries of our birth to remedy the evil, applied it, and since then it is a real satisfaction to see the number of walnuts that grow to maturity. The remedy is this: We continually break with the fingers all the young shoots which can be easily reached, and to the balance of the tree or trees we give a good sound thrashing with a long, slender pole. This thrashing is directed against, and has for its object to break, all the young shoots of the tree, and thus to compel the vital force to expend itself in forming fruit strong enough to arrive at maturity. A. VAN DER NAILLEN.

24 Post St., S. F.

California Dried Fruits.

[Written for the RURAL PRESS by J. R. F.]

With this month ends the dried fruit season of 1886–7, and owing to the large interests at stake, a short review may prove interesting to the many readers of the PACIFIC RURAL PRESS. The following gives the production last year in comparison with 1885, 1884 and 1883:

	1885. lbs.	1883. lbs.	1884. lbs.	1883. lbs.
Raisins	15,000,000	9,400,000	3,500,000	2,500,000
French Prunes	2,150,000	1,400,000	1,524,000	250,000
German Prunes	125,000	150,000	350,000	.....
Apples, sun-dried	300,000	1,073,000	1,200,000	800,000
Peaches, do.	750,000	1,500,000	500,000	500,000
Plums, do.	500,000	1,020,000	700,000	100,000
Pears, do.	50,000	100,000	75,000	75,000
Grapes, do.	175,000	175,000	150,000	125,000
Apricots, do.	150,000	300,000	100,000	300,000
Nectarines, do.	30,000	30,000	10,000	20,000
Figs, do.	150,000	100,000	50,000	60,000
Apples, evaporated	500,000	750,000	400,000	250,000
Apricots, do.	450,000	350,000	100,000	90,000
Peaches, ev. peeled	100,000	150,000	50,000	.....
Peaches, ev. unpeeled	200,000	250,000	80,000	.....
Plums, evaporated	85,000	118,000	75,000	.....
Nectarines, do.	25,000	50,000	10,000	.....
Totals	20,745,000	16,766,000	8,874,000	5,079,000

Raisins show a most remarkable increase, as do French prunes. Apples, plums and peaches show a large falling off, but apricots hold their own, while figs show an increase. The large demand, both home and shipping to the East, for green fruits particularly, in the months of May, June, July and August, caused horticulturists to sell and not dry the fruits. There was shipped to the distribution centers east of the Rocky mountains all of 100 per cent more green fruits than were sent in 1885. While there was an increased shipment, there was also a larger purchasing of several varieties by canners. Besides, the crops of apricots, apples and peaches were light, particularly that of peaches. The season was entered with the market cleaned up and ready buyers in the field at an advance for the more choice dried marketed in attractive packages. The East, which had taken everything in this State in the shape of dried fruits, owing to the low overland freights, was also bare of stocks, but at first held back owing to the advanced views of holders on this coast. As the season advanced, Eastern buyers took more kindly to the situation, and paid quite freely the full figures asked. Soon the demand became more marked, resulting in the market being cleaned up at an earlier date than was the season of 1885–86, and at prices showing an average advance of more than 100 per cent.

Last year's production was better handled and sent to the market in much better condition and style than was ever before done. This improvement in the drying and handling had a most marked effect for the better, and not only aided in their being placed more advantageously, but has built up a reputation for California dried fruits second to none, while in some respects superior, particularly the French prunes and peaches.

The incoming dried fruit crop will come in on a bare and hungry market, both on this coast and at the East. All Eastern advices report that the distribution the past winter and spring was on a more extended scale than ever before known, and what is equally as worthy of special note is that all went into consumption. This year's crop will probably exceed last year's, owing to the high prices obtained for all varieties dried in 1886. It is impossible to give the number of new driers sold to be used, but it is claimed that there will be all of 25 per cent more in use than there was last year. One party living near Los Gatos is said to have added to the number of driers he will use. This he is compelled to, owing to his having bought over 2000 tons of green fruit for drying. Regarding future prices it is difficult to say, but this is safe to state, that all advices from the East are to the effect that they can handle with fair profit to driers all the fruit that can be dried on this coast, provided care is used in drying, handling, and packing it for market.

SHEEP AND WOOL.

The Southdown Breeders.

EDITORS PRESS:—The American Southdown Association held its annual meeting in the Leland hotel, Springfield, Ill., on the 1st inst., President J. H. Potts in the chair.

The report of the secretary was received, showing an encouraging increase of interest in the rearing of good mutton sheep. There has been a very noticeable increase in the demand for Southdown rams for crossing on flocks kept heretofore chiefly for the production of wool. The second volume of the Record was reported as full and in the hands of the printer.

The treasurer's report was referred to the Auditing Committee. It showed a handsome balance on hand with which to pay for the publication of Vol. II of the Record soon to be issued.

On motion Messrs. S. E. Prather and Chas. F. Mills were appointed a committee to prepare resolutions expressing the loss of the association by the death of Geo. Pickrell, late a member of the Board of Directors.

The election of the officers for the ensuing year resulted in the choice of J. H. Potts for president, S. E. Prather for secretary, and D. W. Smith for treasurer. Three directors were also chosen to serve for the term of three years as follows: D. W. Smith, Bates, Ill.; Sam'l J. Sharpless, Philadelphia, Penn., and C. F. Mills, Springfield, Ill. T. T. Shoemaker, Charleston, Ill., was elected a director for the unexpired term made vacant by the death of Geo. Pickrell.

The members of the Board of Directors who hold over until 1889 are H. E. Alvord, Amherst, Mass., C. M. Clay, Whitehall, Ky., and Fred'k Billings, Woodstock, Vt. Those who hold over until 1888 are T. W. Harvey, Chicago, Ill., J. H. Potts, Jacksonville, Ill., and T. T. Shoemaker, Charleston, Ill. PHIL. THRIFTON.

Proposed Quarantine on Sheep.

HELENA (M. T.), June 15.—The Judith Wool-Growers' Association, at a meeting held at Lewistown, passed resolutions requesting the Governor to prohibit the importation of sheep from the States of Nevada, California and Oregon and the Territories of Idaho and Washington, on the ground that nearly all the sheep brought in from the sections stated are affected with scab.

The woolmen were in high spirits, and look to this year's increase to more than offset last winter's losses.

The general sentiment of the members of the association was for all to make no calculations on open winters, but to shut up all the hay possible; not to run too many sheep in one band, and to provide ample protection from storms.

HELENA (M. T.), June 16.—Upon the return of Governor Leslie, now in Kentucky, arranging for the transfer of his family to Montana, a combined effort will be made by the leading wool-growers of the Territory to induce him to quarantine Oregon and California sheep affected with scab. It is not improbable that the request will be granted, and it is worth the attention of those intending to drive into Montana, so that they will not get their bands started on the trail only to find themselves stopped at the border. It is said that one band of scabby sheep, from Oregon, driven into Gallatin county last year, communicated that disease to 40,000 healthy sheep.

Buenos Ayres Sheep.

WASHINGTON, June 8.—L. L. Baker, United States Consul at Buenos Ayres, in his monthly report to the Department of State, treats in great detail the native sheep of the Argentine Republic and their value and the practicability of introducing them into this country. Consul Baker thinks that all the varieties could be tamed with advantage in the desert places of Texas, New Mexico and Arizona, and that even the most unpromising portions of these Territories might in time attain development through the valuable wools which these animals afford, while in other parts of the country, wherever ordinary sheep may be bred, the introduction and acclimatization of these valuable wool-producing animals would give us a new and national source of wealth.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Why is This?

When the land is full of workers,
Busy hands and active brains;
When the craftsmen and the thinkers
Feel about them binding chains;

When the laborer is cheated
Of the work his hands have wrought,
And the thinker, vain of logic,
Sees that reason comes to naught;

When the forces men have harnessed,
And have trained to do their will,
Ought to have no homeless people,
And no hungry mouths to fill;

But have proved themselves the servants
Of the shrewd and selfish few,
And the many get but little
For the work they find to do;

When the labor of a million
Goes to swell the gains of one,
As the slaves of ancient Egypt
Slaved beneath the burning sun;

When the schemer and the sharper
Hold the wealth and rule the land,
Using up the thinker's brain-force,
Mortgaging the craftman's hand;

When the many shear the sheep
And the few secure the wool,
And the gallows claims its victims,
And your costly jails are full;

Then the men who dreamed of progress
And had hopes of peace and bliss,
While they think and wonder vainly—
Ask each other: "Why is this?"

Then the thinker, while confessing
That his vision yet is dim,
Says that one thing very clearly
Is apparent unto him—

That the people, blind or heedless,
Place themselves beneath the rule
Either of the devilish knave, or
Worse, perhaps, the sodden fool.

—*N. P. Willis.*

Grangers' Interstate Picnic-Exhibition in Pennsylvania.

The Fourteenth Annual Interstate Picnic-Exhibition, under the auspices of the Patrons of Husbandry, will open at Williams' Grove, Cumberland county, Penn., Monday, August 29th, and continue through the week. Bro. R. H. Thomas, of Mechanicsburg, general manager of the exhibition, has issued a circular, from which we make the following extracts:

Thirteen years ago Patrons of Husbandry, to the number of a few hundred, came to this spot to hold a pleasant reunion, talk over the work already done and arrange plans for the future. Little did they think that they were even then laying the foundation for the greatest gathering of farmers, manufacturers, and all interested in agricultural pursuits, ever known in the United States. That few hundred has become over 100,000, representing 28 States of the Union.

Varied and extensive as was the display last year, it will be greatly surpassed the present season. A large number of new and handsome permanent buildings will be erected, which, together with other substantial improvements that have been made, will add greatly to the beauty of the place. The applications by exhibitors for space are over 20 per cent greater than at this date in any former year. New manufacturing firms, which have never yet exhibited at Williams' Grove, are preparing for extensive displays. Leading stock-raisers have made arrangements to exhibit largely.

A new and interesting feature of the exercises will be instructive lectures to the members of the Patrons' National Reading Circle and a general conference of the leaders of the different classes for the purpose of determining the best methods of successful work.

Arrangements are being made this year by which the cheap excursion rates to the picnic will cover a greater length of time, thus affording Patrons and others an opportunity to be in at the opening and closing of the exhibition, without being subject to any inconvenience or annoyance from higher rates of fare.

The management are busy preparing to meet the increasing demands for space and quarters. Hundreds will stay in the grove the entire week and thus save the worry and annoyance of seeking lodging-places elsewhere. This is the true way to enjoy the meeting, and those who once adopt this plan are not likely to desire a change.

We do not know how many California Granges will be able to attend this interesting picnic-exhibition; but any who desire to know more about it may address R. H. Thomas, Mechanicsburg, Pa.

GALT GRANGE, agreeably to arrangement noted three weeks since, entertained a delegation of 14 members from Sacramento Pomona Grange on the 4th instant. The ride thither, the sisters' hospitable board, the speeches and social converse generally, all seem to have been thoroughly enjoyed by those whose good fortune it was to go on the fraternal visit.

The Drive-Well Patent.

Bro. Mortimer Whitehead, W. L. N. G., writes as follows in regard to the decision which we briefly mentioned last week:

A case in which tens of thousands of farmers in all parts of the country are interested has lately been decided by the Supreme Court of the United States, viz.: the "Drive-well" patent case. It has been over and over again proven that the first of these wells, which consist of nothing but a pointed tube driven down into the ground, and worked by an ordinary pump, was driven in October, 1861, in the camp of the 66th N. Y. S. V. of which Col. Green was the commanding officer. Other like wells were used during and after the war, and the Circuit Courts in Iowa and Indiana held that this use of the wells by the public rendered the patent void. Decisions upon the same subject have been reached in New Jersey, as well as in Connecticut and Ohio, from which the appeal just decided was taken. The Supreme Court now reverses the lower courts, and holds that the invention had neither been anticipated nor used by others in a matter to invalidate the patent. The interests involved, while small in each individual case, are enormous in the aggregate. The Indiana suit showed that 50,000 of these wells, on each of which $10 royalty was demanded, were in use in that State alone. As many more are in use in Iowa, and the number in the United States has been placed at between 500.000 and 1,000,000.

With the prospect of paving this royalty of from *five* to *ten millions of dollars* staring them in the face, one would think that every farmer in the nation would at once unite with an organization like the Grange, that for years past has been trying to have our unfair patent laws so amended that the *manufacturer* of articles that are patent-infringements shall alone be held responsible, and *not* the innocent purchaser, who pays full price for the machine, drive-well or whatever the article may be, not knowing of the patent, or perhaps being assured that the royalties, etc., have been paid. If every farmer was in the Grange, where he belongs, the law which permits this levying of millions of dollars tax upon farmers from time to time—of which this drive-well is only one instance among many—would be stricken from our statute-books before the adjournment of the next Congress. Farmers, think of this.

Strawberry Festival at Sacramento.

Sacramento Grange has a kindly custom of holding an annual strawberry festival and Harvest Feast, to which the members of neighboring Granges are invited. This pleasant usage was duly observed May 28th.

The W. M. instructed a class in the fourth degree; then came the delicious banquet, and in the afternoon there was an open meeting, largely attended, at which the following toasts were proposed by the W. M., and responded to in entertaining style by the parties mentioned: "The Good of the Order," W. L. P. G., G. W. Hack; "The Next State Grange at Santa Rosa," District Lecturer Geo. W. Hancock; "The Growth of Our Order," Master Elk Grove Grange, Thos. McConnell; "Our Sister Grangers," A. F. Aiken; "The Age of Progression," P. M. Oscar S. Flint; "Our Sisters' Rights," Flora M. Greenlaw; "The Fruit Industry," E. Greer; "The Rising Generation," H. W. Johnson; "Sacramento County," Wm. M. Sims; "Sacramento Grange, No. 12," proposed by W. M., Sims, responded to by W. M., W. Walter Greer; "Sacramento County Pomona Grange," W. O., Jas. Sims; "The Grange," Dr. Caples, of Elk Grove Grange; "Our Visitors," Geo. Wilson, of Enterprise Grange.

The exercises were varied with songs and instrumental music, all present seemed to enjoy themselves, and the meeting was pronounced "an entire success in every particular."

WATSONVILLE GRANGE having proposed that a fair be held in Pajaro valley this fall, the *Pajaronian* indorses the project with enthusiasm as follows: "Heretofore Salinas and Santa Cruz have had a monopoly of the fair business, the former being aided by the State and the latter by a county association. Midway between those towns is Pajaro valley, numbering among her productions the full list of cereals, vegetables and deciduous fruits. No part of the State is richer in soil, no section can show greater variety or more general excellence in productions. * * This year Pajaro valley could make a local exhibit that would surprise even the people of this section, and that could be forwarded to the State or Mechanics' Fair, where it would be bound to attract much attention, and thus further advertise the fertility of this favored spot. Business men, orchardists, dairymen and all classes of farmers should unite to make the fair proposition a certainty, and then unitedly labor to make it a success. Every person interested in the progressive development of Pajaro valley should attend the public meeting to be given by Watsonville Grange at its hall on Saturday afternoon."

BY the death of Bro. Frederick Langenkamp, Valley Grange has lost the counsel and aid of one of its most beloved and genial members. Resolutions expressing their sense of departed worth, of sorrow, and of sympathy with the bereaved family, have been adopted and published by the Grange.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

Ought some restrictions to be placed upon indiscriminate immigration? is one of the subjects proposed for investigation and discussion by members of the Grange in the United States during the summer months, that they may be prepared to take intelligent and concerted action at the meeting of the National and State Granges next fall and winter, and so bring the matter with proper weight before Congress.

It is estimated that upward of 600,000 foreign immigrants will land on our shores this year. In some cities they are camped out, waiting for steamers to transport them.

In every Anarchist meeting or outbreak, in every official statement concerning the condition of labor or the inmates of our almshouses and asylums for the insane, and in every report relating to plague spots in the slums of our great cities, may be found something to remind the people of the United States that immigration is not a blessing. A bill abolishing the State Board of Immigration of Wisconsin passed both houses of the Legislature without a dissenting vote this last winter. We do not want criminals. We do not want insane persons or paupers. The almshouses of New York State contained in 1880 no less than 34,312 foreign-born inhabitants; one foreign-born pauper to every 35 foreign-born inhabitants, as against one native to every 176 of the native population.

Farmers bear the burden of the taxes to support these paupers. We do not want the thousands of laborers who are coming hither with the intention of living here for a few years upon food that the native laborer rejects, of working for very low wages, and then returning to Europe to spend the remainder of their days.

We do not want those whose chief desire is to destroy our institutions, illustrated by him who, on being asked what ticket he was going to vote, answered: "Any that is agin the Govermint." Farmers must bear the burdens of all the troubles this class causes also.

STEAMSHIP LINES who have tickets to sell, railroads who have besides transportation millions of acres of land given them by our too liberal Congress, which they wish to dispose of at good figures, use every device to induce immigration. Millions of acres of land are put under the plow by those used to peasantry living and expense, and produce crops to add to an increasing overproduction year by year; land that could afford to wait for the coming generations, and be developed as needed and not as now forced to yield its increase even to the detriment of a very large proportion of the farmers of other portions of our country.

THE recognition that the Order is receiving, through the enactment of laws and the consideration of various measures that have been advocated by the Grange, by the National and State legislators, is inspiring the farmers of the nation with hope and faith in the practicability and final success of the Order, and of the utility and absolute necessity for organization. It is the hope of those who are laboring for the welfare of American agriculture, and for mankind in general, that the day is not distant when correct conceptions of the means to be employed, and the methods by which the corrective influences appropriate to our form of Government, are to be more clearly understood and universally applied.—*N. Zimmerman, Lecturer Kansas State Grange.*

WE are wont to say farmers are the most independent class there is. It is true that a farmer in good circumstances, with moderate wants, may regard himself and condition with a degree of self-complacency. But whatever his circumstances may be, the most valuable lesson he can learn is to know when to be independent, and when to co-operate with others. In the Grange all matters can be discussed, and each may receive the benefit of the knowledge of all. We say to every farmer, go into the Grange and learn; and to put your newly acquired knowledge to practical test in the useful purposes of life; being a member of the Grange, you have a noble opportunity.

The intelligent and docile Patron of Husbandry will soon find that he can learn much more of the best methods to be pursued in his calling by co-operating with his fellows, who have equal and identical interests, than by working independently and by himself.

He will also find it no less profitable to exercise his independence and his own good judgment in all matters that affect him through the medium of taxation. Let him inquire if it is right for one man, with little or no property, to pay as much for the support of government as the richest, because it is for the interest of his Congressman who gets $5000 a year and 20 cents a mile for travel to tell him so. He certainly ought to have independence enough not to believe that black is white, or that two and two make five, especially when he has to pay for the cheat himself. Why imagine himself an American sovereign and still blindly and servilely follow the dictation of party leaders and professional men who fatten on the fruits of his toil?—*Dirigo Rural.*

THE lecturing force of the National Grange is now disposed of as follows: Deputy Lecturer J. N. Lipscomb has the following partial program: Arkansas, July 1st to 18th, and July 23d to 28th; Mississippi, July 19th to 22d; Interstate Grange Encampment (five States), Spartansburg, South Carolina, August 1st to 6th; Texas, August 9th to 20th; Louisiana, August 21st to September 1st; Alabama, September 1st to 15th, the balance of September and October divided among Georgia, North Carolina and South Carolina.

Deputy Lecturer D. H. Thing is in Maryland; then goes to Pennsylvania until July 2d; then to Maine; August, in New Hampshire and Pennsylvania; September, in Vermont; other meetings are being arranged.

Deputy Lecturer C. L. Whitney is preparing for Colorado.

Deputy Lecturer J. H. Brigham is about completing his Kentucky campaign, and will be actively at work in the central and some of the Western States during the summer and fall.

The Lecturer of the National Grange is still in Virginia; he goes next to Pennsylvania, and arrangements for his Western visit in eight States are nearly completed.

PROGRESS.—Two more new Granges in Penn.

I LOVE the Grange because it is so unselfish and so full of philanthropy. Why all the farmers are not actual members of the Grange and helping us, as Grangers, to accomplish the objects for which we are striving, is, indeed, a mystery.—*W. L. R., Tennessee.*

PITTSTON GRANGE, N. H., holds "children's meetings" once a month for the little folks, and it is a grand feature.

CALIFORNIA PATRONS have taken steps to organize a Grange immigration agency, so that Eastern members of the Grange who may desire to go to California for the purpose of making the State their home, may obtain reliable information in regard to the country without the fear of having frauds perpetrated upon them by parties who are interested in private speculation. The object is laudable, and will doubtless be appreciated by many who are looking toward the Pacific Coast.

THE GRANGE has no sympathy nor fellowship with communism, socialism, nihilism, nor even the least countenance for them. The Grange is composed of the most conservative of all classes—the farmers. A willful violation of law cultivates the spirit of lawlessness. When men meet together and organize for the purpose of defeating the execution of a statute which has been passed and promulgated by the proper authorities as the law of the land, what is such an organization but a school for training men in a spirit of disobedience to civil authority, and graduating them full-fledged anarchists?—*Grange Homes.*

The Beet-Sugar Enterprise to Go Forward.

We are glad to learn that arrangements are advancing to rebuild and re-equip the beet-sugar factory at Alvarado. The trouble in the old establishment was settled by legal methods, and Mr. E. H. Dyer has become owner of the old plant at a valuation of $125,000. He has organized a new company, which has just incorporated under the name of the Pacific Coast Sugar Company, in which there will be put in funds equivalent to Mr. Dyer's possession, making the whole capital a quarter of a million. It is announced that the company will at once begin the construction of a new mill, on which $75,000 will be spent, leaving a working capital of $50,000. The mill will be ready for work for the season commencing in August, 1888. The new mill will be much more scientifically constructed than the old, which was built up from time to time as additions were needed, and was consequently in great measure a patchwork affair. The most improved European and American machinery will be used, but it will all, or nearly all, be made on this coast, and probably by the Union Iron Works, of San Francisco. In the season of 150 days, they expect to be able to turn out 4,000,000 pounds of sugar, which they calculate will cost them 4½ cents a pound. On these figures, even at the present low price of sugar, there is a profit of one cent per pound. If the enterprise turns out a success, the company proposes to build another mill at Decoto, a few miles from Alvarado.

It is expected that the new mill will use from 160 to 200 tons of beets a day. The capaci y of the old mill was 80 tons a day, and it is said that in the years from 1879 to 1886 it made a net profit of $103,349 63, but none of this was made in the last three years of its existence, because of the extremely low price of sugar, coupled in some measure with the lack of improved machinery.

We trust the course of beet-sugar will be henceforward clear and onward. There are many hoping for it.

GEN. BIDWELL'S GIFT TO THE NORMAL SCHOOL.—On the evening of the 14th the citizens' Committee on the Location of the Normal School were notified by Gen. Bidwell that he would donate, as a free gift, eight acres of land in his garden on First street, together with the perpetual right to the waters of Chico creek, for irrigation and school purposes. The committee were highly gratified at the announcement, and immediately prepared a letter of thanks to the General in behalf of the citizens of Chico and vicinity. The land donated is in the edge of town, far preferable to the site he first offered for the purpose, and, with the water-right, is valued at not less than $20,000. This last act is quite in keeping with the humane spirit and many generous deeds which have endeared the General and Mrs. Bidwell to their fellow-citizens and neighbors.

STOCKTON FAIR SPEED PROGRAM.—We have received a copy of the speed program of the Stockton fair. The racing will begin Tuesday, Sept. 27th, and close Saturday, Oct. 11th. Purses aggregate $15,000. The San Joaquin valley district for races comprises the counties of San Joaquin, Tuolumne, Mariposa, Fresno, Calaveras, Stanislaus, Merced, Tulare and Kern. Any desired information can be had by addressing J. M. LaRue, secretary, P. O. box 188, Stockton, Cal.

AGRICULTURAL NOTES.

CALIFORNIA.

Colusa.

QUEER WEATHER.—*Sun*, June 18: Our hot weather came earlier this year than usual, and was followed by more cold weather than is usual for a California summer. Last Sunday was a day of hail and rain. At some places in the valley as much as an inch and a half of rain fell in an incredibly short time. Sunday, immediately after the hailstorm, on the platform at the depot, hail seemed to be several inches deep where it had rolled off the roof of the house. Just think of a pile of ice falling from the clouds so soon after the hot days of the latter part of May! There was only six hundredths of rain at Colusa, and at some places none at all. A streak of the hailstorm passed over a portion of the big grain on Grand island and knocked it down so that it will be hard to gather. J. C. Frazier informs us that out of 2000 acres he has 40 badly down, but that he will get most of the grain.

Contra Costa.

HORTICULTURAL JOTTINGS.—Antioch *Ledger:* Thos. Morgan has a block of lots nearly all set to grapevines. About 300 are two years old—or rather two years ago last January the cuttings were planted. Last year from 30 of these vines 80 pounds of grapes were taken, and they are now showing a fine fruitage. On many vines of the Sweetwater variety, two years old from the cuttings, are a dozen bunches of good-sized grapes. The Muscat and Malaga show the finest growth, several of the two-year-old vines having a circumference of seven or eight inches, and the set of grapes must be very gratifying to the vineyardist. A few apricot trees in the same block, planted one year ago, have fine specimens of fruit, only a dozen or so of the abundant fruitage set upon the branches being allowing to remain. The lot is entirely surrounded by a hedge of Monterey cypress and presents a very attractive appearance. Mr. Morgan owes his abundant success to careful cultivation and painstaking attention to details....In the orchard of N. W. Smith, in Lone Tree valley, we have noticed remarkable instances of continued vigor in the usually short-lived peach tree. Several trees not less than 19 years old are perfectly free from blemish, loaded with fruit, and show a growth for the season of from two to three feet.

El Dorado.

CHERRIES.—*Record-Union*, June 18: W. H. H. Fellows, of the Placerville *Observer*, in his work of making known the superior quality of El Dorado products, has been forwarding to various points boxes of cherries grown 2700 feet above sea level, and without irrigation. There certainly have been no cherries seen in Sacramento superior to these, and few their equal. They are very large, beautifully colored, of charming flavor, and of a texture that will bear shipping almost any distance without deterioration. El Dorado will in the near future become one of our greatest cherry-producing sections.

Humboldt.

HAY AND GRASS.—Eureka *Standard*, June 16: In some portions of Eel River valley farmers have commenced cutting their grass hay. The crop is universally good, just as all grain crops promise to be. So far as we can learn, grass on the ranges is generally good—better than at this time last year. Perhaps it would be well for farmers to save their straw, as far as possible, for it is hard to predict what sort of season the next may be. Time has been when baled straw sold for a very fair price for stock-feeding purposes.

SPRING CLIP.—All accounts thus far agree that the spring clip of wool in Humboldt county will be unusually heavy and good. After the discouraging reports which came from the ranges last winter, we had prepared for a different outcome when shearing time arrived. But the winter reports were exaggerated. Advices received all the way from Kneeland Prairie, thence to the Mad river, Iaqua, Yager, Fort Baker, Van Duzen, Blocksburg, Island Mountain, Spruce Grove, South Fork, main Eel river, Elk Prairie, Upper and Lower Mattole valleys, to the Cape Ridge and Bear River ranges, induce the conclusion that the clip will be greatly in excess of last year's. The prospect is encouraging, as well as being good for remunerative prices, and yet Humboldt county drags along without receiving the benefits which would accrue from a full fledged woolen manufacturing establishment.

Los Angeles.

PROCEEDS OF THE FLORAL FAIRS.—L. A. *Times*, June 16: The annual meeting of the Flower Festival Society was held at the Woman's Home yesterday, with a goodly attendance. Mrs. R. M. Widney, the president, made her report—quite a lengthy and interesting document—setting forth fully the objects and methods of work in the Woman's Home; the work and needs of the exchange; the library and educational work; the attitude of the society toward the wage-workers and the way in which they seek to assist employe and employer, and the great need there is of a work of love among the unfortunate and distressed of our land. The report of the recording secretary, Miss M. M. Fette, reviewed the history of the association. The first flower festival, in 1885, secured $2000; in April, 1886, the festival netted $4100; and with the results of their efforts this year, they have now secured a valuable lot of land and a handsome building, the latter costing about $14,000, exclusive of furniture, all of which is paid for. The report of the financial secretary, Mrs. Abernethy, showed a balance of $300 in the treasury.

HOW TREES AND VINES ARE DOING.—Santa Ana *Standard*, June 18: The apricot crop in the Santa Ana valley is rather light this season, but the peach, apple and pear crop will be first-class. The peach trees are all overloaded, and many will break down unless some of the green fruit is picked from the trees. Grapes are getting a fair size, though the crop will be lighter than last year. English walnuts are heavily loaded, and we notice that our neighbors at San Juan, Tustin and Anaheim are blessed with a fine crop of nuts.

Sacramento.

DATE-PALMS FRUITING.—*Record-Union*, June 17: George Rich, who resides about six miles from the city on the upper Stockton road, has a date tree (commercial quality) which has put forth six stems, each of which is filled with berries and blossoms. This is the first time this tree, which is now eight years old, has ever borne.

LICORICE.—Isaac Lea, near Florin, has gone into licorice-growing on a large scale and made a success of it. He was reported to have 16 tons of the root cut and baled, ready for shipping to Chicago, a fortnight ago.

San Bernardino.

EXTENDING THE GAGE SYSTEM.—*Press and Hort.*, June 18: Matthew Gage has purchased from S. C. Evans about 2400 acres of the Hartshorn tract, lying south of and above the Riverside canals; also about 800 acres from the Riverside Land and Irrigating Company, of the Provost tract adjoining, all at $75 per acre. He will now extend his canal over the land, and thus be enabled to sell it at from $300 to $500 per acre, with water, which will make another important addition to the city of Riverside.

San Diego.

OSTRICH CHICKS.—San Diego, June 20: Fifteen ostriches have just been hatched from a nest of 17 eggs at the Mountain Fair View ostrich farm, in this county. This is claimed to be the best record ever made in America. There are now 80 birds at the farm.

San Joaquin.

IRRIGATED GRAIN.—Stockton *Independent:* Charles Miller, who farms a tract owned by the Weber heirs, on the north side of the Calaveras river and west of the Cherokee Lane road, irrigated a piece of summer-fallowed grain, which is yet green and stands more than four feet high, with well filled heads fully four inches long. Farmers who have noticed the grain believe it will yield 40 bushels per acre. An adjoining field, which was not irrigated, will yield about 10 bushels per acre. John E. Moore, the well-known farmer south of the Calaveras and about three miles from the city, also has a fine piece of irrigated grain, which will yield more than twice as much per acre as his unirrigated land. D. A. Learned lives a short distance southeast of this city. Mormon channel runs through his farm, and he turned water over 65 acres of the tract, but could not irrigate the remaining 40 acres. He says the crop on his irrigated tract will be four times heavier than the yield on the 40 acres which could not be flooded.

Santa Barbara.

CHERRIES AT LOMPOC.—*Record:* The fruit from the orchards of C. E. Carter and W. J. Robinson is equal to the best yield ever reported from the famous cherry belt about S. F. bay. The finest cherries of the Gov. Wood variety we ever saw are from C. E. Carter's. Some of his trees have a yield of 200 pounds. None of our orchards are more than 10 years out. This is as far south as the cherry is known to be grown with profit.

EUCALYPTUS FOR WIND-BREAKS.—The farmers in the valley have come to the conclusion that it will enhance the value of their lands to put out gums to the west and north. It will do more. The value of crops within 500 feet of the gums will more than double their yield. The wood is a great item, and the protection to fruit and change in climate is almost incalculable.

THE CROPS.—Santa Barbara *Independent*, June 18: C. F. Bassett, a prominent member of the S. F. Produce Exchange, who has just arrived from the northern portion of Santa Barbara county, says that in the Lompoc valley the crops of barley, beans and mustard are looking exceptionally well. In the Santa Ynez valley a larger acreage has been planted than ever before, and the crops of barley and wheat are looking much better since the rain of last week. Heading of grain had just been commenced in Lompoc valley and will begin this week in the Santa Ynez; the quality of grain in the latter section will be much better than last season. The honey crop in these sections promises much better than a month ago. Parties are beginning to extract. Reports from the dairy sections are not favorable for a long season for dairy products.

Santa Clara.

THE MONEY IN CHERRIES.—San Jose *Herald*, June 20: Reliable figures concerning the cherry crops begin to come in. Ex-Mayor Settle, who lives in the Willows, reports an average of $3 a tree for white cherries, and $1.50 a tree for black ones. This is an average of about $220 an acre, and a light crop at that. The whole cost of cultivation, picking and marketing would certainly not be more than $45 an acre, so that a clear profit of $175 an acre is realized.

Solano.

EDITORS PRESS:—Yesterday and to-day were the hottest of the season; the mercury stands at 118°, and the north wind is blowing. Fruit is ripening very fast, with a good chance to burn. The hot spell two weeks ago damaged fruit somewhat, and much has fallen off since. What the result of this last one will be is hard to tell. Most of the grain is too far along to shrink much. There is no great excitement here now in the fruit business. Those who have not sold will mostly dry, commencing this week. Some were drying last week near Putah creek. A cannery was projected at Winters, but starting so late in the season, they were not able to get the necessary machinery in; so they are drying. They have some 50 cutters at work, and pay 15 cents per hundred for cutting. At present they are short of help and behind with their work. They are paying 1½ cents per pound for 'cots. The grain crops in Suisun valley are good, and farmers are well pleased with the prospect of good prices. Barley is nearly all headed, and some thrashed which turned out from 15 to 25 sacks per acre. Wheat is better than for several years. Summer-fallow is a little shrunk, and the winter sown will be if the north wind blows a month or two longer.—G., *Vacaville, June 19th.*

Sonoma.

THE WOOL SALE.—*Democrat*, June 18: At the Cloverdale wool sale Wednesday about 490,000 pounds of wool changed hands, the prices ranging from 22 cents to 23¼ cents, the highest. The largest lots were owned by E. M. Hyatt, J. Ludford, W. Rock, Cooper Elkins and J. Vassar. The aggregate amount of money received by the sheep-raisers of Sonoma, Lake and Mendocino counties is estimated to have been between $100,000 and $150,000.

Sutter.

DIFFERENT HARVESTERS.—*Farmer*, June 17: W. T. Blevin & Sons are using a Myers harvester, and from all accounts it is working satisfactorily. This, we think, is the only Myers harvester in the county. Suel Harris, B. F. Walton and H. A. Walton, Jr., are using the Best harvesters, all working successfully. Eli Davis, Berg Bros., J. E. Plaskett and A. H. Wilbur are using the Shippee, and Wm. Sanders and the Hedgers are using the Houser harvester, all working well.

MAKING 'COTS PAY.—Marysville *Appeal*, June 17: Hugh Jones, of Sutter county, has netted from 2 to 2½ cents a pound for his apricots shipped to the bay, over and above the cost of boxes, freight and commission. The cannery has agreed to pay him 1½ cents a pound for his choice Moorparks. He has 12 acres in apricots. The trees were planted in 1883, 24 feet apart, and have made a splendid growth. The owner declares that it pays to give the trees plenty of room. This orchard is on high land that is not irrigated and has never been flooded. It will produce over 100 pounds to the tree this year. The fruit was thinned out and will go about seven to the pound. Mr. Jones is employing white pickers, paying them $1 a day and board. They pick 16 to 17 boxes a day each. This is much better than the average by Chinese, and the proprietor says white labor pays best. This orchard is plowed at a cost of only $1.35 an acre per year. The gang plow used was designed by the owner, and he will show anybody how to make one of the same pattern, which he has found very effective for the purpose.

THE SUTTER CANNERY.—Marysville *Appeal*, June 17: The Sutter Packing and Canning Company began operations for the season on last Monday, and are consuming as much of the supply of apricots as about 80 boys, girls and women can handle, and they advertise for 50 more girls at once. J. J. Pratt, the superintendent, said yesterday that the canning apricots had just commenced to come in, and that the present force is putting up over 2000 cans per day, and with the additional force he expected to make over 3000 cans, or about 20,000 per week. The season's run would be about four months. The places of the Chinamen at present employed are being gradually taken by boys, as they become acquainted with the business. Before the close of the apricot season he expects to have about 100,000 cans, nine-tenths of which will be shipped to Chicago. Contracts are being made with a number of orchardists for peaches, and the cannery's output of that fruit will be largely in excess of the apricots. Special orders for other canned fruits are coming in rapidly, and it is probable that a number of expert canners will have to be secured, with some additional apparatus, to fill the demands. The wages made range from $7 to $15 per week by piece-work.

Tulare.

APIARIAN APPROPRIATORS.—*Delta:* One day last week Mrs. DuBrutz, after making two dozen jars of jelly, placed them on the back porch to cool. A little later she found a swarm of bees in possession, and before night most of the jars were half empty, and seven of them entirely so. There is an apiary a short distance from the place.

BARLEY IN THE SIERRAS.—Visalia *Times*, June 16: As an illustration of what can be done on mountain ranches, a gentleman at Mountain View has just cut eight acres of his barley crop for hay, which yielded 33 tons, a little over four tons to the acre. That portion of the crop saved for grain, it is estimated by competent judges, will yield 75 to 80 bushels to the acre.

THE COOL WEATHER of the past 10 days has been injurious to the fruit crop, particularly apricots, retarding their growth and preventing their ripening. The grain crop, too, fails to ripen, and in some sections of the county a week or more of good sunshine will be needed to mature the grain sufficiently to be harvested.

Yuba.

ALMONDS PROMISING.—Marysville *Appeal*, June 17: The almond orchard of Joseph H. Hoskins, about six miles northeast of town, is a most interesting study in the horticultural line. There are 7000 almond trees in bearing. The varieties are three or four, both hard and soft-shell. The condition of the crop this season is much better than it has been for years. There are several smaller almond orchards in the locality, namely, those of Messrs. Stall, Smith and Hall, and these are in the same flourishing condition.

NEW BARLEY is coming into market very slowly, and probably will not reach the shipping points to any extent until one-half is harvested. H. C. Clark, of Live Oak, it is claimed, sent the first to market. His crop will average 40 bushels to the acre.

FRUIT RUSHING.—The Briggs orchard on Monday shipped 1058 boxes of fruit. Yesterday the shipments from this orchard were 747 boxes of peaches and apricots, and those of the other orchards combined about 900 boxes.

ARIZONA.

TROPICAL GROWTHS.—Phœnix *Herald:* At the residence of Mr. Adolph Asher our reporter saw some fine banana plants growing to-day, and on one of them quite a lot of fruit is making its appearance. No doubt the banana will do well here, and large numbers of plants should be set out. Those on Mr. Asher's grounds were cut down, so far as the leaves were concerned, last winter, but came out promptly this spring and have grown immensely. While we note the growth of the banana here, we also call attention to the fact that on the grounds of the proprietor of the *Herald* a pineapple is growing as though it were on native soil.

A CITRUS ENTERPRISE.—Mr. A. F. Kercheval, a thorough and skillful cultivator of the orange in Los Angeles, Cal., has been in our valley for several days past, and has satisfied himself that the conditions here are most favorable for orange-raising. He has secured a section of land and will prepare it this fall for planting to oranges. He casually informed a *Herald* reporter that if orange trees in his orchard were treated as they are here by those who are trying to raise them, he would expect them to die, and if they live here under the treatment they get, he is certain they will do wonderfully well with proper treatment.

OREGON.

CROPS IN LANE COUNTY.—Cor. *Willamette Farmer*, June 10: Fall grain looks perfect, and winter oats are good. Barley good; early barley quite tall. Volunteer hay is very heavy, with spring cheat and pasture generally extra; but timothy is a poor crop; other early grasses are rank. Gardens are late, but if the present showers continue sufficiently they will be good. All late sown grain looks well, especially barley. Fruit of all kinds is scattering, except grapes. Those blackberry vines that are left may fruit well, as they are just beginning to bloom. This report only refers to land that has been well tilled. Otherwise the dog-fennel crop is superb. Orchard grass and Kentucky blue grass are recommending themselves in this region, and the same can be said of Lincoln grass on dry ground.

DEATH OF ALDEN.—Many Californians will read with melancholy interest the announcement of the death of Charles Alden, the inventor of the Alden fruit evaporator. He committed suicide at the almshouse in Randolph, Mass., on June 21st. He had threatened to kill himself if he should be reduced to the extremity of going to the poorhouse. He was 76 years of age. His life was full of ups and downs. From his invention for evaporating apples he received $600,000, which he lost, with other money, through carelessness and speculation. Up to the time of his death he was at work on chemical salt for preserving cooked fish. He was a native of Randolph, and moved in 1840, making his home in Newburgh, N. Y., at which place he owned one of the finest residences.

PACIFIC GROVE AUCTION.—On the 28th, 29th, and 30th inst., an opportunity will be given to the public to acquire the ownership, on easy terms, of a lot at one of the most lovely summer marine resorts on the Pacific Coast—Pacific grove, Monterey. Fourteen hundred lots in this famous location will be sold. Excursion trains will run to the grounds on the days of sale. Further particulars will be found elsewhere in this issue.

GAS ROSIN.—You can make your own gas-fitters' cement thus: Melt up 4½ lbs. rosin, 1 lb. beeswax, and stir in 3 lbs. Venetian red; it will hold gas in.

Learners.

[Written for the RURAL PRESS by FANNIE H. AVERY.]

Oft when I am sitting reading,
My children come and stand
Close by my knee, and peer into
The book held in my hand.

They want to see the engravings,
And know just what they are,
And are curious to hear the history
Of insect as of star.

They know the books I read the most,
And love to linger o'er,
Are those that tell about the things
Of sea, and sky and shore.

So little brother and sister,
With large and earnest eyes,
Come to ask each picture's meaning
And list with great surprise

While I essay in simple words
To tell, as best I can,
Of the marvels and the beauties
The eyes of man may scan.

Dear children! they think their mamma
Can explain all about
The why and wherefore of all things,
And settle every doubt.

But some time they'll know far better—
That she they love so much
Is only herself a learner,
And always will be such.

Whenever I answer my darlings
The questions that they ask,
Deep joy wells in me that such is
My privilege and task;

And my thoughts go winging upward
To God in grateful prayer,
That He has given unto them
Life's heritage so fair.

Women in California Agriculture.

Some months ago we mentioned an association of college-bred women of California, a committee of which had undertaken to ascertain what California agriculture offers as a field for the enlistment of young women. This committee reported recently and the full report is published in the June *Overland*. Nothing very definite in the way of conclusions is reached in the report, but the information collected is interesting. The document is written in the first person singular, but there is no signature.

It may perhaps be of interest here to give a few selections from replies to the question which refers to "the health, profit and mental development offered to women by the office, the store, the schoolroom or other indoor occupations on the one hand, and agriculture on the other."

A woman who has 23 acres of land, which she bought, and has personally supervised for 10 years with no help from sons, supporting two besides herself, says: "I will say, women work at a disadvantage as regards prices in all occupations, and having to hire all labor done is a great disadvantage in farming. But it has been very profitable to me, and has very much improved my health. One year I cleared, above the price of picking the fruit, $4000, selling the crop on the trees. The year the trees were seven years old I employed Chinamen, picked the crop and cleared $3400. This, exclusive of $300, was from 12½ acres. One year, fruit being low, I made only $2400. I have learned the business by experience, and study every tree on the place. Have employed and trained my own Chinamen, but now have a white foreman."

A lady engaged in teaching writes somewhat as follows: She has ten acres purchased, all cultivated, devoted to fruit trees, does not supervise, and hires all help. Present valuation of place $2000. Bought one place, improved it, and sold at large advance. Has still another which has not come into bearing. She evidently thinks it pays.

Another experience is of a lady who purchased 160 acres about ten years since, has 100 under cultivation; the land is now valued at nearly $4000; with buildings and implements, $500 more. During the early part of the time she kept boarders in order to help pay for the land. She thinks she has not succeeded very well financially—but during these ten years she has supported a family, and has accumulated this property of $4500 and is free from debt.

Another also purchased land—155 acres—has 25 under cultivation in vines, and farm is valued at $8000, besides house. She personally supervises work. She supports a family of four, none of whom help her. I quote verbatim: "I think the vineyard business a good business for many women, and especially those with nervous ailments and dyspepsia. I knew nothing about it when I commenced—started without a dollar of our own. Borrowed money at ten per cent; grubbed and put out 15 acres the third year. I think we shall be able to pay all we owe this year, but have nothing ahead. I was a nervous and ailing woman; could do nothing else. This living has brought me comparative health."

I also quote from a long article written by a woman who has 400 acres left her by the death of her husband four years ago. She has lived on a farm 18 years; has personally supervised it since the death of her husband; has 350 of the 400 acres devoted to cereals. She says: "I do consider it a profitable occupation, and one of the most healthful a woman can engage in, and it is my opinion that there is no more advantageous avenue open for woman to expand her views and ideas upon all subjects, and improve herself mentally as well as physically. She must read enough to familiarize herself with the passing events of the day in her own and foreign land, watch well the market receipts, also reports as to expected crops in Europe, in which she is especially interested. Her mind is kept continually alive, and her pride stimulated. She is proud to know that in some respects she is equal to the opposite sex in carrying on a business which has been followed chiefly by its members."

A woman whose regular occupation is one of the professions, sends among other interesting material the following: "I have a small tract of six acres of orchard and garden, where I have filled in all my spare time for the past 16 years most agreeably and profitably, so far as health is concerned, in working therein, or superintending the work in person. Of course my profession is my means of support, while my floricultural and horticultural labors have been for pastime, and not for financial profit. I am satisfied, however, that women can earn a comfortable living with a few acres of garden land; and the cultivation of the mind and development of body which an intelligent person can derive from such vocation bring a double compensation. Recently I have added to my place improvements in the shape of about three acres of apricot orchard, and some choice raisin grapes, from which a profitable return will be realized, I doubt not, in due time."

A letter from a lady in Southern California states that she owns 34 acres, obtained by purchase, on which she has 200 varieties of orchard fruits, marketed in local and Eastern markets, all known varieties of small fruits, 100 varieties of vines, bearing raisin, table and shipping grapes. She personally supervises her work and supports a family of four. Answering the question if she would advise women to engage in such work, she says: "Yes," with the following qualification: "Only women of mature judgment, pluck and native energy should attempt it." She advises the co-operation of two or three, as in the case of Miss Austin and others at Fresno.

One might suppose the 5000-acre farm was a bequest, but it is not so; only 320 acres were inherited; 2000 acres are now devoted to cereals; the remaining 3000 to a sheep and cattle range. The owner writes: "I have found agriculture a profitable and healthful occupation. But for a woman it has cares and trials, and unless one has a strong constitution, and plenty of will-power, and determination to succeed, I should not advise her to engage in it."

The one letter that was something of an intelligent demurrer, came from a lady whose cool calculation would seem to serve well as a counterbalance for a too ardent enthusiasm. I quote at length from it:

"I regret to say that candor compels the statement that my observation does not warrant the conclusion that many women are physically competent to engage in the agricultural, horticultural or viticultural pursuits successfully, especially if they are to depend to any great extent upon themselves to perform the manual labor involved in carrying on any of these vocations. Women having a good bank account, large executive ability, a special taste for such a business, and the necessary practical knowledge to at least commence it understandingly, may, and probably will, succeed. I have known of a few such instances, but the number would not justify the conclusion that every woman, without some general knowledge of business and of these pursuits, can engage in the same without encountering disappointment and loss. During 10 years' residence in this vicinity, devoted mostly to fruit and raisin-grape culture, I have known several women who, with sufficient courage, intelligence and will-power to have carried them successfully through some other pursuits, fail in these; sacrificing some means, two or three years of valuable time, and in one instance at least, health and life, by a too determined persistence in a business which requires more money, or muscle, or both, before they yield returns, than is generally admitted. I cannot, therefore, without a note of warning, advise every woman to enter a field so new to a majority of our sex."

I give, almost entire, two other letters which may be worth attention.

From the owner of 20 acres, nearly all of which are in oranges: "I regard fruit culture a very healthful and paying occupation, especially for women who have children, boys in particular, growing up to assist them. It is not only health-giving, but in all its tendencies highly refined and preferable, as far as I know it, to any indoor employment. I have made a success of my undertaking, though trained to it only in the severe school of experience; and while I know of no other woman in this immediate settlement who is similarly engaged, I presume there are many throughout Southern California. With a clear head, patient waiting and economical management, a woman may succeed as well as the majority of men, as her natural love for order and beauty tells greatly in a business like this, where the places are kept like gardens; and aside from the usual drawbacks to fruit-growing in the shape of insect pests, there are no discouraging features in this almost perfect climate, where one lives forever in the open air, eats wholesome food and dresses solely for health and comfort."

Again, from a woman not herself engaged in agriculture, but occupying a position that necessitates observations thereupon: "As far as health is concerned, there can be no question of the advantages offered by outdoor employment. In this climate agricultural pursuits are far more agreeable and less laborious than in the Eastern States, and women are capable of performing much of the work. The profits, as with the opposite sex, depend upon the methods employed, the judicious start, the quality of trees and vines planted, the care taken of them, etc., all of which require the exercise of an intelligent mind. I see no reason why women should not train their intellects in this direction, and with gratifying results. If the occupation be not too arduous and confining, it seems to me that a genuine interest in the cultivation of the soil, with the special education attendant upon it, would have a tendency to quicken all the perceptive faculties and broaden the scope of thought so that leisure hours would be spent in a more profitable manner than if a person were cramped within doors, with a monotonous daily routine while gaining a livelihood."

I have drawn thus fully from the correspondence, thinking that the personal expressions of women actively engaged in the vocation in question would be of more interest than theoretical and speculative opinions. None of the committee who conducted the correspondence had any experience upon which to base opinions. In the course of their inquiry, however, they met not a few very interesting women who till the soil in some form or other as a vocation. All these said that they found trials and vexations, and sometimes disappointments. But the same are encountered by men as well, and in all kinds of business.

The general opinion seemed to be that an inordinate degree of manual labor is not needed; certainly not, if one can begin with some capital. Agriculture is a *business*, and requires business management as much as other branches of industry do, and this management is what the owner is expected to give. One cannot think and plan for the future and be plowing or planting trees at the same time. As one lady expresses it: "It is cheaper to keep a man to do your hard work and do your own thinking." This lady left San Francisco nervously worn out with society life. Her husband bought a small farm, of which she has complete control, receiving him Saturday evening on his weekly flight from his city business. She says on no account could she be persuaded to abandon the life which has restored her to health and independence and return to her former idleness; and such cases might be multiplied indefinitely.

One thing upon which the committee desired especially to have information was the result of co-operation by women. They were unable to get communication or intercourse with any cases of this, and by only one of their correspondents was it advised. I do not take this as an indication that co-operative association among women would not yield fruitful results, but that experiments of the kind have as yet scarcely been tried. The probability of success from such undertakings seems to me worthy of especial investigation.

The general conclusion, then, seems to be that the farm will yield to energy, business skill, and perseverance, a profitable occupation, both financially and physically, to women as well as to men. As to mental development, it seems to me there is no chance for intelligent cavil. Close and toilsome labor, in door or out, city or country, forbids intellectual work, but outdoor work perhaps less than its opposite. Country life, of course, precludes, more than life in town, the *social* intellectual stimulus; but if we consider the list of occupations by which we gain our livelihood, we shall find few in which the highest intellectual stimulus goes hand in hand with the occupation itself. Men or women, we must in most cases have sufficient earnestness, persistence and belief in the intellectual life to carry it on in addition to—even to a great extent in spite of—our daily work, if we are to carry it on at all.

The Gamut of Theft.

Taking $1,000 000 is called Genius.

Polly's Life and Death.

[Written for the RURAL PRESS by C. E. B.]

A little more than ten years ago, passing by a bird store on Kearny street, I was attracted by a parrot of very bright, fresh plumage, which I fancied was naturally intelligent.

Being a little lonesome much of the day, when the adult members of my family were away from home on business, I concluded to amuse myself in the training of the young bird, and soon bought it of the dealer for $35.

It was about one foot long, bright, gorgeous green plumage, with a silken yellow tuft at the back of the head. I taught my parrot much as mothers teach their infants to talk. Its vocabulary numbered about 200 words. A short sentence was acquired, with careful teaching, in three or four days. It seemed to appreciate what it said and what it was taught. She recognized many, but her affections were exclusively centered on myself. Her jealousy was furious, attacking any one ferociously who paid attention to me. The words were spoken with perfect clearness, and the elocution thoroughly humanized. She was full of fun and enjoyed play remarkably.

To recount her doings would fill many pages. At the morning meal, at the table, she had been taught to use a napkin like a little child, and would wipe her mouth very cunningly. But before eating her breakfast she must have her face, bill and feet nicely washed and wiped. Having become accustomed to this, she liked it and insisted upon it.

When asked whose Polly she was, she would answer, quite distinctly, "Mamma's dear, sweet, pretty little Polly." If found fault with and called naughty, she understood perfectly and was always anxious to make up and be forgiven, and she would say, earnestly, "Do you like me, Polly? Do you love me, Polly?"

Kind old Dr. Blank always treated Polly with great respect, and Polly thought a great deal of him. When the doctor treated her for some sickness two or three years before her death, she appreciated his efforts to cure her. And the last week of her life she frequently called in pitiful tones, "Doctor! doctor! O doctor!" possibly feeling symptoms of the old malady. But the doctor had been gone to England a year, and this indicates a vivid memory certainly equal to any child. She, from being taught, of course, would sing, "the doctor's gone to London," with proper intonation. When the doctor was accustomed to call aforetime, Polly seemed to understand his pull at the bell, and would call to the servant, "John, the doctor's come!" The master of the house was not friendly to the bird, and would accost her roughly whenever they met—putting in, jokingly, some very ugly words, saying, "I would like to wring your neck." Polly was taught by her mistress never to repeat these naughty words, and she never did—neither these nor any other objectionable phrases. Surely this indicates a capacity for discrimination very remarkable.

Polly was pleased with music, and would listen with deep attention to the piano. She would sing "Marching Through Georgia," giving the proper cadence and peculiar swing to the words, particularly in the chorus. One of her prettiest performances was to sing a waltz (la, la, la, etc.) and dance to the tune, turning round quite properly, and lifting her wings slightly, like a lady lifting her dress. This was so natural and cunning as to create much surprise in the beholder, and Polly often had a sidewalk audience as she indulged in this pretty capering at the window.

I must not omit a touching little incident, illustrative of her affectionate nature and sweet, loving confidence in her mistress. On one occasion my husband was absent over night, and, feeling lonely, on retiring for the night, I put Polly's cage on the vacant pillow, and, with the gas burning, lay awake for some time, Polly and I holding a pleasant conversation. After awhile I set the cage away, took Polly out, and placed her on my breast, pulling the quilt up over her. In this position we both fell asleep, and in the morning I found my dear bird still sleeping peacefully there like a little child.

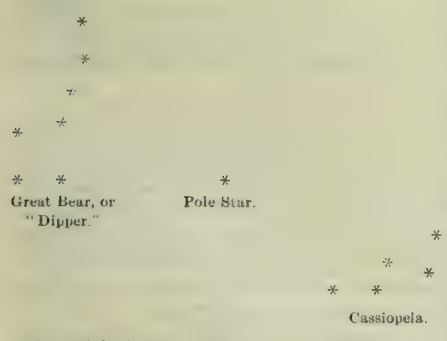
My attachment to Polly, long a solitary companion, became strangely strong in the 10 years I owned her; dead, I mourned her in a manner that seemed strange to my friends, if not ridiculous. I felt that an intelligent, appreciative creature had been forever blotted out of my life, and I was as much affected as one to whom was lost a faithful friend.

I have no inclination to own another parrot, for no other bird shall desecrate the place that my dead Polly has in my memory. I provided a fund for her in case I should die first.

She died of intestinal inflammation, brought on by exposure to cold through the neglect of a servant. A skillful taxidermist has mounted her in all the familiar beauty of her rare plumage. She occupies a favored place on my mantel, fostering a world of agreeable associations.

San Francisco.

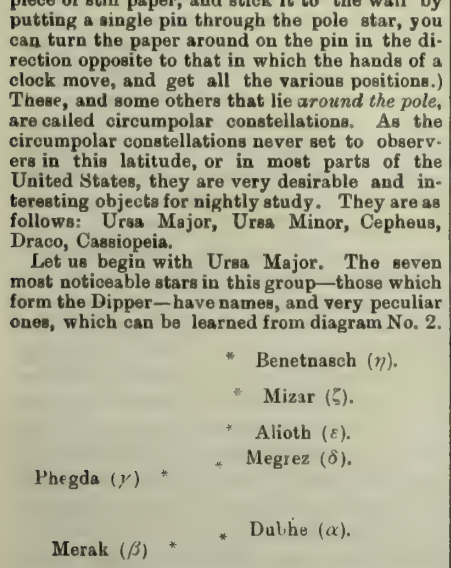
WILD GEESE DESTROY A KITE.—A harrow-shaped flock of wild geese, the Waterbury, (Conn.) *American* says, went northward over the city recently. They seemed to attend sharply to the business of traveling until they spied one of the numerous kites the boys in the northern portion of the city were flying. This



kite was uncommonly high in the air, and the geese objected to it. At least they circled about it two or three times, and then four of their number, delegated for the purpose, attacked the kite and tore it into shreds, and went on their way.

A B C of Astronomy—No. 2.

[Written for the RURAL PRESS by ASTRON.]



In my last, which was also my first, lesson on astronomy, I made a few general statements illustrative of the science, showing to some extent its scope and aim, and endeavored to kindle some sparks of enthusiasm for the study of this great branch of human knowledge. Having thus laid the foundation, it will be now my duty and pleasure to build the superstructure, and with your (my readers') help and encouragement, to make it a labor of love to your teacher.

In my former article, I suggested how you might become acquainted with two important constellations near the pole, viz.: Ursa Minor and Ursa Major, the Little and Great Bear. Now, if you look at Ursa Major in its entirety, and then cast your eye across the northern heavens, taking in line the pole star, you will notice another constellation or group of stars at about the same distance from the pole star as Ursa Major, in form somewhat like a capital W, with the open part toward the pole star. This constellation is named Cassiopeia. I want you now to become quite familiar with these constellations; you will find it a great help to you in your future studies of the Northern Hemisphere, affording you the means of locating the other constellations in these regions of space.

At 9 o'clock in the evening, in the month of July, the constellations of the Dipper (Ursa Major) and Cassiopeia, with the pole star (Polaris) midway between them, appear nearly as in the diagram. And at all hours of the night, and all seasons of the year, these stars keep the same *relative* positions; but they appear to move around the pole star—as the sun appears to rise and set—so that sometimes the Dipper will be above and Cassiopeia below the pole, etc. (If you copy the diagram on a small piece of stiff paper, and stick it to the wall by putting a single pin through the pole star, you can turn the paper around on the pin in the direction opposite to that in which the hands of a clock move, and get all the various positions.) These, and some others that lie *around the pole*, are called circumpolar constellations. As the circumpolar constellations never set to observers in this latitude, or in most parts of the United States, they are very desirable and interesting objects for nightly study. They are as follows: Ursa Major, Ursa Minor, Cepheus, Draco, Cassiopeia.

Let us begin with Ursa Major. The seven most noticeable stars in this group—those which form the Dipper—have names, and very peculiar ones, which can be learned from diagram No. 2.

Mizar is a double star; its companion is named Alcor. This double can be seen with a glass of very low power; some persons can see it with the naked eye. It should be noticed that a line drawn from Merak through Dubhe, and carried about five times as far as those two stars are distant from each other, will bring you to the pole star. Hence these two stars are called the "Pointers."

Astronomers have agreed to use Greek letters to designate the different stars in each constellation. Thus, in the above diagram, Dubhe is α (alpha) of Ursa Major. Benetnasch is η (eta) of Ursa Major, etc. It will therefore be convenient to have the whole Greek alphabet to refer to, although we shall rarely have occasion to use more than the first six or eight letters.

Greek Alphabet.

α, Alpha,	ι, Iota,	ρ, Rho,
β, Beta.	κ, Kappa,	σ, Sigma,
γ, Gamma,	λ, Lambda,	τ, Tau,
δ, Delta,	μ, Mu,	υ, Upsilon,
ε, Epsilon,	ν, Nu,	φ, Phi,
ζ, Zeta,	ο, Xi,	χ, Chi ("ki"),
η, Eta,	ξ, Omicron,	ψ, Psi,
ϑ, Theta,	π, Pi,	ω, Omega.

YOUNG FOLKS' COLUMN.

The Mud-Builders.

[Written for the RURAL PRESS by AUNT SUSIE.]

Many of the children who read the RURAL PRESS know what a colony is. Perhaps some of them are even members of a colony. If so, they know that the first thing the colonists do, when they go to a new country, is to choose a place for their homes. They next build their houses. Sometimes the houses are made of wood, then again of brick; and even mud, in the shape of great thick walls, hardened in the sun, give protection to people when they first settle in a new country.

Now I will tell you of a colony that makes its houses of mud, and will call them the Mud-builders.

One day, as I was walking around the corral, I heard a great twittering, and, on looking up, saw a great many little birds sailing most gracefully about, and every now and then, in their flight, showing their white breasts. Their wings, with sharp points, cut the air with great speed. As I watched, it seemed to me I heard them say, "Where shall we go? where shall we go?" Then the leader answered, "Stay right here—right here!" "What shall we do here—do here?" called back the birds. "Well," said the leader, "we are mud-builders, you know; so mud we must have, at any cost. Some swallows can build without mud, but we don't know any other way to make a house; so this is the place for us, as there is plenty of mud here." "Mud here! mud here! where? where?" call the birds. "Follow me! follow me—me!" answers the leader. Then with a rush they follow him to the edge of the pond, where the pretty, soft-eyed Jersey cows go to drink, and there they find so much mud they don't know where to begin. They chatter away and are very happy over it, then look around and see all the eaves of the barns, and decide no better place can be found; so in pairs they begin their homes. Both birds build. One flies to the chosen place with its bill full of mud, puts it down on the wood and works over it till its mate comes with a bill full; then the first one flies off for more, while the other one works, and in a little while the nest begins to take shape. On they work for hours without rest. I could tell by the wet mud how much had been done in one morning. At last they have enough to form a resting-place—more like a little bracket on the wall than anything else I can think of; then the sides are put on, then the top, and each time a bird comes home with mud it darts into the nest and rubs off any mud that may be on its feet, then puts the lump of mud from its bill on the edge, and quite a lump it is, too. The nest is never left unguarded, and each bird knows its own. There is no quarreling, no calling out "Now that is mine—you sha'n't have it!" but all seem so happy; and when a nest is done it is something the shape of a pear, with the big end on the barn. The opening is very small. As I watch I can see two little heads peeping out from a finished nest. They look very proud as they gaze around upon their neighbors who have not yet finished their homes, and now and then they say, "We are done—are done—done," and the neighbor cheerfully calls back, "We will be, soon—soon—soon," and so they chatter and work, hour after hour.

There are 86 nests under the eaves. Just think of the times those little birds have flown down for mud! and while getting it they keep their wings so high no mud gets on them. Surely one can learn a lesson in patience from these little birds. They work till the sun goes down behind one hill and the big yellow moon comes up from behind another hill, and the stars come out; then the little tired but happy birds go to sleep, each little head under a wing, and so they sleep till daylight; then out they fly and dart here and there through the air for their breakfast. They are the farmer's friends, you know, as they do not light on the trees and eat the blossoms or fruit, but take their food on the wing, eating up many insects that would prey upon the fruit. After breakfast they go to the pond and have a bath. I saw one having *such* a good time. His mate was on the ground near by, but seemed afraid to go in. Her mate called, "Come in—in—in!" but she called back each time, "Don't dare—too cold—too cold!" so he had to take his bath alone. Then they went to work and finished their nest. They flew around where there was dry grass, and took little bits and made the nest all soft and warm inside.

And so the days go by—very happy days for each little bird; and at last in each nest lie tiny eggs, and the mother bird sits on them and keeps them warm; then, all at once, the shells break and out come dear little birds. Their mother thinks they are beautiful, I am sure, even if they haven't many feathers; the father bird gets food for them, and altogether it is a very happy little bird village.

Answer to Egg Puzzle.

[See RURAL PRESS of May 28th.]

The supposition that 5 eggs for 2 cents is at the same rate as 3 eggs for 1 cent and 2 for 1 cent is true only so far as 10 lots of eggs are concerned. Then those belonging to B would be gone, while A would have 10 eggs left. If those were sold at 5 for 2 cents he would receive 4 cents, but he sold 2 for 1 cent, which brought 5 cents.

GOOD HEALTH.

The New Treatment for Consumption.

A novel method of treating patients suffering from phthisis is described in a recent number of the *Medical Record*. It was devised by a French physician, Dr. Bergeon, of Lyons, who has been applying it for two years to cases of chronic pulmonary and throat diseases. The results are said to be remarkable. In acute general phthisis there has been an arrest of the progress of the disease and a cure in a few months. In advanced consumption marked improvement of symptoms is rapidly secured, night-sweats ceasing and the cough becoming less harassing. Two hundred cases have been treated with singular success by Dr. Bergeon in Lyons, where the climate is unfavorable for consumptives. His method has been introduced in the hospitals there and in Paris, and the medical authorities are favorably impressed with it.

The treatment consists of daily injections by enema of medicated gases. Carbonic acid gas when introduced into the system by this method is found to be painless and harmless. Sulphureted hydrogen is mingled with it, the entire structure of the lungs is permeated by the medicated gas, and remarkable curative effects are observed. The carbonic acid gas is practically inert when taken up by the veins of the intestines, but the sulphurous gas reaches every particle of diseased tissue in the lungs and throat, which is eliminated from the system in the process of expiration. The volume of gas used is very large. At the outset a single litre is introduced, but the quantity is rapidly increased to 10 or 12 litres for each injection.

The results of this new system of treating consumption are so well vouched for that we commend the subject to the critical examination of medical circles in this country. Consumption is the chief scourge of the Atlantic seaboard. Any departure in therapeutics so radical as this French method deserves to be thoroughly investigated and adequately tested in American hospitals. Dr. Bergeon is not a smatterer in medicine, but a reputable physician of large practice and good standing. If his method be as effective and successful as he asserts, it merits general attention from the profession in the United States.—*New York Tribune.*

PHYSIC-TIPPLING AND MEDICINE-BIBBING.—At a recent State Sanitary Convention, held in Philadelphia, Dr. Frank Woodbury of that city read a paper with the above title, in which he referred to the rapid increase in the consumption of such drugs as the bromides, chloral, opium, etc. It is said that of chloral hydrate, one ton a day is consumed in England and America. He then spoke of the causes of this increase. A large portion of the death-rate among children was attributed to the abuse by the parents of medicines acting on the nerves. The injurious effects of patent medicines were considered. The author advocated as a remedy for this growing evil, "the instruction of the public to properly estimate drugs, and to regard every unknown medicinal agent as dangerous and endowed with capacity for harm. Let them escape the caustic criticism of Moliere upon those who pour medicine about which they know little into bodies about which they know less, in order to cure disease about which they know nothing at all."

THE LIFE-HABITS.—The life-habits of people who have come to be centenarians are described in an interesting article in the *British Medical Journal*. Activity, out-of-door exercises, and early rising with moderation in diet, seem to be the most important factors of longevity. Few things tend to promote health and vigor more than activity—activity without excitement—an activity which does not wear the body out. The candle ought to burn briskly, and, as a general rule, at both ends, regarding the head or brain as one and the limbs or locomotory agents as the other; but it should not burn too fast.

ARTIFICIAL WHETSTONES.—The *Guide Scientifique* describes the following method of making artificial whetstones: Gelatine of good quality is dissolved in its own weight of water, the operation being conducted in a dark room. To the solution 1½ per cent of bichromate of potash is added, which has previously been dissolved in a little water. A quantity of very fine emery, equal to nine times the weight of the gelatine, is intimately mixed with the gelatine solution. Pulverized flint may be substituted for emery. The mass is molded into any desired shape, and is then consolidated by heavy pressure. It is dried by exposure to strong sunlight for several hours.

SINGULAR PHENOMENON.—A curious story comes from Mackinaw, Ill. About six miles from the town is a spot of ground about 80 feet wide that will not freeze, and snow will not lie upon it. When the earth is disturbed it will flash like burning powder. The Mackinaw *Enterprise* declares that on the coldest days of winter one could walk on this particular spot and warm his feet in a short time. A peculiar gas comes up from the ground. An effort was made to confine some of it in a bottle, but in a very little while the bottle was burst into fragments.

DOMESTIC ECONOMY.

ORANGE SHORTCAKE.—Take a dozen good, small, juicy oranges, peel and put in a cold place. Make a shortcake out of a pint of prepared flour, a tablespoonful of lard and the same of butter rubbed well together and made into a dough with a cup of sour milk. Roll out about an inch thick into a sheet, put into a well-buttered pan and bake in a quick oven a light brown. Take out of the pan, and with a sharp knife divide in two as a biscuit. Spread the oranges thinly sliced between the cake, sprinkling well with sugar; put the rest on top and cover with sugar just before sending to the table. Eat with sauce made from the juice of three oranges and two lemons, boiled in a pint of water and seasoned with sugar and nutmeg.

ONION SOUP.—Take three large onions, slice them and then fry to a light brown in a large spoonful of butter. When brown, add half a teacupful of flour and stir constantly until red. Then stir in slowly one pint of boiling water, stirring steadily till it is all in. Boil and mash four large potatoes and stir into one quart of boiling milk, taking care that there are no lumps. Add this to the fried onions, with one teaspoonful of salt and half a teaspoonful of ground pepper. Let all boil for five minutes and then serve with toasted or fried bread.

GOOD DARK CAKE.—Pour one quart of boiling water over one pound of fat salt pork chopped very fine, add one pint of molasses, one pound of brown sugar, one tablespoonful of salt, cinnamon, allspice and cloves, two grated nutmegs, six well-beaten eggs, one tablespoonful of soda dissolved in a little warm water, flour enough to make a stiff batter, one pound each of currants and raisins well floured. Stir all together thoroughly. Put in two medium-sized sheet-iron pans well greased and bake in a slow oven three hours.

CREAM SPINACH.—Boil and chop the spinach in the usual way. Set it on the fire in the saucepan and stir until it is perfectly dry; add two spoonfuls of butter and stir for five or six minutes. For each two quarts of spinach add two tablespoonfuls of cream, and stir again for five minutes and then take it from the fire. Stir in a spoonful of butter and serve hot, garnishing with hard-boiled eggs and croutons. The eggs should be cut in quarters or even smaller pieces.

EGG SLAW.—Chop finely some tender white cabbage. Let it lie in water half an hour before using. Drain all the water from it. To about three cupfuls of cabbage add a tablespoonful of sugar, one teaspoonful of salt, one of French mustard or of mixed mustard. After mixing well together, add two well-beaten eggs in a cup of boiling vinegar, a little cayenne and a tablespoonful of butter. Pour this over the cabbage; toss well together and serve.

HOMINY CROQUETTES.—To one quart of boiling water add a teaspoonful of salt; stir in gradually a heaping half-pint of the finest hominy; boil three-quarters of an hour, and put it on the back of the range where it will remain hot an hour longer; then put in a large bowl and add the beaten yolks of two eggs, mix it thoroughly, and when cold shape into cones; dip the cones in beaten egg, roll in crumbs and fry in boiling fat.

FRUIT CAKE.—Wash and drain well one pound of currants, chop coarsely one pound of raisins, chop or slice one-half pound of citron. Beat five eggs and two cups of brown sugar together; then add to them one cup of butter, one cup of molasses, one-half cup of sour milk, one teaspoonful of spices to taste. Stir into this mixture six cups of flour, reserving one half cup to mix with the raisins to prevent their settling at the bottom. Add fruit last.

STEWED TRIPE.—Cut the boiled tripe into small pieces and add three or four small onions; pour over the tripe and onions a little warm water. Let it cook slowly until both are tender and the water nearly boiled away. Then add milk sufficient to make a good gravy, a tablespoonful of butter made smooth in an equal quantity of flour, salt and pepper to taste, and boil three minutes.

COLD LEMON PUDDING.—One-half box of gelatine soaked in four tablespoonfuls of water for ten minutes; add a pint of boiling water, juice of two lemons, one cup of sugar. Strain and set away to cool. When cold, stir in the whites of three well-beaten eggs. A thin boiled custard or thick cream may be used to pour over the pudding.

STEAMED INDIAN PUDDING.—One cup of sour cream, one cup of sour milk, one egg, two tablespoonfuls of sugar or molasses, one cup of flour, two cups of meal, one teaspoonful of soda, one teaspoonful of salt, ½ cup of raisins or dried fruit. Steam or boil two hours or more. Serve with sweetened cream.

RICE WAFFLES.—Boil half a pint of rice and let it get cold, mix with it ¼ pound of butter and a little salt, stir in 1½ pints of flour, beat five eggs separately, add yolks together with one quart of milk, lastly the well-beaten whites Beat well and bake at once in waffle irons.

The Week.

The great event of the week is the Victorian Jubilee. It culminated on Tuesday, when, at 11:45 A. M., Victoria *Regina et Imperatrix*, in a black dress, was drawn by eight ponies with red morocco harness, and escorted by her sons and sons-in-law and grandsons and grandsons-in-law, all of them being dressed in their titular uniforms and followed by the royal ladies in gorgeous trappings—was drawn, we say, from the palace through the streets of London, while millions of her loyal subjects and admiring aliens thronged the wayside from the curbstone to the housetop — through the streets of London, we say, until Westminster Abbey was reached, and there, while 10,000 of the peers of the realm, the commons, the clergy, the fellows of royal societies, the diplomatic bodies, with their wives, sisters, cousins and aunts—until Westminster Abbey was reached, we say, and then while the State trumpeters executed fanfares and 10,000 throats sang the national anthem and the grand organ pealed forth the processional march of Handel, the half-century queen and somewhat less long empress passed up the aisle to the coronation chair, put on the royal robe, which had been left hanging over the back of it, and sat down while the sunshine, streaming through the stained glass windows, upon the silks and satins and velvets and jewels, and, we suppose, upon the tombs and other things, gave, as one telegrapher says, "a varied glow to the assemblage which was in itself as picturesque as the world has ever witnessed." The literary exercises in the abbey were appropriate and impressive. The Queen at the close received the warm congratulations of her next of kin, while the assemblage was convulsed with enthusiasm. Then Victoria returned to Buckingham palace again amid throngs of admiring people, taking the same route which she traversed after her coronation 50 years ago. Such in outline was the event. Its observance has stirred the loyal British heart the world around. The United States has frankly spoken our congratulations by letter and telegraph and by local celebration. The coronation of Victoria on June 21st was well timed to express the unity of interest of Britain and America, and in a way which we have not seen mentioned in history or diplomacy, and yet it is so impressive as almost to amount to an augury. It is this: the throats of brass and of mucous membrane which last week roared forth "Rule Britannia," will next week melt to the mellifluous measures of "Yankee Doodle." Hail Victoria! Hail Columbia! Let June 21st and July 4th henceforth entwine in inextricable confusion.

Close of the Volume.

This issue rounds up the half year and completes Volume XXXIII of the PACIFIC RURAL PRESS. The last six months have been of much importance in the growth of California, and have been characterized by action and accomplishment in many directions. Enterprises for the improvement of property have been many, and there has been progress made in lines of production and manufacture as well. These matters have been duly mirrored in our columns. Besides this, the weekly conference between our readers, concerning materials and methods involved in practical agriculture, has been unusually interesting and helpful, and has ministered to the better work of all. This we count our chief field. We aim to teach how various productive work can be best and most profitably done, and as our teaching comes chiefly from those who are doing the things, it becomes teaching by example—the most valuable kind of instruction. If one will scan the full index of the closing volume, which appears on the last page of this issue, an idea of the extent and variety of the topics we have treated can be had. The volume is about one-third larger than our old standard, and gives 580 pages for the price of a half-year's subscription, which, concerning the quality and special adaptiveness of the matter to Californian uses, is an example of cheap literature—in a good, but not in the ordinary sense of the term.

In closing the volume we return sincere thanks to the host of esteemed contributors who have aided us beyond calculation by their records of new facts and experiences, by their expression of true and ennobling sentiment, and by their apt and wholesome instruction. We acknowledge, also, the generous patronage bestowed upon our advertising pages, which coming from those engaged in honorable and creditable production, manufacture and trade, enables us to sustain our enterprise without recourse to the delusive and demoralizing advertising which is far too common in public journals. We are strong in our friends and desire to carry them all with us as we go forward into the labors of a new volume.

AN International Congress of Science and Industry is proposed for Brussels in 1888. Prizes to the value of $100,000 will be awarded for the best papers on various stated subjects, and many important applications of science will be discussed. The commercial section will consider export and import duties. This is expected to prove a welcome change from the round of international exhibitions.

The Victorian Jubilee.

The shot of the assassin that struck down President Garfield on the 2d of July, 1881, showed the vital solidarity of our people more than anything that has ever happened in our National history. Instantly and simultaneously all over the land, North, South, East, and West, the whole population felt a sympathetic thrill of pain, and municipal Governments and large bodies of citizens, irrespective of party, spontaneously came together to express their execration of the crime and offer their condolence to the sufferer and his family. For more than two months this solicitude continued unabated, more than 50,000,000 of people standing in tender, watchful anxiety around their President's sick-bed, as children around the bedside of a father struggling for existence, their hopes or fears rising or falling with the beat of one man's pulse.

While it is pleasant to remember such an exhibition of fraternal kinship, it is still more agreeable to see the beautiful feeling illustrated on a wider scale. We are not, as a rule, inclined to attach much importance to the messages of sympathy or congratulations which come from foreign potentates. They are little more than polite diplomatical acknowledgments of our country's greatness. They bear witness, not to the merits of our republican form of Government, but to our military power and commercial importance. They would hardly be sent to smaller Republics. But when, on the receipt of President Garfield's death, the American flag was heavily draped and raised at half-mast over the leading hotels and business houses of London, Paris, Berlin, Vienna and St. Petersburg, we cannot help feeling it meant something more than a mere perfunctory expression of sympathy. We especially recall the sweet and tender message of Queen Victoria: "With deep grief I and my children learn the sad news, not unexpected, of the sufferings of the President. His loss is a great misfortune. I have learned with deep sorrow that the President has passed away." Believing that this was more than a mere formal condolence, that it was the sad, heartfelt sympathy of one noble, bereaved wife to another, we are not inclined to let the Victorian Jubilee pass unnoticed.

It is pleasant to note that it comes at an hour of profound peace, that throughout the civilized world not a war-drum throbs. But what cyclones may be breeding in that calm sky, no one can guess. It is certain that the swords of three millions of men are not rusting in their scabbards, and the grim forts and war-ships dropping to decay. And yet the reign of Queen Victoria does not indicate that the prophetic era when swords shall be beaten into plowshares and spears into pruning-hooks is nearing the dawn. There has been the war in New Zealand, the Zulu war, the Sikh war, which led to the annexation of Punjab to the British Empire in India; two Afghan wars, three Burmese wars, resulting at last in the conquest of Upper Burmah; the great Crimean war, in which as many people perished as in the Civil war in this country, and at one time England was on the verge of a war with the United States. This is rather a sanguinary showing for one reign. No doubt the civilized world has made some progress during the last 50 years in the direction of the peaceful arts, but there is a deal of the savage in human nature yet, and the roseate dreams of the Quakers and the amiable members of the Peace Society give no promise of a speedy realization. Lecturing on "The Late War Panic in Europe," before a meeting of the Friends in London, John Bright said: "With regard to the question of peace, we are really as far off as our savage forefathers were, and are nearly as barbarous."

Victoria's reign has been marked by great gains in the direction of democratic government. They move slow in England, and it may take a long time to get down to our plane, where the whole Government—executive, legislative and judicial—is made or unmade by frequent popular elections, and all responsibility is merged in the theory that all power exists in the people. They may never quite reach it, but the substance is certainly within their grasp. Already the Radicals do not hesitate to say that the House of Lords has outlived its usefulness, if it ever had any, and should be abolished. With the downfall of that ancient and venerable body, the last prop of the throne would be gone. There is a sad decay of patriotism among the working masses, deep, ominous muttering, like the groan of distant thunder. The present jubilee outburst of enthusiasm is only a kindly feeling for the Queen, who has always been personally popular, but not an acceptance of the present order of things.

Holstein Notes.

Nothing succeeds like success is a trite remark, and it finds illustration in agricultural as in other matters. The advance of the Holstein interest is a case in point. It is exhibited in the growth in popularity of these cattle on this coast as well as elsewhere. Prices realized here are moderate compared with Eastern rates for favorite strains; but the fact that devotees of other breeds are found worshiping at the shrine of the black and the white is an unmistakable indication—not, perhaps, that they love their old favorites less, but that they love the Holsteins more.

We print upon another page a list of prices gained at the sale of Holsteins from Ontare ranch, which occurred at the Oakland Trotting park last Thursday. In addition to the bare figures, there are a few interesting notes which can be made on the sale which may be listed as one of the great events of the year in live-stock circles. Not over 25 or 30 people were present at the commencement of the sale. Later on the collection grew to 50 people, but many of them actuated more by curiosity than with any desire to buy. However, the sale may be considered a success, it laboring under the disadvantages of being an exceedingly large offering and but few buyers present.

A notable incident of the sale, and one that must encourage breeders of the black and white, was the apparent conversion of a number of prominent Jerseymen, who, since the sweeping victory gained by the Holsteins at the great Madison Square Dairy Show, held in New York six weeks ago, have at last come to the conclusion that the Holsteins were a butter cow as well as immense milkers.

Mr. Sneath, of the Jersey Farm, who was at first a thick and thin Jerseyman, but afterward cast about for other blood to mix with his Jersey, bought nearly a dozen head of Holsteins. Mr. Pierce, the representative Jerseyman of the coast, also bought several and paid nice round figures for them, and evidently did not think that he was polluting his ranch in buying these choice young heifers for it. Mr. Buehl, of Humboldt, broke loose entirely from his first love, the Jersey, and went over to the enemy bag and baggage, buying a baker's dozen. Steele Brothers, buttermen of Pescadero, and cheesemen in San Luis Obispo, were evidently well pleased with the breed, after three years' experience, and purchased quite heavily, being the largest purchasers at the sale. Mr. Hall, of Sacramento, must have been pleased with his last year's experience, for he dipped in heavily. The conversion of Steele Brothers is a great victory for the Holstein men, as they are practical and experienced men, and with them it is entirely a matter of bread and butter, or rather, cheese and butter, and their lead in buying and generous bids were boldly followed by other prominent dairymen.

The different strains of breeding, however, were but poorly understood by purchasers generally, the plums of the sale being picked up by Mr. Burke for his already large and very solid herd at Menlo Park; and though in several instances he paid the highest prices of the sale, he bought nothing but Aaggie strains, which he obtained at ridiculously low prices, breeding considered. As an instance, his agent in New York some two years ago offered the importers of Aaggie Kathleen, a celebrated cow, the sum of $800, which was refused. This cow was afterward purchased by the Ontare ranch and brought to this coast. Mr. Burke obtained her at this sale, without expense for transportation or risk, and landed at his very door, for the sum of $310.

The average, while very low, and not half the price the same animals would sell for under the hammer in the East, may be considered a satisfactory one, considering the few buyers and great number of head offered. Below may be found the summary: 43 cows, $7280, averaging $170; 15 bull calves, $1575, averaging $105; 2 yearling bulls, $550, averaging $275; 11 heifer calves, $1260, averaging $114; total average, 71 head, $10,614, averaging $150.

Life History of the Icerya.

Forms of the Female Cottony Cushion Scale.

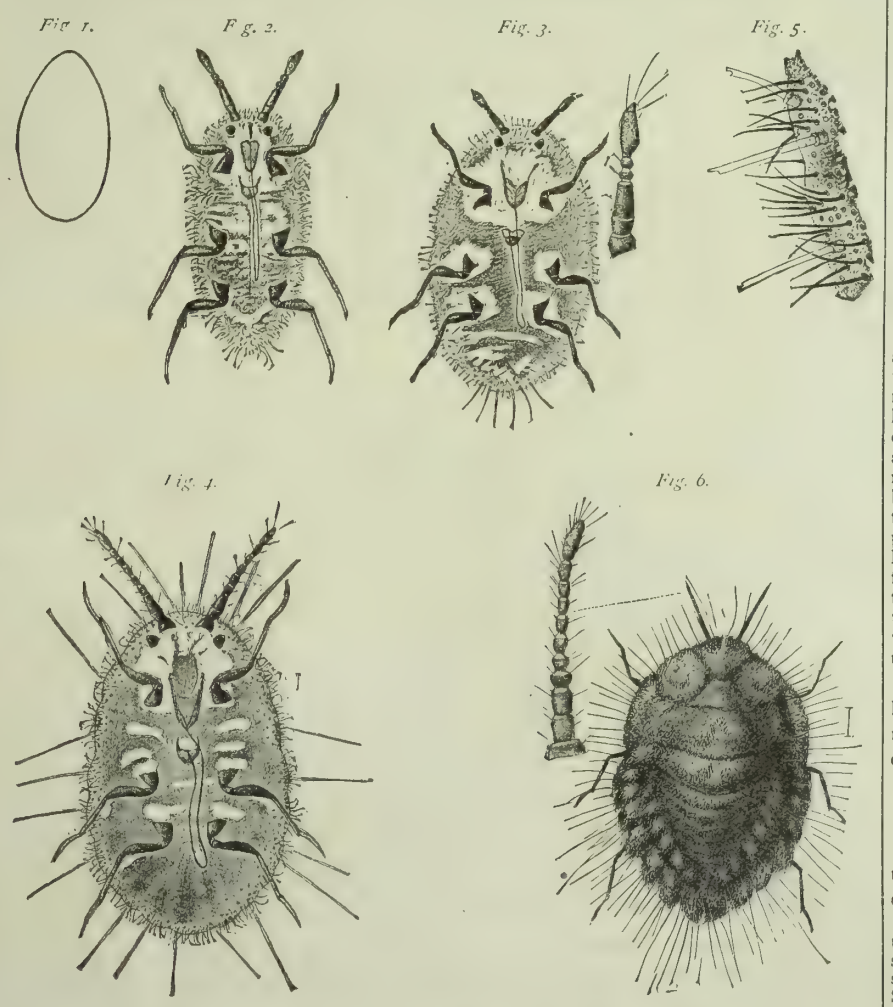
[From advance proofs of report by PROF. C. V. RILEY, U. S. Entomologist.]

As promised last week, we begin on this page the publication of the life history of the *Icerya purchasi*, or "Cottony Cushion Scale." We take up first the forms of the female, and at another time will give those of the male. The public is much indebted to Prof. Riley for the careful study which he has made of this insect, both in the laboratory and in the field, and we are glad to give our readers the benefit of early information of the important facts which have been brought to light by his investigation. This pest has already gained too wide distribution in this State, but there are, of course, many large districts in which it has not yet appeared. We desire all our readers to study the insect in the various forms and be prepared to detect the pest if it should come in their way.

Last week we gave an engraving of a small cluster of the fully grown females as they are seen on an infested plant. The drawing showed the insects as they appear soon after death, as the drawing was made from a specimen some time removed from the tree.

The following is a quotation from Prof. Riley's report, with allusion to the accompanying figures:

The Egg (*Fig. 1*).—The egg is quite smooth, elongateovate in form, and is of a deep orange-yellow color. It measures about 0.7mm. in length.



The average number of eggs laid by the female varies according to the vigor of the individual or the condition of the plant upon which she dwells; prolificacy diminishing in proportion as the plant is badly infested—a general law among Coccidæ. Over 800 eggs have been counted in a single egg-mass, by Mr. Coquillett, while Mr. Koebele has counted in a single egg-mass, which, by the way, was found upon nettle (*Urtica holosericea*), 940 eggs and 72 young larvæ, while 123 eggs yet remained in the dead body of the female, making a total of 1135 eggs from the single female.

The time required for the eggs to hatch after leaving the body of the female varies with the temperature. In the winter time the sacs are usually filled with eggs, while in the hottest part of the summer seldom more than one or two dozen will be found in each sac. Some collected by Mr. Coquillett on the 18th of March did not hatch until the 10th of May; but in mid-summer hatching is only a matter of a few days.

The Female Larva—First Stage (Fig. 2).—The newly-hatched female larva (and probably the male is identical with it at this stage of growth, since we have not been able to separate them into males and females) is red in color, inclining somewhat to brown. The body is ovoid in outline, being flattened beneath and convex above. The antennæ are long and six-jointed. Joint 1 is short and stout, and as broad as long; joints 2, 3, 4, and 5, subcylindrical and sub equal, much more slender than joint 1, and twice as long as broad; joint 6 is as long as 4 and 5 together, and forms a long club, at base equaling joint 5 in diameter, but broadening out to twice its width at tip. The basal portion of the club is sometimes distinctly separate from the rest, forming an additional joint. All joints have a few sparse hairs, and the club, in addition to several short ones, bears near its tip four very long ones, each of which is considerably longer than the whole antenna. The legs are thin and brown in color. The coxæ and femora are moderately large, while the tibiæ and tarsi are long and thin, the terminal joints of the latter bearing several long hairs. The upper digitules are represented by simple hairs, but the lower ones are present and are bent near the base. The eyes are prominent and are each mounted on a short tubercle. The mentum is broad and apparently two-jointed. The rostrum is broad at base and the rostral setæ are not very long. At the tip of the rounded abdomen are six small tubercles, three each side of tip, each of which carries a long stout hair, which is as long as the whole body. The body above shows six rows of secretory pores, four along the middle and one on each side. More or less regular rows of hairs alternate with these pores.

Female Larva—Second Stage.—According to Maskell and Comstock, there are but three stages of growth in the female after hatching, and these are readily distinguished by the number of antennal joints; the larva of the first stage having 6, that of the second 9, and the adult 11. Messrs. Coquillett and Koebele came to the same conclusions; and all have overlooked a form which we have found quite abundantly among the material we have studied, and which seems to constitute an intermediate stage between the so called first and second, and which is of course produced by an additional molt which we have personally observed in the field. Hence the so-called "second stage" of these authors becomes third, while the adult female is fourth instead of third, and there are three molts instead of two.

This new intermediate form (Fig. 3) differs from the female larva of the first stage in the following respects: It is much more rounded and of a stouter general appearance. The antennæ have the same number of joints, six, but their relative proportions are quite different. The antennæ, as a whole, are relatively much shorter. Joint 1 is short and stout, its length equaling its breadth; joint 2 equals joint 1 in length, but is not quite so broad; joint 3 is as broad as joint 2, but is twice as long; joints 4 and 5 are equal in length and width, each narrowing somewhat at base and tip, each considerably narrower than joint 3, and each of the same length as joint 2; joint 6 (club) is of an irregular shape—at base it is as narrow as joint 5, but it broadens until it is slightly wider than 2 or 3, and its tip is narrowed again; its shape is that of an irregular rhomboid with rounded angles and sides, the acutest angles at base and tip. The antennæ carry about the same number of hairs as in the first stage, but those homologous with the four very long hairs of the club in that stage are in this second stage but little longer than the other antennal hairs. The eyes do not appear on the margin of the body, and are only seen on a ventral view. The legs are proportionately much shorter, and the femora are stouter; the trochanters are broader distally, and consequently form a broader triangle in shape. The six tubercles at the anal end of the body are still present, but the hairs which they bear are much shorter. The secretory pores are no longer arranged in rows, but are scattered sparsely over the back and under the sides. The back is more hairy, and the short black hairs occur in irregular tufts.

FEMALE ICERYA, FROM EGG TO ADULT FORM.

Female Larva—Third Stage (*Fig. 4*).—That which has heretofore been considered the second stage, and which as we have just seen, is the third, may be described as follows:

The body is broadly oval in shape and reddish-brown in color, but is soon obscured more or less by the thick, curly, cotton-like execretion. The antennæ are nine-jointed instead of six, and are subcylindrical, tapering somewhat from base to tip. Joints 4, 5, 6, 7 and 8 are subequal in length, and each is about as long as broad; joints 2 and 3 are broader and considerably longer; joint 1 is like the corresponding joint in the previous stage; joint 9 (club) is a suboval joint, proportionately much smaller than in the previous stages; it does not exceed joint 8 in width, and it does not quite equal joints 7 and 8 together in length. The long hairs of the club are proportionately quite short. The insect as a whole is much more hairy than in either of the previous stages. The hairs are short and black, and show a marked tendency to grow together in tufts; even when their bases are well separated their tips turn toward each other or toward the common center of a group; they are quite thickly scattered over the thorax, but less so over the abdomen; all around the edge of the body they appear in close tufts, and the concentric subdorsal ring of tufts which is so prominent in the next stage is plainly seen in this. The secretory pores are scattered irregularly all over the back, and are more numerous than in the previous stage; they also occur under the lateral edges of the body. They are small and circular, and, seen directly from above, have a double outline, indicating a circular central orifice. Around the edge of the body is a row of much larger pores, brown in color, which protrude from the body, masked by the lateral tufts of hairs, each with a circular crown or lip at tip, from which proceeds a long, fragile, glassy tube. (Fig. 5.) The legs and feet are a little stouter than before, the tarsal digitules are shorter, and their enlarged tips quite indistinct. The six anal hairs are still present, though hardly noticeable as they protrude from the mass of shorter hairs.

The Adult Female—Fourth Stage (*Fig. 6*). Immediately after the molt by which the insect passes into this stage, it is free from the waxy excretion and presents a broad oval form, flattened below and quite strongly convex above, with two prominent raised surfaces on the second and third thoracic segments. Its color is still reddish brown, with several darker spots, especially upon the front half and along the sides of the posterior half of the body, and the antennæ and legs are black. The antennæ are now 11 jointed instead of 9; joint 1 is nearly twice as wide as long; joints 2 and 3 are subequal in length and thickness and are each somewhat longer than broad; joint 4 is a little more than half as long as 3 and is narrower; joints 5, 6, 7, 8, 9 and 10 increase gradually and slightly in length and decrease very slightly in width; joint 11 (club) is irregularly ovoid and is $1\frac{1}{2}$ times as long as 10; the special hairs are a little shorter than in the previous stage. The whole body is furnished with short, black hairs, more numerous than in the last stage, arranged in tufts, particularly around the edge, where they occur in a double parallel row, the inner row being practically subdorsal and accentuated by a slight ridge. Down the central portion of the dorsum of the abdomen the segments are indicated by the transverse rows of hair tufts. The secretory pores are exceedingly abundant, occurring in enormous numbers just under the lateral edges of the body, and scattered more sparsely over the back. The individual wax filaments which issue from these pores are very delicate and curly, and there is reason to suppose that two or three issue at one time from one pore, as they are frequently seen connected at base; the pore opening, however, seems to have a single simple opening. The inner row of tufts on the back is broken at its anal point by a depression, in which is situated a very large pore, from which the insect occasionally ejects a globule of a semi-liquid honey-dew. This depression is surrounded by an irregular ring of hairs, which are yellowish in color instead of black. The glassy filaments arising from the large tubular pores described in the last stage are now very long and radiate from the body in almost every direction. They break off easily, yet still often reach a length double that of the insect and her egg-sac together. What is probably the opening of the oviduct is situated on the under side of the seventh abdominal segment. It is surrounded by a transversely oval chitinous ring.

The Egg-Sac.—As the body of the female begins to swell from the eggs forming inside, the beginning of the egg-sac is made. The female lies flat on the bark, the edges of the body turned slightly upward, and the waxy material of which the sac is composed begins to issue from countless pores on the under side of the body, but more especially along the sides below. As the secretion advances the body is raised, the cephalic end being still attached, until, near the completion of the sac, the insect is apparently standing on its head, nearly at right angles to the surface to which it is attached. The egg-laying commences as soon as a thin layer of the secretion has formed on the under side of the abdomen, and it continues during the formation of the sac. There soon appears around the edge of the abdomen a narrow ring of white felt-like wax, which is divided into a number of flutings. These flutings grow in length, and the mass of eggs and wax under them increases, forcing the female upward until the sac is oompleted. When completed, it is from two to two and one-half times the length of the female's body. It is of a snow-white color, and the outside is covered with 15 of these longitudinal ridges or flutings, of subequal size, except that the middle one is smaller than the others. The upper part of the sac is firm in texture, but the lower is looser and thinner, and from the middle of the under side the young make their escape soon after hatching. The size of the sac and the length of time required in its growth depends, leaving the weather and the health of the food-plant out of consideration, upon the number of eggs which the female deposits. So long as oviposition continues, the secretion of wax accompanies it and the egg-mass grows. Concerning the rate of growth, Mr. Coquillett gives the following instance:

"On the 4th of May of the present season I marked a large number of females which were located upon the trunk of an orange tree that was not in a very healthy condition. These females had just begun to secrete the cottony matter, the latter at this date being in the form of short but broad tufts around the margin of the abdomen, those at the hind end of the latter being longest. By the 31st of May the cottony matter was equal in length to one-third of the female's body, and by the middle of July it about equaled in length the entire body of the female. As the egg-masses of some of the females upon the same tree were longer by one-half than the bodies of the females which produced them, it is very probable that at least another month must elapse before the egg-masses of the females which I observed would be completed. It is altogether likely, however, that these egg-masses would have been completed in a shorter time had the females been located upon a healthy tree. The egg-masses found upon healthy trees attain larger size than those found upon sickly trees, owing doubtless to the fact that the females living upon trees of the former kind are more vigorous than those upon unhealthy trees."

Of course the figures represent the insects highly magnified; the natural size is approximately represented by the short line beside each of the figures.

Encouraged and Encouraging.

One of our readers, having occasion to send us a letter about a change of postoffice, goes on to say:

"As soon as I get a little time to spare, I intend to write you, for the benefit of subscribers similarly situated, what I have done clearing brushland and setting out vines and fruit trees in the foothills of Southern Humboldt. I have been three years at the work. Commencing with poor health, I have cut and burned 20 acres; fenced 10 acres with a picket fence six feet high; set 2000 rooted grapevines and 300 fruit trees, besides a good garden and small fruit. Everything is growing very well, and in a year from this summer I will have fruit. I am preparing the other ten acres to set in trees and vines next fall.

"I will not tire you at present—only this I will say for your paper—I would not *think* of growing fruit without it as a companion. Oftentimes when I was tired and almost discouraged, I would take up the PRESS and read of some man who began just as I did, *persevered*, and in a few years began to reap the benefit of his industry. His experience would encourage me, and I would go to work again with renewed vigor."

We are always gratified by such testimony as the above—especially when it comes thus, unasked—a free, spontaneous tribute. It encourages *us*, too, to persevere in trying to make the PRESS yet more constant, trustworthy, and trusted friend and helper of the rural workers.

TO HER DEAD HEROES.—On the anniversary of Bunker Hill, New Haven dedicated a Soldiers' and Sailors' Monument with impressive ceremonies. Over 10,000 men marched in procession from the city to East Rock Park, where the monument was erected, and it is estimated that more than 100,000 strangers, beside representatives of the army and navy and invited guests, were in the city to witness the exercises.

WE are indebted to M. Weiss, book and job printer, at 525 Commercial street, S. F., for the use of the Greek type in the article on astronomy in our "Home Circle."

Southern California.

[NO. 6.—CONTINUED.]

[Editorial Correspondence.]

In continuing our notes upon the improvements in and about Lugonia, we would not omit a reference to the

Belleview Academy,

Which occupies the beautiful site next adjoining that of the Terrace Villa hotel. The building was designed and erected with special reference to its present occupation, and nothing has been omitted which could add to the convenience and comfort of the pupils. It is a private institution under the immediate charge of the Rev. J. G. Hale, as principal, assisted by his wife, daughter and son. The institution is designed as a preparatory school for college or university, and also to fit its pupils for the duties and responsibilities of an intelligent and active life. Especial attention is given to the care and comfort of such young ladies as may find it convenient to make the institution a temporary home during their course of instruction. Here they will be under the especial care of a competent Christian matron—an important matter, especially to the parents of delicate daughters who are seeking for those they love an educational institution and a home at the same time. Persons of both sexes are received as day scholars. Besides the ordinary educational advantages, the surroundings of the institution comprise all that is grand and beautiful in scenery, elevating in social character and standing, and beneficial in climatic and health-producing advantages. The school is far enough removed from the business center to be free from the diversion of time and attention to other matters, and yet within easy reach of the neighboring city of San Bernardino and the continental system of railroads, with which it is now connected by two daily stages, soon to be supplanted by direct railroad communication. Within a few minutes' walk there is a church, hotel, store, postoffice and telephone. But the saloon is an institution which has not yet found its way there.

Bank of East San Bernardino Valley.

So rapidly is the community growing in and about this locality that two banks have already come into existence to meet its wants. The "Union Bank," at Redlands, has already been alluded to in a former letter. The Bank of East San Bernardino valley is the name which has been given to the one at Lugonia. It has a capital of $50,000, and is already doing a thriving business. It is backed by men who have the confidence of the public and are well known as property-owners and sagacious business men. The officers are: F. P. Morrison, president; A. L. Park, vice-president; and John W. Wilson, cashier. Directors, A. L. Park, Frank Hinckley, Geo. H. Craft, F. P. Morrison, Geo. A. Cook.

A Fine Improvement.

What we presume will be the finest block of buildings in the vicinity was in process of erection when we were there, and is probably about finished by the present time. The structure is three stories in hight and covers 75x100 feet of ground room. The first floor is divided into five stores or sections. The corner one will be, or is already, occupied by the bank, and the postoffice will be transferred from its present quarters to another. The others will be occupied as stores. Upstairs there will be a large public hall 50x100 feet in size, and the balance will be fitted up for offices. This block is being put up by Messrs. Wilson & Berry, who also contemplate starting a newspaper there, and a part of the building will be used for editorial rooms, office, etc. These gentlemen are proprietors of the *Union* and *Sun* of San Diego. They are also large owners of real estate in the best part of the town of Lugonia, and are making every effort to advance the interests of the town generally, both by a liberal expenditure of money for improvements and by inducing others to visit this section and obtain personal knowledge of its resources and attractions.

A Domestic Water Supply.

Up to the present time, the domestic water supply of the various localities of this vicinity has been obtained from that employed for irrigation, but with the increase of population, and from the increasing evidence that a large and constantly growing community will soon be centered here, a company has recently been formed to supply the people with pure mountain water under pressure. Every arrangement has been made for a perfect city water system, devised upon a plan similar to that here employed for irrigation, and directly connected with the land. It may be remarked in this connection that the water system adapted to this locality is the most perfect and reliable of any irrigation scheme in the State, and one which will never be disturbed by the riparian and appropriation discussions which form such disturbing elements in nearly every other portion of the State.

The Crown of the Valley.

Lugonia, or by whatever other name the great city that is to grow up here may be called in the future, will and must stand unrivaled in everything that gives an interior city in California prominence and stability. Its features will be especially distinctive and most eminently unique. It will soon stand forth as the real and acknowledged "crown of the valley." Located at its head, golden and grand, as Pasadena is at its foot, silver-tipped, beautiful and lovely, it will in the near future develop into a city of gardens, beautiful with every form of semi-tropical loveliness, dotted with elegant villas, with monuments of culture and schools of various arts, colleges and churches. But its crowning importance will be its undoubted claim to be regarded as the great sanitarium of the Pacific Coast. Situated quite above all the surrounding valleys, above all the other cities and towns in this portion of the State, directly within the warm belt of the Sierra Madre, and yet easily approachable by rail or carriage, it will be without a peer. Located at first as a superior orange belt, above any destructive frost, below any possible snow, between huge mountains which form a perfect shelter from the heavy winds and sandstorms which so frequently visit the lower portions of the valley, the invalid or the seeker after a perfect sanitarium will here most assuredly find that for which he is seeking. The orange groves and the vineyards now planted here must soon largely give way and be cut up into smaller sections to accommodate the great tide of health-seekers who are now so rapidly pouring into this portion of the State from all parts of the Union. A 10-acre lot which was originally designed to accommodate but a single family must be made to domicile from 8 to 10 or more. The area properly suited to such purposes is comparatively limited in extent. The larger portion of this area will be filled, in all probability, within the next five or six years. The balance, now accounted as "outside lands," will not long remain unsought or unoccupied. This is no doubt

The Meaning of the Present Rush

For lands at this locality. This is the reason why land here has advanced to three or four times what it could have been bought for but a few months ago, and these facts furnish a good reason for the opinion that desirable locations will continue to improve in value for a long time to come. Land at from $500 to $1000 per acre can scarcely be made profitable for fruit-growing, *per se;* but it is not a high price for health resorts and suburban residences for sanitary purposes. Such residences must have a reasonable area of land about them, such as may be sufficient to secure pleasant outlooks and plenty of room for flowers, shrubbery and shade. The fruit for the family should also be raised upon the place, so that it can be picked and eaten direct from the tree and only when thoroughly ripened upon the tree. No one, even in health, can relish fruit obtained from the markets in this city who has been accustomed to eating fruit in the country properly ripened upon the parent stem; fruit ripened after being plucked is unfit for invalids. Nowhere else in the wide world can such privileges, together with first class climatic advantages, be so fully obtained as in the section of country of which we are writing. People in search of health, and those who desire to locate themselves where the climate and other surroundings are best calculated to preserve and promote health, are fast pouring into Southern California, and experience is beginning to show that no better spot, even in this specially favored portion of the State, can be found for such an influx than in the immediate locality of which we are writing. Knowing this, and fully believing in manifest destiny, the people there are setting their house in order to secure them.

Beautiful Crafton.

We have already made allusion to this locality as one of the three centers of attraction which go to make up the perfect whole of the future city of the East San Bernardino valley, which is soon to embrace them all in one. Perhaps it should have been the first instead of the last to be especially alluded to in these letters; for it was the first to attract the attention of the settlers in this portion of the valley after Old San Bernardino, which was located over a hundred years ago by the Jesuit fathers. It was for many years known as "Crafton Retreat." It was, and is indeed, "a sylvan scene," "a woody theater of stateliest view," with tree-embowered grounds, "where delicious paradise crowns with her inclosure green, as with a rural mound," the magnificent valley which here opens to view from the foot of the grand old mountain at whose foot it lies. It may be truly said of this favored spot—

"Out of this fertile ground He caused to grow
All trees of noblest kind for sight, smell or taste."

The locality took its name from its owner and first locator, Mr. Crafts, who passed away a few months since, just as he was arriving at the fruition of his 20 years' residence there. The outlook from Crafton, as it is now called, is simply magnificent. We quote the words of another, in whose company we recently rode through the sylvan scenery to which he alludes, and viewed with him the grand old mountains which he so beautifully and truthfully describes:

"Crafton is naturally and literally a grand and elevated stage from which may be viewed the most magnificent natural amphitheater to be found in the world. Turning to the north, east and south, the loftiest peaks of the continent-spanning Sierras loom up towering tens of thousands of feet into the 'upper deep.'

"Their snow-capped heads look down upon the silver and gold lined clouds resting along their upper slopes, and casting their waving and ever-changing shadows here and there upon their lower sides. Through rifts or openings in these clouds may sometimes be caught flashes of sunlight, so brightly shining upon the high snow-clad sides of these grand old mountains that one can hardly resist the impression that God has designedly opened the door to afford him a glimpse of the glories of the upper—heavenly Paradise. Thousands of people every year make the tour of Europe and climb the rugged steeps of the world-renowned Alps to look down upon the green-clad hills and dales of Switzerland, or the vine-covered and sunny plains of Lombardy and Italy; but there is nothing in the grandest views of the Alps equal in grandeur and sublimity to views that are obtainable every day in the year from Crafton, Mount San Bernardino, Old Baldy or Grayback. Nor does any valley scene from the Alps present so beautiful and charming an outlook of waving grainfields, light-green vineyards, and many-shaded orchards of oranges, limes, apples, peaches and apricots, as is spread out before one looking down the San Bernardino valley from Crafton. From the Alps rise many streams that meander through the valleys below, adding variety and beauty to the prospect. So, from Mount San Bernardino and Old Baldy rise streams that, like the water-courses of Lombardy and Italy, at once fructify the soil and give a charm of life and beauty to the valley. Among these may be mentioned the Santa Ana river and Mill creek.

"The latter is a feature of the valley. The dense line of forest trees that line this stream and its artificial outlet or *zanja* from Crafton through Redlands and Lugonia to Old San Bernardino and Colton attracts universal comment and admiration. There is nothing that can rival it in beauty in the State or on the coast. The fall, through its entire length, is about 120 feet to the mile, and the rapidity of its current is wonderful. Its bounding motion and rapidly changing course, the constant sound of its rushing waters, its forest-lined banks, its crystal transparency, and the many bright-colored and glistening rocks and pebbles over which it leaps, give it the charm and attractiveness of a New England stream meandering its course from the green mountains of Vermont or the granite hills of New Hampshire."

The Future of Crafton.

Continuing the language of the writer above quoted: "It may well be asked, what may not the future of Crafton realize? In some respects it is situated similarly to Pasadena. It has been said that Crafton is to San Bernardino and the East San Bernardino valley what Pasadena is to Los Angeles and the San Gabriel valley—the royal crown—the beautiful coronado.

"But if the natural advantages of greater and more commanding elevation; of drier, finer, more crispy and bracing atmosphere; of more delightful, equable, salubrious and congenial climate; of purer, clearer, cooler, more delicious and more sparkling water, in unlimited supply; or heavier, richer, more productive and fertile soil; of local landscape more diversified, with resplendent hilltops and sides; picturesque and fascinating grottoes and alluring umbrageous dales; meandering brooks; charming waterfalls and sparkling cascades; broad irriguous valleys, superbly luxuriant with golden orchard, purple vineyards and waving grainfields; of distant outlook, more diversified, more grand, magnificent and sublime—if these natural advantages are any recommendation in the location of elegant homes to people of refined taste and education, well or ill, or in the selection of a site for a unique and beautiful city of elegant and luxurious houses, then Crafton is much more to San Bernardino and East San Bernardino valley than Pasadena is to Los Angeles and the San Gabriel valley.

"It is, indeed, the royal crown—the grandly beautiful coronado of the most magnificent valley of Southern California, extending and embracing and including Pasadena herself, and no less the Queen City of the South—the matchless Los Angeles." W. B. E.

STRAWBERRY PORK.—The Santa Cruz *Courier* learned from Mr. H. B. Pilkington, who had just returned from Pescadero, that on the plateaus at the top of the cliffs, which border much of the coast from Point New Years to Pescadero, there grow quantities of a delicious wild strawberry, known as the "Beach strawberry," because the sturdy little plant pushes its way even down into the sand along the beach. The fruit is large in size and delicious in flavor, and this year the crop is so enormous that droves of hogs have been turned into these unique seaside pastures. Illinois boasts of her "corn-fed pork," but she will have to take a back seat now in favor of California's new dainty, "strawberry-fed pork."

CARRION AND CONTAGION.—The *Chronicle* makes a pertinent paragraph applying Ohio experience with the distribution of hog cholera from the dropping of choleraic pork from unburied carcasses by crows. This infested substance may fall in fields where healthy animals are pastured and infest them with the cholera germ. The preventive is, of course, to bury dead animals beyond reach of carrion eating animals which might bring it to the surface for carrion birds to fly away with. Attention is called to the numbers of carrion birds on this coast, and therefore the greater danger of distributing infection. It is desirable either to burn dead animals, or, if this be not easy, bury them deeply. This will make the air purer, as well as guard against evil work by the birds.

California Railroads.

A great deal of the material progress of California of late years is due to the creation and extension of the railroad systems of the State. For a time a few years back there was a cessation of railroad building, but for months past gangs of men are at work all over the coast engaged in railroad construction. In California the roads are being extended, and new tracts are feeling the influence of the presence of the locomotive. Rapid settlement of the country is the result, and on all sides are seen the evidences of progress and development. Of course, in carrying out this railroad work immense sums of money are expended for labor and material, which goes into business channels. It is a source of congratulation that this work of construction is again so active, since it augurs well not only for present confidence but future prosperity. There are still several parts of the State where little has been done in railroad building, and these parts are not nearly so prosperous, nor advancing so rapidly, as where the trains are running. The railroad men will not, however, stop with their present plans, but will doubtless look after the interests of other sections in due time.

The following statement of the railroad systems of California shows in brief the miles of road in operation up to the end of last year:

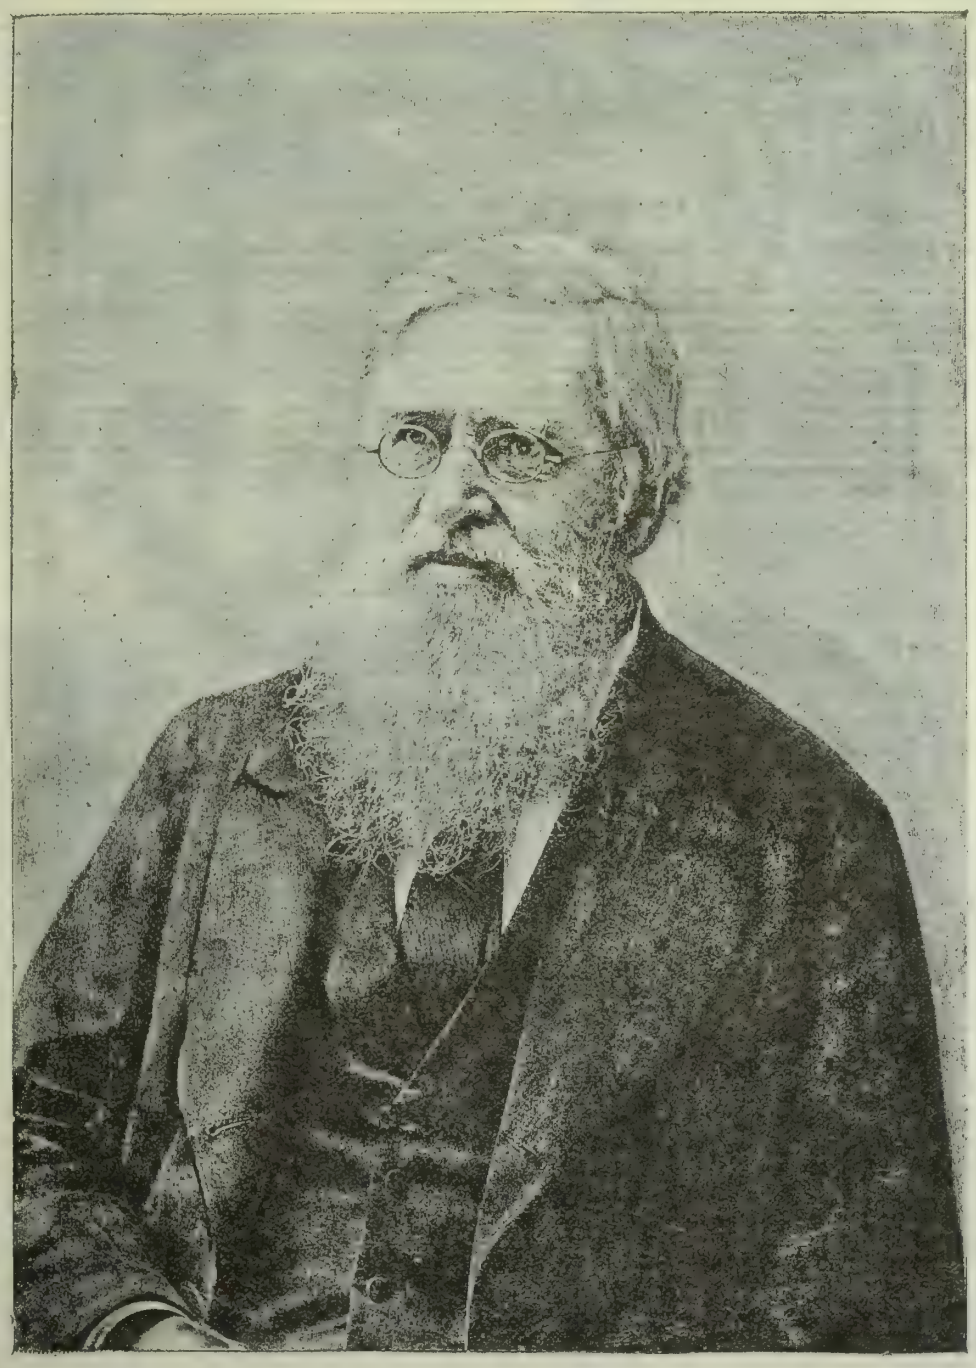
A Texan in California.

EDITORS PRESS:—Please allow me, through the columns of your valuable paper, to express my gratitude upon finding myself enjoying the luxury of breathing the soft, balmy, exhilarating and refreshing breeze being wafted inland from off the roaring, heaving, rolling, billowy bosom of the grand old Pacific ocean. Oh! what a grand sight it is to see the waves rolling, tumbling, leaping, chasing one another, each one determined to be the first to reach the shore.

One week ago I boarded the train at Ennis, Texas. I came via Dallas, where I took a train on the Texas Pacific for El Paso. There, we heard the cry: "Change cars with the Southern Pacific for all points in California." After a rest of three hours there we took our seats in the S. P. train for a pleasant ride through the green pastures and shady groves of New Mexico and Arizona. But O horror! what disappointment! Instead of beautiful landscapes, rich green valleys and grass-covered hills, what do we see? Rocks, gravel, sand, large hills and small ones, great broad valleys all covered with sand. The wind blew and the sand and dust flew. Our eyes, ears, mouth and nostrils were filled with sand till we really felt blue. Onward and upward, sand and dust everywhere on all sides and above and below. Still onward we go.

At last we reach the summit of the mountains. Here we are met by the cool breeze which comes stealing over the mountains from the west. We hear the cry, "California!" Here we descend the western slope and soon behold signs of civilization. Here we see the beautiful valleys, the waving grain, the great fields of golden barley, the cottages, the orchards, the gardens, and the beautiful flowers. At length we hear the cry, "Los Angeles! 30 minutes for supper!" and here we rest for a day after our long, dusty ride of 1600 miles, made in 63 hours.

Through the kindness of a real estate agent, I was permitted to see some of the beautiful farms, orchards and gardens. We rode among these to Florence, distant from the city about five miles. The lands here are all planted to orchards and gardens. Here we saw trees bearing the orange, lemon, banana, walnut, apricot, apple, peach, pear, plum and prune. Here are palaces with beautifully arranged grounds, ornamented with flowers of every shade and variety. The city of Los Angeles is so constructed that one cannot tell where it begins or where it ends. Bidding good-by to Los Angeles, we purchase tickets to the city of San Buena Ventura, in the famous Santa Clara valley of the south. This lovely valley is bordered on the southwest by the Pacific ocean a distance of 25 miles. It is watered chiefly by the Santa Clara river, which has its source far back among the mountains. The land in this valley is mostly level. That which lies nearest the foothills is rolling and sloping to the river. The soil here is of two or more kinds. On the north side of the river it is a dark, rich loam, very deep and inexhaustible. It is claimed that it will produce an abundant crop of whatever may be planted without any irrigation; but, of course, those crops only which pay the largest profits are raised. Fruits of almost every name and kind are grown here, and everything in the vegetable line seems at home here.



The soil on the south side of the Santa Clara river is underlaid by artesian water. It is light and sandy, and well adapted for grain and fruit, either with or without irrigation. During the summer season, at night-time, clouds of moisture are frequently blown in from the ocean, and these assist materially in producing the large growth of vegetables and grain. I have traveled on both sides of the river and visited many corn and bean fields, and I find the crops growing vigorously, which is astonishing to see without irrigation. I am informed that grapes are not raised extensively near the coast, though some varieties produce large and excellent fruit. Since coming here I have obtained reliable estimates which show a great advantage for farming in California over raising corn and cotton in Texas. The weather since I came here has been perfectly delightful, neither too warm nor too cold. I enjoy the most refreshing sleep, and my health is improving.

Real estate is on a "boom" since the railroad reached here. The people have waked up. Lands are selling at $7 per acre for grazing land up to $800 per acre for country seats richly improved. This country certainly beats any part of Texas, and I am glad I am here.

San Buena Ventura. F. M. LEMMON.

Wood Pulp Instead of Plaster of Paris.

An important discovery has just been made at the Sognedal pulp factory in Norway, after several years' experimenting, wood pulp being used for the manufacture of the kinds of building ornaments which are generally made in plaster of Paris. The pulp is first ground from wood, and then, by a machine, pressed into any kind of ornament, such as ceilings, friezes, basreliefs, rosettes, etc., which are quite as well finished as similar articles of plaster of Paris. Another feature is that the articles made from the pulp show painting or gilding to great advantage. Tests have also been made with regard to their strength, by dropping them from various hights or hurling them against stone walls, the results being highly satisfactory. Thus, for instance, a bar of this material one foot in length, one inch in thickness, and five inches in width, neither broke nor sustained any serious injury on being hurled with full force against a stone wall a couple of yards distant. Naturally, too, this material is far lighter than plaster of Paris, an important advantage, as no great harm would be caused to a person by ornaments made from it falling upon him, which is otherwise with those made from plaster of Paris. It should also be mentioned that pulp ceilings, friezes, etc., are, by the hardness and compactness of the material, impervious to wet, and that they may, if desired, be fastened by nails or screws. Finally, the inventors state that ornaments made from this material cost only half the price of similar ones made from plaster of Paris. This discovery will, it is believed, give great impetus to the pulp factories which are now quite unprofitable through the low prices of paper, and the utter failures which have attended the vast production of the latter, direct from wood pulp.

ALFRED RUSSELL WALLACE.

Alfred Russell Wallace.

One of the most distinguished scientific men of the age—Dr. Alfred Russell Wallace—has been for some weeks on a visit to San Francisco. While here he has delivered several lectures on Darwinism before those of our citizens interested in scientific research. We give on this page an engraving of Dr. Wallace, from a recent photograph by Taber.

Dr. Wallace was born at Usk, in Monmouth, Jan. 8, 1822, and was educated as a surveyor and architect, a calling he exercised until 1845, when he devoted himself exclusively to naturalistic studies. He spent four years on the Amazon and eight years on the Malay archipelago, making extensive zoological collections. It was while living in the East, without knowing of Darwin's cognate researches and speculations, that he wrote a theory of development by natural selection, though not using the latter term. He, therefore, really published the theory of evolution before Darwin. He has published many valuable scientific works. Among these are "Travels on the Amazon and Rio Negro," "Palm Trees of the Amazon," "The Malay Archipelago," "Contributions to the Theory of Natural Selection," "The Geographical Distribution of Animals" (which practically founded a new science), "Tropical Nature," etc. He has also written a work "On Miracles and Modern Spiritualism."

Dr. Wallace is a member of the Royal Society, and has long been distinguished in the scientific world. It was curious that both he and Darwin should have been pursuing the same line of investigation, which led to the same results, without either knowing of the other's work. The modern theory of evolution was therefore the result of the conclusions of two independent thinkers. As it bears Darwin's name, however, he is better known in connection with the subject than Dr. Wallace.

THE sheepmen of Butte, Tehama and Colusa counties have all driven their sheep to the mountains.

More Bait for Gudgeons.

A subscriber in Solano county incloses a circular he has received, and asks us to say what we think of it.

The document claims to be "important to those who desire to obtain the long use of money at four per cent." It is issued by an alleged journal in an Eastern city. Said "journal" boasts of its "character" and vast advertising business—though we find its circulation left blank in Ayer's *American Newspaper Annual* for 1886—and professes to divide its "surplus profits," not by lottery, (oh no! *that* would be illegal!) but by loaning out to selected patrons. The scheme ends with blank forms for the intended victim to fill out, *sign* and forward, with a few dollars.

On the reverse of the sheet, in a style that greenhorns might mistake for the work of the typewriter, is printed what purports to be a confidential letter. This epistle runs as follows, save that date and names are somewhat altered:

UTOPIA, All Fools' Day, 1887.

DEAR SIR:—Our prospectus herewith inclosed explains fully the *Bucolic Universe* Loan Investments of surplus profits among the subscribers whose patronage renders profits profitable.

This business policy is fair, safe, and honest.

We have found that while a comparatively small proportion of our subscribers care to negotiate for the Long use of Money, even at a Low Rate, *One good able-bodied Loan* in a community, by inspiring confidence, has more influence in bringing and holding subscription than all the books, chromos, and "gimcrack" premiums we could have bought with five times the amount loaned. So profoundly are we convinced of this, that we have decided to place at the earliest possible moment a good, Solid Loan in each county, where, as yet, we cannot point to a holder of a Loan in the immediate locality as a living proof of the practical workings of our system.

Within the next 90 days, with our present enormous advertising revenue as a criterion, we will place Loans aggregating many *Thousands of Dollars.*

We can, honestly, and without violating the terms of our Prospectus, place them where they will "*do the most good,*" for we make no hypocritical pretense to be running this paper except in our own interest.

So, without going into tiresome particulars, we will simply say: We intend to have the *Bucolic Universe* strongly represented in your community. Rest assured if we did not mean business in this communication, and if we did not know of you, you would not receive it.

Regard it as confidential and let us hear from you fully within 30 days—we cannot hold it open longer. In subscribing, fill blanks on reverse side carefully. Truly yours,

BUCOLIC UNIVERSE.

Dictated to Stenographer by *John Smith.*

The signature is made to look as if it were written, but it is printed like the rest—and the paper (like those for whom it is baited) is very appropriately green.

Our correspondent says he suspects it to be "an unmitigated swindle." We think he has told it all in those three words. We are tired of warning friends and patrons against putting faith in any concern that encourages hopes of getting something for nothing or wants autographs, and we hope none of them will be unwise enough to risk a dollar, much less their legal signature, with any such sharpers.

DRY ROT IN TIMBER.—In a recent number of a German technical paper, Herr Gottgetrue treats of the question of dry rot by the light of a summary of known facts illustrative of the subject. He is of opinion that the problem is still to be solved, and, in view of the occurrence of dry rot under some very peculiar conditions, suggests that the germs of the disease may exist in the living tree. In no other way can he explain the decay of wood from this cause, when it was apparently dry and sound and properly used. In Russia there are entire forests from which the timber is taken, experience having shown that it has always been attacked by dry rot. Sometimes a strong solution of common salt, applied while hot, has been found an efficient preservative of timber. The necessity of airing timber in its built-in position is, of course, universally recognized. Professor Farsky, of Tarbor, Bohemia, has found that salicylic acid is a preventive and cure for dry rot. At first the acid was used in a dry form, but latterly great success has been achieved with a solution of 5.28 ounces of salicylic acid in 0.22 gallon of alcohol, and afterward diluted. This solution has efficiently protected a floor 800 square feet in area from the spread of dry rot, and has removed it from the spots where it seemed to have established itself. The crude acid may be used for this purpose, and its action as an antiseptic is hightened by the admixture of a little carbolic acid. Professor Poleck finds that wood cut in winter and not soaked in water is very susceptible to dry rot, which does not appear when the timber is kept perfectly dry or thoroughly wet. A somewhat high temperature and dampness are almost, though not entirely, essential to the propagation of dry rot mycele.

New Store of G. G. Wickson & Co.

We give on this page an engraving of the new store of G. G. Wickson & Co., which is located at Nos. 3 and 5 Front street, close to and facing Market street, the main thoroughfare of this city. The building is new and spacious, with four floors and basement; it is commanding and handsome in its style, as can be seen from the engraving, and is excellently located in the very center of the large implement and wholesale hardware establishments, and at the head of Front street, so long familiar for its dairy commission-houses.

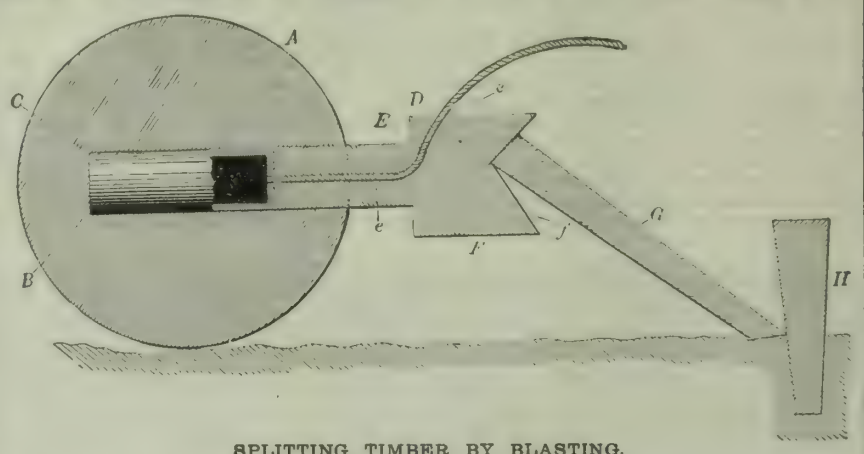
Mr. G. G. Wickson, the senior member of the firm, came to California a number of years ago from the great dairy and implement manufacturing State of New York, having all his life been familiar with the construction and operation of agricultural machinery. During his first years in California he was engaged with one of our leading implement-houses, both in the store and in the field, being especially charged with the handling of improved harvesting appliances. This opportunity for thorough acquaintance with the needs of our agriculturists and the provisions for supplying them soon showed him that though our implement houses exhibited great enterprise and devotion in ministering to the demand for improved agricultural machinery, they had singularly overlooked the great progress which was being made at the East in improved dairy machinery, and as there was no firm in the city which made dairy implements and supplies a distinctive line of effort, Mr. Wickson chose this as his main line, and has thus built up a large business without encroaching upon the business of other houses, and, in fact, has enjoyed the good-will and encouragement of those who have gained the greatest reputation in the general agricultural implement trade. At the same time he has secured the patronage and support of our dairy public, who have found it of decided advantage to have the latest Eastern and foreign inventions brought right before their eyes and to have such a satisfactory headquarters for dairy goods as Mr. Wickson has provided them with. In fact, Mr. Wickson assures us that he has found the dairy interest of the Pacific Coast more wide awake and eager for improvement than he anticipated when he started in his chosen line of trade.

One of Mr. Wickson's first efforts was the introduction of the centrifugal cream separator. Up to about three years ago nothing had succeeded in superseding the old and laborious method of cream-raising in shallow pans. The dairyman had to be content with such cream as he could obtain, and had no help for adverse weather-conditions, different results being obtained in different parts of the State and at different times of the year. In fact, though the shallow pan was the safest device where cold water was not at hand, still its results were largely determined by influences over which the dairyman had no control. The centrifugal machine was almost immediately recognized as giving the dairyman the whip hand over the various weather-conditions, and at the same time it liberated him from a vast amount of expensive work in hand-skimming, pan-washing, shelf and floor scrubbing and the like. The advantages of immediate separation of the cream before its natural flavor has a chance to be attacked, and the securing of fresh, warm, sweet skim milk for calf-feeding, are too well known to be enlarged upon. The other fact that more and better butter is obtained by the centrifugal method is vouched for by some of our most intelligent dairymen, as a deduction from experience covering long and continual use of the machine. A large number of the De Laval machines have been introduced, and are now in use in this State. In addition to the standard size, the firm has two new sizes—one with twice the separating capacity of the regular machine without any appreciable increase of the driving power; another is a smaller separator operated by hand-power, which will be found available in small dairies.

In addition to the centrifugal separators, the firm represents the Stoddard improved barrel churns, roller butter workers, both power and hand sizes, a full line of butter molds, printers and stamps in almost infinite variety, milk-testing appliances as well as improved pails, cans, strainers and the host of accessories of the butter dairy which their new catalogue fully describes, but which we have not space even to mention.

Much attention is also paid to the fitting out of cheese dairies, and there is a growing demand for improved vats, heaters, gang presses, curd-mills and the well-known Danish rennet and color preparations of the Hansen laboratory, for which the firm has the general agency. It would make the old-time cheese-maker laugh to see how science has stepped in to give him his rennet in imperishable shape and uniform strength, either in liquid or the still later tablet form, so that the old rennet jar is banished from the factory. Among cheesemakers' supplies are included seamless bandage, curd knives, press screws, hoops and followers, curd pails, strainers, syphons and all other appliances of the latest pattern. Beside the improved appliances for handling the milk from the dairy, the firm has found it necessary to furnish its customers with the best facilities possible for assisting in the production of the milk and the maintenance of the animal body, and of this department we can only find space to mention that it contains such well-known and popular machines as the Ross fodder and hay cutter, with its wonderful cutting capacity, the Scientific feed-mill just gaining such prominence on this coast, and St. Albans Dairy tread-powers, together with steam engines and boilers, all adapted especially for dairy use, calf-feeders and weaners, and stock-raising appliances of most improved patterns.

The old store of G. G. Wickson & Co., at 38 California street, soon became too small to show a large line of goods to advantage, and for this reason the large new building shown in the engraving was secured. It will give room for spacious show-rooms where dairy machinery can be set up and shown in about the same relative positions as it occupies when in use, and this will serve to give visitors a good idea how improved Eastern dairies are fitted out and conducted. The rooms are high and well lighted, and will serve admirably as a headquarters where dairymen visiting the city can meet to discuss matters relating to their business or for comparison of the merits of the different appliances which are being found useful in dairy work.



NEW STORE OF G. G. WICKSON & CO., 3 and 5 FRONT STREET.

To MAKE A FLANGE JOINT that won't leak nor burn out on steam pipes, mix two parts white lead to one part red lead to a stiff putty; spread on the flange evenly, and cut a liner of gauze wire—like mosquito-net wire—and lay on to the putty, of course cutting out the proper holes; then bring the flanges "fair," put in the bolts and turn the nuts on evenly. For a permanent joint this is A1.

Blasting Plug for Timber.

Powder for splitting logs is largely used on this coast, where our trees are of great size. Wm. T. McCall, of St. Clair, Alabama, has patented an improved means of splitting logs, which is especially applicable to long, thick logs. We give an engraving on this page which shows his plan. *A* designates the section of a tree-trunk of about 22 feet long and 2½ feet in diameter. *B* is a canal, preferably of circular section, made on a radial line of the log at about the central point of its length. The canal, *B*, penetrates to a proper distance on the opposite side of the axis of the log.

SPLITTING TIMBER BY BLASTING.

C is a cartridge filled with gunpowder or other proper explosive, and made to fit snugly in the canal, *B*. The cartridge is of suitable length to lie, when inserted to the bottom of the canal, with its center in the axial line of the log. *c* is a central opening through the outer end of the cartridge-casing. *D* is a block of metal, preferably cast iron, having the extension, *E*, and the head, *F*, as shown. The extension, *E*, is of proper shape to be inserted snugly in the canal, *B*, upon the cartridge, *C*, and is sufficiently long to be used with logs of different diameters.

E is a central longitudinal canal through the extension with its outer end bending upward or outward in the head, *F*, and ending in an orifice, *e*. The inner orifice of the canal lies upon the opening, *c*, of the cartridge. The head, *F*, of the block, *D*, is provided on its outer end with the re-entering shoulder, *f*. *G* is a metal bar, preferably of cast iron, which, in practice, has its upper end formed to fit within the shoulder, *f*, and has its lower end braced against the metal block or bar, *H*, which is driven into the ground.

In practice the block, *D*, weighs about 12 pounds and the bar, *G*, about 40 pounds. The bar, *G*, is about four feet long, and the block or bar, *H*, about two feet long, with one-half its length driven into the ground. The log lies with the canal, *B*, on one side, and the canal, *E*, is properly primed up to the orifice, *e*, so as to fire the cartridge therefrom; or a fuse, *I*, may be inserted into said orifice and fired in the usual manner. It is found in practice that by these means the log can be split straight or into longitudinal sections. A light wad, *i*, is placed between the ends of the extension, *E*, and the cartridge when gunpowder or any material that does not explode by concussion is used; but if a material that is liable to explode by concussion is used, a spiral spring is placed between the extension and the cartridge to prevent such explosion. The inventor thinks that better results are obtained by the use of gunpowder and similar slowly exploding materials than by quickly exploding materials, which would be apt to break the log into small fragments.

The Ballot, Not the Bomb.

Under the above heading, W. D. Vincent wrote for the *Labor Organizer* the following article, which has in it good points for all well-meaning voters:

I am not an admirer of standing armies. The practice of calling out the soldiers and militia to shoot down workingmen cannot be too strongly condemned. But who made the standing army and who calls it out? The lawmakers. Who made the law-makers? The workingmen. The laborers of this country have made their own beds and must lie in them until they have sense enough to make new ones. Year in and year out they have persisted in sending men to our legislative bodies to make laws to sustain themselves. All workingmen have not done this, but more than nine-tenths of them have. One man votes for himself, while the other nine vote for the monopolists. The man who has failed to exercise sufficient judgment to shoot the ballot intelligently had better not undertake to handle the Gatling gun. He is just as likely to shoot his friends as his enemies, and more likely to have the muzzle of the gun pointed toward himself than in any other direction.

There is not a reform that is asked for, and none that would be beneficial to the people, that cannot be brought about by the ballot. Otherwise our form of government is a failure. If Republican government is a failure, then what shall we substitute for it? If a majority of the people shall not rule, who shall? But it is not a failure. The trouble is with the people. They have not yet learned that "eternal vigilance is the price of liberty," or else they have forgotten it. Their troubles have been brought on themselves—the result of their own carelessness in voting. The men who advocate shooting now are the very men who have been voting to enslave themselves, and will probably do the same thing at the next election. If they had been voting right and trying to educate others to vote right, they would know better than to think they could get a very large number of men to shoot right, even if shooting was the most practical and proper thing to do.

There can be no question that we are suffering from a system of robbery. The few are getting the benefit of what the many produce. The idlers are living at the expense of the industrious. But whose fault is it? Our law-makers have done just what we sent them there to do. These robber laws and unjust symptoms have not all grown up in a day. The coil of greed and monopoly has been drawn tighter and tighter around us every day. Our Government has done this, but it could not have done it without our consent. We walk up to the polls at each election and give our consent by balloting to keep the same men and the same old political parties in power that have done all the mischief. There is not one abuse that we complain of that cannot be corrected in two years' time by intelligent action on the part of the laboring men. It can be done peaceably, quietly and lawfully by voting for a principle instead of a prejudice—by voting for ourselves instead of "our party."

Party prejudice is at the bottom of our troubles. The average voter thinks more of his party than he does of himself, his family or his native land. He is afraid to vote for what he knows to be right, for fear of throwing away his vote. It is costing him all he earns, over and above a scanty existence, for the blessed privilege of voting for his party. I shall always contend that men should have what a majority ask for and vote for, but it is mighty hard on the other fellows who don't want it.

There ought to be some means of plastering up the mouths of these fellows who are always wanting to bear arms against somebody—not that there is any danger in them, but because they are doing the labor cause a great deal of harm. They create a prejudice in the minds of well meaning but unthinking people that is hard to overcome. Let us hear no more about "Gatling guns," "Winchester rifles" and "dynamite," but rather let us arm ourselves with ballots and shoot them intelligently and in the right direction.

INVINCIBLE!

ÆTNA
HOT MINERAL SPRINGS.

THE EMS OF AMERICA.

The waters of the Ætna Springs are generally acknowledged to be the equal, if not greatly the superior, of any on the Pacific Coast for the relief and cure of all curable diseases. Their analysis so closely resembles the celebrated Ems of Germany that the Ætna may well be called the Ems of America. The location is pleasant, the air pure, no fogs, malaria, or mosquitoes. Nights always cool. A fine mineral water swimming bath attached. Postoffice and Wells, Fargo & Co.'s Express on the premises. Stage leaves St. Helena for the springs daily (except Sundays) on arrival of A. M. train from San Francisco. Board and baths, $10 to $12 per week. Write for circulars to Liddell Postoffice, Napa county, Cal.

W. H. LIDDELL, Proprietor.
S. J. STEWART, Superintendent.

WANTED—A HORTICULTURIST

To take charge of a farm near Walnut Creek, containing a young orchard, a small nursery, some grain land, live-stock, etc. Address as below, stating age, experience, nationality, wages expected, etc.; references required.

A. F., P. O. Box 2322, San Francisco.

FREE!—Our Illustrated Catalogue and Complete Treatise. Send for it now. Local Agents wanted.

JAMES LINFORTH,
General Agent for Pacific Coast,
120 FRONT ST., SAN FRANCISCO.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WAGON-REACH.—A. Singer, Lovelock, Nev. No. 362,231. Dated May 3, 1887. This wagon-reach consists of the double-jointed or hinged reach, the object of which is to avoid strain on the reach and allow for the motions of the wagon in passing over uneven ground. The reach adjusts itself to all the movements of the wagon.

FRUIT-DRIER.—G. A. Fleming & C. F. Fleming, San Jose. No. 362,736. Dated May 10, 1887. This invention consists in various details of construction and arrangement relating to the heating of the air, its control and admission to the fruit chambers, the management and disposal of the fruit trays, the natural and artificial draft and other features.

CONDITION POWDER.—James W. Griffes, Hanford, Tulare Co. No. 364,408. Dated June 7, 1887. This is a new and useful composition of matter to be used in veterinary practice as a condition powder. It is intended for the treatment of all blood diseases, and is given in doses of one tablespoonful twice a day, mixed with the feed. The compound is composed entirely of vegetable substances.

REVERSIBLE PLOW.—Neil McLean, Watsonville. No. 364,362. Dated June 7, 1887. This is an improvement on a patent which was granted to the same inventor last year. The present invention has for its object such a construction of the framework and the shares that either one may be removed when desired to use the plow as a single plow only, and a short supplemental landside may be put on in the place of the one removed. It also relates to certain improvements in the device for holding and locking the beam.

COMBINED BALING PRESS AND FEEDER.—L. G. Thompson and A. H. Isham, S. F., assignors to Truman, Isham & Hooker. No. 363,095. Dated May 17, 1887. This improvement in baling presses consists in a novel means for lifting the hay or material to be baled in regular or irregular quantities into the press, and partially compressing it before delivering it to the press; an improved mechanism for pressing the same in successive charges, and a means for loosening and discharging the bale after it has been finished.

SULKY CULTIVATOR.—Ira B. Kilgore, S. F. No. 362,286. Dated May 3, 1887. The entire tooth-carrying frame is of simple construction and the main bars are all of gaspipe. The cultivator teeth are all in front of the driver's seat. The teeth are easily raised to the desired hight and kept at any distance required. By operating a lever, the wheels may at once be turned to an angle with the previous line of travel, thereby throwing the tooth-carrying frame around, and this movement will enable the machine not only to turn the corners, but also to turn temporarily out of the way of any projection or obstruction on the line of travel.

TRACTION ENGINE.—Jacob Price, San Leandro. No. 363,966. Dated May 31, 1887. This traction engine is especially for use on ordinary roadways or fields. It consists of an engine and boiler mounted on suitable bearings and traction wheels and an intermitten ly oscillating clutch mechanism of peculiar construction, by which the reciprocating motion of the engine is transmitted to the driving wheels, so as to produce a continuous rotary motion of the same without the intervention of gearing; and it also consists in a means for adjusting the transmitted stroke and the consequent power which is applied to the engine.

GLOSSY INK.—Any common writing ink can be made glossy by adding to it a little gum arabic or white sugar. If the latter is used care must be had not to use too much sugar, else the mixture will be sticky when dry, and if too much of either gum or sugar is used the ink will become too thick to flow well.

San Francisco Costumes.

San Francisco may feel justly proud. If not the originator of fashion, she has still a fashion of her own, and it is considered first-class. Many of the rich costumes worn at the Washington receptions and at the New York drawing-room were designed and made by our local houses, and found to surpass some of the celebrated Worth's or Laferier's dresses. San Francisco merchants import at the commencement of each season a few of the most stylish Parisian dresses. Then, combining taste, skill and the knowledge of what becomes our San Francisco ladies, they get up a style of their own, which, in most all cases, gains them the credit of having our California ladies the best dressed in the land. The house that has always taken high rank is the Lace House on Post street.

The Lace House has justly earned the name of having sent out the handsomest ball costume, the most elegant bridal dresses and the richest street suits, and was one of the very first to make the tailor-made suits. It would surprise some of the unsophisticated to look over the number of orders received not only from the city and State, but from Eastern visitors who had some dresses made at this establishment while visiting here. The Lace House is now selling dresses and mantles to some of the best houses in the trade, which are used as models to copy ladies' as well as misses' suits and cloaks.

STREET OR TRAVELING COSTUME.

The smaller cut on this page represents a costume just made by the Lace House for street or traveling. Other cuts will appear in these columns from time to time.

Ladies' Costume.

The adaptability of the costume to black lace is here shown, the choice being Kursheedt's Standard Chantilly lace in net and flouncing. The round, four-gored skirt is made of silk, with a knife plaiting of silk for its foot garniture, and its draperies are of the lace flouncing. A beautiful effect is achieved by the arrangement of the front drapery, which falls straight at the right-side edge and is lifted with a high, graceful curve at the left-side edge by a cluster of upturning plaits hidden under downward-turning plaits; plaits all across at the top, a group of plaits at the left side of the center caught to the skirt under a deep loop, and a tacking a little below the right hip producing the handsome folds and artistic draping characterizing the mode. The lower back drapery is also lifted with a graceful curve at the left side, but no higher than is the front drapery, while at the right side it falls undraped even with the front drapery, its top being gathered and sewed to the skirt a little below the belt. Where the skirt is exposed by the draperies at the left side it is covered with lace flouncing, and bows of ribbon are tacked over the plaits in the left edge of the front drapery, over the plaits in front of these plaits, and also over the draping below the right hip. Falling over the top of the lower back drapery in two fluffy wings is a short drapery that is plaited at the belt and shirred through the center, producing a bouffant effect over the bustle. The superb adjustment of the basque is made by curved darts and seams. The net is arranged over silk for the basque, the silk, however, being cut away from under the lace in V outline at the neck. A falling frill of lace edging to match is arranged in bertha fashion to follow the outline of the V, and is continued down the closing to terminate in points below the waist-line, a bow of ribbon being fastened at the point of the V. A high standing collar, with rounding front corners, finishes the neck. The outline of the basque is decidedly *chic*, forming a point at the end of the closing, a high arch at the sides and a square postilion outline at the back, where a stylish fullness is introduced by an underfolded double box plait at the end of the center seam. The coat sleeves are slightly shortened and are of the lace net, unlined.

LADIES' COSTUME.

White crepe folds are added to the neck and wrists, and a lace-pin secures the collar ends. The lace may be obtained in needful widths for the draperies and in a variety of pretty and novel patterns. While the mode is especially suited to the development of lace costumes, it is none the less adapted to all varieties of seasonable dress goods in tissue, silks and woolens, and in cottons that can be worn a season without laundering. Embroidered tissues, tulles or crepes make up well in this way, with ribbon for decoration. Under lace or tissue, velvet, surah, moire, satin or grosgrain may be attractively used. Passementerie ornaments or rosettes of picot-edged love ribbons may take the place of ribbon bows. The straw hat is trimmed with lace and feathers.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, *or beyond the time he intends to pay for it*, let him not fail to write us *direct* to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Catching Fowls.

EDITORS PRESS:—The recent event of one of our neighbors sending a stray bullet through a crowded store, while trying to capture a chicken out of the yard for dinner, by using his revolver, tempts me to send, for the benefit of your readers, my plan to catch chickens easily in daylight:

Make a lath or slat run roof-shaped, A, about three feet long and two feet high, with a door fitted at each end to slide down and close it, when desired, and a slide door on one side to reach through to catch them.

Let one end of this run against the hole in the chicken-house or fence where they pass through, so they will become used to it. When you want to catch one, drive them into the house and close the outer door of the run; then drive them out into the run and close the inner door, thus shutting them in the run, and you can reach in and capture what you wish.

This run also answers for a coop for general use, being especially convenient to reach into. More anon. CHICO.

Chico, Cal.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, $3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

For Sale—An Ideal Vineyard

THIRTY-ACRE TRACT

(Nearly square), Mountain View, Santa Clara County, Cal. Three miles from Railroad station, toward foothills, warm belt. Mountain View is 36 miles south of San Francisco, 12 miles from San Jose, and about 4 miles from the great Stanford University grounds. It is separated from the ocean by the high Coast Range, and possesses a remarkably genial climate. Three hundred olives ("Picholine"), one to four years old, surround the Vineyard; most of them planted spring of 1885—two years old when planted. There is a carefully selected home orchard of about 80 thriving trees, two years old when planted—1885—and two large oak trees reserved for the homestead lot.

The whole Vineyard planted in Resistant vines (Phylloxera-proof), Riparia rooted-cuttings and Californica Seedlings; the greater part planted spring of 1885, the reminder in 1886. About one hundred, scattered over two blocks, were experimentally grafted, spring of 1886, to "Crabb's Black Burgundy," and have made excellent growths. Soil is gravelly loam, easily worked, and, as analyzed at the State University, particularly adapted to vines and fruit. Every foot of soil cultivable. The vines are planted on the celebrated "Chaintre system," long pruning (the latest and best system, now extensively adopted in France and Algiers), but can be trained otherwise.

413 CALIFORNIA STREET, SAN FRANCISCO.

Glen Cove Rancho for Sale.

This Rancho is situated at tide-water on the north shore of the Straits of Carquinez in Solano County, and comprises about 415 acres of good grain land. It is fenced and cross-fenced with five-board fence, and is well calculated for fruit raising. Has a young orchard of upward of 700 trees now well started; also a vineyard of 7000 vines of wine-producing grapes. The improvements consist of a large barn covering an area of 30x60, with 15-foot stables on either side; also a warehouse 30x60 for storing grain (with wharf) at tide-water, thus saving the expense of hauling grain for shipment. A wagon-house, a conservatory, sheds for storing machinery, hen-houses and inclosed yards, with a modern-built, two-story house with mansard roof and cellar under the whole structure, resting on an 18-inch stone wall; has 15 large, fine rooms, hard-finished walls, furnished with hot and cold water from two large cisterns and a spring upward of 100 feet above the house. Has a fine garden and pleasant surroundings; is about 30 miles from San Francisco and four miles from Vallejo or Benicia, with good roads by land and a pleasant sail by water. The prospective railroad from Santa Rosa to Benicia is expected to pass directly in front of the place, and a flag station is promised by said railroad company. The soil is of a rich loam and very deep. In point of health and climate no section of the State can surpass it. The live-stock and the farming implements will be sold, if desired, at very low figures. A rare opportunity is offered for any one who wants a very desirable place at a very favorable price. For further particulars apply on the premises or address, JOHN F. DEMING, Vallejo, Solano Co., Cal.

WEST COAST LAND CO.

TEMPLETON, SAN LUIS OBISPO CO., CAL.

THE VINEYARD.

Cut-Worms.

We hear that there is still some trouble with cut-worms in the vineyards. It is getting late in the season for these pests. They are worst early in the season when the foliage is first appearing on the vines. There are several species of caterpillars which are called cut-worms. They are all larvæ of night-flying moths. The worms can be recognized by Prof. Riley's description: "They are, as a rule, stout, naked worms of somber colors, curling into a roll when disturbed." "Naked," as applied to a worm, means smooth—not clothed with hairs. For many years the best way to kill cut-worms has been in question, and thousands of dollars have been spent by our vine-growers every spring for years, in hiring men to remove the loose dirt about the vine-stock and killing the worms which secrete themselves there during the daytime. This is an unnecessary expense. The worms can be effectually fought by taking cabbage or lettuce leaves or some other foliage which the worms enjoy, dipping the leaves in a mixture of a tablespoonful of Paris green in a bucket of water, keeping the mixture well stirred to prevent the poison from settling at the bottom. If more convenient, the leaves can be moistened and then sprinkled with a powder composed of one part of Paris green to 20 parts of flour. The poisoned leaves should be placed at the base of the vine, toward evening, and if the weather is cloudy, will remain in condition for two or three days, and must then be replaced with new leaves. Of course all fowls or other valuable vegetarians must be kept away from the vineyard while the leaves are exposed. This use of poison will obviate the danger which might come from applying it directly to the vines.

We have given this treatment before in the RURAL. It was suggested by Prof. Riley to the cabbage-growers of the South and has done them excellent service. It is, of course, useful in gardens and wherever cut-worms do injury.

Grape-Growers' Meeting.

The Wine-Growers' Association of California held a special meeting at the Grand hotel, June 21st, H. W. McIntyre presiding, and E. H. Rixford acting as secretary.

C. A. Wetmore submitted the following resolution, which was adopted:

Resolved, That any new movement looking toward the modification of Internal Revenue laws so as to permit the use of any spirits, excepting grape brandy, free of tax in fortifying wines, should be vigorously opposed by all friends of viticulture.

The following resolution was also submitted by Mr. Wetmore:

Resolved, That a committee of five be appointed to confer with the Board of Regents and to request that body to grant such assistance as may be necessary to enable the State Analyst to perform the duties of his office, and if such efforts fail, to devise ways and means through contributions from wine-growers, or by means of an agreed fee for all analyses required under the Pure-Wine Act.

After discussion, in which the action of the dealers requiring analyses from producers was vigorously denounced, Mr. Doyle offered an amendment striking out of the resolution the words "under the Pure-Wine Act," which was accepted by Mr. Wetmore.

The resolution as amended, being put to a vote, was unanimously adopted.

In accordance with the requirements of the resolution, the chair appointed the following as a committee: C. A. Wetmore and J. P. Smith, of Livermore; M. M. Estee, of Napa; H. A. Merriam, of Los Gatos; and H. M. Larue, of Sacramento.

Mr. Doyle submitted a motion to appoint a committee of three on legislation, to point out the ambiguities of the law and seek either their amendment or total repeal.

Mr. Wetmore objected to the measure on the ground that no legislation can be accomplished for 18 months. As the idea seemed to him a little premature, he introduced the following resolution:

Resolved, That a committee, to be composed of the president and secretary of the State Viticultural Association and the State Analyst, be appointed, to report at the January meeting of this body, in what respects the Pure-Wine Act is operative and beneficial, in what respects inoperative and prejudicial to the best interests of producers, and in what respects it should be amended.

The adoption of the resolution was vigorously opposed on the ground that all the association had now to do was to see that the law was properly enforced.

A motion that the resolution should be laid on the table was lost, and the adoption of the substitute resolution coming to a vote was carried by a small majority. An amendment to the resolution as adopted, appointing Mr. Doyle and M. M. Estee as members of that committee, was submitted by H. M. Larue, and after some discussion was adopted.

The contemplated introduction of a new process of condensing musts was explained by Prof. Hilgard. He stated that there was no hope of introducing the process this season, as unlooked-for difficulties have arisen. The apparatus used in manufacturing wine by this process was patented in Germany by Dr. F. Springmuehl, and arrangements have been made to place a plant of 80 tons of grape capacity in operation in this State. It is expected to produce wine of good quality and at a reduced cost.

The statement that the condensation of musts would relieve the trade of a surplus of wines was combated by Mr. Wetmore in a vigorous argument. His remarks were listened to with interest, and at their close Mr. Doyle submitted a resolution to appoint a committee of three to make public all information concerning the prospects of relieving the grape market during the present season of any process for condensing musts. This motion was unanimously carried, and J. T. Doyle, J. H. Wheeler and E. W. Hilgard were appointed such committee.

Senator L. J. Rose, of San Gabriel, addressed the association upon the Pure-Wine law. He recognized the importance of the relations between the dealers and the growers, and the necessity of harmonious action. One cannot thrive without the other, and both can advance their interests by strictly adhering to the law.

There was a discussion of the stamp provision in the new law, Mr. Estee sustaining and Mr. Wetmore denouncing it. The society finally adjourned to August 5th.

Phylloxera Investigation.

At the last meeting of the Viticultural Commission, Charles Krug, H. Crabbe and Chief Executive Officer Wheeler were appointed a committee to examine into the success of the methods employed in Napa valley for resisting phylloxera.

Mr. Wheeler returned from his mission of investigation yesterday, and stated to a reporter of the *Call* that the committee had examined the mercurial remedy discovered by J. A. Bauer, a local chemist, designed to resist the ravages of the phylloxera, but the committee was unable to report the success desired and anticipated regarding the remedy.

"We found," continued Mr. Wheeler, "considerable areas of vinifera vines totally abandoned to the pest. Remarkable progress has been made in the plantation of American stocks, particularly riparia. The vineyard of the late General Miller exhibits the perfect success of this method, his being an extensive one, now grafted and doing well on riparia roots. Judge Stanley's vineyard, near Suscol, is a remarkable example of success with resistant vines, over 100 acres being found grafted on riparia roots, showing great vigor and healthy growth, notwithstanding vineyards immediately adjacent have been given up to phylloxera. The wines grown from these vines leave no question as to the success of the method.

"The vineyard of Henry Hogan of Napa became an object of special interest to the committee in that the grafting of Mr. Hogan's resistant roots has been performed to a large extent above ground. Mr. Mini, the foreman, has, during the past five years, practiced this novel method of grafting and has been equally successful in this as with customary methods of grafting underground. Vines many years old and covering large arbors have been grafted on their branches with no more precaution or care than is bestowed on the customary graft beneath the soil. The success of this method of grafting, performed for the first time by him, has led to its application to large areas in the field working with all kinds of labor, and he has met with a success equal to any other method, contrary to the idea generally prevailing, that above ground grafting is unsuccessful. Many advantages will result from this new method, which will be fully detailed in Mr. Krug's report to the board. The Viticultural Commission will make further examination of this method. Reports from all inspectors will be called for, that a collation of all experiments of this manner of grafting may be made. If generally successful, it will work a revolution in the substitution of better varieties in our old vineyards.

"Many so called resistant stocks other than the riparia were found on Mr. Hogan's place, but none giving perfectly satisfactory results. Next to the riparia ranks the lenoir, which shows great powers of resistance, the wine from this grape, however, not thus far proving satisfactory."

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

EDMUND WRIGHT—Shasta and Tehama Cos.
H. M. HAMILTON—San Mateo and Santa Cruz Cos.

A New Japanese Nursery.

Much attention is now being paid to the importation of Japanese plants, seeds and trees for trial in California. For a number of years there has been considerable traffic of this kind, but the interest seems to be widening. Mr. S. L. Goldman, the originator and former manager of the Japanese Tree-Importing Co., has just started a new company under the name of Oriental Importing Co., with its office at 120 Sutter St., room 77, and a depot at the store of the well-known seed merchants, Trumbull & Beebe, 419 to 421 Sansome St. The new company also controls Mr. Goldman's old nursery at Vacaville, and a new one in San Rafael with 3 hothouses, lattice-house and packing-room, which is just being fitted up, and we are told that it will be one of the neatest nurseries in the State. The work is to be done entirely by experienced Japanese gardeners. The officers of the company are: Mr. H. U. Jaudin of San Francisco, President; Mr. T. Hayame of Osaka, Japan, Secretary; Mr. S. L. Goldman Manager. The company intends to do a general nursery business, making the propagating of fruit trees a specialty. The Unshiu orange trees, which they offer, have been transplanted already since March, and their shape been corrected. Extreme care has been taken to suit the California market in selecting the stock. Every tree is washed before it leaves Japan, and when they arrive here they undergo the same process, and a certificate that the trees are free from any scale pest is given with each lot. The Unshiu is said to be the same as the Oonshiu. The Japanese Agricultural Association of Tokio (Governmental) calls it the Unshiu, and this name has also been adopted by the Washington horticulturists. We are told that the Satsuma and Canton hybrid orange trees will also form a prominent part of the company's importations.

FOR JAPAN.—Mr. H. E. Amoore, president of the Japanese Tree Importing Co., of this city, departed for Yokohama, Japan, on the 15th inst., to make further shipments of the seedless Oonshiu orange trees. They are said to have had great success with their former shipment of 30,000, having disposed of all but a few, which they have planted out in their nurseries near Santa Cruz.

A Terrible Fire

Arouses the apprehensions of a whole city, and yet the wild havoc of disease startles no one. Sad to relate, women suffer from year to year with chronic diseases and weaknesses peculiar to their sex, knowing that they are growing worse with every day, and still take no measures for their own relief Dr. Pierce's "Favorite Prescription" is the result of life-long and learned study of female complaints. It is guaranteed to cure.

Decay of the Bones,

With some thirty other symptoms, mark the progress of that terrible disease known as catarrh. It advances from stage to stage of fearful annoyances, and if neglected, is certain to end in general debility, and possibly in consumption or insanity Dr. Sage's Catarrh Remedy will cure it at any stage. This medicine has been long before the public, and thousands have been restored to health by its never-failing virtues.

* * * * Premature decline of manly powers, nervous debility and kindred diseases, radically cured. Consultation free. Book, 10 cents in stamps. Address, confidentially, World's Dispensary Medical Association, Buffalo, N. Y.

AGRICULTURAL BOOKS.

Sold by Dewey & Co., Publishers "Pacific Rural Press."

CALIFORNIA FRUIT GROWER.—A practical Handbook for the orchardist (in preparation).
CATALOGUE OF EUROPEAN VINES—With synonyms and brief descriptions, by I. Bleasdale, D. D. Invaluable to those growing the vinifera. Price, in pamphlet, 50 cents.
ORANGE GROWING IN CALIFORNIA—By T. A. Garey, of Los Angeles. The most comprehensive treatise on the growth of this fruit. It contains full instructions for growing the trees, planting and care of orchards, etc.; 227 pages. Price, 75 cents.
SILK GROWERS' MANUAL—By W. B. Ewer, A. M. A practical treatise full of useful hints for beginners in this State; 20 pages. Pamphlet, price 25 cents.
FRUIT GROWERS' CONVENTION REPORTS.—These annual conventions have resulted in bringing out the best and most useful information concerning the growth of different fruits in this State. The subjects discussed are of the most direct practical value and the facts laid down will prove helpful and suggestive to all in the fruit business. We have the reports of 1881, 1882, 1884, and 1885—the first for 10 cents, the others at 25 cents each.
THE AGRICULTURAL FEATURES OF CALIFORNIA—By Prof. Hilgard, 138 large pages, bound in stiff cloth, with colored maps, $1. This book is the best general review of California soils, climate and productions in existence.
NILES' STOCK AND POULTRY BOOK—Pamphlet, giving directions applicable to poultry growing in this State; 120 pages, post-paid for 50 cents.
KENDALL'S TREATISE ON THE HORSE AND DISEASES—Post-paid for 25 cents.
ARCHITECTURE SIMPLIFIED OR HOW TO BUILD A HOUSE.—Contains plans and amounts of materials for a number of buildings from a little cottage to a large dwelling. Price, five cents.

First-Class Mowing Machine for Sale.

A brand-new mower of well-known make can be obtained cheap for cash by addressing D. F., Box 2361, San Francisco, Cal.

IMPORTANT SECRET DIVULGED.—Send 10 cents to Capital Soap Co, Sacramento, and prove it.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, *to those who pay fully one year in advance of date*, IF REQUESTED the following articles (while this notice continues), at the very greatly reduced figures named at the right:

1.—The Agricultural Features of California, by Prof. Hilgard, 138 large pages, illustrated, cloth, with colored maps (full price $1).....$0 25
2.—World's Cyclopedia, 794 pages, 1250 illustrations; (exceedingly valuable).....50
3.—Dewey's Patent Elastic Binder (cloth cover), name of this paper stamped in gilt.....50
4.—Niles' Stock and Poultry Book for Pacific Coast, pamphlet, 120 pages, illustrated.....25
5.—Kendall's Treatise on the Horse and Diseases, 89 pages, instructive illustrations.....05
6.—TO NEW SUBSCRIBERS, 12 select back Nos. of the RURAL PRESS, "good as new".....Free
7.—Any of Harper's, Frank Leslie's and most other first-class U. S. periodicals, 15 per ct. off regular rates.
9.—Pacific Coast and Eastern Dailies, Books and Periodicals, *except special publications*, we can usually give 10 to 15 per cent off advertised retail rates.
10.—March of Empire, by Mallie Stafford.....25
11.—Life Among the Apaches, 322 pages, stiff cloth .25
12.—$1 worth of choice seeds, to be selected from a list of 107 flower and 82 garden seeds, as previously published, or which list we will send on application .25
14.—Dewey's Pat. Newspaper Fileholder (18 to 36 in.) .25
15.—European Vines Described, 63 pages.....05
19.—Webster's Dictionary, 634 pages, with 1500 illustrations; very handy and reliable.....50
23.—Architecture Simplified, 60 pages.....05
24.—Mother Bickerdyke's Life with the Army; patriotic and ably written; 166 pp., cloth, $1.00.....50
25.—Ropp's Easy Calculator, cloth, 80 pp.....25
26.—How to Tell the Age of a Horse.....05
27.—Percheron Stud Book—French—bound in leather, 192 pages (full price, $3).....1.00
28.—What Every One Should Know; a cyclopedia of valuable information; 510 pp.; cloth; (full price $1).....50
29.—Knitting and Crochet, by Jennie June; 144 pp., 200 illustrations.....25
30.—Needle Work, by Jennie June; 126 pp., 200 illustrations.....25
31.—Ladies' Fancy Work, by Jennie June; 152 pp., 700 illustrations.....25
32.—The Way to do Magic; illustrated, 60 pp.....10
33.—The Taxidermist's Manual; illustrated, 64 pp..10
Beautiful Poetic Review, entertaining and instructive; 35 pages (a handsome and pleasing present)..25

NOTE.—The cash must accompany all orders. Address this office, No. 252 Market St., S. F.

Consumption Cured.

An old physician, retired from practice, having had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung Affections, also a positive and radical cure for Nervous Debility and all Nervous Complaints, after having tested its wonderful curative powers in thousands of cases, has felt it his duty to make it known to his suffering fellows. Actuated by this motive and a desire to relieve human suffering, I will send free of charge, to all who desire it, this recipe, in German, French, or English, with full directions for preparing and using. Sent by mail by addressing with samp, naming this paper, W. A. NOYES, 149 Powers' Block, Rochester, N. Y.

BACK FILES of the PACIFIC RURAL PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes) $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

Breeders' Directory.

Six lines or less in this Directory at 50c per line per month.

HORSES AND CATTLE.

BRADLEY RANCH, San Jose, Cal., breeder of recorded thoroughbred Shorthorn Cattle and Berkshire Hogs. A choice lot of young stock for sale.

M. D. HOPKINS, Petaluma, Cal. Eastern Imported registered Shorthorn Bulls and Heifers for sale.

HOLSTEINS, AAGGIE, JACOB; NETHERLAND and Artis strains; all ages; largest herd to select from. Young bulls, low. (All registered.) F. H. Burke, 401 Montgomery St., S. F.

E. J. TURNER, Hollister, Breeder of Percheron-Norman registered Horses and Roadsters.

E. W. STEELE, San Luis Obispo, Cal., breeder of Thoroughbred Holstein and Jersey Cattle.

SETH COOK, Danville, "Cook Farm," Contra Costa Co., breeder of Aberdeen Angus, Galloways and Devons (Registered). Young stock for sale.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOEBIG—Dear Sir: I have analyzed your sample of **"Nitrogenous Superphosphate,"** with the following result:

Soluble Phosphoric Acid	12.90 per cent
Reverted Phosphoric Acid	.95 "
Insoluble Phosphoric Acid	2.83 "
Potash	2.23 "
Ammonia	1.87 "
Nitric Acid	2.95 "

The above amount of **Nitric Acid** is equal to 0.85 per cent **Ammonia**, therefore, total of Nitrogen calculated as **Ammonia**, 2.72 per cent.

This **Fertilizer** is a **Valuable Manure** for vineyards, orchards, gardens, farms, and I **recommend** its use by the cultivators of the soil **generally**, in **California.** Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the **"Nitrogenous Superphosphate"** Fertilizer, analyzed by him at your request. It is a **high-grade article**, and as such returns the user a better money value than a low-grade fertilizer. It is **especially well** adapted to use in **California**, on account of the **predominance** in it of **Phosphoric Acid**, which is generally in small supply in our soils. Yet it is desirable that **"complete"** fertilizers be used in our orchards and vineyards, and **yours is of that character** in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of **Phosphoric Acid**—the chief element of all plant food—in combination with the necessary quantities of **Potash** and **Ammonia**, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from ½ pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sobranto, Station of the C. P. R. R., 20 miles north of San Francisco, at $30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

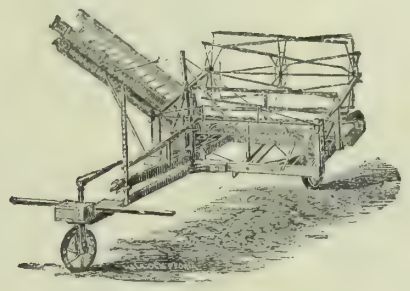
$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources of their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.



THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitor anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. **A NEW FEATURE** has been added to the Premium List this year, in the shape of awards for a **Sheaf Display of Cereals.** Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor. Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

EDWIN F. SMITH, Secretary. L. U. SHIPPEE, President.

A Treatise on the Horse and his Diseases
By B. J. KENDALL, M. D.

35 Fine Engravings showing the positions and actions of sick horses Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines. Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year. It is printed on fine paper and has nearly 100 pages, 7½x5 inches. Price, only 25 cents, or five for $1, on receipt of which we will send by mail to any address. DEWEY & CO.,
220 Market St., S. F.

S. F. Market Report

NOTE. Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, June 22, 1887.

The past week was characterized by hot weather for two days, followed by cooler winds. So far as can be ascertained no great damage was done to maturing grains. The weather for fruit purposes was of the best, both for gathering, drying and canning. The English wheat market was more or less unsettled throughout the week, owing to the break in values at the East. While Eastern wheat was weak and offered for less money, Californian was strongly held and not put on the market. The following is to-day's cable:

LONDON, June 22.—Cargoes off coast, very little demand; cargoes on passage and for shipment, inactive; Mark Lane, turn easier; Liverpool wheat, spot, inactive; Liverpool wheat, Cal., 7s 7d@7s 10d.

Foreign Review.

LONDON, June 20.—The *Mark Lane Express*, in its weekly review of the British grain trade, says: Continued hot, brilliant weather is causing wheat to ear in the northern districts. The crop is immensely improved, giving greater promise than at the corresponding date of 1886. The outlook is vastly better than at the beginning of the month. Deliveries of new wheat are lessening rapidly. Values have fallen 1s. Sales of English wheat during the past week 39,738 quarters at 35s 1d against 43,178 quarters at 31s 4d during the corresponding period last year. The trade in foreign wheat is almost at a standstill. The breakup of the Chicago ring made little difference in the values, as the supplies at London continued small, but prices are somewhat in buyers' favor. There would doubtless be a bad break if a large quantity of American should be sent to be sold on commission. The demand for flour is restricted. Prices somewhat favor buyers. At Glasgow values declined 6d@1s. At to-day's market the trade in wheat was of a holiday character. There were no buyers and prices went nominally 1s lower. Flour is dull at a decline of 6d. Corn is slow; barley, oats, beans and peas are quiet. Linseed is cheaper.

Eastern Wheat Markets.

NEW YORK, June 19.—On Saturday the bears were fearful of a squeeze on the short side, and so were free buyers of wheat to close out contracts over Sunday. The result was higher prices for June and large dealing all around. Spot prices were ½@1½c higher and there were purchases of over 140,000 bushels for export and nearly 100,000 bushels to arrive C. J. F. June ended at 94¼c, July, 88c, the other months losing ⅜@½c net as follows: August, 86¾; September, 87¼; October, 89¾; November, 89¼; December, 90½c.

CHICAGO, June 20.—On the afternoon board the cereal sold down to a lower level than has yet been reached, again breaking the record of 25 years. There seemed to be no cause for the break beyond the generally accepted theory that the banks were calling their wheat loans, thus throwing a great load of cash property on a weak and reluctant market. The shorts were the principal buyers on the afternoon board. There was no special excitement. June sold from 69 to 68½c, closing at 68½c. July sold early at 71c, fell to 70c, closing at 70⅜c. August opened at 72⅝c, fell to 72¼@72⅜c, closing at 72½c. September fell from 74⅝c to 74¼c, closing at 74¼c. October sold at 75¾ and 76c. December opened at 79@79⅛c, fell to 78⅝c, closing at 78⅜@79c.

CHICAGO, June 21.—The suspension of the Fidelity Bank, which has demoralized speculation, has put life into the cash trade, and great activity in every channel of the cash wheat market is noted in the pit. Closing quotations were 69¾c for July, 72c for August, 73½c for September and 78½c for December.

NEW YORK, June 21.—The wheat market has been nervous and semi-panicky to-day. Shippers are taking advantage of the break to export purchases amounting to upward of 500,000 bushels.

CHICAGO, June 22—1 P. M.—Wheat about steady; cash, 69c; July, 69 15-16c; August, 72 5-16c. Corn steady; cash, 35⅜c; July, 36 3-16; August, 37⅞c. Oats steady; cash, 25c; July, 25⅜c.

NEW YORK, June 22.—The big "shorts" in Chicago telegraphed their N. Y. correspondents to sell all the June wheat they could. The Produce Exchange men, on obeying orders, carried the defeat of the clique into a rout, and June, that closed Monday afternoon at 95½c, sunk yesterday to 87c. The transactions for the session ran up to 18,000,000 bushels.

Crops at the East.

CHICAGO, June 19.—The following is the weekly crop summary published by the *Farmers' Review:* At this date of writing the report of the winter wheat crop, in all sections so far as it has reached maturity, shows no change in its condition, and none will take place unless hail, insects or rust should damage ripening grain. Eight of the winter wheat-growing States report an average condition of the crop at 89 per cent. The other reports on its condition in the different States are as follows: Seventy counties in Illinois report an average condition of 89 per cent. Insects and drought are little complained of. Eight counties in Indiana report the condition at 91 per cent. Kansas counties report no improvement in the crop. The damage by insects is very serious in Marshall, Smith, Franklin and Neosho counties. Kentucky reports an average condition of 96 per cent, with damage by insects in Hardin county. Michigan reports an average condition of 93 per cent. Missouri an average condition of 100 per cent. Ten counties in Ohio report a condition of 68 per cent. Seven counties in Wisconsin place the average at 93 per cent, with damage by chinch bugs in Portage county.

The condition of spring wheat in the different States is as follows: Wisconsin counties report an average condition of 63 per cent; 17 counties in Iowa place the average at 84 per cent; 11 Minnesota counties place the average of 87 per cent; 9 Nebraska counties place the average at 90 per cent, and six counties in Dakota report an average of 109 per cent.

The condition of the oat crop from drought and insects is everywhere below the average. The corn prospects are first-class. Hay and grass are short from drought. The fruit prospects are fair.

Eastern Wool Markets.

NEW YORK, June 19.—Wool—Among holders of domestic wools the feeling remains unsettled, and the market is slow to adjust itself regarding the new clip. Most buyers complain of an unsatisfactory goods market, and repeat the usual story of scant margins at the current cost of wool, but they find it necessary to invest to keep the mills running, and are picking up anything that looks like a bargain. Holders have met the call fairly well and stiffened somewhat on anything in the way of really desirable parcels. Sales include 25,000 lbs fall California at 15@16c; 13,000 lbs scoured California at 42@56c; 10,000 lbs Montana at 21c; 10,000 lbs Oregon at 21@22c.

The Philadelphia market as a whole has continued quiet. Manufacturers lack confidence in present prices, and pay them grudgingly and only for such wools as are imperatively required for present consumption. Among the sales were 1000 lbs of Territory bucks and 5000 lbs Territory one-quarter furry at 23½c; 7000 lbs Montana medium and 2500 lbs fine medium at 13½c.

The Boston market has ruled active, and on all sorts and conditions of fleece. The closing quotations are exceedingly firm. Among sales were 55,000 lbs fine Territory at 24c, 40,000 lbs fine medium Territory at 23@24c, 85,400 lbs medium Territory at 25@27c, 195,000 lbs spring California at 20@23c, 97,000 lbs fall California at 12@20c, 110,000 lbs Eastern Oregon at 18@22c.

NEW YORK, June 21.—Wool is quiet and firmly held. Domestic fleece, 30@37c; pulled, 14@34c; Texas, 9@24c.

California Products at Chicago.

CHICAGO, June 18.—There is not much to say about the dried fruit market any more than to repeat that prices are ruling about steady and that the market remains quiet. There is something doing all the time, however, and as stocks are very small holders cannot well allow fruit to go out of their hands at anything under previous prices. California dried fruits are quiet, owing to the very small supply. There is some inquiry for the several lines, and quotations range as follows: Pitted plums evaporated, 10@11c; sun-dried, 7@9c; apricots, evaporated, spot goods, 18@20c; future delivery, 16@18c; sun-dried, none here; prunes, 9@11c; raisins, London layers, 20-lb boxes, ₱ box, $1.50@1.75; loose Muscatel, $1.25@1.35; California layers, $1.25@1.35.

CHICAGO, June 21.—California dried fruits are dull and steady. California green fruits are in good supply. Choice fruit is selling well. More or less fruit comes in poor order; this has to be sold cheap. Apricots, 20-lb boxes, $1.50@1.75; apricots, half crates, $1.75@2; peaches, 20-lb boxes, $2.@2.25; cherries, Black Tartarian, 10-lb boxes, 1.50@1.75; cherries, Royal Ann, 10-lb boxes, $2@2.25; plums, Cherry, 10-lb boxes, $1@1.25; plums, Peach, 20-lb boxes, $3@3.25; plums, Royal, native, half crates, $3@3.25. Stock in soft order sells at less prices. Prices of new potatoes cover a wide range. The demand is light and the market dull. California potatoes are dull and lower, at $1.75@2 ₱ 100 lbs.

New York Hop Market.

NEW YORK, June 19.—The market remains very firm. There is nothing in the business passing or in the demand that is purely speculative. Dealers and brewers adhere to the most conservative methods. The choice Pacific are wanted to some extent. On 1886 Washington Territory hops 23c cash was realized, and choice 1885 Pacific brought 13c here. 1886, best, 23c; same, common to good, 17@21c; 1885, good to prime, 10@18c.

California Fruits in New York.

NEW YORK, June 19.—Green—California apricots, 25c a quart; California peaches, 75c@$1.50 a dozen.

Dried—The market is quiet and little effort is made to urge distribution. Malaga and California raisins are held about as before, with the trade most in the way of jobbing lots.

Canned—California pears are unchanged.

Pacific Coast Wool Sales.

CLOVERDALE, June 15.—At the wool sale to-day about 1200 bales were offered, and most of it was sold, prices ranging from 21¾ to 23½c ₱ lb. About $75,000 has been distributed among the wool-growers. The principal buyers were Costigan, Cohn & Co., Goldfish, Cohn & Co., and L. Breslauer & Co. of S. F., and E. H. Tryon of Sacramento.

TACOMA (W. T.), June 15.—The Pierce county wool clip of 1887 was sold at auction to-day. It was purchased by Frauenthal Brothers of Seattle, at 24⅜c ₱ lb. There were 25,000 lbs.

ALBANY (Or.), June 20.—A lot of 16,000 lbs of wool, pooled by farmers near Albany, was sold to-day to A. S. Cahen of San Francisco, for 25c ₱ lb.

Local Markets.

BAGS—The market is strong but quiet. The consumption is larger in this State than estimated. Standard size is quoted at 6¼@6⅝c, as to quantity and age.

BARLEY—The market has shown considerable activity in futures, with few fluctuations. The general impression is that there is strong pool buying. In the Market Information fuller information is given. To-day's sales on Call were as follows:

Morning Session: Buyer 1887—100 tons, $1.15; 100, $1.15¼; 100, $1.15⅜; 100, $1.15¼. Seller 1887, new crop—400 tons, $1.06⅜ ₱ ctl. Afternoon Session: Buyer 1887—200 tons, $1.15¼; 300, $1.15½; 100, $1.15⅝; 600, $1.15¾; 200, $1.16; 300, $1.16½; 100, $1.16¼. Seller 1887, new crop—100 tons, $1.06⅜ ₱ ctl.

FLOUR—The market is steady at full quotations.

WHEAT—With rapid declines and only slight reactions the New York and Chicago markets caused many to sell futures in our market, but without any visible effect, for large buyers took all put out. Many are inclined to the opinion that a decided advance in options is likely to take place before deliveries can be made, forcing many who have sold to fill or else put up more margin. Of course this is only conjectural and time can only prove it correct. Some new choice to extra choice wheat was sold to a miller at $1.87½. Shippers pay quotations. At to-day's Call the sales were as follows:

Morning Session: Seller 1887—600 tons, $1.83½; 1000, $1.83⅝. July—100 tons, $1.84¾ ₱ ctl. Afternoon Session: Buyer 1887—100 tons, $1.90. Seller 1887—400 tons, $1.83¾; 100, $1.83⅞; 200, $1.84; 100, $1.84⅜; 100, $1.84½; 200, $1.84¾; 100, $1.84⅞; 300, $1.85. July—100 tons, $1.84¾ ₱ ctl.

BUTTER—Hard, strictly choice, gilt-edged butter is in good demand, and fetches full prices, but soft butter and also off-color butter is slow and hard to place.

CHEESE—The market is barely steady under liberal supplies and an offish demand, owing to strong competition from the West.

EGGS—Strictly choice fresh-laid ranch eggs are in light supply and wanted at full figures, but off eggs and also Eastern eggs are in excessive supply, and move slow except at low prices.

[COMMUNICATED.]

Market Information.

Cereals.

The collapse of the Eastern wheat deal continues to attract attention, with active operators in this market on the alert for the latest telegraphic advices from Chicago. After steadying up, that market again broke under an authentic report that the Fidelity Bank of Cincinnati, which had been backing the bulls on 'Change, had been ordered to wind up its affairs. In speaking of the situation, the last issue of the New York *Shipping List* to hand says: "The wheat market is no longer under the control of the speculative clique that, regardless of the statistical position of supplies or the other influences that usually shape the course of trade, forced values to their recent hight. In the parlance of the Exchange the corner is 'busted,' and the drop yesterday has eliminated the wind with which values had become inflated. Meanwhile, however, the statistical position of supplies both here and abroad is favorable. The low prices that have prevailed during the past two years have discouraged production in foreign countries, and accordingly, with increasing consumption, the relations of supply and demand have become of a more healthful character. The tendency of speculation is always to go to an extreme, and the recent inflation of values has been of this character; but the liquidation now in progress is calculated to create a more healthy feeling, revive the export demand and quicken the movement of legitimate trade, which has been checked by the 'deal.'"

That the position of wheat is a strong one is not denied by any one. And that moneyed men believe in it is witnessed in the strength exhibited by this market in the face of a large break and lower prices at the East, and also lower values abroad in sympathy. From all that can be ascertained, the syndicate in this city have bought in options over 220,000 tons of wheat, and are still buying. It is claimed that they are not only buying options, but also all the new wheat they can at current quotations.

Harvesting is progressing favorably in the more advanced sections. The grain, both barley and wheat, is said to be fully up to the average.

Eastern exchanges report that the latest statistical compilation shows that the wheat crop of the United Kingdom in 1886, less seed, was 57,457,821 bushels, of which on June 4, 1887, about 45,769 848 bushels, or about 80 per cent, had been delivered. The annual requirements of the United Kingdom for food and manufactures, aside from flour, are about 212,000,000 bushels, and in the crop season to end on August 31, 1887, about 154,500,000 bushels in wheat, and flour equivalent, are required to be imported. Of this quantity about 105,000,000 bushels net were imported from September 1, 1886, to June 5, 1887, leaving additional imports from June 4 to August 31, 1887, of about 49,500,000 bushels. There were, however, on June 8, 1887, 13,200,000 bushels of wheat and flour on passage thence, against 19,600,000 bushels on June 9, 1886, and 22,800,000 bushels on June 10, 1885. Of the 13,200,000 bushels on passage June 8, 1887, about 10,000,000 bushels are on long sail voyage from distant points, 3½ to 4½ months off, so that only about 3,000,000 bushels of this 13,200,000 is likely to become available for consumption in the United Kingdom before September 1, 1887. This 3,000,000 bushels deducted from 49 500,000 bushels, leaves about 46,500,000 bushels to be purchased in and shipped from all foreign countries to arrive prior to August 31, 1887, provided stocks are to be kept normal. The stocks of wheat and wheat flour at importing ports of the United Kingdom, taken in each year of the six years ended in 1886, on June 30 and December 31, averaged something less than 16,000,000 bushels, which may be considered as about the normal stock. The stock June 1, 1887, is believed to be under normal. The smallest stock in the 12 records referred to was about 9,000,000 bushels. By drawing on stocks to the extent of 7,000,000 bushels, leaving them September 1, 1887, only 9,000,000 bushels, the quantity of wheat to be purchased in and shipped from foreign countries from June 4 to August 31, 1887, might be reduced to 39,500,000 bushels. Some part of this quantity may be supplied by Russia, some by Austro-Hungary, as flour; and a portion may come from India, via the Suez canal; but much the larger share must be obtained from Atlantic ports of North America.

The average wheat crop of France from 1876 to 1885 inclusive has been 301,096,357 bushels; average imports, 51,096,846 bushels; average exports, 10,249,113 bushels; average net imports, 40,856,733 bushels; an average supply of 341,943,100 bushels. The wheat crop of France in 1886 was under average, and much of it of inferior quality and light weight. The net imports of wheat into France from August 1, 1886, to April 30, 1887, have been 28,275,592 bushels, against 13,169,072 bushels in the corresponding period in 1885-86. The quantity of wheat on passage from France May 26, 1887, was 1,800,000 bushels, against 520,000 bushels at the corresponding date in 1886. The wants of France for the last quarter of her crop season, May, June, and July, according to Paris advices, will be large, as her reserves are small and most of her home crop has been delivered. Her wheat crop is three weeks late and stocks in importing ports are small.

It is claimed that large quantities of new barley have been taken for account of Eastern buyers. The grade is said to be good to choice brewing. There has been free selling on Call the past week, chiefly by interior dealers and farmers. The buying on Call was by consumers and also speculators who believe in a higher market later on, owing to the short crop and large increased demand.

Oats have been shading off under fair receipts, light demand and continued favorable crop reports from Oregon and Puget Sound. It is claimed by well-informed parties that the crop in Oregon and on the Sound will be all of 50 per cent more than last year's.

Corn has eased off slowly, owing to a lower, declining market at the East, together with free receipts here. Stocks with us are not excessive, but the demand is only fair.

Rye is very scarce, but then the demand is about over, owing to the probabilities that new will be on the market soon.

Feedstuff.

Both bran and middlings are weak and lower under freer receipts and a restricted demand, owing to the high prices that ruled about two weeks since. It is now thought that the supply will be larger and consequently prices continue down.

Feedmeal and ground barley have a weaker tone, but so far as can be ascertained the price for best grades is not shaded.

Oilcake meal is in good request, considering the high prices asked.

Fruits.

Senator Buck, of Vacaville, sent the first grapes of the season to market on Monday, June 20th. They fetched 25c per lb.

Apricots continue in very heavy supply, notwithstanding free purchases by driers and canners. A. Lusk & Co. received from Briggs' ranch the first large consignment of this season. The quality of dried apricots is unsurpassed, and they sell readily to jobbers at 11½@13c per lb. It is claimed that several shipments of this season's dried apricots have been made to the East.

Peaches continue in liberal supply, but as yet the quality is poor and do not sell readily. Many coming in are too green, but still they sell on distant orders. It is claimed that the better varieties of fruits will begin to put in an appearance soon, owing to the fine maturing weather.

Strawberries are in moderate supply, but as the receipts of other fruits increase, the consumption decreases. Canners only buy overstocks.

Blackberries and raspberries shade off under freer receipts. Many of the former coming in are very poor.

Apples and pears show very little improvement, and consequently move slow.

Raisins are well cleaned up, but then the demand is light.

Dried fruits of last year's curing are about all gone, causing quotations to be more or less nominal. The East reports Europe cleaning up the markets of all grades of apples.

Live-Stock.

Beef cattle, mutton sheep, hogs and large veal are lower under a fair supply and a lessened consumption. The market for beeves closed with a steadier tone, but sheep and hogs were weak. In work horses the demand is slack, owing to both farmers and railroad contractors being well supplied. The market for other horses is barely steady.

The following are the wholesale rates of slaughterers to butchers:

BEEF — Extra, 7½c; first grade, grass fed, 6¾@7¼c per lb.; second grade, 6@6½c; third grade, 4½@5¼c.

MUTTON—Ewes, 5½@6c; wethers, 6½@7c.

LAMB—Spring, 9@10c.

VEAL—Large, 6@7c; small, 6@8c.

PORK—Live hogs, 4½@4¾c for heavy and medium; hard dressed, 6½@7½c per lb; light, 4¾c; dressed, 6½@7c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

Asparagus is growing scarce, causing a stronger market.

String beans are in liberal supply, but peas come in sparingly.

Green corn is more plentiful, with still heavier receipts, and lower prices looked for after next week.

All kinds of seasonable vegetables are in better supply, with prices gradually favoring buyers. It is thought that canners will start up on tomatoes in about a fortnight.

Free shipments of potatoes continue to be made eastward, notwithstanding which prices do not improve, although at the close a steadier tone is reported, which may be followed by a slight advance.

Onions are in free supply, with prices favoring buyers. There is a better inquiry at the close for hard good keepers to fill distant orders.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	274,273	286,097
In port, disengaged	99,797	35,084
In port, engaged	25,255	22,551
Totals	399,425	343,733

The above gives a carrying capacity as follows: 1887, 636,643 short tons; 1886, 320,526 short tons; increase over last year, 116,117.

A very large number of wheat vessels have gone into lumber commission, which are available for wheat when required. Several wheat charters were drawn the past week, generally at a shading on the rates of preceding week.

All kinds of fowls are weak and lower, under a light demand and fair receipts.

Free wools, medium to fine, are wanted at full prices, with some extra choice sold at a slight advance. Off grades of wool are slow and appear to be accumulating.

There is a better inquiry for hops for future delivery. A slight advance on last week's bids is reported to have been made, but growers are indifferent and ask more money.

There has been a freer movement in beans, chiefly for shipping on orders to east of the Rocky mountains.

San Francisco, June 22, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

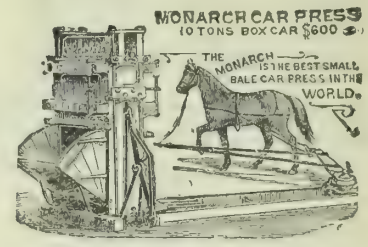
HEADQUARTERS

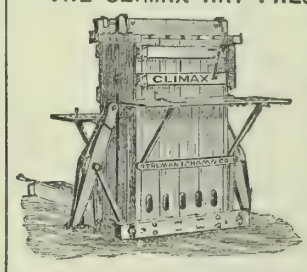


FOR ALL KINDS OF

BALING PRESSES

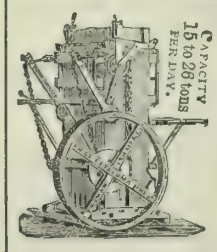
—AND—

HAYING TOOLS.



THE MONARCH, JR., HAY PRESS.

IMPROVED FOR 1887.



Any young man can earn more on an investment of $500 in this press than can be earned in expending $2000 for any other machine. We have a Monarch Press, which we sell for $600, but has been used a very little and is just as good as new, which we will sell for $450.

THE CLIMAX HAY PRESS. $350.

Weight, 2200 lbs. A crew of three men—four can be used to advantage.

Five ropes are used on the bales. Capacity, 10 to 15 tons per day. The best press for the money in the world.

The Celebrated Petaluma

BALING PRESS.

Weight, 2600 lbs. Price, $450, delivered at the factory.

Size of bale, 22x22x48 inches. Capacity, 26 tons per day. Weight of bale from 225 to 400 lbs. This remarkable machine still stands at the head of all vertical baling presses, and probably bales three-quarters of all the hay west of the Rocky Mountains.

Whitman's IMPROVED New Rebound Plunger.

GREATLY IMPROVED FOR 1887.

Do not confound our NEW Press with that made two years since. EVERY PRESS FULLY WARRANTED. For one or two horses. The most powerful in use. The most rapid and durable, and the most perfect. Makes the most perfect bale. The most simple to operate. Least expense for repairs. NO STOPS FOR TYING BALE.

The Greatest Success of the Age.

Victorious in every contest. Double-acting, with new concentrating power. Do not buy a Press until you have seen the IMPROVED New Whitman with concentrating power. Puts from 10 to 15 Tons in a Car.

16x18 Mounted, weight, 3600 lbs.....$400 00
18x22 Mounted, weight, 3800 lbs..... 450 00

All make bales of variable size.

Hay Forks, Hay Carriers, Harpoon Forks, and all kinds of Haying Tools in great variety. In baling your hay, use our **Steel Baling Ties.** Cheaper than Wire—Better than Rope.

TRUMAN, ISHAM & HOOKER,

421—427 Market Street, San Francisco.

Short Hand

Taught thoroughly by mail. Terms reasonable. Send for circulars. Miss Barrett, 240 Montgomery St., S. F.

HORTON & KENNEDY'S

FAMOUS

ENTERPRISE

Self-Regulating

WINDMILL

Is recognized as THE BEST.

Always gives satisfaction. SIMPLE STRONG and DURABLE in all parts. Solid Wrought-iron Crank Shaft with DOUBLE BEARINGS for the Crank to work in, all turned and run in adjustable babbitted boxes.

Positively Self-Regulating.

With no cone springs, or springs of any kind. No little rods, joints, levers, or anything of the kind to get out of order, as such things do. Mills in use 6 to 12 years in good order now, that have never cost one cent for repairs. All genuine Enterprise Mills for the Pacific Coast trade come only through this agency, and none, whether of the old or latest pattern, are genuine except those bearing the "Enterprise Co." stamp. Look out for this, as inferior mills are being offered with testimonials applied to them which were given for ours. Prices to suit the times. Full particulars free. Best Pumps, Feed Mills, etc., kept in stock. Address,

STOCKTON COMBINED HARVESTER & AG'L WORKS

Stockton, Cal.

The only Manufactory that makes a Specialty of Building

COMBINED HARVESTERS.

PULL and PUSH, BELT and GEARED.

Houser, Minges, Shippee, and Powell

THE LEADING HARVESTERS OF THE PACIFIC COAST.

THE HOUSER BELT IS OUR STANDARD.

THE BEST KNOWN AND MOST POPULAR.

300 in Field Use and No Failures.

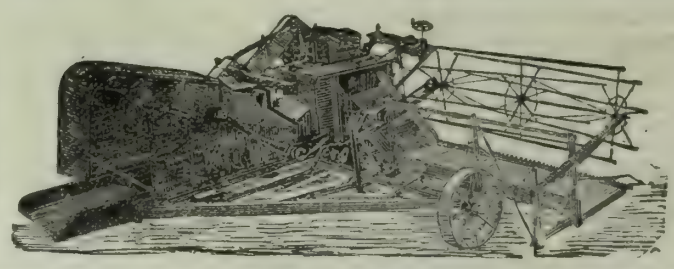
NONE EVER RETURNED TO THE WORKS.

HAS STEEL SHAFTING & GEARING & WIDER CYLINDER than 1886

They are built for 1887 with 30-inch Cylinder and 42-inch Separator. We are also building them with 46-inch Separator.

They Cut, Thrash, Clean, and Sack

For less than $1.00 an acre, and place the grain in the sack at less cost than the old method of putting it in the stack. **They Save Three Bushels an Acre** over and above Heading and Thrashing, or enough grain to pay the cost of harvesting.



THEY REQUIRE FROM THREE TO FOUR MEN AND TWELVE TO TWENTY-FOUR ANIMALS, according to width of cut and condition of grain. ☞See Testimonials and large cut of the Houser, outside pages, RURAL PRESS, issues of January 15th and 29th. Call at Works. Send for Circulars. Address

STOCKTON COMBINED HARVESTER & AGRICULTURAL WORKS.

MATTESON & WILLIAMSON,

THE PIONEER HARVESTER BUILDERS OF THE WORLD.

Not One of These Harvesters Has Been Returned.

Not One of These Harvesters Has Been Returned.

THE HARVEST QUEEN.

MATTESON & WILLIAMSON,

The only manufacturers in Stockton who make a specialty of making everything needed by the farmer in seeding and harvesting. Among their latest triumphs in harvesting machinery is the unrivaled

HARVEST QUEEN,

To Which They Invite the Attention of the Careful Farmer.

This machine was first placed in the field during the harvest of 1886. From the testimonials of those who have had it in use it is considered the peer of any now offered for public favor. For stanchness of build, lightness of draft, economy of manual labor and animal power, and in saving and cleaning the grain, its equal has yet to be produced. It is so furnished with efficient and ready-operating brakes that the lives and limbs of operators are in no degree endangered. A limited number of the HARVEST QUEEN are being constructed for the harvest of 1887.

ORDERS AND CORRESPONDENCE SOLICITED.

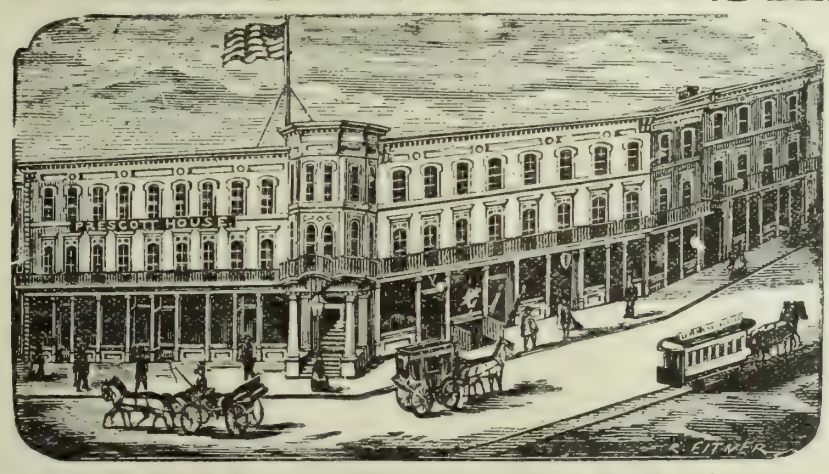
JUDSON POWDER,
The Only Reliable and Efficient Powder
For Stump and Bank Blasting. From 5 to 20 pounds blows any Stump, Tree or Root clear out of ground at less cost than grubbing. Railroaders and Farmers use no other.

As other makers IMITATE our Giant Powder, so do they Judson, by Manufacturing a second-grade, inferior to Judson.
BANDMANN, NIELSEN & CO, General Agents, San Francisco.

MERY'S IMPROVED PIONEER
BARLEY CRUSHER
Using the Benoit Corrugated Rollers.
STILL AT THE FRONT.

VALUABLE IMPROVEMENTS HAVE BEEN ADDED THIS YEAR.



This Mill has been in use on this Coast for 6 years,
TAKEN THE PREMIUM AT THE STATE FAIR
Four years in succession, and has met with general favor, there now being
Over 200 of them in use in California, Nevada & Oregon
It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

Free Coach to and from the House. J. W. BECKER, Proprietor.

THE "NEW BECKER."
SEVENTH IMPROVEMENT, April 1, 1887.

At Last to "Perfection."

SENT ON 60 Days' Test Trial.

AGENTS WANTED.

Approaches nearer to the old method of hand-rubbing than any invention yet introduced to the public. EASILY worked, and washes PERFECTLY clean. Owing to its intrinsic merits thousands have been sold all over the United States, and all giving PERFECT satisfaction. It only needs to be seen and tried to be appreciated. Awarded first premiums 1883, 1884, 1885 and 1886. In localities where as yet I have NO agent, I will ship sample Machine and Wringer on 60 days' trial, the party to pay for them at WHOLESALE prices and act as Agent, if found satisfactory, IF NOT, return them. Do not lose money by waiting until SOME ONE ELSE orders samples and secures an agency for your locality. Farmers make $200 to $500 during the year. Ladies have great success selling this washer. WRITE AT ONCE for New Illustrated and Descriptive Pamphlet, which contains my liberal proposition. Mention this paper. DO NOT DELAY.

E. W. MELVIN, Proprietor and Manufacturer.

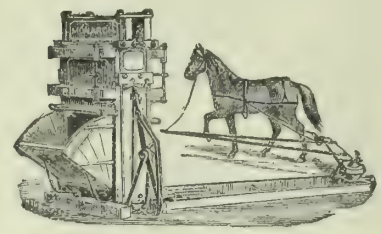
HAY PRESSES.

THE HURRICANE,
A Mounted Double-Ender Baling Machine, capable of baling 40 tons per day.



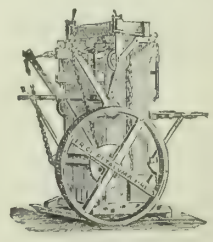
ITS RECORD

For the first year of its existence is as follows: **Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.**

Two sizes: Compressed bales and common bales. **Improved this year so that it is nearly one-quarter faster than before, and the back-and-forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.**

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., **$1000.**

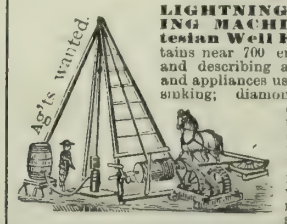


THE JUNIOR MONARCH
Does its own Tramping. Feeds at Side, near the Bottom.

HAS THE FOLLOWING RECORD:

33 tons in one day; 105 tons in 3½ days; 20 tons, and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., **$500.**



—THE—
Genuine Price Petaluma,
With Latest Improvements.

Made under the supervision of the inventor, JACOB PRICE. Too well known to need further description. First-class material and workmanship Capacity, from 10 to 18 tons per day. Hay must be tramped in press.

Price, at factory, San Leandro, Cal., **$350.**

Send for large illustrated Catalogue of above presses. **Office and Factory, SAN LEANDRO, CAL.** Address

PRICE HAY PRESS CO.

LIGHTNING WELL SINKING MACHINERY. THE

PACIFIC RURAL PRESS.

The Leading Agricultural Home Newspaper and standard authority on all branches of California Agriculture.

It is the chief medium for the dissemination of information concerning fruit-growing in California.

It has the fullest and most accurate REPORTS OF HORTICULTURAL MEETINGS, and is the best record of the EXPERIENCE OF INDIVIDUAL FRUIT-GROWERS in all parts of the State.

Its market reports are prepared with care and the greatest reliability possible for the benefit of the producer.

THE PACIFIC RURAL PRESS has more circulation and influence in the Pacific States and Territories than all the other agricultural weeklies in the United States combined. Advertisers can reach nearly all the leading reading farmers through its columns.

A well-known horticulturist who was in attendance upon the meetings of fruit-growers, writes; "The greatest praise that could be bestowed on the RURAL PRESS at the late Fruit-Growers' Convention, and which shows, undoubtedly, the well deserved popularity of that paper, is the fact that almost all the members of that Convention were subscribers to the Press."

It is a Farm and Home Journal of the highest class, pure in tone and well informed on all matters of industrial interest. It is handsomely printed and illustrated. It is a 20-page weekly, and is furnished, postage paid, for $3 per year in advance. Single copies, 10 cents, prepaid.

What Others Say of the "Rural Press."

PROUD OF THE RURAL.—We feel proud of the RURAL PRESS. It is a paper that we are not ashamed to send to our friends in the East. Every farmer on the Pacific Coast should take it, and it is a valuable paper for anyone to read. We appreciate your efforts. Long may you live to bless our cause. *James Blood, Santa Barbara Co.*

THE RURAL BEST OF ALL.—I take from four to six papers but *if I could take but one*, I should unhesitatingly choose the PACIFIC RURAL PRESS.—*J. M. Asher, San Diego Co.*

INVALUABLE.—I congratulate you on the *general excellence* of the RURAL PRESS, and consider it simply invaluable to all residents of the Pacific Coast.—*Frederick C. Sheldon, M. D., Los Angeles Co.*

Established 1870. Yearly subscription $3. [Thirteen and one-half months are allowed new subscribers and old subscribers paying $3, strictly in advance.
